*Infringement, Worley *et al.* v. Loker Tobacco Company *et al*	559
*Infringement of patent by joint owner, Herring v. Gas Consumers' Association	203
*Injunction, Ager *et al.* v. Murray	1197
*Injunction, Crandal v. Walters	945
*Injunction, Cross v. Livermore	139
*Injunction, Gottfried v. Miller	711
*Injunction, Graham v. McCormick *et al*	1533
*Injunction, Hammerschlag v. Garrett *et al*	1199
*Injunction, Lindsay v. Stein	1613
*Injunction, Loercher *et al.* v. Crandal	863
*Injunction, Macauley v. White Sewing Machine Company *et al*	204
*Injunction, Macauley v. White Sewing Machine Company *et al*	496
*Injunction, Matthews *et al.* v. Boston Machine Company *et al*	1349
*Injunction, Miller *et al.* v. Force *et al*	947
*Injunction, Root v. Lake Shore and Michigan Southern Railway Company	1112
*Injunction, Schmidt v. Freese	1876
*Injunction, Searls v. Bouton *et al*	1784
*Injunction, Strobridge v. Landers *et al*	1027

	Page.
*Injunction, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company	411
*Injunction, Worden *et al.* v. Fisher *et al.*	1957
*Interference, *ex parte* Marston	633
Interference, Harmet v. Reese *et al*	1875
*Interference, National Feather Duster Company v. Hibbard	635
*Iron from blast-furnace slag, Vinton *et al.* v. Hamilton *et al.*	557
*Jurisdiction, Root v. Lake Shore and Michigan Southern Railway Company	1112
Laches, Harmet v. Reese *et al*	1875
*Laches, Matthews *et al.* v. Boston Machine Company *et al.*	1349
*Laches, Miller & Company, Edward, v. Bridgeport Brass Company	201
Lamps, *ex parte* Palmer	1111
*Lamps, Miller & Company, Edward, v. Bridgeport Brass Company	201
*Lathes for turning irregular forms, Spring *et al.* v. Domestic Sewing Machine Company	633
*Law in equity, Root v. Lake Shore and Michigan Southern Railway Company	1112
*Locomotives, Mellon *et al.* v. Delaware, Lackawanna, and Western Railroad Company	1616
*Looms, Webster Loom Company v. Higgins *et al.*	2031
*License, Gottfried v. Miller	711
*License, Hapgood *et al.* v. Hewitt	1786
*License, Mellon *et al.* v. Delaware, Lackawanna, and Western Railroad Company	1616
*License, Searls v. Bouton *et al.*	1784
*License, Union Paper Bag Machine Company *et al.* v. Nixon *et al*	1275
Machine for making paper bags, Union Paper Bag Machine Company *et al.* v. Nixon *et al*	1275
Machine for making waxed paper, Hammerschlag v. Garrett *et al*	1199
*Machine for pitching beer-barrels, Gottfried v. Miller	711
*Metallic cases, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company	411
*Metal moldings, Combined Patents Can Company v. Lloyd.	713
*Molding crucibles, Pickering *et al.* v. McCullough, Dalzell & Co	73
*Moldings, apparatus for enameling, Wallick v. Cantrell *et al*	1878
*Neckties, Hart v. Thayer	791
*New matter, Crandal v. Walters *et al*	945
New matter, *ex parte* McDougall	1783
*New matter, Bantz v. Frantz *et al*	2037
*New matter, Miller & Company, Edward, v. Bridgeport Brass Company	201
*New matter, Searls v. Bouton *et al*	1784
*Novelty, Bernard *et al.* v. Heimann *et al*	140
*Novelty, Graham v. McCormick *et al.*	1533
*Novelty, Lehnbeuter *et al.* v. Holthaus *et al*	1783
*Novelty, Pickering *et al.* v. McCullough, Dalzell & Co	73
*Novelty, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company *et al.*	1689
Oath with regard to foreign patents, Opinion of Secretary of the Interior	1197
*Packing cooked meats, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company	411
*Packing cooked meats, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company *et al*	1689
*Pavements, Guidet v. City of Brooklyn	1692
*Pavements, Stow v. City of Chicago	790
*Pill-machines, McKesson *et al.* v. Carndick	137
*Plows, Hapgood *et al.* v. Hewitt	1786
*Practice in the courts, Adams *et al.* v. Howard *et al.*	264
Practice in the courts, American Ballast Log Company v. Cotter	1030
*Practice in the courts, Gardner v. Crossman *et al*	204
*Practice in the courts, Heald v. Rice	1443
*Practice in the courts, Lehnbeuter *et al.* v. Holthaus *et al.*	1783
*Practice in the courts, Macauley v. White Sewing Machine Company *et al*	496
*Practice in the courts, Root v. Lake Shore and Michigan Southern Railway Company	1112
*Practice in the courts, Webster Loom Company v. Higgins *et al*	2031
Practice in the Patent Office, *ex parte* McDougall	1783
Practice in the Patent Office, Harmet v. Reese *et al*	1875
Practice in the Patent Office, Opinion of Secretary of the Interior	1197
*Practice in the Patent Office, Searls v. Worden *et al*	1955
*Priority of invention, Graham v. McCormick *et al*	1533
*Priority of invention, Green v. French	1351
Priority of invention, Harmet v. Reese *et al*	1875
*Priority of invention, Heald v. Rice	1443
*Priority of invention, Searls v. Bouton *et al.*	1784
*Priority of invention, Webster Loom Company v. Higgins *et al*	2031
*Pumps, Goulds Manufacturing Company v. Cowing *et al*	1277
*Railroad-car brakes, Root v. Lake Shore and Michigan Southern Railway Company	1112
*Reissue, Bantz v. Frantz *et al*	2037
*Reissues, Clexton v. Campbell *et al.*	337
*Reissues, Combined Patents Can Company v. Lloyd	713
*Reissues, Crandal v. Walters *et al*	945
*Reissues, Edgarton *et al.* v. Furst & Bradley Manufacturing Company *et al*	261
*Reissues, Egbert v. Lippmann *et al*	75
*Reissues, Green v. French	1351
*Reissues, Guidet v. City of Brooklyn	1692
*Reissues, Hart v. Thayer	791
*Reissues, Heald v. Rice	1443
*Reissues, James v. Campbell *et al*	337
*Reissues, Loercher *et al.* v. Crandal	863
*Reissues, Matthews *et al.* v. Boston Machine Company *et al.*	1349
*Reissues, Miller *et al.* v. Force *et al*	947
*Reissues, Pickering *et al.* v. McCullough, Dalzell & Co	73
*Reissues, Searls v. Bouton *et al*	1784
*Reissues, Searls v. Worden *et al*	1955
*Reissues, Stow v. City of Chicago	790
*Reissues, Strobridge v. Landers *et al*	1027
*Reissues, Worden *et al.* v. Fisher *et al*	1957
*Reissues, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company	411
*Reissues, Wilson Packing Company *et al.* v. Chicago Packing and Provision Company *et al*	1689
*Reissues, Wooster v. Clark *et al*	264
*Sewing-machines, button-hole attachments for, Wright, Jr., v. Randel *et al*	493
*Sewing-machines, Schmidt v. Freese	1876
*Show-cases, Lehnbeuter *et al.* v. Holthaus *et al*	1783
*Sleeve-supporters, Lindsay v. Stein	1613
*Stamp, canceling, Clexton v. Campbell *et al*	337
*Stamp, canceling, James v. Campbell *et al*	337
*Steam-boilers, Bantz v. Frantz *et al*	2037
*Steam-boilers, Heald v. Rice	1443
Steel, manufacture of, Harmet v. Reese *et al*	1875
*Stoves, Bridge, Beach & Co. v. Excelsior Manufacturing Company *et al*	1955
*Tobacco, mode of finishing, Worley *et al.* v. Loker Tobacco Company *et al*	559
*Tobacco-plugs, process for marking, Miller *et al.* v. Force *et al*	947
Trade-marks, *ex parte* Fairchild	789
*Trustee, Ager *et al.* v. Murray	1197
*Whip-holders, Worden *et al.* v. Fisher *et al*	1957
*Whip-sockets, Searls v. Bouton *et al*	1784
*Whip-sockets, Searls v. Worden *et al*	1955

"The pictorial representation of a man."

LABELS.

2,581.—Title: "PAIN STOP," (FOR A MEDICINE.)—*John W. Aitken*, Carbondale, Pa. Application filed November 5, 1881.

2,582.—Title: "KIDNEY COFFEE."—*E. Waldo Cutler*, Boston, Mass. Application filed November 30, 1881.

2,583.—Title: "MADAM SMITH'S HEALING SALVE."—*Eliza Smith*, Newark, N. J. Application filed December 5, 1881.

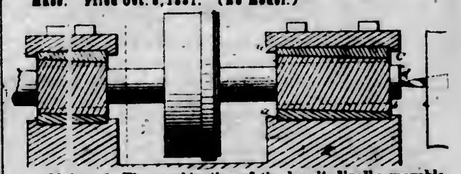
2,584.—Title: "DR. NATHAN'S COUGH ELIXIR."—*A. S. Udell & Co.*, Ottumwa, Iowa. Application filed December 8, 1881.

PATENTS

GRANTED JAN. 3, 1882.

251,685. STOCKING AND THE METHOD OF MANUFACTURING THE SAME. JOHN ADAMS, Philadelphia, Pa. Filed Nov. 1, 1881. (No model.)

Claim.—1. A stocking in which a partly-covered tube of knitted fabric, or a partly-covered flat fabric adapted to be formed into a tube, is combined with a T-shaped heel-piece, B, having a central portion C and two equal and like shaped side portions, D E, said central portion being folded, seamed, or united at its end *h g* to the edge of the partly-covered tube or fabric, and the side portions D E being folded and seamed or united to the covered fabric and to the folded central portion C in such manner that their side edges, *a d* and *b e*, are joined to the edge of the covered fabric, and their end edges, *c d* and *f c*, are joined to the side edges, *h f* and *e g*, of the central portion C of said projection.

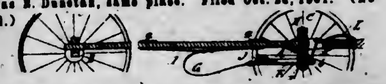


2. A stocking in which the toe is formed by a T-shaped projection, having a central portion T and two equal and like shaped side portions, X Y, on a tube of knitted fabric, or upon a flat fabric adapted to be formed into a tube, said central portion of said T-shaped projection being folded, seamed, or united to said fabric or tube in such manner that its end edge *p q* is joined to the covered edge of said fabric, and said side portions X Y of said projection being folded, seamed, and united to said tube or fabric in such manner that their side edges are joined to the edge of the covered fabric and their end edges, *o m* and *l n*, are joined to the side edges, *o p* and *n q*, of the central portion of said projection.

3. The mode herein described of forming the heel of a sock or stocking, which consists in providing a partly-covered tube, A, of a knitted fabric, or a partly-covered flat fabric adapted to be formed into a tube, with a projecting T-shaped heel-piece having a central portion C and two equal and like shaped side portions, D E, and in folding, seaming, or uniting said heel-piece to the tube or fabric in such manner that the end edge *h g* of the central portion C is joined to the edge of the tube or fabric, and the side edges, *a d* and *b e*, of the side portions D E are joined to the edge of the tube or fabric, and the end edges *f c* and *c d*, of the side portions D E are joined to the respective side edges, *f h* and *e g*, of the central portion.

4. The mode herein described of forming the toe of the sock or stocking, which consists in providing the end of a tube of knitted fabric or the end of a piece of knitted fabric adapted to form a tube with a T-shaped projection having a central portion T and two equal and like shaped side portions, X Y, and in folding, seaming, or uniting said T-shaped projection to the tube or fabric in such manner that the end edge *p q* of the central portion T is joined to the edge of the tube or fabric and the side edges, *m k* and *l j*, of the side portions X Y are joined to the edge of the tube or fabric, and the end edges, *o m* and *l n*, of the side portions are joined to the respective side edges, *o p* and *n q*, of the central portion.

5. The method of forming a pocket or pouch shaped portion of a knitted fabric, which consists in providing the edge of the fabric which forms the outline of the plain side of said pocket or pouch with a T-shaped projection, having a central portion and two equal and like shaped side portions, and in folding and securing said T-shaped projection to said first-named fabric, which forms the plain side of said pocket, in such manner that the end edge of the central portion of said projection is joined to the edge of the fabric, and the side edges of the side portions of said projection are joined to the edge of the fabric, and the end edges of the side portion of said projection are joined to the respective side edges of the central portion of said projection.

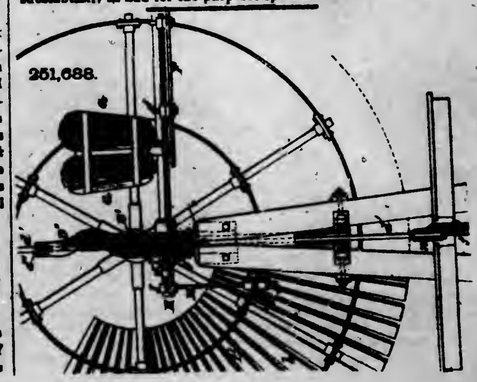


251,686. BORING-MACHINE. BENJAMIN F. ALLEN, Boston, Mass. Filed Oct. 6, 1881. (No model.)

Claim.—1. The combination of the longitudinally-movable auger-shaft bearing a cone-shaped boring-tool with mechanism, substantially such as described, for automatically moving it in a lateral direction simultaneously with its longitudinal movement, substantially as and for the purpose described.

2. The boring-arbor D, provided with inclined splines *b*, in combination with the sleeve-journal C, having inclined grooves *c*, arranged and operating in the manner and for the purpose specified.

251,687. RUNNING-GEAR FOR WAGONS. AMOS BARNES, Pontiac, Mich., assignor to himself, Janine Ten Eyck, and Thomas B. Dunstan, same place. Filed Oct. 26, 1881. (No model.)

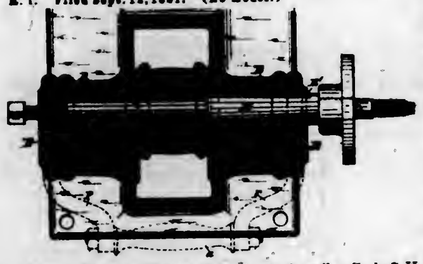


Claim.—1. A wagon, and, in combination with the forward axle and reach thereof, the fifth-wheel E, secured to the spring G, for relieving the strain upon the reach, when constructed substantially in the manner set forth.

2. In combination with the axle A of a wagon, the fifth-wheel E, spring G, truss plate or bar F, guide-stop J, and the bar I, substantially as and for the purposes herein set forth.

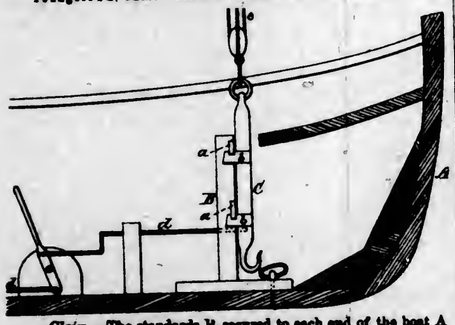
3. In combination with the axle A and fifth-wheel E of a wagon, when constructed substantially as described, the T-headed plate K and spring L, when constructed, arranged, and operating substantially as and for the purposes specified.

251,688.



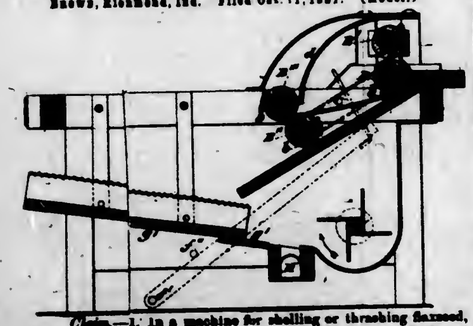
251,688. WINDMILL. WILLIAM S. BACON, Farmers' Institute, Ind. Filed Aug. 30, 1881. (No model.)

Claim.—1. The combination of the wind-wheel B, horizontal shaft E, placed at a right angle to the face of the wind-wheel, vane F, attached to said shaft, vane G, placed at a right angle to vane F, weighted arm H, and a cord or chain for changing the position of the vanes F and G, the parts being arranged substantially as and for the purpose set forth.



2. The combination of the rock-shaft E, having vanes F and G, arm J, cord *f*, pipe-rod *f'*, and guides *f''* and *f'''*, with the wind-wheel B, as and for the purpose described.

251,689. POLISHING-HEAD. HENRY BLUNDELL, Providence, R. I. Filed Sept. 12, 1881. (No model.)



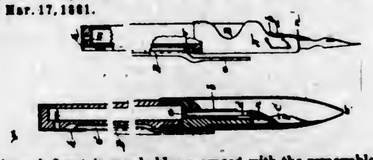
Claim.—The combination of the frame A, pulley C, shaft H, eccentric journal-bearings E E, and connecting-handle G, substantially as described.

251,690. BOAT-DETACHING APPARATUS. MARTIN BOURKE, Youngstown, Ohio. Filed July 15, 1881. (No model.)

Claim.—The standards B, secured to each end of the boat A and extending up inside thereof, and provided with suitable holding devices, *a*, in combination with the clutches C, having shoulders *b*, for engaging with the holding devices on the standards, and the sliding bolts *d*, passing through the standards and entering the clutches, substantially as and for the purpose set forth.

251,691. MACHINE FOR CRUSHING FLAX-BOLLS. SETH BROWN, Richmond, Ind. Filed Oct. 11, 1881. (Model.)

Claim.—1. In a machine for shelling or thrashing flaxseed, the combination of two pairs of yielding-surfaced rollers, B B' and B'' B''', the yielding apron *a*, and the curved deflector *d*, for conducting the material from the first pair of rollers to the second pair, said rollers B and B' being arranged in a higher plane than that of B'' and B''', substantially as and for the purpose set forth.



2. In a machine for shelling or thrashing flaxseed, the combination of two pairs of rollers arranged in different planes, the yokes E, connecting the upper roller of each pair, the spring F, and the connecting-rod *f*, substantially as and for the purpose described.

251,692. ORNAMENTAL GLASS TO IMITATE WOOD. JAMES HUDD, Boston, Mass., assignor, by direct and mesne assignments, to the Glass Veneer Company, of Maine. Filed May 24, 1881. (Specimens.)

Claim.—1. The herein-described process for ornamenting glass, which consists in applying to the same a liquid dye to represent any desired wood, then applying photographer's varnish, and afterward heating the glass before applying various shades of dyes in representation of the shades of the respective woods imitated, shellac combined with dry plaster-of-paris and suitable dry colors being then applied to form a background to bring out the proper effect, and at the same time serve as a backing, as and for the purpose specified.

2. As a new article of manufacture, sheets of glass ornamented to represent highly-polished woods by applying to the same liquid dyes of the proper color to represent any desired wood and covering the same with photographer's varnish, to which, after heating, is applied a backing of shellac, into which is rubbed powdered plaster-of-paris with various dry colors, substantially as specified.

251,693. FOUNTAIN-PEN. HUGO BURCHAS, I, Leipsic, Germany. Filed Apr. 6, 1881. (No model.) Patented in Germany Mar. 17, 1881.

Claim.—A fountain-pen holder provided with the removable guiding-tube *b*, ink-distributing tube *d*, and air-hole *m*, closed by a suitable valve or spring, *h*, in combination with the operating device D upon the upper side of the pen-holder, arranged to move the valve by lateral pressure upon said device, substantially in the manner herein described.

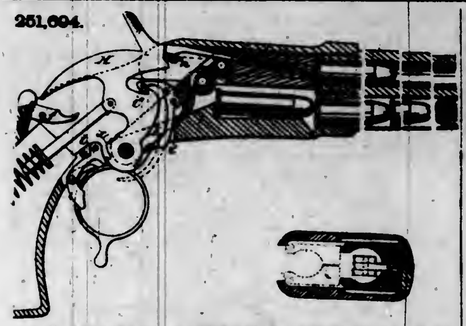
251,694. MAGAZINE FIRE-ARM. ANDREW BENNETT, Owego, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—1. In the frame of a breech-loading fire-arm, a lever, L, a latch, *i*, and a hammer, H, all in combination with a projection, *f*, arranged in the frame to uncouple the lever from the hammer, substantially as described.

2. In the frame of a breech-loading fire-arm, the lever, latch, and hammer described, when said latch is provided with an extension to the outside of the frame to operate the latch, substantially as and for the purpose set forth.

3. In a breech-loading fire-arm, a reciprocating bolt, a hammer, a guard-lever, and coupling mechanism, in combination substantially as described, whereby the turning or wrenching movement of the hand withdraws the bolt by the combined force of the hammer and guard-lever.

4. The rocking lever or trigger *t'*, in combination with the rear *i*, pivoted to the trigger and in the frame, and the guard-lever, which furnishes a bearing for the said trigger, substantially as and for the purpose described.

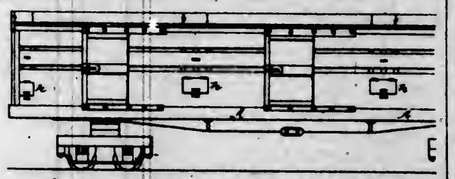


5. In a magazine-gun, a reciprocating breech-bolt provided at its forward end with a hook, A, in combination with a shoulder, A', whereby the cartridge is grasped and withdrawn from the magazine in the act of opening the breech, substantially as specified.

6. A carrier constructed, substantially as described, with two sides vertically open in front, said sides springing together, in combination with an extension on the bolt to open the carrier in the closing movement of the breech, substantially as described.

7. A carrier provided with spring sides, reduced at *e* and extending upward above the center of the cartridge, and a bolt having recesses *d' d'* to receive said upward extensions of the carrier, whereby the carrier is permitted to remain in its upward position until the cartridge is entered well into the barrel, substantially as set forth.

8. The stud S, having the recess S', in combination with a lip on the barrel to enter said recess and a screw to enter the magazine, recess, and lip to secure the parts together, all in combination substantially as specified.



251,694.

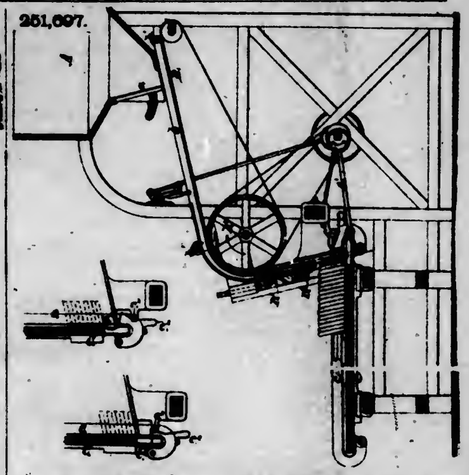
9. A guard-strap provided with the projections *p''* or *p'''*, in combination with a frame having grooves to receive said projections, and a pin or screw to bind the parts together in a fire-arm, substantially as set forth.

10. In a fire-arm, a spring, S''', located in a recess at the breech, and a stud, S'', located near the muzzle and extending back parallel with the barrel, and a rod with a concavity in its face, all in combination, so that the said spring and stud hold the rod between them, substantially as specified.

251,695. STOCK-CAR. GEORGE D. BURTON, New Ipswich, N. H., assignor of one-half to Joel H. Holden, Boston, Mass. Filed Aug. 30, 1880. (No model.)

Claim.—1. In a cattle-car, the combination, with the car-body A, of the transverse partitions B, dividing the car into compartments, the cattle-stanchions arranged parallel to the partitions, on each side thereof, the transverse feed-troughs extending across the car below the partitions, and the doors A on each side of the car, opposite the feed-troughs, all constructed and arranged substantially as described.

2. In a cattle-car, a ridge-pole provided with a groove or trough on its upper side, and with suitable pipe-connections, whereby it is adapted to serve as a water-conductor for supplying the feeding-troughs, substantially as described.



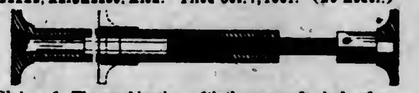
251,696. COFFEE-POT. EDWARD B. CHAMBERS, Alexandria, Ind. Filed Aug. 31, 1881. (No model.)

Claim.—1. A coffee-pot having a spout provided with an opening or slot, *s'*, adapted to be opened and closed by a cap, K, provided with a slot, *s*, substantially as set forth.

2. The combination of the pot B, removable condenser A, having a hinged lid, A', the slotted spout H, and adjustable slotted cap K, substantially as and for the purpose set forth.

251,697. MACHINE FOR PACKING CRACKERS. HENRY C. CHESEMAN, Providence, R. I. Filed Mar. 6, 1881. (No model.)

Claim.—1. The combination, with the hopper A, of the endless apron B, the partitions *b*, the channels, the partitions *c*, devices for adjusting the partitions to adapt them for guiding crackers of different diameter, and the reciprocating table C, all combined to deliver the crackers on the table edgewise, as described.



2. The combination, with the hopper A, the endless apron B, and the reciprocating table C, of the brushes D, D', and D'', constructed as described, whereby the delivery of the crackers is regulated, as set forth.

3. The combination, with the hopper A, the endless apron B, reciprocating table C, and the adjustable partitions *b* and *c* for dividing it into channels, of the adjustable stop C', constructed to rise and hold the crackers at the outward reciprocation of the table and to be depressed on the inward reciprocation, as described.

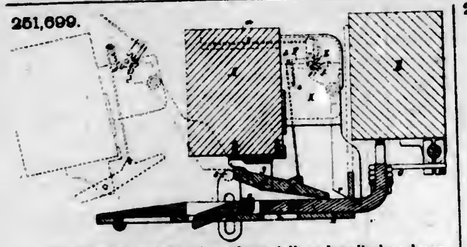
4. In a cracker-packing machine, the combination, with an endless apron on which the crackers are deposited, of the oscillating brush D, constructed to allow only one thickness of cracker to pass, and to sweep the same, as described.

5. In a machine constructed to deliver crackers edgewise, the combination, with vertical or inclined channels through which the crackers may fall by gravity, of two or more oscillating brushes, constructed to alternately hold and release the crackers, so to allow them to fall any desired distance without injury, as described.

251,698. JACK-SCREW. WILLIAM R. OGATE and WILLIAM H. VIBBARD, Kalamazoo, Mich. Filed Oct. 7, 1881. (No model.)

Claim.—1. The combination, with the screw of a jack, of an extensible stock, whereby the length of the jack can be altered independently of the screw, substantially as described.

2. The combination, with the screw of a jack, of a stock made in two or more sections, whereby its length may be varied independently of the screw, substantially as specified.

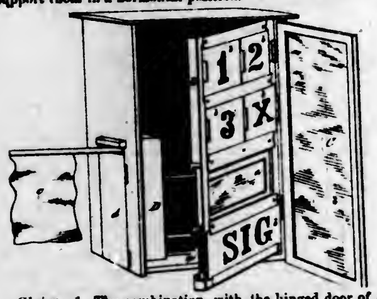


3. The combination, with the screw of a jack, of a stock provided with a removable base, whereby the stock may be lengthened independently of the screw, substantially as described.

4. A jack provided with an inclined base and cap, substantially as described, and for the purpose set forth.

251,699. WEFT STOP-MOTION FOR LOOMS. ELWOOD H. COLE, Lewiston, Me. Filed July 28, 1881. (No model.)

Brief.—A sector on the shaft of the weft-fork engages one on a lever, which is turned to throw up the fork as the lay goes back by coming in contact with a projection on a bracket secured to the breast-beam. An arm on the weft-fork shaft is connected by a slotted rod with a pawl hung to the under side of the lay-beam, which, when the weft is absent from under the fork, is permitted to descend far enough to engage with a catch-lever pivoted in a slide mounted on the bracket upon the breast-beam. As the lay next moves forward the slide is also carried forward, and through the spring-lever operates the shipping mechanism.



251,699.

Claim.—The combination substantially as described, such consisting of the lever-spring O and the stop-motion fork C, lever I, arm F, sectoral gears E and *f*, slotted connection-rod G, pawl H, projection *s*, slotted and grooved bracket L, slider M, and catch-lever N, all arranged and adapted to operate essentially as set forth.

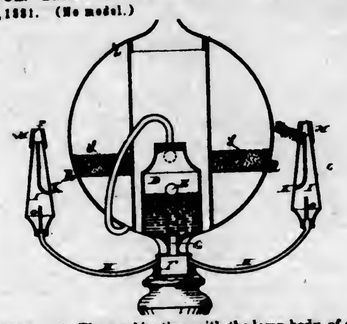
251,700. SIGNAL. TIMOTHY J. COSTELLO, Cleveland, Ohio. Filed May 24, 1881. (No model.)

Brief.—A hinged inner door having removable glass and perforated slides and a transparent outer door. Flag-signals are pivoted in recesses in the main signal-box, the doors thereof serving to support them in a horizontal position.

Claim.—1. The combination, with the hinged door of a box or cabinet, of removable glass slides and perforated slides and a transparent outer door, substantially as set forth.

2. In a railway-signal, the combination of the recess D, flags *c*, and door *d*, said door serving to support said flags in a horizontal position, substantially as shown and described.

251,701. EXTRACTING JUICES FROM BAGASSE, PLANTS, &c. PETER COLLINS, Washington, D. C. Filed Oct. 14, 1880. (No model.)



Claim.—1. A leach consisting of a series of movable tanks connected by suitable tubing arranged on a series of fixed steps greater in number than the tanks, thereby permitting the addition of tanks filled with fresh material at the bottom of the series and the removal of the spent tanks at the top, substantially as described.

2. In a leaching apparatus, the combination of two or more movable tanks with three or more fixed steps, substantially as described.

3. In a leaching apparatus, the combination of the above-described series of tanks and steps and a central derrick for moving said tanks.

251,702. LAMP. MATTHIAS CRIEGER, New York, N. Y. Filed Apr. 25, 1881. (No model.)

Claim.—1. The combination, with the lamp-body, of an interior closed chamber connected with the body by a siphon having its inner end closed or opened by a ball-valve, substantially as described.

2. The combination of the external chamber or reservoir, the interior or supply chamber, and a siphon connecting with substantially the lowest part of the reservoir and the top of the closed supply-chamber, whereby feeding of the oil will be uninterrupted at its highest and lowest level and undue accumulation of oil at the burner is prevented, substantially as described.

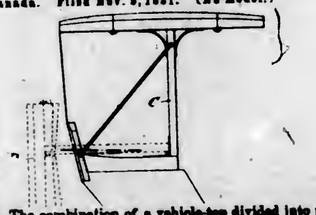
3. The combination of the lamp-body having the shaft B with the supply-chamber and the siphon.

4. The burner I, containing the air-pipe K, surrounded by a mineral cone serving as a wick, substantially as set forth.

5. The combination, with the burner, of the conic frustum M, having an internal perforated flange to catch the solid impurities of the flame and capable of sliding vertically upon the burner, substantially as and for the purpose specified.

6. The combination, in a lamp-body, of the chamber for the unfiltered oil above, the filtering device E S, and a chamber for refined and filtered oil below, substantially as described.

7. The combination of the burner having the mineral cone described, the tube H, the supply-chamber D, the siphon, and the reservoir, all as set forth.



251,703. CAR-COUPLING. HUGH P. DALY, Wheeling, W. Va., assignor of two-thirds to Randolph Stalnaker, Jr., same place. Filed Nov. 14, 1881. (No model.)

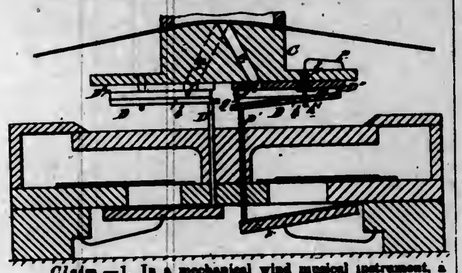
Claim.—1. In a car-coupler, the combination, with a draw-head having holes *a* and *b b'*, of a coupling-pin, C, arranged horizontally within the draw-head, and a coupling-link, E, having hooks G G and an elongated slot, F, substantially as set forth.

2. In a car-coupler, the combination, with a draw-head having holes, as described, of a coupling-link having an elongated slot, F, and hooks G, a coupling-pin, C, passing transversely through the draw-head, and a retaining device, D, substantially as set forth.

251,704. CARRIAGE-TOP. PIERRE DARSERSAU, Montreal, Quebec, Canada. Filed Nov. 5, 1881. (No model.)

Claim.—The combination of a vehicle-top divided into rigid parts, all of which said parts are hinged together, and one of said parts being attached fixedly to the single pair of posts C, with the said posts C hinged to the body of the vehicle, and arranged to carry the whole of the top and turn back therewith, substantially as described.

251,705. COMBINED INK-FOUNTAIN AND PEN-HOLDER. ALFRED DOUBLEDAY, Cincinnati, Ohio. Filed Feb. 21, 1881. (No model.)



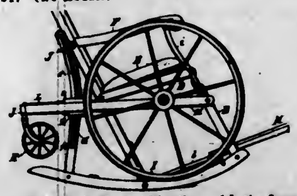
Claim.—1. A removable ink-fountain in pen-holders, having a pin projecting from its lower end, as herein specified.

2. A removable ink-fountain for pen-holders, provided at its lower end with a projecting pin and having its upper end closed with a rubber cork or head, as herein set forth.

3. A tubular pen holder or staff, in combination with a removable ink cell or fountain having a pin projecting from its lower end and its upper end closed with a rubber cork or head, as and for the purpose herein set forth.

251,706. PNEUMATIC LEVER FOR MECHANICAL MUSICAL INSTRUMENTS. ALONZO DEBERG, New York, N. Y., assignor to Messrs Harris, same place. Filed Apr. 21, 1881. (No model.)

Claim.—1. In a mechanical wind musical instrument, a pneumatic diaphragm-lever, D, constructed substantially as herein shown and described, consisting of the recessed block D', provided with orifices *b* and *l*, and having a raised rim, *f*, flexible diaphragm *g*, hinged tapering lever A, provided with valve-closing screw A^2, and exhaust-valve *m*, arranged as set forth.



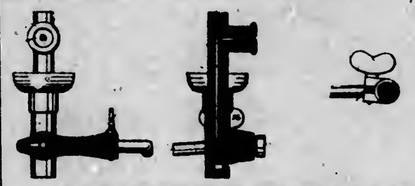
2. In a pneumatic diaphragm-lever provided with an exhaust-valve, a screw arranged upon said lever substantially as described, and adapted to be operated by the valvular action of the diaphragm to close and hold the exhaust-valve, as set forth.

251,707. STATION-INDICATOR. JOHN P. EDWARDS, New York, N. Y. Filed Mar. 26, 1881. (No model.)

Claim.—In a station-indicator having an apron, E, mounted on independently-operated rollers C D, the bracket G, bearing against each roller, and adjusting-screws H, operating upon each wing of the bracket, in combination with said rollers and with means, *c d*, for operating them, substantially as set forth.

251,708. CHAIR. CARROLL GALLUP, Norwalk, Ohio. Filed Aug. 3, 1881. (No model.)

Claim.—1. In a chair, the combination, with the forward leg, of an adjustable bar pivoted to the leg and carrying the wheels I and K, and provided with levers *h h'*, and the rear brace having a lug, *f*, with which said levers are adapted to engage, substantially as set forth.



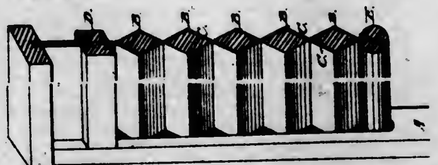
2. In a chair, the combination, with the back pivoted to the rockers, of a brace pivoted near the rear end of the rocker and longitudinally slotted, as described, and a thumb-screw, by means of which the back is secured at any desired adjustment, substantially as set forth.

3. The combination, with the chair-back, of the cleat *l*, secured to a rung thereof, the foot-rest M, and support O, the latter having its ends bent and pivoted to the rockers, so that it may be turned up or down, substantially as set forth.

4. In a chair, the combination, with the rockers and back, of the adjustable bar H, carrying the large wheels, the bar J, and the slotted brace supporting the back, and provided with a device for locking the back at any adjustment and the bar H in either upper or lower position, substantially as set forth.

251,709. VAPOR-BURNER. ESEK O. GARLAND, New Bedford, Mass. Filed Sept. 26, 1881. (No model.)

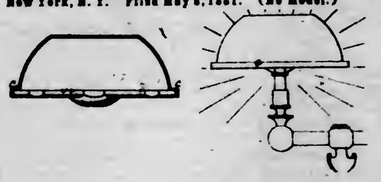
Brief.—A clamping-screw serves to hold the reciprocating valve-operating mechanism in any desired position.



Claim.—1. The guide-tube, lateral projection therefrom, and handle-socket extending laterally from the said projection, all made of a single piece, combined with the needle-valve and its carrying-block fitted in the said guide-tube, and the valve-operating handle mounted in the said socket, and connected with the said block, to operate it and the connected valve, substantially as described.

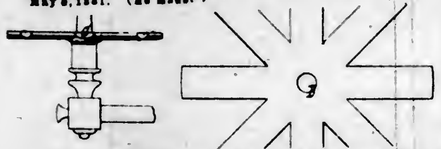
2. The guide-tube, tubular projection therefrom, and handle-socket, combined with the valve and its slotted or notched carrying-block and the handled spindle, and pin mounted therein and entering the slot of the valve-carrying block, substantially as described.

3. The reciprocating needle-valve and its carrying-block, and the valve-operating handle connected with the said block, combined with the handle-socket slotted and pivoted with a clamping-screw to fix the said handle and valve in any desired position, substantially as described.



4. The valve and guide-tube and lateral tubular projection therefrom and the handle-socket, combined with the valve-operating handled spindle and pin to connect it with the said valve, and the screw-plug to close the end of the said tubular projection and retain the said pin in proper position, substantially as described.

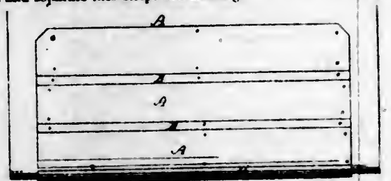
251,710. WASH-BOARD. PHILEMON T. GAYNS, New York, assignor of one-half to Jacob H. Nellis, Canajoharie, N. Y. Filed Jan. 18, 1880.



Claim.—As an improved article of manufacture, the herein-described reversible wash-board, consisting of the frame provided with a series of wooden bars, B, arranged transversely therein, and with a stiff corrugated sheet of metal, C, interposed between the bars and exposed alternately upon opposite sides of the board, substantially as and for the purpose specified.

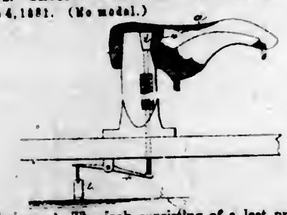
251,711. COMBINED SHADE AND CONCENTRATOR FOR ARTIFICIAL LIGHT. J. SIDNEY GOLDSMITH and HIRAM H. SMITH, New York, N. Y. Filed May 6, 1881. (No model.)

Claim.—In combination with a glass light-concentrator consisting of a center portion having a convex lower surface and a series of radial arms having convex lower surfaces, a reflecting-shade placed above said concentrator so as to surround the light, substantially as specified.



251,712. CONCENTRATOR FOR ARTIFICIAL LIGHT. J. SIDNEY GOLDSMITH and HIRAM H. SMITH, New York, N. Y. Filed May 5, 1881. (No model.)

Claim.—A glass concentrator for artificial light, consisting of a convex central portion provided with a hole, as described, and a series of solid arms radiating from said central portion, each of the radial arms having a flat upper surface and a convex lower surface, substantially as specified.



251,713. STEP OR STAIR. CHARLES H. GOULD, New York, N. Y. Filed May 5, 1879.

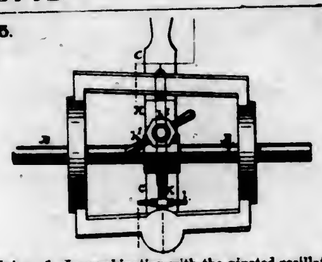
Brief.—A rubber plate backed by canvas and secured to the tread of the step with a metallic shield applied over the nosing and protecting the front edge of the rubber. Wood strips may divide and separate into strips the matting.

Claim.—The combination of a step or stair, D, mat or soft covering A, and nosing-shield C, arranged to project above the stair-nosing to protect the mat, substantially as and for the purpose herein specified.

251,714. LASTING-JACK. ISAAC HALL, Boston, Mass. Filed June 4, 1881. (No model.)

Claim.—1. The jack consisting of a last provided with a socket, and a standard therefor provided with a movable last-locking device or block to enable it to enter the said socket and block the last rigidly thereon, substantially as described.

2. The standard and wedge-shaped locking-block fitted in a recess in the end thereof, and its spring-pressed actuating-rod to move the said block, combined with the last provided with a socket shaped to fit the end of the standard and block when the latter is in position in the said recess, substantially as described.



3. The socketed last, combined with the standard and block *b*, and means, substantially as described, to move it longitudinally from the said standard, to thereby elevate and release the last or throw it from the standard, as hereinbefore set forth.

4. The combination, with the last *a* and its block *b*, of the spring-actuated toothed or notched pin and the key to withdraw the said pin, substantially as described.

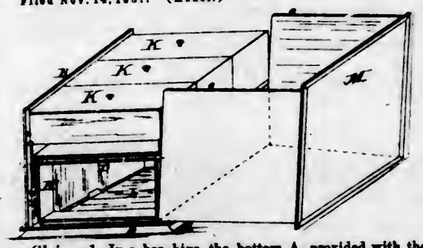
5. The last *a* and its block *b*, combined with the block-adjusting device provided with a shank, which is inserted into the last between it and the block, substantially as described.

6. The last, its block, and adjusting device, combined with the locking device to engage the said adjusting device, substantially as described.

251,715. HAND-LEVER ATTACHMENT FOR STEAM-PUMPS. WILLIAM D. HOCKEN, Oakland, Cal. Filed May 13, 1881. (No model.)

Claim.—1. In combination with the pivoted oscillating lever C and the reciprocating rod B, the right-angle oscillating reciprocating pin adapted to slide in one part and to oscillate in the other part, substantially as described.

2. In combination with the oscillating lever C, having the bearings *e e*, and the clamping-block H, having the socket A, the right-angle oscillating reciprocating wrist-pin F G, arranged and applied substantially as described, to operate as set forth.

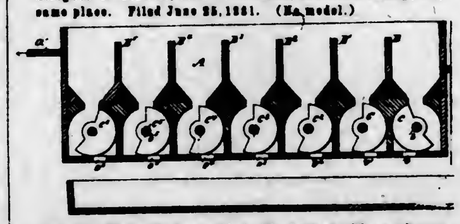


3. In combination with the oscillating reciprocating wrist-pin F G, held in bearings on the oscillating lever C, the clamp formed of the part or sections H and the hollow sleeve A, screw-threaded on its end, which holds the parts H together, and also forms the socket for the pin, substantially as herein described.

4. The combination, with the oscillating lever, of the two-part clamp H, the screw-threaded sleeve A, the piston-rod B, with its groove *q*, and the projection on the inner surface of the clamp, substantially as and for the purpose described.

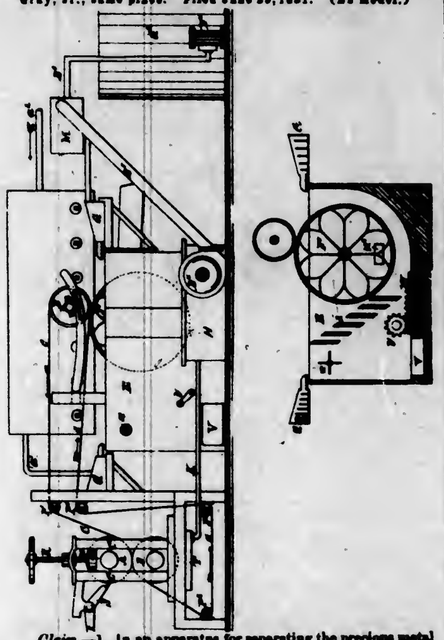
5. The combination of the oscillating lever with the two-part clamp H, the screw-threaded sleeve A, the oscillating reciprocating wrist-pin F G, and the screw pin or wedge, substantially as and for the purpose described.

6. The combination of the oscillating and reciprocating wrist-pin F G with the oscillating lever C and its guides *e e*, the piston-rod, clamp H, and the screw pin or wedge, substantially as and for the purpose described.



251,716. BEE-HIVE. CHARLES HOWARD, Schroleville, Ind. Filed Nov. 14, 1881. (Model.)

Claim.—1. In a bee-hive, the bottom A, provided with the stationary wall B and posts C D, and removable glass slides E F, in combination with the casing M, of the form shown, substantially as and for the purpose set forth.



2. A bee-hive consisting of the bottom A, wall B, posts C D, glass slides E F, false bottom L, sections H, skeleton-partition I, comb-frames K, and the casing M, all constructed and arranged to operate as shown and described.

251,717. SETTLING-TANK. ALFRED E. JONES, Newark, N. J., assignor to himself, John T. Rowland, and Robert Gray, Jr., same place. Filed June 25, 1881. (No model.)

Claim.—The tank A, provided at its bottom with openings *c*, and having partitions B, said partitions having inclined and curved portions, as shown, in combination with the segmental disks C, substantially as described, and for the purpose specified.

251,718. APPARATUS FOR SEPARATING GOLD FROM QUARTZ AND ROCK-TAILINGS. ALFRED E. JONES, Newark, N. J., assignor to himself and John T. Rowland and Robert Gray, Jr., same place. Filed June 25, 1881. (No model.)

Claim.—1. In an apparatus for separating the precious metal from sand-tailings with fibrous material, &c., the combination of the tank G^4, mixing-box G, cylinder F, vat E, endless belt C, rollers A and B, and scraper S, substantially as described, and for the purpose specified.

2. In an apparatus for separating the precious metal from sand-tailings, the combination of the tank G^4, mixing-box G, cylinder F, vat E, endless belt C, with its pulleys, rollers A and B, and save-all T and its pipe K, scraper S, pump B^3, box M and its connecting-pipes, and box H, substantially as described, and for the purpose specified.

3. In an apparatus for separating precious metal from sand-tailings, &c., the combination of the tank G^4, pump D^3, box N and its pipes, box Q, vat E, cylinder F, belt C and its pulleys, and rollers A and B, substantially as described, and for the purpose specified.

4. In an apparatus for separating the precious metal from sand-tailings, &c., the combination of the tanks G^4 and G^5, mixing-boxes G and Q, vat E, cylinder F, pumps B^4 and B^3, with their pipes, belt C, with its pulleys, tank-boxes H and H', boxes M and N and their pipes, rollers A and B, save-all T and its pipe K, scraper S, agitator X, sliding bottom W and wheel Y, and pan V, substantially as described, and for the purpose specified.

251,719. CRUCIBLE. MILTON H. KNAPP, Adrian, Mich. Filed Sept. 28, 1881. (No model.)

Claim.—1. A crucible composed of asbestus fiber and paper-stock mixed and molded into shape, substantially as described.

2. A crucible made in two parts, the inner one composed of asbestus fiber and paper-stock mixed and pressed into shape and the outer part made of metal for supporting the inner part, substantially as described.

251,720. ATOMIZER. RUSSEL LOCKWOOD, Charlestown, Mass. Filed July 9, 1881. (Model.)

Claim.—1. The air-tube and its tip free to be rotated thereon, the said tip being provided with an air-orifice and central opening,

251,720

combined with the liquid-tube, and its jet-piece passing through the said central opening, substantially as and for the purpose described.

2. The air-tube and its tip free to be rotated thereon, the said tip being provided with an air-orifice and central opening and seat, combined with the liquid-tube and its jet-piece passing through the said central opening, and provided with a shoulder to engage the said seat, substantially as and for the purpose described.

3. In an atomizer, the air and liquid tubes, combined with a removable tip for the air-tube and an independent loosely-connected removable jet-piece for the liquid-tube, of smaller bore than the said tube and inserted therein, and an air-forcing apparatus to force air through the said air-tube and its tip, substantially as and for the purpose described.

251,721. TRICHINOSCOPE. CARL P. LOMB and EDWARD BAUSCH, Rochester, N. Y. Filed June 6, 1881. (No model.)

Claim.—1. The herein-described trichinoscope, consisting of a suitable microscope arranged to be moved in a plane parallel with the compression-plates *a a'*, and attached thereto by a suitable support adapted to permit the said motion, substantially as and for the purposes set forth.

2. The combination of the compression-plates *a a'*, frames *b b'*, clamping-screw *c*, hinge *d*, microscope *e*, and movable support *f*, substantially as described.

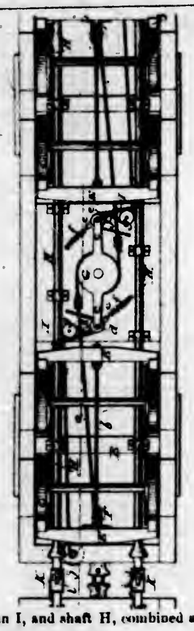
3. The combination, with the compression-plates *a a'*, of the frames *b b'*, clamping-screw *c*, and microscope *e*, arranged to be adjusted parallel to the plates by means of slide *h* and suitable support, *f*, substantially as described.

4. The combination, with the compression-plates *a a'*, of the frames *b b'*, clamp *c*, adjusting-screw *g*, and microscope *e*, arranged to be adjusted in planes parallel to the plates, substantially as described.

5. The combination, with the clamped compression-plates *a a'*, of the microscope *e*, connected to the plates so as to be moved in a plane parallel therewith, and having a focusing adjustment at right angles thereto, substantially as described.

251,722. CAR-BRAKE. ADELARD F. HARTEL, Montreal, Quebec, Canada, assignor of one-fourth to Charles A. Hartel, same place. Filed Nov. 1, 1881. (No model.)

Claim.—1. The coupling K, consisting of the parts *i j*, provided respectively with spring *l* and stud *m*, and adapted to move lengthwise upon the shaft-sections to which they are applied.

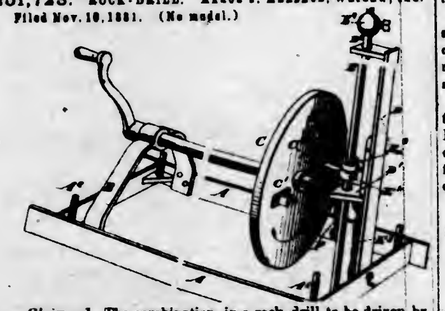


2. In combination with the operating-shaft H, having prismatic ends, the coupling K, applied thereto, and the chain *k*, having its ends attached respectively to the coupling and the shaft, whereby the end movement of the coupling is limited.

3. In combination with the brakes and the drum G, a spring connected with said drum, as and for the purposes explained.

4. In combination with the drum or lever connected with the brakes and provided with an arm, the chain I, made fast to the car at one end and passing around a pulley on the arm to a winding-shaft, substantially as shown.

5. The herein-described brake mechanism for cars, consisting of the ordinary brakes, their operating connecting-rods, the drum



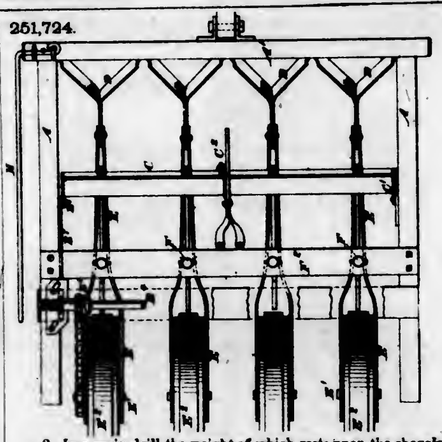
251,721.

G, spring *f*, chain I, and shaft H, combined and operating as set forth.

6. The combination, substantially as shown and described, with the ordinary brakes of a car, of the drum G, spring *f*, chain I, shaft H, chain J, pulley *g*, and windlasses, all arranged to operate in the manner explained.

251,723. ROCK-DRILL. AARON J. HUBBELL, Warsaw, Ind. Filed Nov. 10, 1881. (No model.)

Claim.—1. The combination, in a rock-drill to be driven by hand or other power, of a balance-wheel, C, having upon its face segmentally-formed lifting-projections, a lifting-arm for raising the drill, a drill-stock, said arm being placed loosely upon the drill-stock so as to turn thereon, an arm for giving impetus to the downward movement of the drill, and a spring for aiding such movement, all substantially as described.



2. The combination of the adjustable frame A, the column D, drill-stock E, and spring E^2, substantially as shown and described.

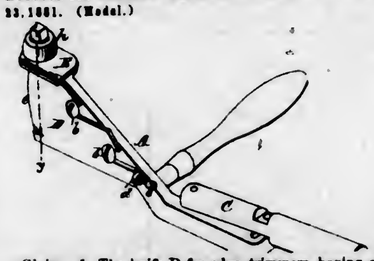
3. The combination of the pivoted lever F and the arm E', substantially as and for the purpose set forth.

251,724. GRAIN-DRILL. ROBERT C. MORRIS, Olney, Ill. Filed Apr. 18, 1881. (Model.)

Claim.—1. A grain-drill combining in its construction a frame for supporting the operating parts, a series of hoes or furrow-openers carried upon jointed rods and having a vertically-adjustable movement, a series of rotating seed-coverers arranged in the rear of the furrow-openers, a seed-box, and a series of feeding-wheels and suitable mechanism for driving them, the construction and arrangement of the parts being substantially such as are herein described, whereby the carrying-wheels usually employed for carrying grain-drills are dispensed with and the weight of the machine is made to rest mainly upon the furrow-openers, as described.

251,724.

2. In a grain-drill the weight of which rests upon the shovels or furrow-openers, a series of jointed vertically-moving drag-bars and a series of compacting-rollers having their journals placed in bearings formed in the drag-bars, they being arranged substantially as set forth, whereby they are made to follow in the path of the hoes or furrow-openers and to leave a channel in the earth below its general level, as set forth, and for the purpose specified.



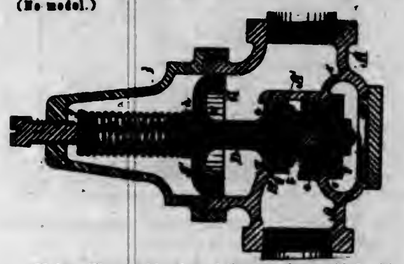
3. In a grain-drill the weight of which rests mainly upon the shovels which form the furrows for the reception of the grain, a series of curved cutters the lower ends of which are secured to the points of the shovels, or to the standards which carry them, and their upper ends to swinging beams, substantially as and for the purpose set forth.

4. In a grain-drill the weight of which rests mainly upon the shovels which form the furrows for the reception of the grain, a series of springs arranged substantially as shown and described, whereby they are made to communicate or transfer the weight of the frame of the machine, substantially as set forth.

5. In a grain-drill the weight of which rests mainly upon the shovels which form the furrows for the reception of the grain, the combination of the frame A A and A', the bars D, beams E, and rollers E^2, the parts being constructed and arranged for joint operation substantially as set forth.

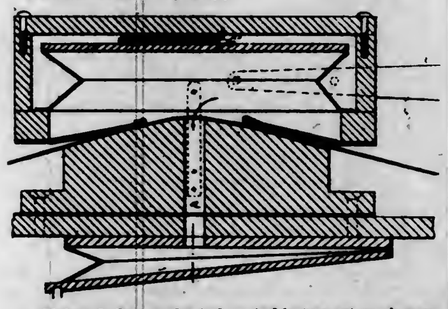
6. The combination of the frame A A A', the bars D, attached to the frame, the beams E, rollers E^2, shovels E^3, cutters E^4, rods F, springs F', slotted beam F^2, lever C^2, tumbling-beam C, and chain G, the parts being arranged for regulating the depth of the furrows and for throwing the weight of the machine upon the rollers, substantially as set forth.

251,725. EDGE-TRIMMING-MACHINE KNIFE. FRANKLIN HOULTON and CHARLES H. ADAMS, Ashland, Mass. Filed May 23, 1881. (Model.)



Claim.—1. The knife D for edge-trimmers, having cutting-edge *e* and the cutting-edge *f*, arranged with relation to each other, as shown and described, said knife being provided with slots *a a*, by means of which it may be adjustably and removably connected to the holder A, substantially as and for the purpose set forth.

2. The holder A, having plate E, with groove *g*, in combination with the knife D, having cutting-edges *e f*, substantially as and for the purpose specified.



3. The holder A, pivoted to the stationary arm C, and having plate E, with groove *g*, in combination with the knife D, having cutting-edges *e f*, said knife being detachably and adjustably connected to the holder, substantially as and for the purpose described.

251,726. WATER-PRESSURE REGULATOR. HIERONYMUS MUELLER and JOHN GROSS, Decatur, Ill. Filed July 6, 1881. (No model.)

Claim.—The combination of the case A, provided with a removable bottom plug, K, the cup-shaped diaphragm G, adapted to slide within said case, valve-stem D, and conical valve H, with sleeve *b*, disked valve *c*, and the rubber disk *e*, adapted to rest against the bottom edge of the valve-chamber A', substantially as and for the purposes described.

251,727. MECHANICAL MUSICAL INSTRUMENT. ROBERT W. PAIR, New York, N. Y., assignor to Moses Harris, same place. Filed Aug. 31, 1881. (Model.)

Claim.—1. In a mechanical musical instrument, an air reservoir or chest provided with interior flexible strips arranged, as described, to bear upon the perforated music-sheet and prevent the escape of air from said chest excepting through the perforations of said sheet, substantially as herein shown and set forth.

2. In a mechanical musical instrument, an air-reservoir or chest provided with interior flexible strips arranged, substantially as described, to prevent the escape of air from its sides, and having its ends deeper than its sides to permit the free passage of a music-sheet beneath the said sides and over the action-board of the instrument, substantially as herein shown and described.

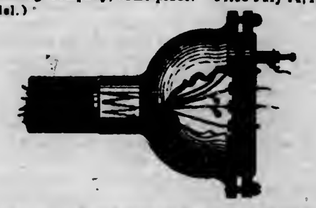
3. In a mechanical musical instrument, an air reservoir or chest adapted to be set over the perforated music-sheet upon the action-board, and provided with interior flexible air-tight strips, and with a weighted or spring-actuated bellows-like platform, to increase the pressure of air from said reservoir, substantially as herein shown and described.

4. In a mechanical musical instrument, the combination, with movable air reservoir or chest adapted to be set over the perforated music-sheet upon the action-board, of attached arms whereby said chest may be held to and lifted from its position, substantially as herein shown and described.

5. In a mechanical musical instrument, the combination, with a movable air reservoir or chest adapted to be set over the perforated music-sheet, of latches or springs, whereby said chest is held to the instrument, substantially as herein shown and described.

251,728. GATE. LEMUEL PATTERSON and IRENAS J. PALMER, Olean, N. Y. Filed Oct. 29, 1881. (Model.)

Claim.—1. The herein-described gate, embodying in its construction the longitudinal wire barriers G, the single horizontal swing-bar E, and the end bar, F, pivoted at its center to the free end of bar E, as described, for the purpose set forth.

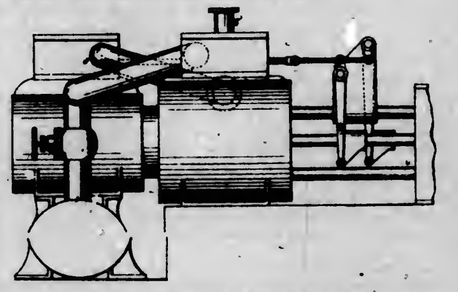


2. The combination of the gate-post A, the hinge-bolt C, the horizontal bar E, pivoted to said hinge-bolt, and having pivoted bar F, and the barrier-wires G, as described, for the purpose set forth.

251,728.

3. The combination of the post A, the bar E, pivoted to the hinge-bolt C, and having centrally-pivoted bar F, the upper barrier-wire having its ends connected to the bar F and to the gate-post in rear of the axis upon which the gate turns, and the lower barrier-wire secured to the bar F and to the hinge-bolt C, so that said wire shall become slackened when the gate is tilted, as set forth.

251,729. TELEGRAPH-CABLE TERMINAL. WILLIAM E. PATTERSON, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Filed July 14, 1881. (No model.)



Claim.—1. The combination of the cap of insulating material with the pipe of the telegraph-cable, hollow pins, one for each conductor, and means whereby the cap is closely fitted to the pipe, substantially as shown and described.

2. The combination of the cap of insulating material, provided with hollow pins, one for each conductor, the cap attached to the pipe of the cable, and the ring and binding-posts, whereby connection may be maintained with the several conductors, substantially as shown and set forth.

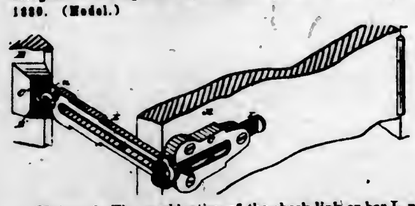
3. A binding-post provided with a hollow attaching-screw, whereby the post may be attached to an underground conduit and a wire from the interior made fast thereto, and having a binding-screw, by which connection can be made to an exterior conductor, substantially as shown and described.

251,730. PUMPING-ENGINE. WILLIAM A. PERRY, Bay Ridge, N. Y. Filed June 27, 1881. (No model.)

Claim.—1. The improvement in compounded duplex steam pumping-engines, consisting in the combination of a high-pressure and an expanding cylinder, co-operating upon one side of the engine, with an expanding-cylinder operating alone upon the opposite side, the whole being arranged and operated to produce an equal development of power upon both sides of the engine, substantially as and for the purpose set forth.

2. The combination, with the high-pressure and expanding cylinders arranged and operated, as herein described, upon one side of a duplex pumping-engine, of the intermediate tank and single expanding-cylinder operating alone upon the opposite side of the engine, substantially as and for the purpose set forth.

251,731. ARTIFICIAL WHALEBONE. GEORGE H. PHELPS, Newton, Mass. Filed Oct. 25, 1881. (No model.)



Claim.—1. As an improved article of manufacture, whalebone or substitute for whalebone, it being composed of long fibers, such as described, arranged in mass, with individual strands parallel, the said strands being united together to form strips or ribs, substantially as described.

2. A sheet of whalebone composed of fibrous material, gelatine, and chromic acid, or equivalents, united under pressure, substantially as described.

3. That improvement in the art or method of forming whalebone or substitute for whalebone which consists in arranging the fibers of tampico, istle, or equivalent fiber side by side, coating or treating the same with a solution of gelatine, and then with chromic acid, and then subjecting the same to the action of light, heat, and pressure to form the said fiber into a homogeneous substance adapted to be cut into strips or ribs, substantially as described.

4. That improvement in the art or method of manufacturing whalebone or artificial whalebone which consists in uniting the fibers of tampico, istle, or equivalent substance with a cementitious or glutinous material, substantially as described.

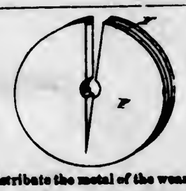
251,732. DOOR-CHECK. FRANCIS V. PHILLIPS, Chicago, Ill., assignor to George H. Dayton, same place. Filed Aug. 23, 1880. (Model.)

Claim.—1. The combination of the check link or bar L, pivoted to the door-frame, the case or plate C, secured to the door, and the turn-pin or catch T, held movably to the door by means of the case C, said turn-pin T being adapted to engage the link or bar L, and to be moved, while thus engaged, inwardly from and outwardly to the edge of the door, so as to co-operate with the bar L to check the door when ajar, and to form therewith a fastening to the closed door, substantially as described.

2. In combination with a rigid check link or bar, L, having a notch or shoulder, N, and a suitable catch, T, on the door, arranged to engage with said link or bar to check the door ajar, the gliding latch I, adapted to be engaged at will with the shoulder N of the link L, so as to hold the door from closing, substantially as described.

3. In combination with the slotted link or bar L, the turn-pin T, secured movably to the door by means which permit the turn-pin to slide inward from and outward to the edge of the door, and to rotate to receive or release the link only when receded, substantially as described.

4. In a door-check, the slotted link L, pivoted to the boss C on the door-frame, the case C, having the slot D, the turn-pin T, having projections *t* and *t'* and the groove *g*, and the bottom plate, I, provided with the rib *r*, combined and operating substantially as described.

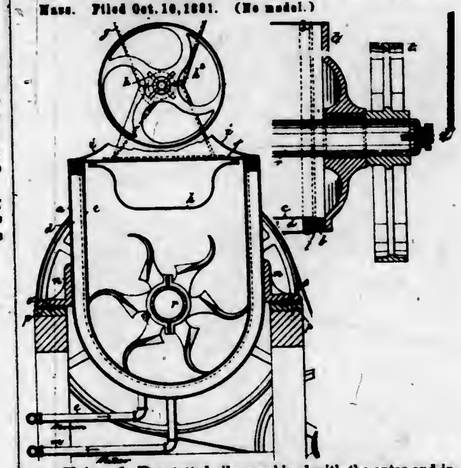


5. In combination, the slotted link L, pivoted to the door-frame, the retaining-case C on the door, the rotating turn-pin T, held by the case C, and slide I, having the lugs *b b*, whereby the turn-pin may be secured from rotation when operating with the link L as a fastening for the closed door, substantially as described.

6. The link L, pivoted to the door-frame by the hook E' and eye *e*, and constructed with the corner-projections *a*, which bear against the hook E' to prevent the link from swinging in the way of the door, substantially as described.

251,733. ROTARY ENGINE. WILLIAM C. PEGLEY, Louisville, Ky. Filed May 13, 1881. (No model.)

Claim.—1. In a rotary engine, the wheel D, having the depressions F on the sides, for the purpose of forming oil-chambers



251,733.

and to equally distribute the metal of the wearing-surface, as herein set forth.

2. In a rotary engine, the adjustable plate F', having the groove F², for packing material, in combination with the set-screws H' in the rear cap, and with the wheel D, as herein set forth.

251,734. DRYING APPARATUS. GEORGE W. RAWSON, Boston, Mass. Filed Oct. 10, 1881. (No model.)

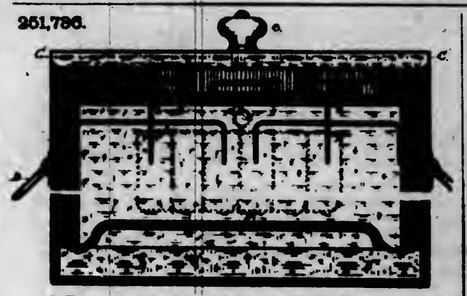
Claim.—1. The slotted ribs, combined with the outer and inner metal plates of the casing secured thereto, to compensate for unequal expansion of the said plates, substantially as described.

2. The metal casings *a c*, having the steam-space *d* between them, combined with the hollow shaft *r*, and the series of broad-faced arms *s*, curved as shown and described, to lift the material, the broad faces of the arms being inclined in the direction of their width with relation to the axis of the said shaft, as set forth, to operate all substantially as and for the purpose described.

3. The metal casings *a c*, steam-space *d* between them, and the upper plate, *f*, hollow shaft *r*, and its series of curved broad-faced arms to lift the material, combined with the long trough *h*, connected with the said upper plate only at intervals, to thus leave passages nearly the entire length of the edges of the said trough for the passage of vapor and gases to the uptake *i*, substantially as described.

4. The metal casings *a c*, having steam-space *d* between them, combined with the hollow shaft and its curved and inclined arms *s*, to operate all as shown and described.

251,735. CORSET. JOHN K. REES, Newark, N. J. Filed Aug. 9, 1881. (No model.)



Claim.—1. A corset-stiffener constructed, as herein shown and described, of strips of woven grass cloth and cording stitched together between layers of fabric, substantially as set forth.

2. In combination with a corset consisting of strips of grass cloth and cording stitched together between layers of fabric, the stays formed of metal, bone, or hard rubber, substantially as set forth, and for the purpose described.

251,736. COOKING UTENSIL. LIBERTY H. S. RUPERT and REBECCA WYSONG, Williamsport, Pa. Filed Oct. 30, 1881. (No model.)

Claim.—1. The oven A, in combination with the removable pan B, having partition P and removable rods M, and provided with means of suspension within the oven A, as shown and described, and for the purposes set forth.

251,736.

2. The oven A, in combination with the rod E, provided with notches *e*, and so arranged as to be removed from the loops L L', as shown and described, and for the purposes set forth.

3. The box A, provided with a hinged cover, C, handles D, and loops L L', in combination with the rod E and hooks H H' H'', as shown and described, and for the purposes set forth.

251,737. COMBINED PARLOR AND SLEEPING CAR. J. ADOLPH SCHMITZ, Lake Forest, Ill. Filed Sept. 17, 1881. (No model.)

Claim.—1. In a combined parlor and sleeping car, two adjacent chairs having their backs and sides shaped and contrived, substantially as described, to form, with the seats of said chairs, a rectangular berth wider than the chair-seats, when arranged in a horizontal plane therewith, substantially as and for the purposes set forth.

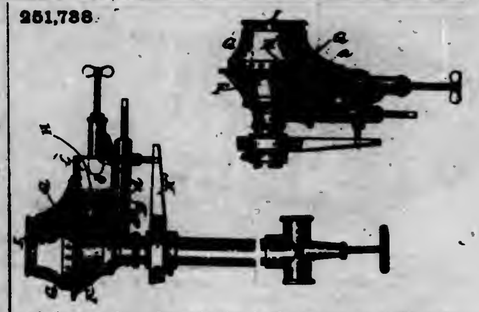
2. In a car, two adjacent chairs having the back and arms both extensible into a horizontal position to form a berth, combined with mechanism whereby the extended parts are supported, substantially as described.

3. In a car, two adjacent rotating chairs having downwardly-folding backs, arranged and constructed to form a continuous horizontal surface by having the back of one chair fall into proximity with the seat of the next, substantially as and for the purposes set forth.

4. In a car, the chair described, having side extensions for the seat and back, and also having the back constructed to lie in the same plane with the seat, whereby said chair may form a berth or part of a berth, substantially as set forth.

5. In a combined parlor and sleeping car, two adjacent chairs laterally and rearwardly extensible, whereby said chairs are converted into a berth, substantially as described.

6. In a car, a chair provided with the retreating projections *a a*, combined with an adjacent chair having its back extensible into the same plane with the seat, substantially as described, and for the purposes set forth.



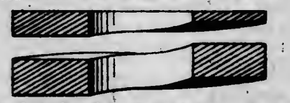
7. In combination with a series of chairs having their backs and arms extensible into the plane of the seats, the partitions F, extended to the level of the seats, substantially as described.

8. In a car-chair wherein the back is provided with lateral extensions and wherein the back and arms are constructed to fall into the plane of the seats, the arms having an inclined rear edge and the back wings similarly inclined on their lower edges, whereby the parts closely proximate when in horizontal position, substantially as described.

251,738. VAPOR-BURNER. PAUL SCHNEIDER and HENRY TRENKAMP, Cleveland, Ohio. Filed July 23, 1881. (Model.)

Claim.—1. In vapor-burners, the cover I, and depending therefrom a cylinder with open ends, the lower end of which terminates near the bottom of the base F of the combustion-chamber

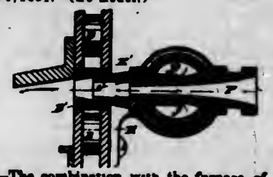
251,738.



and the opposite end terminating in the upper part of the said chamber, and perforated ring G, in combination with the said base and horizontal induction-pipe, substantially as described, and for the purpose set forth.

2. In vapor-burners for gasoline-stoves, the base of the combustion-chamber provided with an orifice for the emission of oil to the heating-cup flange *a'* and point for conducting the oil into the heating-cup, substantially as described, and for the purpose set forth.

3. The induction-pipe H, inserted in the side of the combustion-chamber and terminating in a cylinder therein, and arranged in relation to and in combination with a needle-valve mechanism, substantially as set forth, and for the purpose specified.

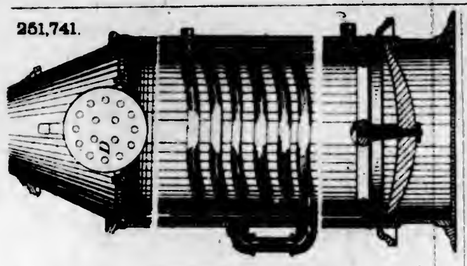


4. The combination of the perforated ring G, the cup and depending cylinder, the base F, having the orifice *d*, the horizontal induction-pipe, and the conduit provided with a collar and point, substantially as and for the purpose set forth.

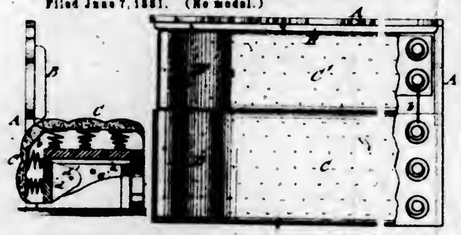
251,739. CAR-SPRING. CHAS. SCOTT and CHAS. T. SCHOBY, Philadelphia, Pa. Filed Mar. 17, 1881. (No model.)

Claim.—A single-coil bearing or bolster spring consisting of a bar coiled on its edge, the width of said bar being substantially twice its thickness and about three-fourths the diameter of the mandrel-hole, the diameter of the spiral being equal to or greater than its height, substantially as shown and described.

251,740. APPARATUS FOR INJECTING AIR AND STEAM INTO FURNACES. ALONZO J. SIMMONS, Indianapolis, Ind. Filed June 3, 1881. (No model.)



Claim.—The combination, with the furnace, of the steam-drum D, the steam-nozzle E', one of whose extremities extends within the hollow stay-bolt B', the other having a conical mouth extending half-way through the drum, stay-bolt B, air-pipe F, extending a short distance inside the mouth of said steam-nozzle, and the nut F', having outside threads corresponding with other threads in the side of the steam-drum and inside threads corresponding with other threads upon the outside of the air-pipe, substantially as and for the purposes described.



251,741. WATER HEATER AND CIRCULATOR. PETER SMITH, Detroit, Mich., assignor to himself, THOMAS A. BISSELL, and JOHN C. MCLAUGHLIN, same place. Filed Sept. 16, 1881. (No model.)

Claim.—A water heater and circulator consisting of an upright furnace with an inclosing water-jacket, a conduit leading into the jacket from the outside of the furnace, and a pipe-coil arranged within the furnace, and having one terminal connected with the water-jacket and the other leading directly to the outside of the furnace, and adapted for connecting with a water-conveying pipe, substantially as described.

251,741.

251,742. SOFA-BED. JAMES K. STOCKTON, Brooklyn, N. Y. Filed June 7, 1881. (No model.)

Claim.—1. The combination, in a sofa or lounge bed, of a main frame, A, having a back, B, which is open or recessed below the upper upholstered section, with a movable main section, C, having a rear section, C', jointed to the main section and adapted to be thrown into the open back of the main frame or raised to a level with the drawn-out main section of the seat, substantially as set forth.

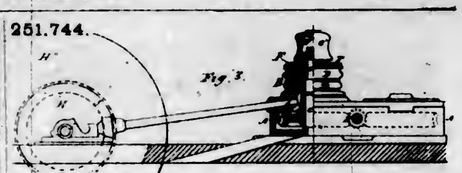
2. The combination, with the main frame A, of the sliding and guided seat-section C, made in one piece with its head-piece D, and provided with a swinging rear section, C', jointed thereto, substantially as specified.

3. The combination of the main frame A and back B, having an open lower part, with a sliding seat-section, C, having a head-piece, D, made in one piece therewith, hinged rear section, C', jointed to the main section and pivoted to the main frame A, and with an adjustable rear head-piece, D', which is adapted to be raised or lowered as required, substantially as set forth.

4. The combination, in a sofa or lounge bed, of the main frame A and back B, having a lower open part, with a sliding main seat, C, pivoted and jointed rear section, C', connected by bracket-arms to pivots of the main frame and adapted to be stopped by pins of the same, substantially as and for the purpose set forth.

5. The combination, in a sofa or lounge bed, with the main frame A, of a rear piece, D', composed of two parts, *f f'*, which are hinged together, the upper part being pivoted to the main frame and the lower adapted to be retained on a rail or seat, *f''*, of the rear seat-section, or a rail, *f''*, of the frame A, substantially as described.

251,743. DEVICE FOR PROTECTING THE EYES. JNO. STORY, Castle Shannon, Pa. Filed May 17, 1881. (No model.)



Claim.—1. The combination, with a lamp or other light, of a prism and mechanism for adjusting the prism vertically, substantially as shown.

2. The combination of the lamp, the arm *d*, sleeve *e*, the screw *g*, support *i*, and prism *b*, substantially as described.

251,744. APPARATUS FOR TAKING IN, STOPPING, AND STOWING WIRE AND OTHER ROPE CABLES. JAMES TAYLOR, Birkenhead, County of Chester, England. Filed Aug. 20, 1881. (No model.) Patented in England Oct. 3, 1880.

Claim.—1. The combination of mounting sheaves or pulleys B, friction-clutches F, and friction-gear K, coacting in relation to each other, substantially as described, for the purpose specified.

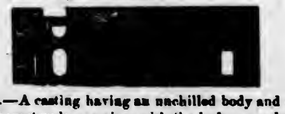
251,744.

2. The arrangement of the pulleys B shown at Figs. 1 and 2 of the drawings hereto annexed.

3. The arrangement of the pulleys B, in combination with the friction stowing-drums H, as shown at Figs. 3 and 4 of the drawings hereto annexed.

4. The arrangement and combination of pulleys, friction-clutches, gearing, and frictional stowing-drums, as herein described, and shown at Figs. 5, 5ª and 6, 6ª of the drawings hereto annexed.

5. The arrangement of pulleys, friction-clutches, brakes and operating-gear herein described, and shown at Figs. 7 and 8 of the drawings hereto annexed.



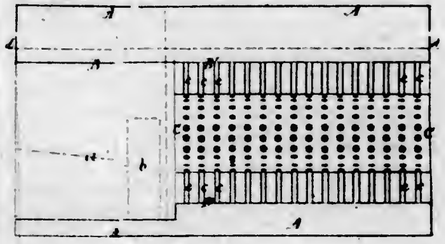
6. The arrangement of pulleys, friction-clutches, and operating-gear herein described, and shown at Figs. 9, 10, 9ª and 10ª of the drawings hereto annexed.

7. The various arrangements of friction-drums for taking in and stowing wire-rope or other like cable, as herein described, and shown at Figs. 3, 4, 5ª, 6ª, 11, 12, 13, 14, and 15 of the drawings hereto annexed.

8. The combination of corrugated sides or plates H'' with the friction stowing-drum H, substantially as described, for the purpose specified.

251,745. NUMBERING SEWING-MACHINE CASTINGS. EDDY T. THOMAS, New York, N. Y. Filed Apr. 1, 1881. (No model.)

Brief.—The letters may either be cut in the chill or a thin layer of sand may be placed over the chill-plate and the letters cut in the sand through to the chill.

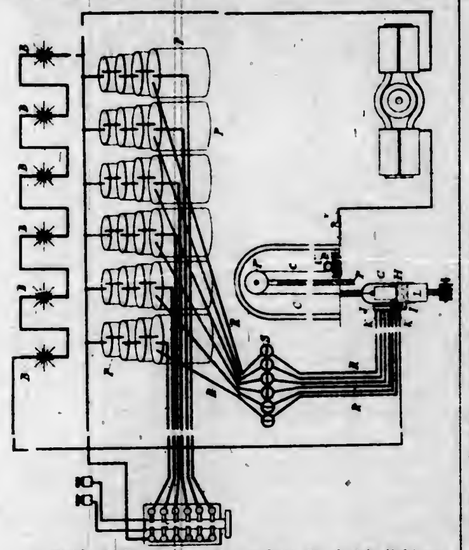


Claim.—A casting having an unchilled body and chilled designating-characters in one piece with the body, as and for the purpose set forth.

251,746. PROCESS OF REPRODUCING DRAWINGS AND DESIGNS. MAURICE TILNEY, Paris, France. Filed Jan. 8, 1881. (No specimens.) Patented in France Aug. 31, 1879, in England Nov. 26, 1880, in Belgium Nov. 27, 1880, and in Germany Nov. 29, 1880.

Claim.—1. In the process of preparing negative paper for reproducing drawings and designs, the two baths consisting, first, of white soap, alum, Flanders glue, whites of eggs beaten up, glacial acetic acid, alcohol, and water, and, second, of burnt amber ground in alcohol, black pigment, Flanders glue, bichromate of potash, and water, all in about the relative proportions described.

2. In the process of preparing positive paper for reproducing drawings and designs from negatives upon paper prepared in the manner described and claimed, a bath consisting of black or colored pigments, Flanders glue, bichromate of potash, and water, all in about the relative proportions described.



251,747. MARINE BOILER. GEORGE B. N. TOWER, Boston, Mass., assignor, by direct and mesne assignments, to David Renshaw, Cohasset, and Harvey T. Litchfield, Hull, Mass. Filed Aug. 27, 1879.

Claim.—A marine boiler consisting of the outer shell, A, inner shell, B B', fire-box, and ash-pit, to which is connected the water-flue C, communicating with the water-space of the boiler by a number of radiating water-tubes, *a*, all arranged substantially as shown, and for the purpose specified.

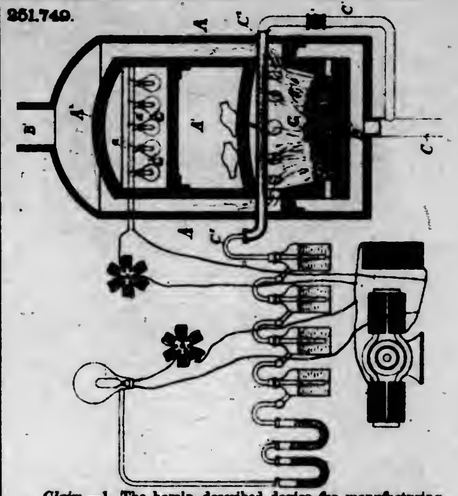
251,748. AUTOMATIC REGULATOR FOR ELECTRIC-LIGHT SYSTEMS. WILLIAM L. VOELKER, Morton, Pa. Filed Aug. 5, 1881. (No model.)

Brief.—Secondary batteries are placed in shunt-circuits connected with a vessel containing mercury, the connections being at different levels. A weight is suspended in the mercury-vessel by a thin metallic band, which forms part of the circuit. Excess of current heats the band, and by its expansion the weight is lowered into the mercury, raising its level and closing the shunt-circuits to the secondary batteries.

Claim.—1. In an automatic regulator for electric-light systems, the combination, with a strip of metal and a liquid-displacing body, of a cistern containing mercury, or an equivalent conducting-fluid, and a series of shunts having communication with said cistern, substantially as and for the uses and purposes shown and described.

2. The combination of the strip of metal C, weight G, conducting-fluid I, shunt-connections K, conductors R, and secondary battery P, the whole arranged to operate substantially as shown and described.

3. The combination, with the strip of metal C, carrying shunting device, as described, of the double case or shade, the space between the two portions of the shade being filled with a solution of alum or its equivalent, substantially as and for the uses and purposes shown and described.



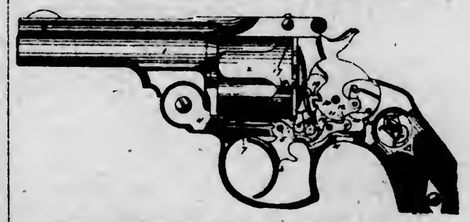
4. In an automatic regulator for electric-light systems, the combination, with the strip of metal C and its displacing-body, of the cistern containing a conducting-fluid having electrical connection with the cups of a removable secondary battery, substantially as shown and described.

5. The herein-described method of equalizing the current upon the main circuit of an electric generator and preventing waste of electric energy, consisting in automatically shunting the main current through a secondary battery or batteries in proportions to correspond with the increase of current strength in the main circuit.

6. The combination, substantially as described, of a main electric circuit containing lights or other apparatus, an electric generator for supplying a current thereto, a series of shunt-circuits containing secondary batteries, and an automatic circuit-closer for said shunt-circuits, the whole operating in the manner set forth.

251,749. APPARATUS FOR MANUFACTURING INCANDESCENT LAMPS AND CARBONS. WILLIAM L. VOELKER, Morton, Pa. Filed Aug. 5, 1881. (No model.)

251,749.

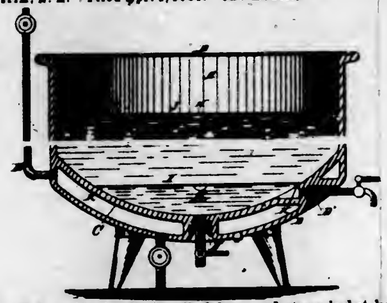


Claim.—1. The herein-described device for manufacturing and testing incandescent electric lamps, consisting of a furnace or fire-pot supplied with an air-blast, the annealing-oven and the drying-oven located above said fire-pot, and the nitrogen-generator in said fire-pot, the whole combined and arranged to operate substantially as set forth.

2. The herein-described method of expelling the moisture from the glass bulbs of incandescent electric lamps and their inclosed carbon by subjecting said lamps before sealing to heat of the requisite temperature and at the same time passing an electric current therethrough, substantially as shown and described.

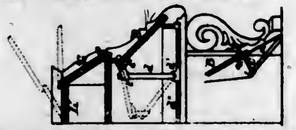
3. In a device for manufacturing and testing incandescent lamps and carbons, the fire-pot B, blast-pipe C, pipes C' and C', annealing-oven A', and drying-oven A², the whole combined and arranged to operate substantially as shown and described.

4. In a device for manufacturing and testing incandescent electric lamps and carbons, the combination, with the oven A', heated by fire-pot B, of the conductors *a a*, having connection with a dynamo-machine, substantially as shown and described.



251,750. REVOLVING FIRE-ARM. JOS. H. WESSON, Springfield, Mass. Filed Sept. 23, 1881. (No model.)

Claim.—1. The combination, in a revolving fire-arm, of a cylinder-stop secured in the frame and adapted to engage in stop-recesses made in the cylinder and extending rearward past the trigger, a sear pivoted in the frame, and whose forward end engages with said cylinder-stop, a sear-spring to hold the sear into contact with the hammer-tumbler, and a hammer-tumbler adapted to engage with the rear end of said sear, and thereby actuate the cylinder-stop in disengaging it from the cylinder independently from the trigger, substantially as described.

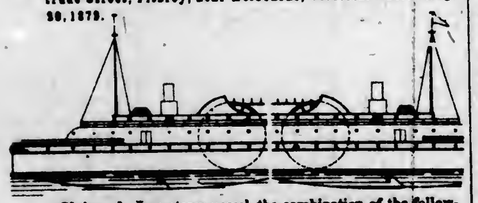


2. The combination, in a revolving fire-arm, of a hammer-tumbler provided with a safety-notch and an incline or shoulder just in rear of said safety-notch, a sear pivoted in the frame and whose catch is held in contact with the hammer-tumbler by a spring, and a cylinder-stop pivoted in the frame and adapted to engage in stop-recesses in the cylinder, and whose rear portion extends rearward past the trigger and into engagement with the sear, whereby the said cylinder may be locked when the catch of the sear is in the safety-notch of the tumbler, and is released by the further backward movement of the hammer, substantially as described.

251,751. STEAM-JACKET KETTLE. EDWARD WHITELEY, Antrim, N. H. Filed Apr. 4, 1881. (No model.)

Claim.—The herein-described improved steam-jacket kettle, consisting of the kettle A, having the inner and outer skins, C D, the outer skin being provided with the recess D', constructed substantially as shown, for the purpose of allowing the insertion of a pipe in the inner skin or bottom, C, without piercing the outer skin or entering the steam-chamber, as above set forth.

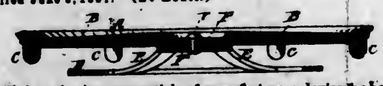
251,752. CABINET-ORGAN CASE. ORISON C. WHITNEY, Cleveland, Ohio. Filed Sept. 6, 1880. (No model.)



Claim.—1. The lid B, provided with the ears *b b*, arranged and adapted to slide in the grooves *a a*, having notches *a'* in the frame-work of the case, to afford a covering for the pedal-opening, as set forth.

2. The tilting frame consisting of the two uprights *d d*, connected by bar *f*, and pivoted to blocks *d' d'* on the board *d''*, and provided with the short arms *e e*, to which the fall-board D is attached by the ears *d' d'*, having buttons *d''*, all arranged to operate as and for the purpose specified.

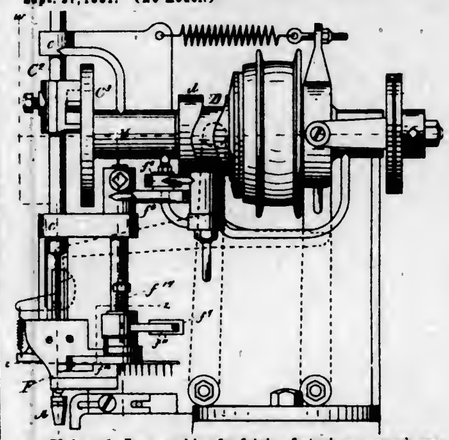
3. The music-rest G, hinged to the front edge of the lid H, the said rest G forming a covering to the front opening, and the lid H a cover on the top of the music-receptacle, as shown and described.



251,753. CONSTRUCTION OF SHIPS. ROBT. WILCOX, 55 Gertrude Street, Fitzroy, near Melbourne, Victoria. Filed Aug. 20, 1879.

Claim.—1. In a steam-vessel, the combination of the following elements: first, a hull having a central space extending the entire length of the vessel; second, central propelling mechanism located in the central space; and, third, the steering mechanism, substantially as described, located on the quarter, the construction being such that the vessel may run with equal facility in either direction.

2. A hull having on each side two sections of semi-cigar shape placed end to end and a continuous central space extending the entire length of the hull.



251,754. DISH-HOLDER. EDWIN O. WILSS, Boston, Mass. Filed June 9, 1881. (No model.)

Claim.—1. As a new article of manufacture, a device for holding dishes which is made of two parts, so constructed and arranged that one part serves as a base upon which the other part revolves, all substantially as set forth.

2. The combination of the frame A B, made with a raised rim, G, upon the upper surface and the projections C C upon the lower surface, with the frame D E, made with a raised center, F, and the rivet *r*, all constructed and arranged substantially as set forth.

251,755. TACKING-MACHINE. ERASTUS WOODWARD, Somerville, assignor to George W. Copeland, Malden, Mass. Filed Sept. 27, 1881. (No model.)

Claim.—1. In a machine for driving fastenings, a nozzle provided with a vertical movement, in combination with mechanism, substantially as described, connecting it with the actuating-pulley, whereby the movement of the nozzle both starts and stops the machine, all substantially as and for the purposes set forth.

2. The combination of a nozzle provided with a vertical movement and the means for centering it in relation to the driveway of the machine during its upward movement, substantially as specified.

3. The combination of a nozzle provided with a vertical movement and the means, substantially as set forth, for maintaining it firmly in position while at its highest position and while the fastening is being driven, all substantially as described.

4. In a machine for driving fastenings, the combination, substantially as shown, of a movable member of the clutch mechanism, adapted to be operated as described, and a frictional device for stopping the machine, operated by said member, whereby, upon its disengagement from the other member, the friction mechanism is caused to act and the machine is stopped, and whereby, upon its engagement with said member, the friction is released, all substantially as specified.

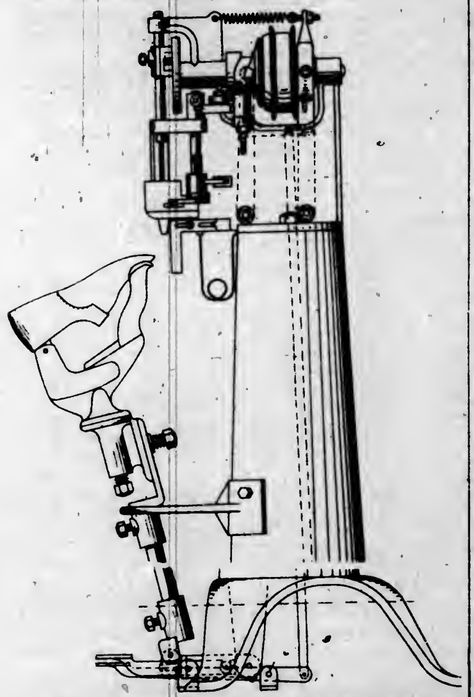
5. In a machine for driving fastenings, the combination of devices, substantially as specified, for engaging and disengaging the members of the clutch mechanism and frictional mechanism, substantially as specified, adapted to be automatically operated, as described, all substantially as set forth.

6. In a machine for driving tacks from a tack-strip, as a means for centering a tack in the throat of the machine, a yielding or movable block, E, having the centering-projections *d' d'*, forming a recess, *e*, and adapted to close or be closed into the feedway, all substantially as specified.

7. In a machine for driving tacks from a tack-strip, a feed-pawl arranged to feed the tack-strip having three or more teeth, as and for the purposes indicated.

8. In a machine for driving tacks from a tack-strip, the feed-pawl and means, substantially as set forth, for imparting to it closing, advancing, withdrawing, and backward movements, all substantially as specified.

9. The combination of the cam D, the pawl F, and the intermediate mechanism described for providing the pawl with the movement specified, all as set forth.



10. As a means for providing the feed-pawl with a four-motion feed, the lever f^3, having reciprocating movements imparted to it, the arms f^{10} f^{11}, pivoted and clamped to said lever, substantially as specified, and stops for changing the direction of the movement of said arms, all substantially as described.

11. In a tacking-machine for driving tacks from a tack-supporting strip, the knife G, means, substantially as specified, for imparting to it a reciprocating movement, the tack-driving and tack-feeding mechanism, all arranged in relation to each other as set forth, whereby the knife is operated to sever from the tack-supporting strip the portions from which tacks have been removed, all substantially as described.

12. In an organized power-machine for driving tacks from a tack-supporting strip, the combination of the main shaft, a cam, and starting and stopping mechanism with said feed-pawl and start and stop mechanism, all substantially as specified.

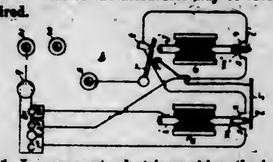
13. In an organized power tacking-machine for driving tacks from a tack-supporting strip, the combination of the following instrumentalities: a driver and feed-pawl, a main shaft having a cam for operating the pawl, and a crank for operating the driver, and the means for revolving it, all substantially as specified.

251,756. FASTENING-DRIVING MACHINE. ERASTUS WOODWARD, Somerville, assignor to George W. Copeland, Malden, Mass. Filed Nov. 10, 1881. (No model.)

Claim.—The combination of the nozzle of a fastening-driving machine, a jack and last adapted to be raised to and held against the said nozzle by a treadle while the fastening is driven, and a second treadle adapted to actuate the start and stop motions of the fastening-driving machine while the jack-treadle is kept down to hold the last and jack to the nozzle, substantially as specified.

251,757. COMBINED TOY AND BOTTLE-STOPPER. PORFIRIO C. SABETTI, Bryan, Tex. Filed Nov. 10, 1881. (No model.)

Claim.—1. A bottle-stopper consisting of a tube, A, closed at the upper end, and having flange B, packing-ring C, and diagonally-upward-projecting gutter D, substantially as and for the purpose set forth.



2. A bottle-stopper consisting of a tube, A, closed at the upper end, and having flange B, packing-ring C, diagonally-upward-projecting gutter D, and self-closing valve F, substantially as and for the purpose set forth.

3. The combination, with a bottle-stopper having a gutter for the escape of fluid, of an automaton or jointed figure actuated by a paddle-wheel which is operated by the escaping fluid, substantially as set forth.

4. The bottle-stopper A, having gutter D for the escape of fluid, in combination with the removable U-shaped bracket G, having legs H, shaft I, paddle-wheel J, and automaton K, substantially as set forth.

251,758. MAGNETO-ELECTRIC MACHINE FOR TELEPHONE-SIGNALING. ORDRON LEE ANDREW, Boston, Mass., assignor to American Bell Telephone Company, same place. Filed Apr. 13, 1880. (No model.)

Brief.—The machine has two armatures, so arranged that while one is producing its maximum current the other is producing its minimum current. Switches and contacts are provided whereby alternate, intermittent, or straight currents may be sent to line, as desired. One of the armatures may be thrown out of gear when desired.

Claim.—1. In a magneto-electric machine, the inductive armatures relatively arranged as described, so that the current generated in one armature is strongest when it is weakest in the other, and combined with commutators for carrying off the currents in the same direction, and conductors for carrying the current from each armature directly to line without passing through the other, substantially as described.

2. The combination, with the same magnet, of inductive armatures mounted on separate shafts and arranged so that their poles alternate in approaching the poles of the magnet, and combined with gearing for revolving them, and commutators and conductors for carrying off the currents generated in both armatures into one circuit, substantially as described.

3. In a magneto-electric machine, an armature and coil therefor in which alternately positive and negative currents may be induced, in combination with conductors and contact devices connected, as explained, with said coil and with the exterior circuit, so that only the immediate currents of one polarity are sent to the exterior circuit, substantially as described.

4. The combination, with a permanent magnet and an inductive armature therefor having its coil in continual connection with one end of an exterior circuit, of a commutator-piece connected with the other end of the coil, and a spring or contact-piece connected with the other end of the exterior circuit, said spring being arranged, as explained, so as intermittently to make contact with said commutator-piece, substantially as described.

5. The combination, with the induction-coil of a magneto-electric machine in which alternating currents of opposite polarity are generated, of a commutating device having contact-pieces which are in connection with one end of the coil while the current therein is of one, and with the other end thereof when it is of the other polarity, and contact-pieces which are continuously in connection one with one and the other with the other end of said coil, and means, as described, to connect any of said contact-pieces in circuit independently of the others, whereby currents of alternating polarity, or separated or consecutive currents of the same polarity, may be transmitted to an exterior circuit, as desired, by making the proper connection, substantially as and for the purpose specified.

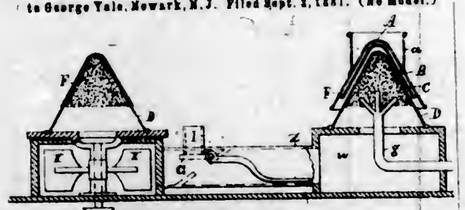
6. A magneto-electric machine with inductive armatures arranged, as described, so that the maximum and minimum currents are generated in the coils of said armatures not simultaneously but successively, and means, as set forth, to connect the ends of said coils continuously or alternately with an exterior circuit, whereby currents of various character—as steady or fluctuating or separated—may be transmitted to the exterior circuit, as desired, substantially as described.

7. In a magneto-electric machine, a magnet and two armatures and a driving mechanism to rotate them near the poles of the said magnet to generate electric currents, combined with means, as set forth, to disengage one of the said armatures from the driving mechanism and hold it with its poles remote from those of the magnet, as and for the purpose described.

8. In a magneto-machine, two armatures and a driving mechanism to rotate them in fixed relation to one another, combined with means, as described, to disengage one of the said armatures

from the driving mechanism, and then cause it to be re-engaged in the required positive relation to the other, as and for the purpose set forth.

9. In a magneto-electric machine, the combination, with the spindle of the rotary armature bored and lined with insulating material, as described, of a metal pin split longitudinally, and having its two parts thus divided separated by a layer of insulating material and fitted within the said bored spindle, substantially as described.



10. In combination with an inductive armature wrapped with insulated wire, a rotary commutator consisting of two metal pieces insulated from one another and adapted to come alternately in contact with suitable contact-springs in their rotation, one of the said metal pieces being in contact with an independent contact-piece during its entire rotation, and both of them being connected with the ends of the armature-coils, as and for the purpose specified.

11. The combination, with the armature of a magneto-electric machine and the coils of said armature, of contact-pieces for taking off the currents of alternately-opposite polarities as generated in the said coils, contact-pieces for taking off currents of one polarity only, and means, as indicated, for connecting in with an electric circuit either set of contact-pieces, substantially as described.

12. A magneto-electric machine provided with contact-pieces connected with its induction-coils, and a series of independent open keys connected with the said contact-pieces, and a reversing-key connected with the anvils of said keys to enable the character of the current to be controlled by properly operating the independent keys, and the said currents of proper character to be sent to line in either direction, as desired, by the reversing-key, substantially as described.

251,759. MAKING AND UNITING BATS TO HAT-BODIES.

WILLIAM A. BAGLIN, Brooklyn, N.Y., assignor of one-fourth to George Yale, Newark, N.J. Filed Sept. 2, 1881. (No model.)

Claim.—1. The process herein described for making bats, consisting in forming the bat upon a cone at several successive operations, the material of the bat being deposited upon different parts of the cone at different times, in figures of predetermined shape, substantially as and for the purpose set forth.

2. The process herein described for removing a bat from the forming-cone, consisting in the application of steam or air pressure to the interior of the forming-cone, substantially as herein set forth.

3. The method herein described for securing or uniting a nap-bat to a body-felt, consisting, first, in forming the nap-bat upon an exhausted cone of suitable shape to fit the body-felt; second, in applying the body-felt to the nap-bat while upon the forming-cone and pressing them both together; third, in removing the body-felt and nap-bat from the cone together; and, fourth, in sticking and scalding the same together in the usual manner.

4. The process herein described for preparing hat-body felts for union with nap-bats formed in one piece, consisting in shrinking the felts to an approximately-uniform size and blocking them to secure an approximately-uniform shape, substantially as and for the purpose set forth.

5. As a new article of manufacture, a nap-bat formed in one piece of suitable shape to fit the body-felt to which it is to be applied, and adapted to be stuck thereto and scalded without any clipping or fitting, substantially as herein set forth.

6. As a new article of manufacture, the annular conical nap-bat herein described, formed in one piece and adapted to be stuck to the brim of a hat without clipping or tearing, substantially as herein set forth.

7. As a new article of manufacture, a nap-bat consisting of material of different colors deposited in different parts of the bat in distinct locations, patterns, or figures, substantially as herein set forth.

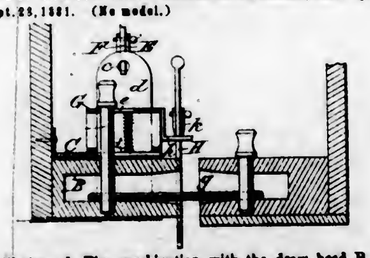
8. As a new article of manufacture, a nap-bat consisting of material of different colors disposed to form distinct figures appearing through a ground of uniform color, said ground being formed by the body of the bat, substantially as herein set forth.

9. The carrier for hat-bodies, consisting of a hollow cone, A, provided with means for carrying it, as flange *a*, a finger-ring at the apex, or equivalent device, as and for the purpose set forth.

10. In combination with the conical carrier A, the presser B, constructed and operated to press the hat-body to the shape of the carrier, as and for the purpose set forth.

11. In combination with the fan X, the blast-pipe Z, valve in the blast-pipe arranged and operated to admit air to the forming-cone D, and wind-chest *w*, or other suitable support for the forming-cone, substantially as herein set forth.

12. In combination with the steam-pipe *g*, a valve arranged and operated to admit steam to the forming-cone D, and a table or suitable support for such cone, substantially as herein set forth.

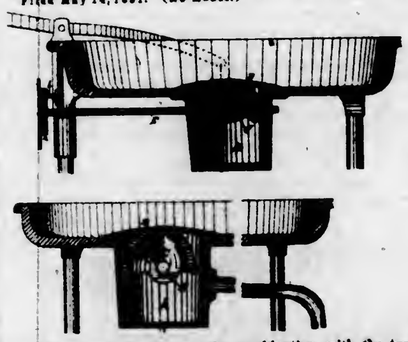


13. In combination with the forming-cone D, the guard-cone E, for covering the tip of cone D when forming an annular conical nap-bat, substantially as herein set forth.

14. In combination with the forming-cone D, the guard-cone *k*, shaped with a serrated, scalloped, or indented border, substantially as and for the purpose set forth.

15. The guard-cone L, perforated only at certain points in figures of ornamental shape, and operated in combination with the forming-cone D by placing the guard-cone inside the latter, substantially as herein set forth.

16. In combination with the guard-cone M, formed with holes arranged in ornamental patterns, as *m*, and provided with a gage mark or pin, as *e*, the forming-cone D, provided with gage or mark, as *d*, substantially as herein set forth.

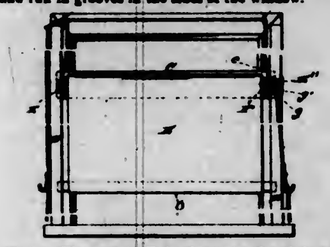


251,760. CAR-COUPLING. DANIEL BEVIS, Marion, Ohio. Filed Sept. 23, 1881. (No model.)

Claim.—1. The combination, with the draw-head B and frames D D′, having standards E E, of the levers F F, pivoted in said standards, and the slotted and spring-seated box or frame G, adapted to move vertically in the frame D D′, and having lugs *d d* for engagement with the inner ends of the operating-levers, substantially as set forth.

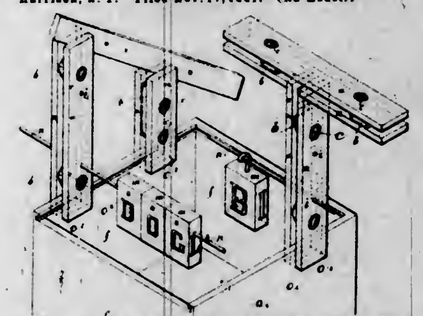
2. The combination, with the frame D, having brackets *h h*, of the swivels *h k* and levers H H, pivoted therein, whereby said levers may be moved in any desired direction for supporting and guiding the coupling-links, substantially as shown and described.

251,761. TUYERE. THOMAS H. BULLOCK, Cleveland, Ohio. Filed May 14, 1881. (No model.)



Claim.—1. In a tuyere, the combination, with the tuyere-grate formed concave on its under side, of the tuyere-valve constructed with a cam-shaped periphery in cross-section and cut away on one side of its shaft, said valve being arranged to be forced snugly against the concave seat on the under side of the grate, substantially as set forth.

2. A tuyere-valve, the same being made cam-shaped in cross-section, in combination with the shaft E and its ratchets *a* and pawl *b*, all operating substantially as and for the purpose shown and described.



251,762. CURTAIN-FIXTURE. THOS. H. BURGESS, Big Rapids, Mich. Filed Aug. 6, 1881. (No model.)

Brief.—The strip upon which the journal-brackets are fastened and the slat in the bottom of the curtain are extended at each end and run in grooves in the sides of the window.

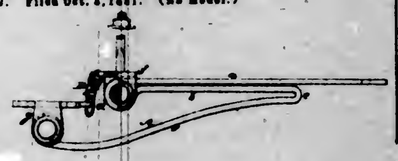
Claim.—The curtain E, having strips C and C, in combination with strips B, having grooves *b*, the ends of the strips traveling in the grooves, roller F, having drum *g*, and cords for winding up and for lifting the curtain, whereby the curtain can be raised or lowered and is kept steady at any position, as set forth.

251,763. TOY BUILDING-BLOCKS. FRANCIS W. CARPENTER, Harrison, N. Y. Filed Nov. 17, 1881. (No model.)

Claim.—1. In a toy-block, the combination, with the slats *a a* and intermediate pieces, *b*, of the rivets *c*, passing through the parts and securing them together, as set forth.

2. In a toy block, the combination, with the slats *a a* and intermediate pieces, *b*, of the rivets *c*, passing through the parts, and the elastic washers *d*, substantially as set forth.

3. In combination with the toy block composed of double slats riveted together, the box having sides *f*, that are adapted to receive the double slats, substantially as set forth.

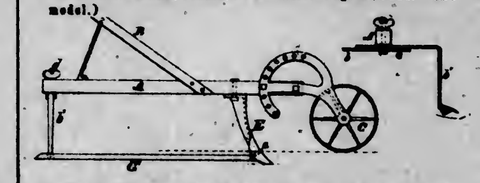


4. The toy slats *a a* and *c*, having holes through them, in combination with the toy blocks *m*, having holes through them, and the rod or similar device for connecting the parts, as set forth.

5. The combination, with the separate toy blocks *m*, having holes through them and letters or characters on their surfaces, of the box *f*, with holes through the sides of the box, and the removable supporting device *a* for the blocks *m*, substantially as set forth.

6. In combination with the toy block formed of the double slats *a a* and intermediate pieces, *b*, riveted together, the angle-piece *c*, having square ends adapted to pass into the spaces between the slats, substantially as set forth.

7. The toy block having letters or characters upon one or more of its surfaces, and a hole in the block, in combination with the metallic suspending-hook connected with each block, substantially as set forth.

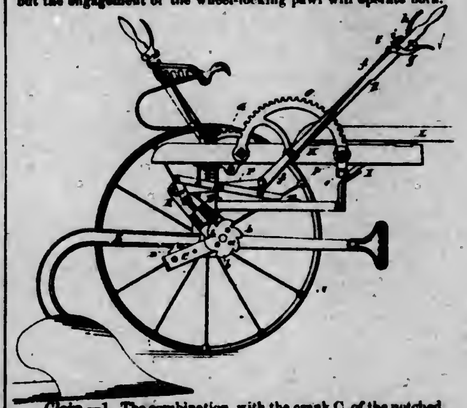


251,764. SPRING FOR VEHICLES. JOSEPH K. CREW, Salem, N. J. Filed Oct. 3, 1881. (No model.)

Claim.—1. The spring A, formed of three continuous leaves one above the other, in combination with the bearing *f* and the connection *g*, the end of the spring opposite to said connection being adapted to be secured to the body of the vehicle, whereby there are produced two springs, *a d b* and *b e c*, operating in reversed order, substantially as and for the purpose set forth.

2. The spring provided with the clip or bearing *f* and clip *g*, in combination with the guarding-strap B, connected to said clips, substantially as and for the purpose set forth.

251,765. IMPLEMENT FOR CUTTING WEEDS AND BEANS. WILLIAM H. CLARK, Groton, N. Y. Filed Aug. 23, 1881. (No model.)



Claim.—1. In combination with the body A and furrow-tooth E, the diverging blades G G′, pivoted to the tooth E and held to the body A by adjustable standards or parts *b b′*.

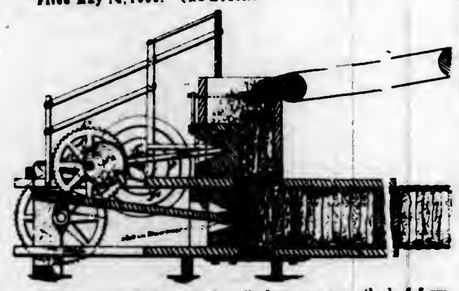
2. The combination of the body A, tooth E, diverging blades G G′, bent adjustable notched standards *b b′*, and fastening device, as and for the purpose set forth.

251,766. SULKY-PLOW. THOMAS A. CORLISS and JOHN H. KENNETH, Dixon, Ill., assignors to the Grand Detour Plow Company, same place. Filed Mar. 21, 1881. (No model.)

Brief.—Hand lifting and team lifting devices for raising the plow. Either may be used independent of the other, and in either case the plow may be locked either in the ground or when raised. When raised by the team the wheel is automatically unlocked when the plow is up, and at the same moment the rack-pawl engages. The rack-pawl may be released separately to use the hand-lever, but the engagement of the wheel-locking pawl will operate both.

Claim.—1. The combination, with the crank C, of the notched plate *a*, located on the furrow-wheel hub, the sliding arm or catch *e*, located on the lifting-arm E, the strap or bar *d*, the link *c*, provided with an extension, *a*, the connecting-rod *f*, the bell-crank levers *g h* upon the arm N, and the strap *o*, for automatically raising the arm or catch when the plow is raised, substantially as described.

2. The combination, with the lifting-lever N, of the segmental rack O, the connecting-link P, arranged between the lifting-lever and lifting-arm, and the lifting-arm E, the bail or crank connected with said lifting-arm, the notched plate *a*, located on the furrow-wheel hub, the sliding arm or catch *e*, the strap *d*, link *c*, connecting-rod *f*, and bell-crank levers upon the lifting-lever N, said members being organized for operation substantially as described.



251,767. WATER-CLOSET. WILLIAM H. DASHELL, Pottsville, Pa. Filed May 21, 1881. (No model.)

Claim.—The combination of the sleeve *a*, having vertical walls or sides, pivoted pan *d*, and hinged valve *l*, having weight *n*, and adapted to rest, when closed, against the beveled edges *o* of the valve-seat, substantially as shown and described.

251,767.

251,768. BALING-PRESS. PETER K. DEDERICK, Albany, N. Y. Filed May 14, 1880. (No model.)

Claim.—1. The herein-described process or method of forming cotton-bales, consisting in condensing separate successive flakes of cotton into a charge or section and then compressing the several charges into a bale.

2. In a baling-press, the combination of a movable die, a condensing-traverser for depositing successive flakes of material into the die to form a sectional charge, a bale-chamber, and a pressing-traverser for forcing the charges out of the die and into the bale-chamber, substantially as described.

3. In a baling-press, the combination of a condensing-traverser, a pressing-traverser, a movable die having openings adapted to be alternately presented to the condensing and pressing traversers, and a bale-chamber into which the sections or charges are forced by the pressing-traverser and formed thereby into bales, substantially as described.

4. In a baling-press, the combination of a die-wheel having two or more compartments or openings with a condensing-traverser, a pressing-traverser, and a bale-chamber, substantially as described.

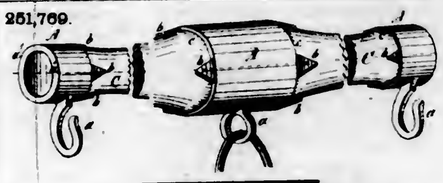
5. In a baling-press, the combination of a die having two or more compartments or openings with a condensing-traverser, a pressing-traverser, and mechanism for imparting two or more strokes to the condensing-traverser while the pressing-traverser is making but one stroke, substantially as described.

6. The combination of the hopper, the reciprocating condenser arranged in the upper part thereof, the condensing-traverser, the die-wheel, the pressing-traverser, and bale-chamber.

7. The combination of the hopper, the reciprocating condenser arranged in the upper part thereof, the automatic feeder, the condensing-traverser, the die-wheel, the pressing-traverser, and bale-chamber, substantially as described.

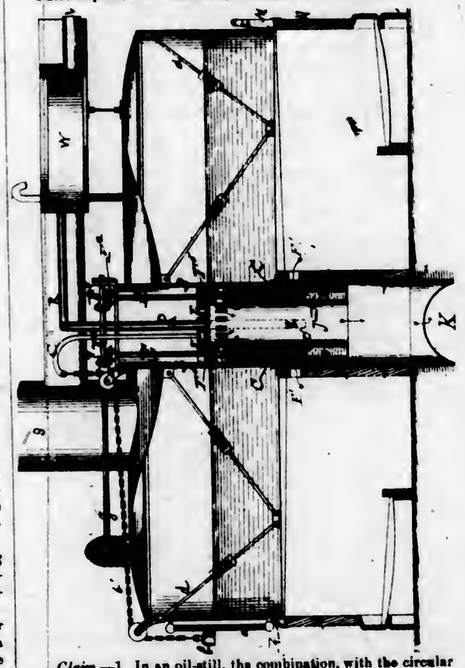
8. The combination of the long crank, the pitman, and the pressing-traverser, slotted to permit the play of the pitman-head, substantially as described.

9. The slotted pitman, in combination with the crank and the hinged hook, substantially as described.



10. The combination, with the press-box, bale-chamber, and reciprocating traverser of a continuously-operating baling-press, of a condensing-traverser for depositing successive flakes of material into a chamber to form a sectional charge, and means for carrying each sectional charge into the bale-chamber of the press in position for it to be forced forward into the bale-chamber by the operation of the reciprocating traverser of the press, substantially as described.

251,769. WHIFFLETREE-HOOK. THOMAS W. DE TRAY, Canton, assignor of one-half to William Harman, Malta, Ohio. Filed Sept. 9, 1881. (No model.)



Claim.—1. The combination, with the sleeve of a single-tree hook, of a series of spurs, *b*, upon one end and an inwardly-projecting flange, *a'*, upon the other end, as and for the purpose specified.

2. In combination with a single or double tree having the shoulders *a*, the sleeves A, having the spurs *b* and flanges *a'*, applied and operating as and for the purpose specified.

251,769.

251,770. OIL-STILL AND ATTACHMENT. JOHN E. DUBLER, Philadelphia, Pa. Filed May 11, 1881. (No model.)

Claim.—1. In an oil-still, the combination, with the circular wall F, having the ports F', of the double tube D, having the ports H near its upper end, the tube J, and the draft-chamber K, substantially as and for the purpose set forth.

2. In an oil-still, the combination, with the double tube D, having an inner chamber, J, and tube B, of the water-chamber W and branch pipes R, substantially as and for the purpose set forth.

3. In a still for refining crude oil or petroleum, the combination, with the central tube, B, double-walled tube D, and pipe R, of the spring heat-checks E and bar *c*, having connected to it a weighted chain, *V*.

251,771. LOCK AND DAM. JOHN DU BOIS, Du Bois, Pa. Filed Nov. 11, 1881. (No model.)

Brief.—The height of the water beneath the dam-sections is regulated by a vertically-adjustable overflow or outlet gate located in advance of the dam. Each leaf of the dam is formed of sections arranged in "break-joint" order and having packing-strips between their edges.

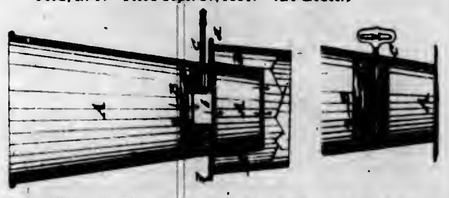
Claim.—1. In combination with a flexible dam or gate having means for conducting and maintaining water thereunder, an overflow or discharge to limit the head of the water located at a point in advance of the gate, whereby the surplus water is permitted to escape before reaching the gate.

2. The combination of a jointed or flexible gate elevated by the admission of water thereunder and a vertically-adjustable outlet to limit the head of the water acting beneath the gate or dam, whereby the gate may be caused to stop automatically at any desired height.

3. In combination with the flexible dam, the flume B and wickets *f*, a discharge or overflow chamber, h, arranged in connection with the flume, substantially as shown.

4. In combination with the dam A, flume B, and means for retaining a head of water in the flume and beneath the dam, the overflow-chamber h, provided with removable boards i.

5. The flexible dam or gate consisting of hinged overlapping leaves, each leaf composed of a series of sections arranged side by side and provided with packing seated in grooves in their adjacent edges, substantially as shown.

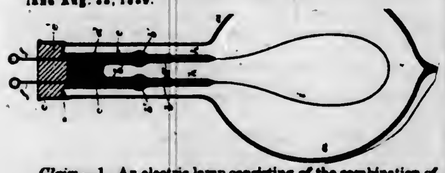


6. A flexible dam or gate consisting of co-operating leaves, each leaf composed of a series of sections, the sections of one leaf arranged to overlap or break joint with the sections of the other leaf, substantially as described.

251,772. COMPOUND FOR PRESERVING MEATS AND FISH. JNO. SCHARF, Munich, Bavaria, Germany. Filed Nov. 18, 1880. (Specimens.)

Claim.—1. The preserving-salt composed of chloride of sodium and boracic acid with the smaller quantities of tartaric and salicylic acid, substantially as herein specified.

2. The message described, having a filling of meat saturated with the preserving-solution, as herein specified.

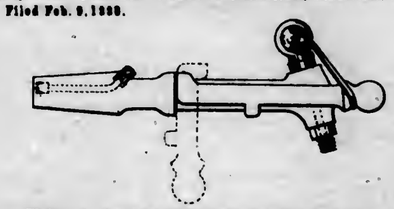


251,773. MIXING AND STRAINING CUP. ARTHUR ROGERS, New York, N. Y. Filed Sept. 27, 1881. (No model.)

Claim.—1. The combination of a mixing-cup, A, having a slotted bottom, B, and a valve or stop-cock, C, below the bottom, with a detachable straining-cup, D, having a flange, *d*, at its upper edge, said straining-cup being fitted to the lower part of the mixing-cup, substantially as set forth.

2. The combination of a mixing-cup, A, having a slotted bottom, B, and a valve or stop-cock, C, below the same, of a detachable straining-cup, D, having a flange, *d*, at the upper edge, and of a detachable auxiliary cup, E, having a central bottom perforation, *f*, the cup E being fitted over the straining-cup D, substantially as set forth.

251,774. ELECTRIC LAMP. ST. GEORGE LANE FOX, London, England. Filed June 15, 1881. (No model.) Patented in England Aug. 22, 1880.



Claim.—1. An electric lamp consisting of the combination of a vacuum-flask, *a*, incandescent bridge or filament *i* therein, two tubes, *b b*, projecting into said flask, leading-in wires *g g*, fused into said tubes, their inner ends connected to the end of the filament *i* and their outer ends projecting up into the tubes *b' b'*, a portion of mercury in each tube *b* covering the point of emergence of the wires *g g*, and terminal wires *f f*, passing through the neck of the flask, and each extending into one of the tubes *b b* and dipping into the mercury therein, whereby the mercury serves both to prevent leakage of air into the flask and to make connection between the wires *f* and *g*, substantially as set forth.

2. An electric lamp consisting of the combination of vacuum-flask *a*, incandescent bridge or filament *i* therein, tubes *b b*, projecting into said flask, leading-in wires *g g*, fused into said tubes and connected with the ends of said filament, a portion of mercury in each of said tubes around said wires, and a layer of hardened plastic substance over said mercury, whereby the latter is retained in place whatever be the position of the lamp, substantially as set forth.

3. An electric lamp consisting of the combination of a vacuum-flask, *a*, an incandescent bridge or filament, *i*, therein, leading-in wires *g g*, fused into said flask, carbon or plumbago blocks or cylinders *h h*, each receiving in its socket the end of one of said wires and one end of the filament, and genuine Indian or Chinese ink *k*, applied substantially as described, and for the purposes set forth.

251,775. FAUCET. JOSIAH B. GATHRIGHT, Louisville, Ky. Filed Feb. 9, 1880.

Claim.—1. As an article of manufacture, a faucet having its driving-head constructed separately, as shown and described.

2. In a faucet, the driving-head constructed separately and adapted to deliver the blow behind the plug, as shown and described.

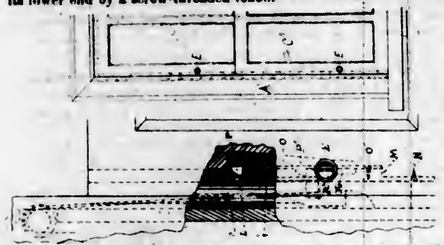
251,776. FASTENER FOR STRAPS. JOSIAH B. GATHRIGHT, Louisville, Ky. Filed Mar. 21, 1881. (No model.)

Claim.—1. A cast-metal strap-fastener constructed with two jaws, A and B, one of which is in skeleton form and one or both toothed, as and for the purpose specified.

2. A metal strap-fastener composed of jaws A and B, one of which is provided with a loop, E, as and for the purpose specified.

251,777. ELECTRIC GAS-LIGHTER. CHARLES D. HASKINS, New York, N. Y., assignor to the Union Electric Manufacturing Company, same place. Filed May 31, 1881. (No model.)

Brief.—The weight of the pull-chain holds the pawl against the ratchet.



Claim.—1. In an electric gas-lighter, the combination of the pawl *c*, pivoted to the contact-lever *d*, with pendant *f*, attached to the outer portion of said pawl, whereby the weight of said pawl and pendant hold the pawl in engagement with the ratchet, substantially as shown and described.

2. The combination, in an electric gas-lighter, of pillar *a*, ratchet and valve *b*, provided with opening *c*, contact-arm *d*, provided with three lugs, pawl *e*, pivoted to one of the lugs, pendant *f*, attached to the outer portion of the pawl and below the pivotal point, contact-points *i h*, spring *l*, and the stop attached to the pillar, substantially as and for the purpose specified.

251,778. WINDOW FRAME AND SASH. FRANCIS W. HUTTINSON, Reading, Pa. Filed Sept. 13, 1881. (No model.)

Brief.—The outer upright casing of the window-frame overlaps the upper sash and the inner casing is flush with the inner face of the jamb. The inner side face of the window-frame has a semicircular groove and the side of the sash is correspondingly grooved for the insertion of a sliding slotted guide-tube having a notch and shoulder for the sash-cord. The guide-tube is provided with a perforated projection having a shoulder, with which the hook-heads of a suspension-spring on the sash engage. The suspension-spring, secured in a slot in the sash, consists of a spring-piece having two hook-heads connected to a needle-guide, which enters the perforated projection on the guide-tube. The hook-heads are released from the guide-tube by a key inserted in the sash and wedging between a block on the needle-guide and the spring suspension-piece. The lintel of the window-frame has a perforation for the entrance of the guide-tube when partly released from the

sash, and the guide-tube has a wooden extension secured to it at its lower end by a screw-threaded tenon.

Claim.—1. A window-frame, B, having its inner jambs, B', grooved longitudinally on the inner face, one groove for each independent sash to slide in the frame, the lintel bored with a concentric hole, as specified, over each groove, and sash-cord attachments adapted to play in said grooves, the outer facing-piece, A, projecting beyond the inner face of lintel and jambs, and the interior facing-piece, A', having its inner edge flush with the face of the lintel and jambs, substantially as shown, and for the purpose described.

2. The glazed sash C or screen-sash D, having its vertical stiles grooved at C^2 to correspond with B^2 in the frame and provided with a square groove, C^2, spring suspension-hooks, and needle-guides O K L, escutcheon-holes E, and sash-cord attachments adapted to play in said groove, substantially as shown, and for the purpose specified.

3. The independent movable tubular sash-guide and cord-fastener F, cut away on the jamb side for about two-thirds of its length to permit the entrance of the cord, having an abutment, H, with a reduced slot to catch the knot of the cord T, a whistle-mouth, I, a supplemental guide, G, provided with a hooked head, G', and a bell-mouthed passage, G^2, through the same, the lower end of the tube being threaded, substantially as shown, and for the purpose set forth.

4. The double-hooked spring-suspenders O, having heads I^2 I^2, secured to pad M of the needle-guide block K, and in combination therewith, substantially as shown, and for the purpose described.

5. The needle-block K and guide-needle L, provided with pad M and screw-hole N, in combination with the double-headed spring-suspenders O, connected by the rivet or screw O', substantially as shown, and for the purpose specified.

6. The combination of the frame B with semicircular grooved jambs B', sash-cord guides R, facing-pieces A A', and guide-holes in lintel, as described, with the tubular suspension-guide F and extension J, and the sash-cord T, substantially as described, and for the purpose set forth.

7. The combination of a window-frame constructed and arranged as described with the glazed sash C or screen-sash D, the spring-suspenders and needle-guides O K L, and the suspension tubular guide F, the hook G', cord T, weight S, and guide-sheaves R, substantially as shown, and for the purpose specified.

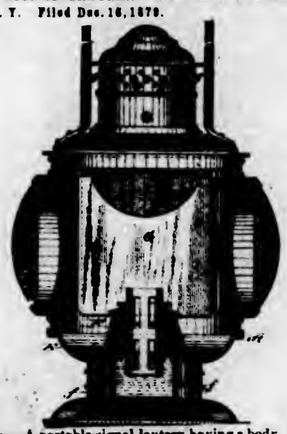
8. The combination of the hard-wood guide J, having a threaded tenon, with the tubular suspension-guide F, substantially as shown, and for the purpose set forth.

9. The combination of the sash C or screen D with the grooved jambs B' and suspension-guides F, constructed as described, whereby they are adapted to be removed or replaced, substantially as specified, and for the purpose set forth.

251,779. BOTTLE-STOPPER. GEORGE F. HOPPER, Chicago, Ill. Filed Nov. 21, 1881. (No model.)

Claim.—1. The elastic stopper-bulb with an interiorly-grooved flange fastened between two circular centrally-perforated concaved metal plates by a screw passing through the perforations of said plates into a wooden concaved button resting in the cone-shaped cavity of said bulb, substantially as shown and described.

2. The combination of two circular centrally-perforated concaved metal plates, with the cone-shaped hollow elastic bulb having an interiorly-grooved flange, by the upper portion of said flange being fastened between said plates, substantially as set forth.



251,780. CORK-PROTECTOR. FREDERICK HOLLENDER, New York, N. Y. Filed Oct. 26, 1881. (No model.)

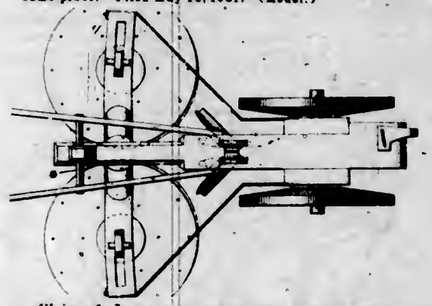
251,780.

Claim.—A cork-protector for bottles containing fermented beverages to be exposed to steaming, consisting of a circular plate having downwardly-projecting prongs at diametrically-opposite points of the plate and one or more ribs or corrugations transversely to the line of the prongs at both sides thereof, substantially as specified.

251,781. SIGNAL-LANTERN. LAWSON G. HUNTINGTON, New York, N. Y. Filed Dec. 16, 1879.

Claim.—A portable signal-lantern having a body, A, provided with base E and hinged top C, removable lamp F, secured in place by means of springs *f f*, and pockets G, arranged within the body of the lamp for the reception of spare glasses, substantially as shown and described.

251,782. RUBBER SHOE. ALEXANDRE HUTCHINSON, Paris, France. Filed Aug. 20, 1881. (No model.) Patented in France July 23, 1881.



Claim.—A rubber shoe composed of an upper, *f*, and an outer sole, *g*, both of rubber, a fibrous-rubber insole, *a*, a lining, *b*, of knit fabric, a thick sole, *c*, of felt or other analogous light material, a retaining-strip, *d*, and the fastening strip or lining *e*, all combined and arranged substantially as shown and described.

251,783. FOLDING AND RECLINING ROCKING-CHAIR. WILLIAM W. JOHNSON and JULIUS Y. JOHNSON, Nicholson, Pa. Filed Jan. 10, 1881. (Model.)

Claim.—The combination of the back-frame, pivoted cross-legs, the rear legs being provided with ratchet-teeth on their upper surface, the rockers, pivoted to the lower ends of the front legs, and having the slots H, the rear legs being provided with pins to work in said slots, and the jointed arms, pivoted to the back-frame and rear legs at *e f* and together at *d*, and engaging with the ratchet-teeth on the rear legs, as and for the purpose set forth.

251,784. CORN AND COTTON CULTIVATOR. MOSES LINDSEY, Asheville, N. C., assignor of one-half to Enos H. Merriman, same place. Filed May 16, 1881. (Model.)

Claim.—1. In a corn or cotton cultivator, the central plows or cultivators, constructed substantially as described, in combination with two reversible and laterally-adjustable rotating harrows in the rear of the plows, substantially as set forth.

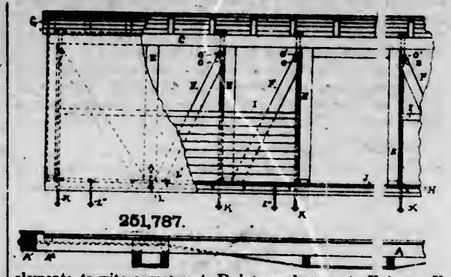
2. In a corn or cotton cultivator, the adjustable plows and scrapers, in combination with two laterally-adjustable rotating harrows in the rear of the plows, substantially as described.

251,785. BURNING HYDROCARBONS. HARVEY T. LITCHFIELD, Hull, and DAVID RENSHAW, Cohasset, Mass. Filed Mar. 7, 1881. (No model.)

Claim.—1. In a hydrocarbon-furnace, the perforated rotating pipe extending across or lengthwise of the furnace, the mixture in said pipe being forced through and disseminated by steam-pressure, substantially as set forth.

2. In a hydrocarbon-furnace, the rotating pipe provided on its inner side with nipples or projections, the projections being provided with communications through them, said projections being adapted to retain within the pipe any liquid fuel until it is converted into gas, substantially as shown and described.

3. The combination, in a hydrocarbon-furnace provided with a rotating perforated pipe, of the motive-power attachments and the swivel-joint with the fuel-supply conduits, whereby fuel is fed to the rotary pipe while in operation, in the manner shown and described.



251,786. BASIN-PLUG. JOHN C. LUDWIG, San Francisco, Cal., assignor to Charles W. Banks, same place. Filed Aug. 29, 1881. (No model.)

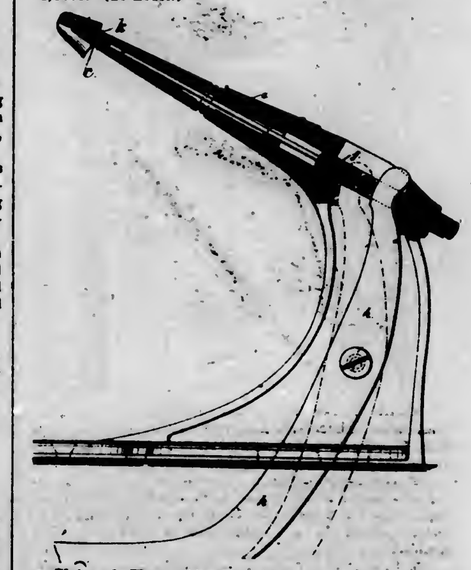
Claim.—In a wastewey-plug, the combination, with a stationary plate having radial arms and slots and provided with a central interiorly-threaded pipe or tube, of a movable plate having corresponding arms and spaces, and provided with a threaded spindle which passes through the stationary plate and its central tube, substantially as and for the purpose specified.

251,787. RAILWAY-CAR. JOHN P. MAUBS, Reading, Pa. Filed Oct. 27, 1881. (No model.)

Claim.—1. An independent car-body composed of the usual

251,787.

elements, to wit: corner-posts D, intermediate posts, E, braces F, caps C C', roof G, railing I, and the usual lining and siding, when provided with sill-plates M, N, and P, brace-caps O, and supplemental sills H, and joint-bolts L, whereby the frame is adapted to carry the floor J, and the body, as a whole, may be removed from or connected with the independent sill-frame A, as shown and described, and substantially for the purpose set forth.



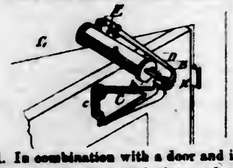
2. The loose braces F, seated upon the sill-plates P, capped with the cap O, (which is provided with a tension-bolt guide-hole on its back,) secured in place and adjustable thereon by the nut O' on the enlargement K' of the tension-bolt K, for the purpose described, and substantially as shown.

251,788. RIVET FOR BELTS, &c. STEPHEN A. HARNER, Hartford, assignor to Holmes, Booth & Haydens, Waterbury, Conn. Filed Oct. 3, 1881. (No model.)

Claim.—The conical-headed rivet or washer having a flat outer end surface having a rib or projections on the conical surface for the purposes and as set forth.

251,789. APPARATUS FOR TURNING THE EDGES OF SHOE-UPPERS. JAS. MCGUIGAN, East New York, N. Y. Filed Nov. 4, 1881. (No model.)

Claim.—1. The combination, with the standard, of a removable finger, *c*, a pusher, *k*, within the split ends of the finger, and a lever for actuating such pusher, substantially as set forth.



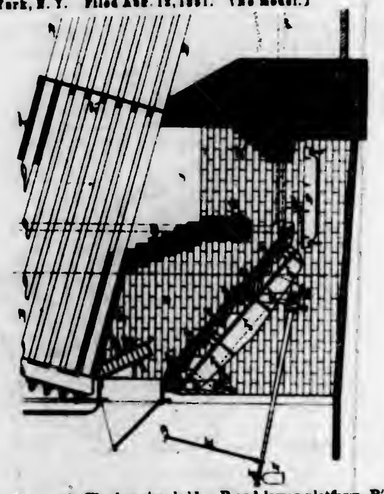
2. The combination, in an apparatus for turning the edges of shoe-uppers, of a stationary finger, *c*, a pusher, *k*, within the finger, and means for moving the pusher, substantially as set forth.

3. The combination, in an apparatus for turning the edges of

shoe uppers, of a finger, *c*, a standard for supporting the same, a pusher, *k*, sliding within the finger, a stock, *f*, to which the shank of the pusher is connected, a lever, *h*, for moving the same, and stops *e* upon the standard, substantially as set forth.

4. The combination, in an apparatus for turning the edges of shoe-uppers, of a standard having a fixed base and an inclined projecting upper end, and a finger that is removably connected with such standard and rounded at the end, substantially as specified.

251,790. DOOR-CHECK. LEWIS C. NORTON, Boston, Mass., assignor to the Norton Door Check and Spring Company, Portland, Me. Filed June 25, 1881. (No model.)

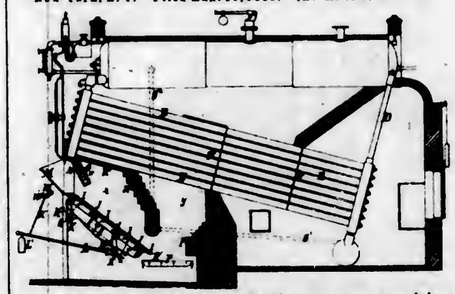


Claim.—1. In combination with a door and its jamb, a compressed-air door-check of the kind above referred to, provided with an arm whereby its piston-rod may be operated, a guide-rod whereby the stroke or its piston will be controlled, and suitable devices for attachment of said arm, guide-rod, and door-check to the said door or its jamb, all connected and operating together substantially as, and adapted for the purposes set forth.

2. The combination of the door-check A B, hinge-plate E, guide-rod D, and the arm C, provided with a suitable device for attaching it to the door or its jamb, all arranged and connected together substantially as above described, and adapted for the purpose set forth.

3. In a door-check, the combination of the piston-rod B, guide-rod D, and arm C with its adjusting-disk H, all substantially as shown and described.

251,791. STEAM-BOILER FURNACE. GEORGE H. PALMER, Chicago, Ill., assignor to the Babcock & Wilcox Company, New York, N. Y. Filed Aug. 12, 1881. (No model.)



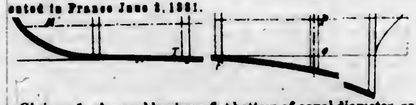
Claim.—1. The hanging bridge R and lower platform, R', in combination with the back masonry, F, partition T, and upper platform, T', and with the boiler A, inclined tubes B, and connections C and D, as herein specified.

2. The case O, having provisions for receiving and distributing air arranged at the front of the furnace and receiving air in adjustable quantities from the side or sides, in combination with a hopper and with a hanging bridge and an inclined grate, as herein specified.

3. In a furnace formed in two partially-separated chambers, the first lined with non-conducting material on all sides and above, and the second similarly lined on all sides, an inclined grate with provisions for feeding fuel slowly down thereon, a hanging bridge, and a transverse tube, G, having connections *g' g'* to a steam-boiler, A, combined and arranged to serve as herein specified.

4. The method herein set forth of obtaining the complete combustion of partly-solid and partly-volatile fuel by first distilling off the volatile matter and partially burning the solid matter in a chamber inclosed within non-conducting walls, then discharging both the gaseous and the remaining solid matter at an extraordinary temperature into a second chamber, also inclosed, or nearly so, within non-conducting walls, in which second chamber the solid matter is completely burned with an excess of air and the gases therefrom mingled with the gaseous matter from the first chamber, all substantially as herein specified.

251,792. GRATE FOR FURNACES. GEORGE H. PALMER and AMASA WORTHINGTON, Chicago, Ill., and GEORGE A. ROWELL, Brooklyn, N. Y., assignors to the Babcock & Wilcox Company, New York, N. Y. Filed Aug. 13, 1881. (No model.)



Claim.—1. An inclined grate having transverse bars lying nearly or quite flatwise, a portion being mounted stationary and another set mounted in the spaces between, being movable horizontally, as herein specified.

2. The bottom grate, P, with its front dead-plate, P', in combination with a separate inclined grate, with means for moving a portion of the latter forward and backward, as herein specified.

3. The flexible connection X, leading from a constantly-moving part, W, in combination with the hand-lever L, and with an inclined grate connected thereto, arranged to serve at will to shake the grate by power, and also to allow the grate to be shaken by hand, substantially as herein specified.

4. The combination of an inclined grate, I J, with provisions for shaking a part, a feeding-hopper, M, for supplying fuel thereto, a horizontal grate, P, for burning the residue, and a hanging bridge, R, arranged to induce a mixture and complete combustion of the gases, as herein specified.

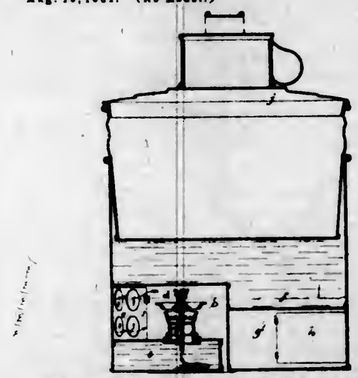
251,793. CONSTRUCTION OF SHIPS. RAOUL PICTET PICTET, Geneva, Switzerland. Filed Oct. 12, 1881. (No model.) Patented in France June 3, 1881.

Claim.—1. A vessel having a flat bottom of equal diameter, or practically so, throughout its length, said bottom being constructed to form a parabolic curve trending downward from stem to stern, substantially as and for the purpose specified.

2. A vessel having its greatest diameter amidships and a bottom of practically equal diameter throughout its length, constructed to form a parabolic curve trending downward from stem to stern, and having its greatest concavity at or near the stern, substantially as and for the purpose specified.

251,794. VEHICLE-HUB. JOHN R. FOSTER, Pleasant Creek, assignor of one-half to Emory L. Hoster and William A. Hoster, both of Grafton, W. Va. Filed Nov. 21, 1881. (No model.)

Claim.—1. A hub consisting of the plates A' A', the plate A' having an annular shoulder, *a*, formed around the hub-box, and

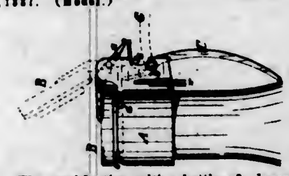


adapted to receive the pivot-pin *d* of the screws D, substantially as shown and described.

2. In a hub, the screws D, pivoted in the annular shoulder *a* by the pivot-pins *d*, and provided with heads *d'* and lock-nuts *d''*, operating in combination with the expansion-blocks C and shoulder *a*, substantially as and for the purposes set forth.

3. The expansion-blocks C, curved to conform with the curvature of the groove, operating in combination with the screws D and the spokes, and adapted to keep the spokes pressed firmly outward, substantially as and for the purposes specified.

4. In a hub, the combination of the plates A' A', expansion-blocks C, screws D, and shoulder *a* with the spokes, substantially as shown and described.



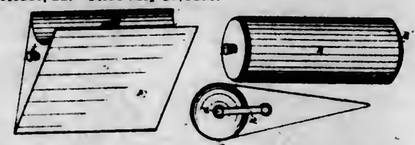
251,795. DINNER-PAIL. FRANCIS J. FOWER, Boston, assignor of one-half to Royal B. Wadleigh, Newtonville, Mass. Filed Aug. 19, 1881. (No model.)

Claim.—1. The pail having the liquid-receptacle *a*, provided with the recess *b* at one side thereof, the door *c*, hinged to said pail portion *a*, so as to cover the recess therein, and the lamp *e*, secured to and moving with said door, all combined and arranged as shown.

2. In a dinner-pail having a liquid-receptacle and a heating-compartment, the chamber *g*, arranged in the liquid-receptacle, and separated therefrom by the partition *f* and the wall of the heating-compartment, and having a door, *h*, whereby access may be had thereinto, substantially as described.

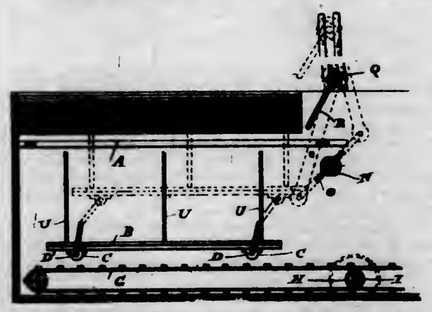
251,796. BOTTLE-STOPPER. OWEN RUSSELL, Rochester, N. Y., assignor of one-half to George P. Goulding, same place. Filed Nov. 22, 1881. (Model.)

Claim.—The combination, with a bottle, of a lever-valve bottle-stopper, which consists of the thimble A, lugs *b*, washer *c*, disk-lever B, and hand or actuating lever C, constructed and operating as and for the purpose described.



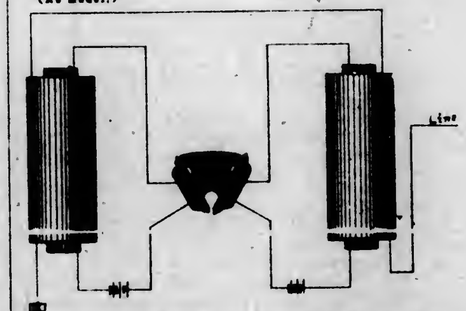
251,797. MECHANISM FOR FEEDING AIR AND STEAM TO FURNACES. DAVID RENSHAW, Cohasset, assignor of one-half to Harvey T. Litchfield, Hull, Mass. Filed Nov. 1, 1880. (No model.)

Brief.—The perforated pipe is made to rapidly revolve, dashing the jets in all directions.



Claim.—The combination, with a furnace, of a perforated pipe extending transversely or longitudinally through the furnace-chamber, above the fuel, and arranged to receive a forced blast of air or of air and steam, and also adapted for rapid rotation, by means of which the fluid or gaseous contents are evenly distributed over the incandescent fuel, in the manner shown and set forth.

251,798. PASSENGER HEAD-REST. ERNEST SCHARPS, New Orleans, La. Filed July 28, 1876.

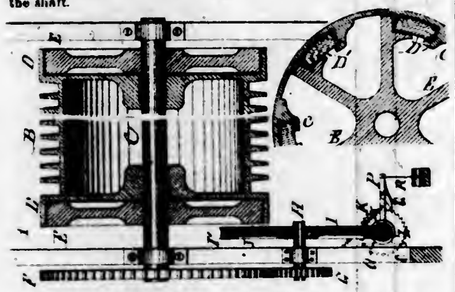


Claim.—A passenger head-rest composed of the cylindrical pillow-section A, wedge-shaped section E, and the links *k*, uniting the two sections together, whereby the section A may be rotated, substantially as described.

251,799. SELF-FEEDER FOR THRASHING-MACHINES. JOHN SCHELL, Elk Grove, Cal. Filed July 30, 1881. (No model.)

Claim.—In a self-feeding attachment for thrashing-machines, the combination, with the fixed grating A and movable grating-B, having journal-boxes C C and teeth U, the latter adapted to enter the spaces in the upper grating, of the crank-shafts D D', pulleys E E', grain-carrier G, drum H, having a shaft, I, carrying pulleys J K, the roller N, provided with teeth O, cross-bar Q, having teeth R, and suitable connecting and operating mechanism, substantially as and for the purpose shown and described.

251,800. BATTERY TELEPHONE-TRANSMITTER. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Filed May 14, 1881. (No model.)

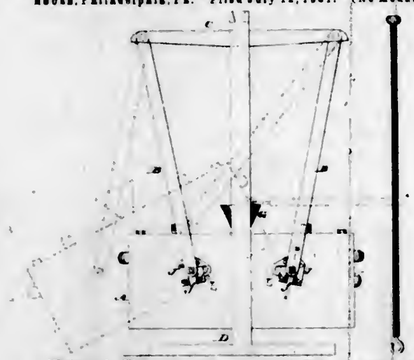


Claim.—The combination of two or more battery-transmitters so placed as to be acted upon simultaneously by the same sounds, and each being in an independent local circuit, a part of which forms the primary of an induction-coil, while the several secondaries are in line in the main line.

251,801. LOOM. CHARLES SMITH, Belleville, N. J. Filed Apr. 4, 1881. (No model.)

Brief.—To permit the warp-beam to yield, particularly in weaving wire, and thus lessen the strain upon the warp when the filling is struck up and prevent stretching, the warp-beam is placed loosely upon its shaft and provided with flanged rims having stops,

between which and arms secured to the shaft are placed blocks of rubber. These springs allow the beam to yield when strain is applied to the warps. The warp-beam shaft is driven by means of a worm through a train of gears, the first wheel of which is secured to its shaft in a similar manner to the warp-beam, and the worm-sleeve is connected to the shaft, carrying it by a spline and a spring placed between the end of the worm-sleeve and a nut upon the shaft.



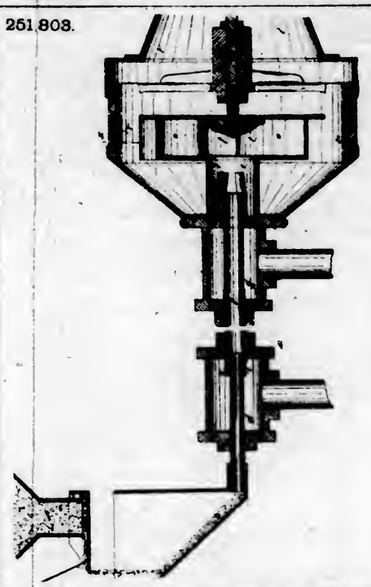
Claim.—1. The combination of the warp-beam B with the shaft C, having the projecting arms E, and a series of springs, D', bearing against projections on the beam and said arms E, and adapted to permit the beam to yield to loosen the strain on the warp when the lay is struck up, substantially as specified.

2. The warp-beam B, having the heads provided with the flanged rims D and stops or lugs *c*, in combination with the springs D', arms E, shaft C, and means for operating the shaft, substantially as and for the purpose set forth.

3. The combination, with the shaft C, beam B, spur-wheel F, shaft H, gear G, and the spider J, of springs J', worm-wheel I, worm K, shaft L, and means for operating said shaft, substantially as and for the purpose named.

4. The shaft H, wheel I, spider J, and springs J', in combination with the worm K and means for operating it, substantially as and for the purpose specified.

251,802. CHURN. CHARLES W. BOGGS and ALVAN RITTER, Boggs, Philadelphia, Pa. Filed July 12, 1881. (No model.)



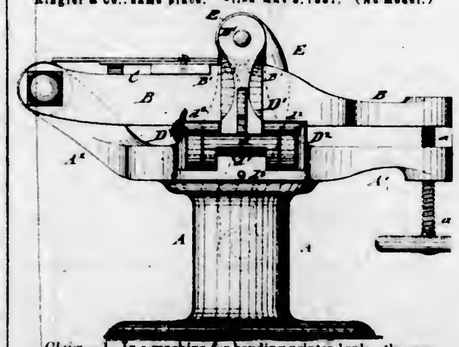
Claim.—1. The concavo-convex guard H, bent upward in the middle, as shown, and provided with perforations *c* and peripheral notches *d*, in combination with churn-lid F, having inlet *b*, and hooks *e*, operating substantially as shown.

2. The hooks L, in combination with slotted brackets J, churn-body A, arms B, and headed pins or studs on said arms entering the slots of said brackets.

251,803. APPARATUS FOR PULVERIZING MINERAL AND OTHER SUBSTANCES. DAVID G. STARKEY, New York, N. Y. Filed July 22, 1881. (No model.)

Claim.—1. The combination, in an apparatus for pulverizing mineral and other substances, of a supply-pipe for such material, a nozzle for an issuing jet of air under pressure to impart an initial velocity, a straight tube leading from the first nozzle to the second nozzle, a second nozzle for fluid under pressure to issue in the same direction and augment the velocity of the material, and a concussion-plate for the material to strike against, the second nozzle being employed between the first nozzle and the concussion-plate, substantially as set forth.

251,803.



2. The method herein specified of shattering mineral and other substances, consisting in imparting an initial velocity to the material by an issuing jet of fluid, then augmenting that velocity by one or more jets of fluid, and then causing the material to strike upon a concussion-plate, substantially as set forth.

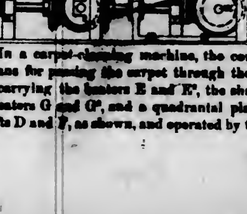
3. In a pulverizing-machine, in combination with apparatus for imparting to material to be pulverized a rapid movement by an issuing current of air or fluid, a revolving centrifugal concussion-plate, substantially as set forth.

4. In a pulverizing-machine, the centrifugal concussion-plate and cycloidal trunks, in combination with the stationary percussion-ring, substantially as set forth.

5. The method herein specified of shattering mineral or other substances by imparting to the same an initial velocity by air under pressure, and then bringing steam at a high temperature and velocity into contact with such material and the air to increase the velocity and heat the air, and then arresting such material against a target for its disintegration, substantially as specified.

251,804. MACHINE FOR BENDING PRINTERS' RULES. CHARLES V. STEINBACH, New York, N. Y., assignor to F. A. Ringler & Co., same place. Filed May 9, 1881. (No model.)

Claim.—1. In a machine for bending printers' rules, the combination of smooth bending-rolls supported in a vertically-adjustable frame with a ribbed curving-cylinder above the same, and with a platform and side gage secured to the adjustable frame at one side of the bending-rolls, substantially as set forth.



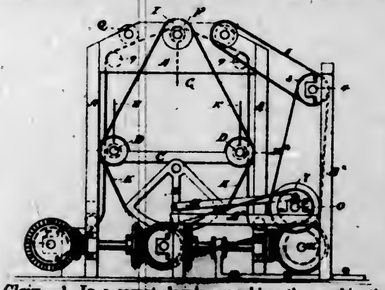
2. In a machine for bending printers' rules, the combination of the supporting main standard A and a hinged and adjustable supporting-frame, B, carrying the lower bending-rolls, B', platform C, and side gage, C', with a ribbed carving-cylinder, E, above the rolls B', substantially as described.

3. In a machine for bending printers' rules, the combination of the main standard A, having arms A' A^2 extending therefrom in opposite direction, with a roll-supporting frame, B, which is hinged to one standard, A', and adjusted by a set-screw, *a*, at the end of the opposite standard, substantially as set forth.

4. In a machine for bending printers' rules, the combination of the supporting main standard A, having side standards, D D', and guide-brackets D^2, extending to one side thereof, with an upper carving-cylinder, E, hinged and adjustable frame B, and lower bending-rolls, B', the side standard D being stationary, while the side standards D' is laterally movable in the guide-brackets D^2, and adapted to be retained thereby or to be thrown down for removing circularly-bent rules from the bending-rolls, substantially as specified.

5. In a machine for carving printers' rules, the main frame A, having sidewise-extending lugs or brackets D^2, provided with a fixed transverse guide-pin, *d'*, and projections d^2, in combination with a laterally-movable side standard, D', having a slotted base, *d*, and with a fixed projecting stop-pin, d^2, on the main standard A, substantially as specified.

251,805. SHOULDER-BRACE AND SUSPENDERS. CHARLES W. STEVENS, New York, N. Y. Filed Nov. 15, 1881. (No model.)



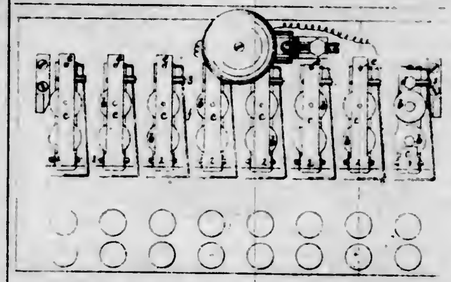
Claim.—1. A shoulder-brace constructed of independent shoulder straps or loops A A, drawn together at the back by interlaced adjustable suspender-cords D D, led over the shoulders and adapted to be secured to a waistband, substantially in the manner and for the purpose herein set forth.

2. The combination, with the independent shoulder-straps A A, constituting a shoulder-brace, and interlacing cords D D, adjusted to draw them together, of stiffening-plates B B, serving to equalize the tension upon the brace-straps, substantially as and for the purpose herein set forth.

3. The combination, with the shoulder-straps A A, stiffening-plates B B, and tension suspender-cords D D, of a series of pulleys, C C, through which the cords are led to interlace and draw together the shoulder-straps, substantially as and for the purpose herein set forth.

4. In combination with the end of the suspender and tension cords D D of the shoulder-braces A A, the tubular retaining device K, provided with a pivoted catch-plate, L, actuated by a swinging outer plate, M, through which the cord is led, substantially in the manner and for the purpose herein set forth.

251,806. CARPET-CLEANING MACHINE. AUGUSTUS P. STEVENS, Brooklyn, N. Y. Filed Nov. 14, 1881. (No model.)



Claim.—1. In a carpet-cleaning machine, the combination, with suitable means for passing the carpet through the machine, of the shafts D, carrying the beaters E and E^2, the shaft F, provided with the beaters G and G^2, and a quadrantal plate, L, connected to the shafts D and F, as shown, and operated by the pitman M, crank N, and driving-shaft O, when the same shall be constructed and operate substantially as and for the purposes set forth.

2. In a carpet-cleaning machine, the combination, with suitable means for passing the carpet through the machine, of the spiral brushes Q and the shafts D, carrying the beaters E and E^2, and the shaft F, provided with the beaters G and G^2, and a quadrantal plate, L, connected to the shafts D and F, as shown, and operated by a pitman, M, crank N, and driving-shaft O, when the same shall be constructed and operate substantially as and for the purposes set forth.

251,807. SIGNALING AND CIRCUIT-CONNECTING APPARATUS. THOMAS A. WATSON, Everett, assignor to the American Bell Telephone Company, Boston, Mass. Filed July 6, 1880. (No model.)

Brief.—Clearly explained by the claims in connection with the drawings. Designed especially for a telephone system having but few stations.

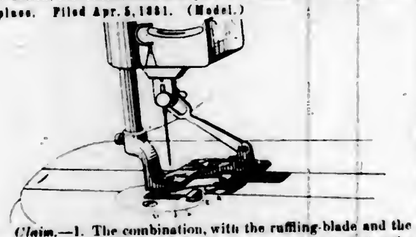
Claim.—1. A series of three or more signaling-instruments, comprising each a set of signal-keys and signaling devices connected with one another, as indicated—that is to say, the signal-keys in one instrument being connected with signal devices in the other instruments, a separate key with each signal device, whereby a signal can be given from any of said instruments at any other by means of the appropriate signal-key, which signal will indicate whence it is sent, and a return signal can in like manner be given, substantially as described.

2. A series of three or more telephone signaling-instruments, comprising signal-keys, telephone-keys, and signal devices and electrically connected, as indicated—that is to say, the signal keys and devices in each instrument being connected with corresponding devices and keys in others, a separate key to each signal device, and the telephone-key in each instrument being similarly connected with the telephone-keys in other instruments, substantially as described.

3. Sets of telephone-keys having a common anvil for each set, in combination with telephones, conductors connecting the telephones with said anvils and with the ground or a return wire or wires, and conductors connecting the keys with one another and the keys in each set with keys in all the other sets, substantially as described.

4. The combination, with a series of spring-keys, of a common anvil and means, as indicated, for retaining the keys in contact with said anvil, whereby, when a key or keys are depressed, they are automatically engaged, and when a key or keys are subsequently depressed they are engaged and the keys formerly depressed are automatically disengaged, substantially as described.

5. A series of signaling and circuit-connecting instruments at different stations, each provided with a series of signal-keys and a corresponding series of signaling devices, to give and to receive characteristic signals at and from the other instruments of the series, and also provided with a series of telephone-keys corresponding to the said signaling keys and devices, each telephone-key of the instrument at one station having electrical connections, as explained, so as to close a circuit through telephonic instruments at the said station to a corresponding telephone-key in the instrument at another station, each of the two connected telephone-keys corresponding in position with the signaling key and device of the said instrument devoted to signaling between the said two connected stations, whereby the operators, after signaling one another by operating the proper signaling-keys, may be placed in telephonic communication by operating the telephone-keys corresponding to the said signaling-keys, substantially as described.

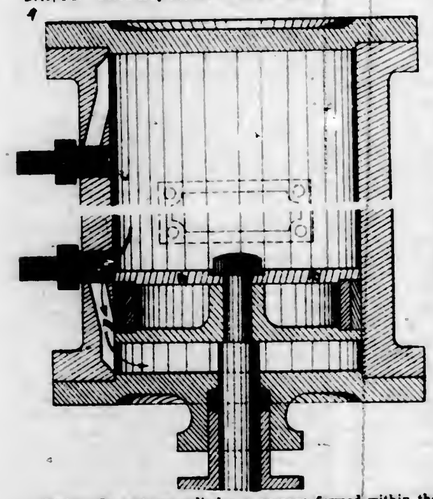


6. In an electrical system having a series of three or more stations connected with one another, the herein-described arrangement of wires leading from the several stations to a central point

or station, where they are permanently connected with the wires leading to other stations, substantially as described.

7. In a signaling and circuit-connecting instrument, the combination of the following elements: a series of annunciator-drops or indicating-signals to indicate from what point a communication is desired, a series of signaling-keys corresponding thereto, and a series of telephone-keys corresponding to the indicating signals and keys, substantially as and for the purpose set forth.

8. A series of circuit-controlling keys connected with a series of independent telephonic circuits and a common anvil constructed, as explained, so as to engage and hold any one of the said keys when depressed, and to be disengaged therefrom when operated by the depression of a second key, the said anvil being connected with one electrode of a telephonic instrument having its other electrode connected with the ground or a return-circuit common to all the said independent telephonic circuits, substantially as and for the purpose described.



251,808. RUFFLER FOR SEWING MACHINES. MICHAEL WHINNA, Cleveland, Ohio, assignor to Bailey & Whitmore, same place. Filed Apr. 5, 1881. (Model.)

Claim.—1. The combination, with the ruffling-blade and the needle-plate, of a guard-spring secured below said blade so that the latter may bear thereon, and provided at its outer end with strips or arms bent parallel with the end of the spring, one above and one below the same, to form guides, the under strip being secured to the needle-plate, substantially as set forth.

2. The combination, with a presser-foot provided with an inclined slot, of an adjustable spring-guide, *e*, one end of which is secured to the ruffler, while the other end extends into the slot of the presser-foot, as and for the purpose set forth.

251,809. STEAM-ENGINE CYLINDER. WALTER J. ALLEN, Erie, Pa. Filed May 12, 1881. (No model.)

Claim.—In a steam-cylinder, a passage formed within the walls of said cylinder for admitting steam from the body of the cylinder to the clearance-spaces immediately before the exhaust takes place, said passage having at one end a cage provided with a port registering with the passage, and a valve inserted from the outside of the cylinder and retained in said cage by a plug closing the outer end of said cage, which valve opens by pressure from the body of the cylinder-cavity and closes by pressure from the clearance-space, substantially in the manner described.

251,810. TELEPHONE-SIGNAL. GEORGE LEE ANDERS, Boston, Mass., assignor to American Bell Telephone Company, same place. Filed Nov. 20, 1880. (No model.)

Brief.—The bell-hammer is vibrated by clock-work, and has a longitudinal movement of its axis, caused by the pressure on the end of said axis of the arm *k*, attached to the armature *a*. In its first position the hammer cannot strike the bell, and the clock-work is held stopped. (See Fig. 2.) The closure of the circuit throws the hammer and its axis into the second position and releases the clock-work. Further motion of the axis is prevented by the disk *i*, (see Fig. 3;) but the disk is revolved by the clock-work until at a predetermined time for each station. A notch in the disk comes opposite the end of the axis, and allows it to be thrown into its third position (see Fig. 4) by a second movement of the armature, when the hammer reaches the bell and rings it until automatically thrown back into first position.

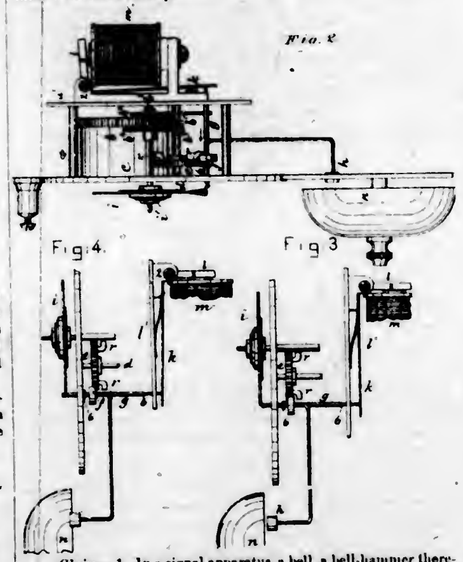


Fig. 2.

Fig. 4. Fig. 3

Claim.—1. In a signal apparatus, a bell, a bell-hammer therefor, and a mechanical motor to set the said hammer in motion, combined with controlling mechanism, substantially as described, whereby the said bell-hammer, in its movement caused by the motor, is either prevented from striking the said bell or caused to strike it to give a signal, as desired, without interruption to the said movement.

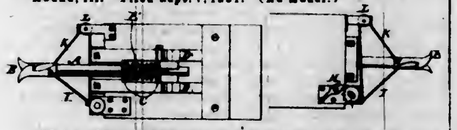
2. In a telephone-signal instrument, the following elements in combination, viz: a mechanical motor having a uniform movement, a bell-hammer operated thereby, a bell, and a controlling device, as explained, to control the position of the bell-hammer relative to the bell, whereby, in a series of such instruments, all may have their bell-hammers kept in motion, by the motor and any desired one of the said bell-hammers may be brought into operation upon its bell independently of the others, substantially as and for the purpose described.

3. The combination, with a mechanical motor, automatic stopping mechanism, a controlling-disk revolved by said motor, and an electro-magnet and devices controlled thereby for starting said motor, of a mechanical alarm and devices, as indicated, for causing the alarm to sound when required, said devices being movable under the attraction of the electro-magnet when it is excited by an electric current and the controlling-disk is in the proper predetermined position, but being prevented from moving under said attraction by the disk except when in said position, substantially as described.

4. In a signal apparatus, a mechanical motor and a bell-hammer vibrated thereby and connected with a rock-shaft longitudinally movable in its bearings to change the plane of vibration of the said hammer, combined with an electro-magnet to move the said shaft, and a moving controlling device, as indicated, to control its movement, allowing the said shaft to be moved by the magnet into position to cause the hammer to operate on the bell only when the controlling device is in a certain position in its movement, substantially as described.

5. In a signal apparatus, a mechanical motor and a bell-hammer mounted on a rock-shaft and adapted to be set in vibratory movement by the said motor, the said rock-shaft being movable in its bearings longitudinally, combined with stopping mechanism operated by the longitudinal movement of the said rock-shaft to stop the motor, and an electro-magnet to move the said rock-shaft, and a controlling device to govern its movement, the said magnet and controlling device co-operating, as described, to cause an impulse of the magnet in acting on the said rock-shaft when at rest, to disengage the stopping mechanism and allow the motor to set the hammer in vibration, but not in position to strike its bell, and a second impulse to either throw the said hammer in position to strike the bell or not, according to the position of the controlling device, without interrupting its vibratory movement in either case, substantially as described.

6. The combination, with the longitudinally-movable rock-shaft and bell-hammer mechanically vibrated thereon, of an electro-magnet to bring a armature upon the said shaft, and the notched controlling-disk to afford an obstacle to the said rock-shaft, except when the notched portion is opposite thereto, substantially as described.



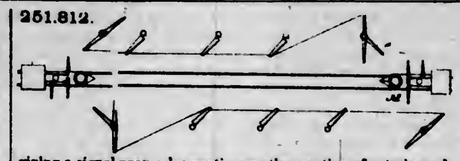
7. The longitudinally-movable rock-shaft and bell-hammer connected therewith and pallets thereon, and an escape-wheel to operate them, combined with the stop-wings and a stop-cam to move the said rock-shaft and bring the pallets into position to engage the said stop-wings, substantially as and for the purpose described.

8. The controlling-disk, notched and provided with an inclined or cam portion, combined with a shaft or pin movable in a direction transverse to the plane of the said disk, and an electro-magnet to move it, the disk being arranged, as described, to afford an obstacle to the movement of the said shaft, except when in the rotation of the said disk its notched position is opposite to the said shaft, when the end of the latter may be moved through the said notch and retained there during the further rotation of the disk until engaged by the cam thereof and moved back by the said cam, substantially as and for the purpose set forth.

9. In a telephone-signal apparatus, a series of mechanical motors or clock-works to control the operation of the signals and automatic stop mechanism to stop the said motors, combined with an electro-magnet to operate upon the said stop mechanism to start the motor, the said magnet or its armature being polarized, whereby a current of one polarity causes it to attract its armature to start the motor, while a current of the other polarity causes no movement in the armature, substantially as described, and for the purpose set forth.

10. The combination of the shaft *g*, controlling-disk *i*, and the electro-magnet *m* and its armature and arm *k l*, substantially as described, and for the purpose set forth.

251,811. CAR-COUPLING. ANDREW H. ARMSTRONG, Blue Mound, Ill. Filed Sept. 7, 1881. (No model.)



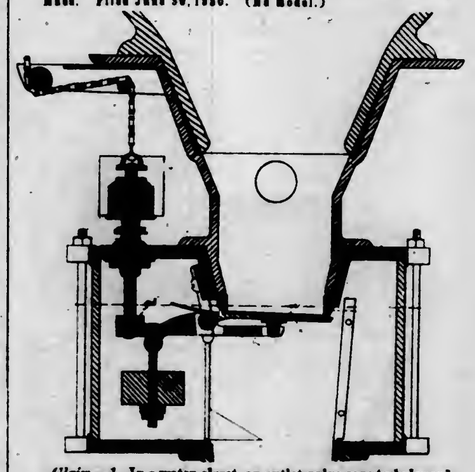
Claim.—The combination, with the sliding and revolving rod A, provided with the hooks or clutches B B and spring E, of the windlass F, having ratchet G and dog H, and the cords I and K, connecting said windlass with the hooks or clutches B B, the cord K passing over pulley L, the several parts constructed and relatively arranged to operate in the manner herein shown and described.

251,812. RAILROAD DANGER-SIGNAL APPARATUS. GIUSEPPE A. ANSARITA, New York, N. Y. Filed Oct. 25, 1881. (No model.)

Brief.—One of the terminal levers of each series of swinging signal-operating arms is operated by a passing locomotive to set the series, so that a train approaching in an opposite direction on same line will be warned through an arm thereon coming in contact with one of said signal-arms, and a train following the first named will also be similarly signaled if the first has not left the section. Upon the first train leaving the section it restores the signals to their normal position.

Claim.—1. The combination, substantially as described, of a series of connected arms, levers, or equivalent devices placed beside a railroad-track, an arm or projection upon one side of a locomotive or train, adapted to engage with the terminal arms of the series, so as to turn all of the arms into and out of position for

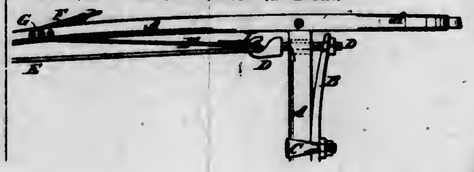
251,812.



giving a signal upon a locomotive or other portion of a train, and signaling mechanism upon the other side of the locomotive or other portion of the train, adapted to engage with the intermediate arms or levers of the series.

2. The combination, substantially as described, of a series of connected arms or levers ranged beside a railroad-track, a setting-projection upon a moving train, adapted to engage and turn the terminal levers of the series, signaling mechanism upon the same side of a following train as the setting-projection, and an arm or projection upon the terminal lever at the entrance end of the series, adapted to be thrown into and out of the path of the said signaling mechanism, as set forth.

3. The combination, substantially as described, of a series of arms or levers placed beside a railroad-track, a second series ranged upon the opposite side of the track and overlapping the first series, a setting-projection upon a locomotive or other portion of a train, adapted to engage with the terminal levers of the series upon one side of the track, bell-ringing devices upon the same side of a following locomotive with the setting-projection thereof, adapted to engage with a projection upon a terminal lever, and upon the other side of a locomotive or train approaching in the opposite direction bell-ringing devices adapted to engage with the intermediate levers of a series or section.



251,813. WATER-CLOSET. H. WILLIAM ATWATER, Boston, Mass. Filed June 30, 1880. (No model.)

Claim.—1. In a water-closet, an outlet-valve counterbalanced to close the outlet when the bowl is empty and to open it when the bowl is filled to a designated depth, in combination with a weighted stop, *g*, which, when raised, leaves the outlet-valve free to act and when lowered prevents the outlet-valve from opening, substantially as described.

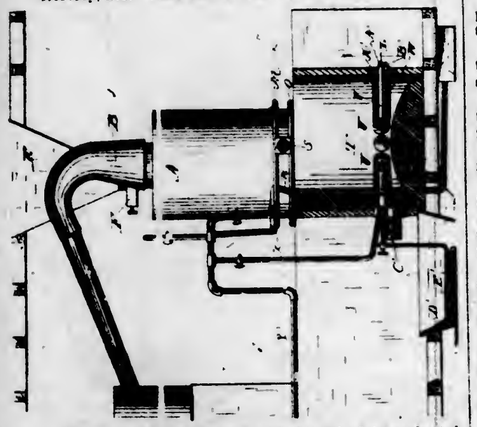
2. In a water-closet, the combination of a bowl having an outlet-valve which is self-acting when its retaining-stop is withdrawn with an overflow-pipe and its outwardly-opening valve, substantially as and for the purposes set forth.

251,814. HOLDBACK FOR VEHICLES. ANSON J. HAGON, Hallowell, Me. Filed Nov. 5, 1881. (No model.)

Claim.—1. The combination, with the thills A, provided with the holdback-irons G and the holdback-tugs F, of the spring B, secured to the rear of the cross-bar of the thills, and the hooks D, substantially as and for the purpose set forth.

2. The combination, with the draft-spring B, holdback-irons G, and harness-breeching H, of the holdback-tugs F, substantially as herein shown and described, whereby the strain on the holdback-tugs will be of an elastic nature and will be resisted by the draft-spring, as set forth.

251,815. SPINDLE FOR TWISTER-FRAMES. JOSEPH B. BANCROFT, Hopedale, Mass. Filed July 29, 1878.



Brief.—The spindle is provided with a permanently-attached metallic sleeve provided at its base with bobbin-driving pins, and is supported in a long bolster extended upward between the spindle and sleeve. The whirl is removably connected to the spindle between the bolster and step-rails, so as to reduce the strain by its position and permit the spindle, when released from the whirl, to be drawn up through the whirl, bolster, and usual ring-rail. The whirl surrounds a tube projecting upward from the step, and is provided with a sleeve extending up into the bolster.

Claim.—1. The spindle and its permanently-attached metallic sleeve provided with bobbin-driving pins, combined with a bolster extended upward between the sleeve and spindle and a whirl removably attached to the spindle between the step and bolster rails, substantially as described.

2. The spindle and the whirl *i j*, connected therewith by a screw, combined with the bolster and the step provided with a tubular portion, substantially as described.

251,816. TURPENTINE-STILL. LEONARD BELLINGRATH, Castleberry, Ala. Filed Oct. 10, 1881. (No model.)

Claim.—1. The combination, with the still, of the perforated steam-pipes and the radial heating-tubes and connecting-pipes, and the annular pipes communicating respectively with the radial tubes and pipes, and with a steam-generator and trap, substantially as specified.

2. In combination with the still and the steam supply and eduction pipes, the evaporating-vessel, the radial steam-heating tubes located in the still and in the evaporating-vessel, and the induction and eduction pipes, substantially as specified.

251,817. GANG-PLOW. BENJAMIN S. BENSON, Baltimore, Md. Filed Mar. 24, 1881. (No model.)

Brief.—A truck-frame carrying by means of sprocket-wheels an endless track is attached to each side of the frame of a gang of plows. The plows may be drawn by any kind of power, and the draft is upon the plow-frame, which carries forward the trucks and lays down the endless track. A hand-wheel, screw-rods, and cross-bars permit the plow-beams to be deflected, a pulley in the front end of each beam running upon cross-braces. A supplemental short beam and springs allow the plows to yield to obstructions separately. A hand-wheel and screw-rod with a pivoted lever and gage-wheel regulate the depth.

251,817.

Claim.—1. In combination with the gang-plow frame, the supporting-trucks 62 on each side thereof, having endless tracks 66, tie-rods 67, and feet 68, as set forth.

2. In combination with the gang-plow frame, the supporting-trucks running upon endless tracks pivoted to either side of the same, and connected therewith by arms 72, as set forth.

3. In combination with the gang-plow frame and pull-bar 82, the adjustably-pivoted lateral pull-bars 73 85 and screw-rod, as set forth.

4. In combination with the gang-plow frame and pull-bars 73, 82, and 85, the pivoted cross-bar 86 and screw-rod 83, as set forth.

5. In combination with the plow-gang and frame 78, the cross-bar 96, nut 99, rod 97, and hand-wheel 98, as set forth.

6. In combination with the wheel, rod, nut, and bar, 98, 97, 99, and 96, the series of plows connected to the bar by bell-crank levers, as set forth.

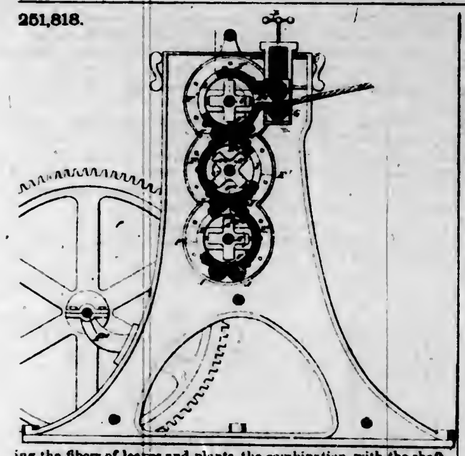
7. In combination with the frame having segmental braces 92, the series of plows having the front ends of their beams adapted to run upon said braces, and mechanism for actuating the said beams laterally, as set forth.

8. In combination with the plow-beam 94, having slot 102, the beam 91, having lug 103, and a spring for holding the lug against ordinary strain in engagement with the slot, as set forth.

9. In combination with the beams 91 94, having slot and lug, the lever 104 and spring 105, as set forth.

10. In combination with the long beam 94, having wheels 93, arcs 101, and slots, the short beams 91, having lugs, and the rods 90, as set forth.

11. In combination with the beam 61 and the gang-plow, the trucks 62, levers 75, and beams 74, as set forth.



12. In combination with the plow-gang, the supporting-trucks, having feet 68 and endless tracks, and connected with the pull-bars by rods 72, as set forth.

251,818. MACHINE FOR CLEANING AND SEPARATING THE FIBERS OF LEAVES. EUGENIO BRETON, Mineral de Catorce, Mexico. Filed Aug. 31, 1881. (No model.)

Claim.—1. In a machine for cleaning the fibers of leaves and plants, the combination, with the roller A, provided with the longitudinally-grooved wings A', the springs B, and the means for securing them in the said grooved wings, of the rasping or scraping blades B', having beveled outer edge, and the pressing or feeding blades B², provided with heads B³, triangular in cross-section, substantially as and for the purpose set forth.

2. In a rasping or scraping roller, A, for machines for cleaning the fibers of leaves and plants, the combination, with the shaft A' and the longitudinally-grooved radial wings A², provided with recesses A³, of the blades B' B², provided with recesses *e*, the springs B, and the caps B³, substantially as herein shown and described, and for the purpose set forth.

251,818.

3. In a machine for cleaning the fibers of leaves and plants, the combination, with the rotating cylinder, provided with spring-supported rasping or scraping blades B', formed with projections C, of the end casing, C', formed with apertures into which the said projections extend, substantially as and for the purpose set forth.

4. In a machine for cleaning the fibers of leaves and plants, the combination, with the frames D' D², provided with apertures E, and the casings F, having the same diameter as the apertures E, the rasping or scraping rollers A, contained in the casings F, of the feed-rollers J J, located between the casings F, and of gearing for operating the rasping or scraping rollers and the feed-rollers, substantially as herein shown and described, and for the purpose set forth.

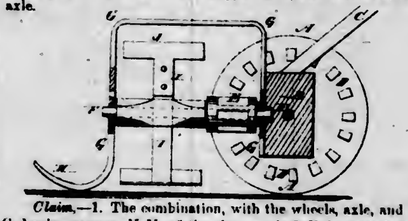
5. In a machine for cleaning the fibers of leaves and plants, the cylindrical casings F, constructed, substantially as herein shown and described, with a bottom longitudinal opening, F', extending throughout the entire length of the casing, with a top longitudinal opening, F², extending to within a short distance from the ends of the casing, and with a longitudinal side opening, F³, extending to within a short distance of the ends of the casing and forming segmental ribs I on the inner sides of the frames D' D², substantially as herein shown and described, and for the purpose set forth.

6. In a machine for cleaning the fibers of leaves and plants, the combination, with the casings F, of the feed-rollers J, located between two casings in such a manner that the periphery of the rollers J will touch the inner periphery of the casing F above the feed-rollers and will be a short distance above or from the inner periphery of the casing F below the feed-rollers, substantially as herein shown and described, and for the purpose set forth.

7. In a machine for cleaning the fibers of leaves and plants, the combination, with the frames D' D², of the rasping and scraping rollers A, the feed-rollers J and O, the casings F, the cog-wheels M, the pinion O, the cog-wheel P, the shaft P', the cog-wheels P² Q, the pinion Q⁴, the cog-wheels R R' R² R³, the pinions S' T' S² T² S³ T³, the cog-wheels U and V, and the pinions W and X, substantially as herein shown and described, and for the purpose set forth.

8. In a machine for cleaning the fibers of leaves and plants, the combination, with the rasping or scraping rollers A, the feed-rollers J, and the casings F, of devices for rotating the rasping or scraping rollers with a much greater rapidity than that of the feed-rollers, substantially as herein shown and described, and for the purpose set forth.

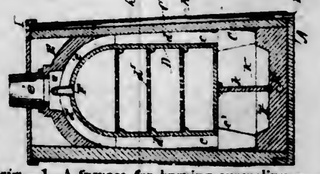
251,819. SELF-CLOSING STOPPER FOR BOTTLES. DAVID BEARY, Bolinas, Cal. Filed Oct. 31, 1881. (No model.)



Claim.—1. The open-sided screw-threaded sleeve B, fitted to clasp the neck of a bottle below the projecting head D, in combination with the screw-cap C, having the transversely-sliding plates E, stems F, and operating-levers H, substantially as and for the purpose herein described.

2. The screw-threaded detachable sleeve B and the cap C, fitted thereto, in combination with the transversely-sliding plates E, with their stems F and levers H, and the returning-springs G, all combined to operate substantially as herein described.

251,820. COTTON-CHOPPER. JOHN H. BETHUNE, Fayetteville, N. C. Filed July 23, 1881. (No model.)



Brief.—Runners are formed on the arched bar, which forms bearings for both ends of the chopper shaft, and is secured to the axle.

Claim.—1. The combination, with the wheels, axle, and bar G, having runners H H, of the chopper-shaft F, journaled at the front in said bar and at the rear in said axle, as shown and described.

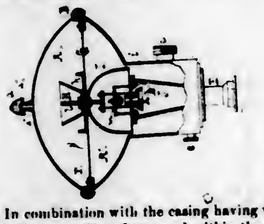
2. The combination, with the wheels, axle, and handles A B C, of the gear-wheels D E, the shaft F, carrying the hoe-arms I, and the arched bar G, carrying in front the runners H H, as and for the purpose specified.

251,821. PORTABLE FURNACE FOR BURNING THE ENAMELING ON PORCELAIN, &c. SAMUEL BEVINGTON, Philadelphia, Pa. Filed Nov. 17, 1881. (No model.)

Claim.—1. A furnace for burning enameling on porcelain, &c., consisting of a fire-box, a conical wall the exterior surface of which is fluted or corrugated, a surrounding metallic sheath, an interior oven, between which and the fluted wall are tapering flues terminating in a contracted or conical exit-opening, substantially as shown and described.

2. A furnace for burning enameling on porcelain, &c., consisting of a fire-box, exterior fluted wall, and metallic covering, and an interior oven provided with a tapering exit-pipe and peep-holes, and having between said oven and fluted wall a series of tapering heat-flues, substantially as described.

3. A furnace for burning enamel on porcelain, &c., consisting of a fire-box, a heat-chamber back of the same and below the oven, and provided with a division wall or partition, from said chamber arising a series of tapering flues surrounding the oven, and of an outer wall the exterior surface of which is corrugated or fluted and surrounded by a metallic covering or sheath, substantially as shown and described.



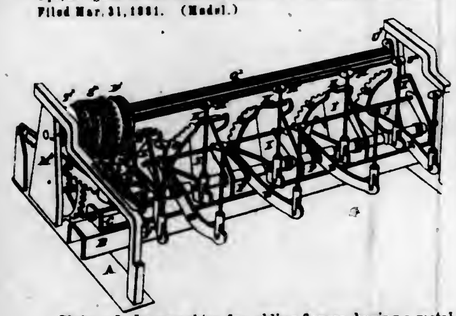
4. The combination of fire-box A, heat-chamber K, wall C, corrugated exteriorly, the sheath H, oven D, having tapering pipe F surrounded with tapering flues *d*, substantially as shown and described.

5. The combination, with furnace B, having walls C, of oven D, provided with perforated shelves *d*², tapering flue F, having stopple *f'*, and peep-hole pipes G, substantially as shown and described.

6. The combination, with furnace B, provided with doors *a'* and attached chains *o* and *a'*, and counterpoise *a*², of walls C C, having surrounding sheath H, provided with folding doors I I, substantially as shown and described.

7. In combination with furnace B, walls C C, and oven D, said parts being arranged in relation to each other to provide tapering flues *d d* between said oven and walls, a heating-chamber, K, having partition *k*, the forward edge of which is beveled or made prow shape, substantially as shown and described.

251,822. GAS-REGULATOR. LLEWELLYS P. BLAIR, Baltimore, Md. Filed Nov. 1, 1881. (No model.)

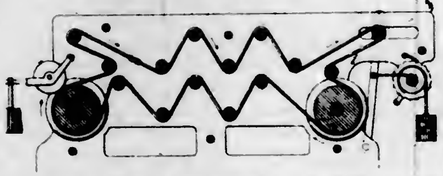


Claim.—1. In combination with the casing having valve and diaphragm, the bell I, extending downward within the part i, as and for the purpose set forth.

2. In combination with the diaphragm and valve, the casing A A', sealed as described, and having sheltered orifice a', as and for the purpose set forth.

3. In combination with the valve and diaphragm, the bell I and casing A A', having peripheral flanges, and the inclosing-ring B and lock C, as set forth.

251,823. ADDING-MACHINE. MICHAEL BOUCHEY, Louisville, Ky., assignor of one-half to Bennett D. Mattingly, same place. Filed Mar. 31, 1881. (Model.)

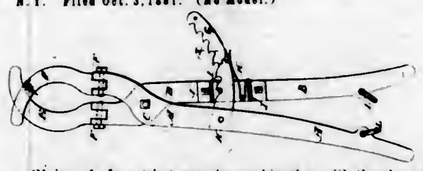


Claim.—1. In a machine for adding figures, having a metal frame, the fluted cog-roller O' and indicator-pulleys P', S', and T', in combination with the roller-pinion L', wheel K', pinion J', and rack G'; for setting the machine, substantially as herein described, and for the purpose set forth.

2. In a machine for adding figures, having a cog-roller, O', and pulleys P', S', and T', the double lever O, with its extended point N', in combination with the stand B', shaft Z, rods Y, and spring A', also the pinions U and three-pointed devices V and W, when arranged, constructed, and operated substantially as and for the purpose set forth.

3. In an adding-machine having a cog-roller, O', pulleys P', S', and T', the combination of the levers K, springs F, lever H, cog-segments G, and plates I with the flanges K, substantially as herein described, and for the purpose set forth.

251,824. MACHINE FOR STRETCHING BELTING. JAMES BRADY, Brooklyn, N.Y. Filed Oct. 28, 1881. (No model.)



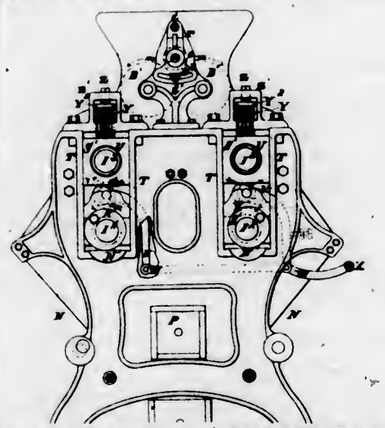
Claim.—1. The specified mode of stretching belting, consisting in submitting the belting to a repeated or continued motion over rollers or supports while under a continuous regulated tension, whereby the belt is kept uniformly taut, substantially as herein shown and described.

2. The specified mode of stretching belting, consisting in joining the belt in the form of an endless band and keeping this band in motion over rollers or supports while under a continuous regulated tension, substantially as herein shown and described.

3. A machine for stretching belting while in the form of an endless band, consisting of a driving drum or pulley over which one loop of the belt is passed, in combination with a movable tension or take-up roller or bar over which another loop of the belt is passed, and means for advancing said roller to render the belt tant and take up the slack or stretch therein, and a suitable supporting-frame for said parts, substantially as herein shown and described.

4. In a machine for stretching belting, the combination, with a driving drum or pulley to keep the belt in motion, of a series of flexion and reflexion bars or rollers over which the belt passes in bends from the driving-drum, and one or more movable take-up or tension rollers over which a loop of the belt passes in its course, substantially as and for the purpose set forth.

251,825. CATTLE-TONGS. CHRISTOPHER DAUBL, Green Point, N.Y. Filed Oct. 3, 1881. (No model.)



Claim.—1. In cattle-tongs, the combination, with the pivoted handles A B, of the jaws D E, hinged to the said handles, substantially as and for the purpose set forth.

2. In cattle-tongs, the combination, with the pivoted handles A B, provided with the hinged jaws D E, of the hinged serrated arm G, the locking-pin I, the spring K, and the keeper J, substantially as and for the purpose set forth.

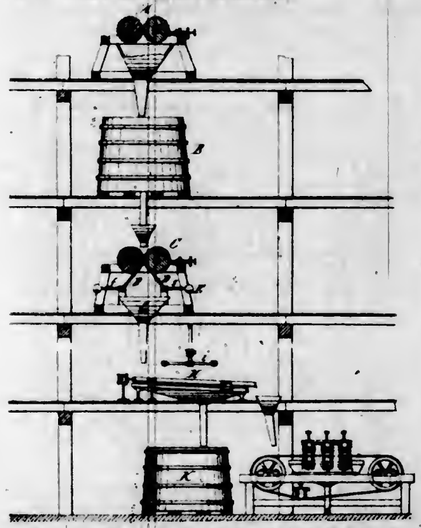
3. In cattle-tongs, the serrated locking-arm G, made with a hinge-joint, substantially as herein shown and described, whereby the free end of the said arm can swing down out of the way, as set forth.

251,826. ROLLER-MILL FOR GRINDING GRAIN. CHARLES G. BURKHARDT, Buffalo, N.Y. Filed Jan. 17, 1881. (Model.)

Claim.—1. The combination, with the feed-slides D, having yokes D' on their under sides, of eccentrics E, engaging in said yokes and mounted each on a separate shaft, F, arranged underneath each feed-slide, arms F', secured to the shafts F, and a rod, G, whereby the arms F' are connected, substantially as set forth.

2. The combination, with the pillow-block S and guideways T, of a journal-box, R, capable of turning in the block S, and provided with an eccentric flange, R', bearing against a support, N', substantially as set forth.

3. The combination, with the rolls I I', of the pillow-blocks S S', rectilinear guideways T, and the eccentrics V, interposed between the blocks S S' for adjusting the distance between the rolls, substantially as set forth.



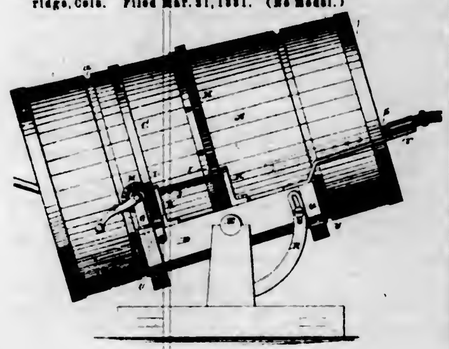
4. The combination, with the rolls I I', of the pillow-block S S', having lugs *s*, guideways T, and eccentrics V, pivoted between the lugs *s*, substantially as set forth.

5. The combination, with the rolls I I', of the blocks S S', guideways T, eccentrics V, provided with arms *e*, rods W, connecting arms e, and cross-bar X, substantially as set forth.

6. The combination, with the rolls I I', of the pillow-blocks S S', guideways T, eccentrics V, interposed between the blocks S S', and adjustable spring Z, bearing upon the upper block, S', substantially as set forth.

7. The combination, with the journal-box R, of the pillow-block S, composed of two side portions, S', and connecting-piece S', to which the side portions are secured, substantially as set forth.

251,827. METHOD OF AND APPARATUS FOR OBTAINING STARCH FROM GRAIN. GOTTFRIED BURKHARDT, Buffalo, N.Y. Filed Aug. 6, 1881. (No model.)



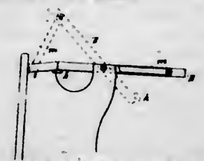
Claim.—1. The herein-described method of obtaining starch from grain, which consists in first coarsely grinding or cracking the grain, then steeping the broken grain, then crushing the steeped grain between rolls, whereby the starch is reduced to powder and the bran flattened out to flakes, and then separating the starch from the bran by sifting, substantially as set forth.

2. In an apparatus for manufacturing starch from grain, the combination of a preliminary reducing apparatus, A, whereby the grain is coarsely broken, a steep, B, in which the broken grain is softened, a pair of crushing-rolls, C, which operate upon the steeped grain, and whereby the starch is reduced to powder and the bran to flakes, and a sieve, H, whereby the bran is separated from the starch, substantially as set forth.

3. In an apparatus for manufacturing starch from grain, the combination of corrugated preliminary reducing-rollers A, a steep, B, smooth crushing-rolls C, and a sieve, H, in the manner and for the purpose set forth.

4. The combination, with the crushing-rolls C, of self-adjusting scraper-plates D, substantially as set forth.

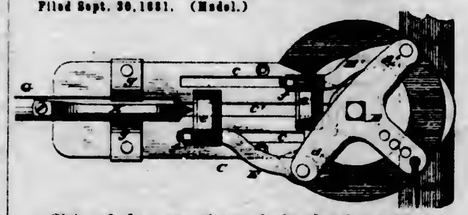
251,828. ORE-CONCENTRATOR. GEORGE S. RUBB, Breckinridge, Colo. Filed Mar. 31, 1881. (No model.)



Claim.—1. An ore-concentrator consisting of a revolving cylinder having a spiral blade connected to its inner circumference and extending from end to end of the cylinder, in combination with means for tilting the cylinder and holding it to its adjusted position, substantially as set forth.

2. An ore-concentrator consisting of a revolving and tilting cylinder having a spiral blade extending along its inner circumference from one end to the other of the cylinder, in combination with means for locking the cylinder to its adjusted position, and a water-supply adjustable with the cylinder, so as to maintain its relative position thereto no matter what the pitch of the cylinder be, substantially as set forth.

3. An ore-concentrator consisting of a revolving cylinder having a spiral blade connected to its inner circumference and extending from end to end of the cylinder, in combination with the supporting and tilting frame D, segment R, and a set-screw for locking the parts, substantially as set forth.



4. The revolving cylinder provided with a spiral blade within its circumference, in combination with the supporting and tilting frame D and arm T, connected to the frame and extending to a point in front of the cylinder, and supporting the supply-pipe S, whereby the several parts are adapted to operate as set forth.

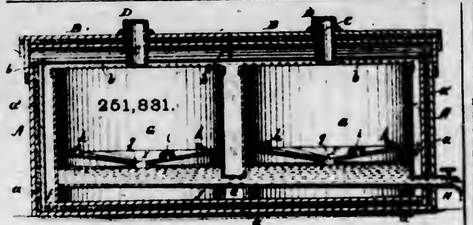
251,829. SCHOOL-DESK. CHARLES HUSCALL, New York, N.Y. Filed Nov. 26, 1881. (No model.)

Claim.—A school-desk having a top, B, pivoted at each side to an arm, *d*, of the frame, the said top being provided with a slat, A, secured along one of its edges, and with a pair of arms, *m*, pivoted to its sides, as herein shown and described, and for the purposes specified.

251,830. CORN-PLANTER CHECK-ROWER. WILLIAM R. CAMPBELL and WILLIAM J. CHAMBERS, Warren County, Ill. Filed Sept. 30, 1881. (Model.)

Claim.—1. In a corn-planter check-rower, in combination with the head D, with arms E E', hinged thereto, lugs *e e'*, hinged to the arms E E', whereby they may swing in vertical planes transversely to the arms E E' to pass each other, substantially as and for the purpose specified.

2. In combination with the head D, arms E E', and swinging lugs *e e'*, the lugs *f'*, which slide in the slots *e* and guide the movements of the lugs *e e'* in straight paths, substantially as and for the purpose specified.



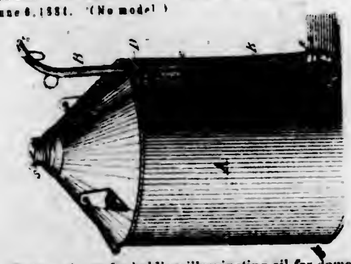
3. In combination with the head D, arms E E', and swinging lugs *e e'*, the sliding tappet-arm G, adapted to impart movement alternately to the lugs *e e'*, substantially as and for the purpose specified.

4. In combination with the sliding tappet-arm G, swinging lugs *e e'*, and sliding arms E E', the guard H, adapted to limit the movement of the swinging lugs *e e'*, substantially as and for the purpose described.

5. In combination with the head D, arms E E', swinging lugs *e e'*, and tappet-arm G, the rock-shaft B and rod I, adapted to receive motion from the tappet-wire, substantially as and for the purpose specified.

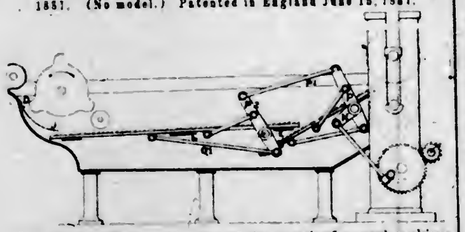
251,831. PORTABLE CASE FOR TRANSPORTING CREAM. JOHN G. CURRAY, Cedar Rapids, Iowa. Filed Oct. 10, 1881. (No model.)

Claim.—1. A portable case for transporting cream, consisting of the outer case, A, having double walls and filling, and provided with a double-walled and filled cover adapted to close practically



air-tight, provided with ports, and devices for closing said ports, for filling through said covers into the receivers G G without removing said covers, in combination with the receiver or receivers secured inside said case, and connected to a faucet on the outside, and provided with floats adapted to float upon the surface of the cream, said float having an opening practically in line with the port to allow the cream to pass underneath, all substantially as described.

2. A portable case for transporting cream, consisting of the outer case, A, having double walls, between which is a filling, *a'*, and containing in its upper edge a yielding cushion or packing, *b*, one or more double-walled and filled sliding covers, B B, having therein the screw-capped filling-ports C C, one or more receivers, G G, having inclined bottoms, and floats I I, provided with central openings, and the faucet H, entering the case and receiver G, all constructed and arranged substantially as shown and described, and for the purposes specified.



3. The combination of the outer case, A, having along its upper edge a yielding cushion, *b*, one or more covers, B B, the pins or studs *c c*, clamps F F, and the pivoted and slotted straps E E, all substantially as and for the purposes specified.

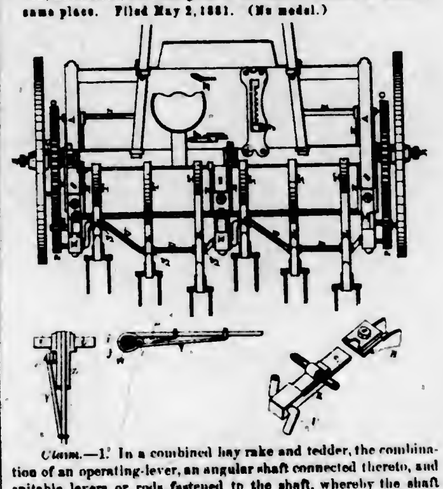
251,832. OIL-CAN. FRANCIS L. CLARK, Sawtelley, Pa. Filed June 6, 1881. (No model.)

Claim.—A can for holding illuminating-oil for domestic use, having in combination a body, A, with a short discharge-pipe, *a'*, near its bottom, a discharge-tube, B, flexible rubber tube *b*, connecting the pipe and discharge-tube, and a spring, C, secured to the cam-body and discharge-tube, and adapted to raise the free end of the tube when released and to cause it to move in a given plane, substantially as set forth.

251,833. WOOL-WASHING MACHINE. JOHN CLOUGH, Halecliffe, near Keighley, County of York, England. Filed Aug. 4, 1881. (No model.) Patented in England June 15, 1881.

Claim.—The combination of the trough of a wool-washing machine with a series of reciprocating toothed bars forming the bottom of the washing-space, and adapted to feed the fibery forward under the liquor in place of the ordinary overhead rakes, all substantially as and for the purpose set forth.

251,834. PILE FOR RAIL-PLATES. OLIVER P. COBB, Aurora, Ind. Filed Apr 26, 1880. (No model.)



Claim.—The pile or fagot constructed substantially as before

251,834.

set forth—namely, of horizontal rows of rails lying on their side in reverse order in the respective rows, confined between top and bottom plates, the foot or flange of each rail being cut off on one side of the rail to terminate on a line with the head of the rail on that side, and the interstices being filled with scrap.

251,835. COMBINED RAKE AND TEDDER. ROBERT J. COLVIN, Lancaster, Pa., assignor of one-half to Israel L. Landis, same place. Filed May 2, 1881. (No model.)

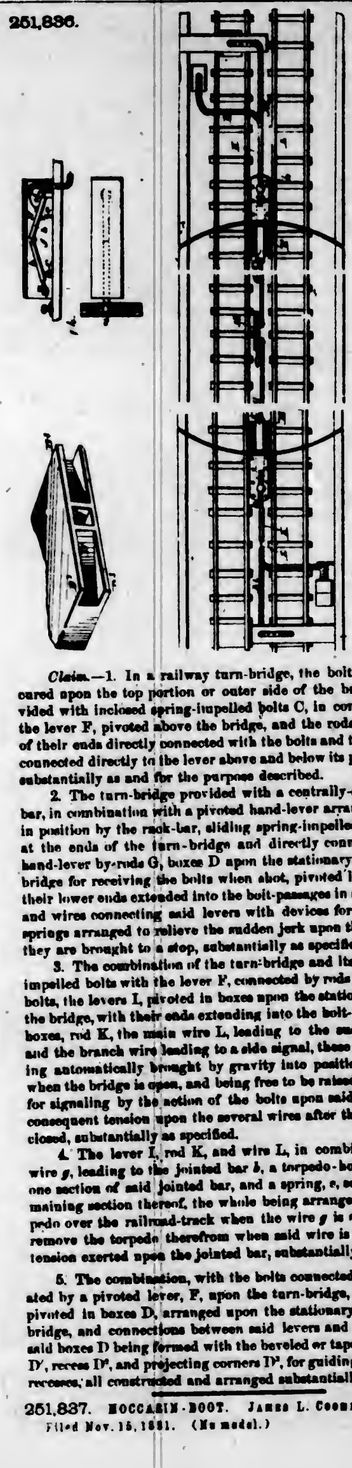
Claim.—1. In a combined hay rake and tedder, the combination of an operating-lever, an angular shaft connected thereto, and suitable levers or rods fastened to the shaft, whereby the shaft may be made to operate either a tedder or a rake, substantially as shown.

2. The combination of the axle B, the levers H, secured at their front ends to the rod I and provided with sockets on their rear ends, with removable boxes, in which the tedder-shaft is journaled, substantially as described.

3. In a hay-tedder, the removable boxes K, having a short shaft secured to their outer sides, the intermediate wheels, N, for meshing with driving-wheels O, the tedder-shaft U, provided with the pinions P, levers H, rod I, and lever J, substantially as set forth.

4. The combination of the cranked shaft, the fork-handles, the collars connected to the shaft, and the boxes or bearings for securing the collars and shaft to the fork-handles, substantially as set forth.

5. In a tedder-fork, the combination of the two separate tines, a bolt which passes through the end of the fork-handle, a spring which bears upon the top of the bolt, and suitable guides for the upper end of the tines, whereby the fork or tines can be relieved when striking an obstruction, substantially as shown.



6. In a hay-tedder, the combination of a series of box-plates united together by connecting-rods, a driving-pinion, and the cranked shaft, the box-plates being adapted to be removed from the frame, substantially as described.

7. The combination of the angular rod W, the stationary ferrules *i*, placed thereon, and provided with the grooves *j*, supports Z, and projections 1, with the springs Y and rake-teeth, substantially as specified.

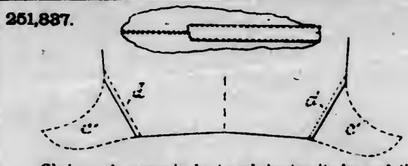
251,836. LOCK AND SIGNAL FOR TURN-BRIDGES. FRANK W. COOLBAUGH, Hoboken, N. J. Filed July 21, 1880. Renewed May 14, 1881. (No model.)

Brief.—Spring-impelled bolts in casings on the top of the swinging bridge are withdrawn from the bolt-boxes on the abutments by rods and a lever adjustable on a rack-bar above the center of the bridge. The lower end of a pivoted lever projects into the bolt-boxes on the abutments, and a rod at its upper end connects by a main wire and branch wire with gravity-signals. Another branch wire connects with a spring-actuated buckling-bar at the side of the railroad-track carrying a torpedo. The bolt-boxes are constructed with a center recess and tapering guide-grooves.

251,836.

Claim.—1. In a railway turn-bridge, the bolt-casings C', secured upon the top portion or outer side of the bridge, and provided with inclosed spring-impelled bolts C, in combination with the lever F, pivoted above the bridge, and the rods G, having one of their ends directly connected with the bolts and their other ends connected directly to the lever above and below its pivotal support, substantially as and for the purpose described.

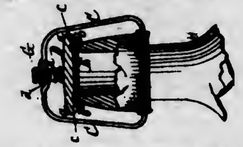
2. The turn-bridge provided with a centrally-arranged rack-bar, in combination with a pivoted hand-lever arranged to be held in position by the rack-bar, sliding spring-impelled bolts located at the ends of the turn-bridge and directly connected with the hand-lever by rods G, boxes D upon the stationary sections of the bridge for receiving the bolts when shot, pivoted levers I, having their lower ends extended into the bolt-passages in said boxes, rods and wires connecting said levers with devices for signaling, and springs arranged to relieve the sudden jerk upon the signals when they are brought to a stop, substantially as specified.



3. The combination of the turn-bridge and its sliding spring-impelled bolts with the lever F, connected by rods G with the said bolts, the levers I, pivoted in boxes upon the stationary sections of the bridge, with their ends extending into the bolt-passages in said boxes, rod K, the main wire L, leading to the suspended ball O, and the branch wire leading to a side signal, these said signals being automatically brought by gravity into position for signaling when the bridge is open, and being free to be raised out of position for signaling by the action of the bolts upon said levers and the consequent tension upon the several wires after the turn-bridge is closed, substantially as specified.

4. The lever I, rod K, and wire L, in combination with the wire *g*, leading to the jointed bar *b*, a torpedo-holder secured to one section of said jointed bar, and a spring, *e*, secured to the remaining section thereof, the whole being arranged to place a torpedo over the railroad-track when the wire *g* is slackened and to remove the torpedo therefrom when said wire is tightened and a tension exerted upon the jointed bar, substantially as specified.

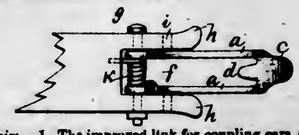
5. The combination, with the bolts connected with and operated by a pivoted lever, F, upon the turn-bridge, of the levers I, pivoted in boxes D, arranged upon the stationary sections of the bridge, and connections between said levers and the signals, the said boxes D being formed with the beveled or tapering front ends, D', recess D², and projecting corners D³, for guiding the bolts to the recesses, all constructed and arranged substantially as described.



251,837. MOCCASIN-BOOT. JAMES L. COOMBS, Bangor, Me. Filed Nov. 15, 1881. (No model.)

251,837.

Claim.—A moccasin-boot pack having its leg and tip or tongue cut substantially from the pattern shown and described, and united by the seams *d d*, said seams being of any known character.



251,838. BOTTLE-STOPPER. JETHRO B. CRAWFORD, Rochester, N. Y. Filed June 27, 1881. (No model.)

Claim.—1. In a bottle-stopper, the combination of a neck-wire encircling the neck of the bottle, a bail or yoke pivoted to the neck-wire and extending above the bottle, a metallic stopper-cap provided with a packing-disk on its under side, a vertical screw made fast to the top of the stopper-cap, and coils made in the bail or yoke embracing the screw, engaging with the threads thereof, and forming the nut through which the screw moves, as herein shown and described.

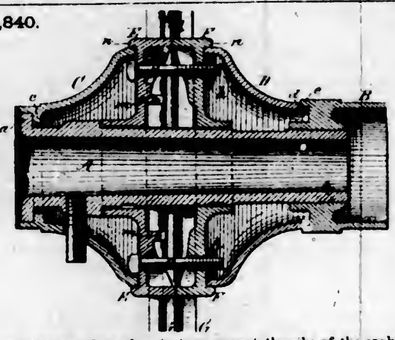
2. In a bottle-stopper, the combination of the stopper-cap D, provided with a fixed screw, G, projecting from its top, and a bail or yoke, C, provided with coils *d d*, which fit the threads of the screw and form the nut through which the screw runs, as herein shown and described.

251,839. CAR-COUPLING. CHARLES L. DAHLBERG, Des Moines, assignor of one-half to Robert M. Dahlberg, Keosauqua, Iowa. Filed Nov. 12, 1881. (No model.)

Claim.—1. The improved link for coupling cars, composed of the parallel and perforated bars *a b* and the cross-head or inclined-plane lever and hook *c d*, substantially as shown and described, for the purpose specified.

2. The link *a b c d*, in combination with a draw-head and a spring, substantially as shown and described, to operate in the manner set forth, for the purpose specified.

3. The link *a b c d*, hinged to a draw-head, the compound lever *m a r*, and the rope or chain *s*, substantially as shown and described, to operate in the manner set forth, for the purpose of uncoupling cars.

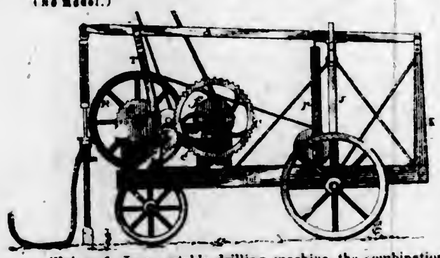


4. An improved car-coupling, composed of a link having an inclined cross-head, adapted to perform the functions of a direct-jag-plane and a coupling-hook at its front end and perforations at its rear end, a draw-bar having a cavity, *f*, at its front end, a pin or screw-bolt, *g*, a spring, and an operating-lever connected with the cross-head of the link by means of a flexible rope or chain, substantially as shown and described, to operate in the manner set forth, for the purpose specified.

251,840. WHEEL-HUB. ROBERT W. DAVIS and DANIEL DAVIS, Elmira, N. Y., assignors to the Davis Improved Wrought Iron Wagon Wheel Company, same place. Filed Nov. 15, 1881. (No model.)

Claim.—1. In a metal hub having the usual shells or hollow metal sections, the combination, with the spoke formed with ribbed sides and a notch near its inner end, of two independent clamping-plates located between said shells or hollow sections, one of said clamping-plates having on its inner face radiating grooves, provided with transverse bars forming a counter to and fitting the notched spoke, substantially as and for the purpose specified.

2. In a metal wheel-hub, the combination, with a ribbed and notched spoke, of clamping-plates having on their inner faces radial grooves corresponding with and fitting the ribbed spokes, said

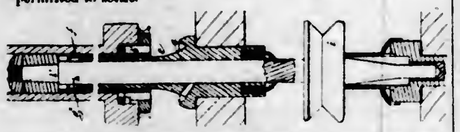


251,840.

grooves being so formed as to bear against the ribs of the spoke and relieve the edges thereof from contact with said clamping-plates, substantially as and for the purpose set forth.

3. In a metal wheel-hub, the combination of the ribbed spoke G, having notch *k*, clamping-plates E F, with their radial grooves *l* and transverse bars *m*, hub shells or sections C D, axle-box A, cap or nut B, and clamping-bolts *g*, substantially as described.

251,841. PORTABLE DRILLING-MACHINE FOR OIL-WELLS, &c. ROBERT M. DOWNIE, Allegheny, Pa. Filed Nov. 25, 1881. (No model.)



Claim.—1. In a portable drilling-machine, the combination of the reel *f* and cog-wheels S, C, and *m* with the driving-wheel R, as shown and described.

2. In a portable drilling-machine, the combination of the driving-wheel R, wheel S, rod T, beam *a*, and tube *p*, arranged as set forth.

251,842. SPINDLE-BOLSTER. GEORGE DRAPER, Hopedale, Mass. Filed June 24, 1875.

Brief.—The long bolster extending up between the spindle and its sleeve is provided with an oil-receiving opening and a spiral groove leading from the bottom of the bolster to its top, up which the oil is carried during the rotation of the spindle. At the top of the bolster a cup-like collar with its upper end bent in toward the spindle forms an oil-receiving chamber, into which oil enters through an outlet in the bolster, and in which gritty particles are permitted to settle.

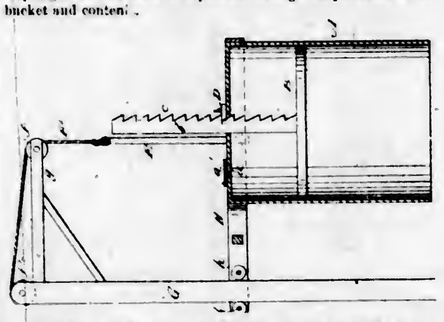
Claim.—1. The spindle and its attached surrounding sleeve, in combination with the spirally-grooved bolster intermediate of the said spindle and sleeve, the cup-like collar at the top of the bolster forming the oil-chamber *g*, having an outlet, *h*, at its top, substantially as shown and described.

2. The spirally-grooved bolster having an oil-inlet and a cup-like collar, *f*, at its top, provided with an oil-chamber, *g*, and outlet *h*, combined with an internal spindle and an external sleeve, all substantially as shown and described.

251,843. WALKING-STICK. JOHN DRAPER, Whitby, Ontario, Canada. Filed Nov. 8, 1881. (No model.)

Claim.—1. In a walking-stick having a metallic lamp-case inserted in it, as described, an outer casing, J, encircling the tube I, containing the lamp, and forming an air-space through which the

251,843.

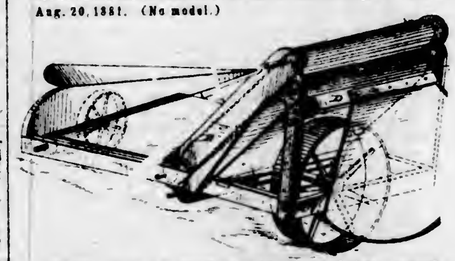


air passes into the lamp, in combination with the vertical wings M and circular flange L, arranged around the casing J, for the purpose of protecting the air-openings, substantially as and for the purpose specified.

2. In combination with a walking-stick having a metallic lamp-case inserted in it, as described, the cone-shaped top F, situated within the case immediately below the top G, forming an air-space, substantially as and for the purpose specified.

251,844. SUCTION-ELEVATOR. HENRY R. DULANY, Alexandria, La. Filed Aug. 24, 1881. (No model.)

Brief.—A suction-excavator consisting of an inverted cylindrical bucket having a self-acting piston within and an outwardly-opening valve in its head, the piston-rod being notched to engage a spring-catch to sustain it in position during transportation of the bucket and content.



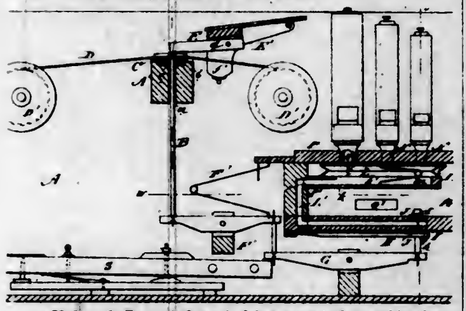
Claim.—1. The device herein shown and described for elevating substances, consisting of the inverted bucket or cup A, containing the self-acting piston B, the top of the bucket or cup being provided with the valved opening *a*, substantially as and for the purposes set forth.

2. The inverted bucket or cup A, provided with the valved opening *a*, and with the spring-actuated catch D, in combination with the self-acting piston B, provided with the notched piston-rod *b*, substantially as and for the purposes set forth.

3. The inverted bucket or cup provided with the self-acting piston B, in combination with the yoke H, post G, arm *g*, pulleys *f* and *f'*, rope F, and bail E, substantially as and for the purposes set forth.

251,845. SWATHING ATTACHMENT FOR HARVESTERS. CHARLES C. DUNKEL and ALBERT TECHOP, Harrisburg, assignors of one-third to Charles N. Owen, Manheimburg, Pa. Filed Aug. 20, 1881. (No model.)

Claim.—1. In a harvesting-machine, a spiral chute or swathing device located on the stubble side of the main frame and outside of the drive-wheel.



2. The combination, in a harvesting-machine, of mechanism for elevating the grain over the main drive-wheel and a swathing device for receiving the grain from said elevating mechanism and depositing it upon the ground in a continuous swath, with the stalks at right angles, or thereabout, to the line of said swath.

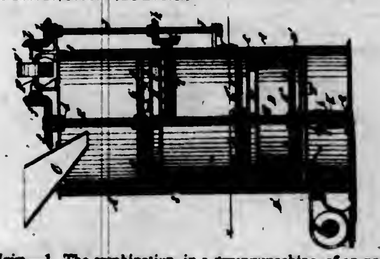
3. The combination, in a harvesting-machine, of a carrying-platform, a swathing device for depositing the grain in a continuous swath upon the ground, a driving-wheel interposed between said platform and swathing device, and mechanism for elevating

the grain over the driving-wheel and delivering it to said swathing device.

4. In a harvesting-machine, the combination of mechanism for elevating the grain and a swathing device adapted to receive the grain from said elevating mechanism, and to deposit the same upon the ground, with the straw at right angles, or nearly so, to the position in which it was received from the elevating mechanism.

251,846. MECHANICAL MUSICAL INSTRUMENT. ALONZO DUNBAR, New York, N. Y., assignor to Moses Harris, same place. Filed May 12, 1881. (No model.)

Claim.—1. In a wind musical instrument, the combination, with a perforated music-sheet and jacks, levers, or key-moving fingers arranged on one side of it and push-pins arranged on the other side thereof, of a perforated block embracing said sheet and movable laterally, substantially as herein shown and described, whereby a lateral movement of the said music-sheet is imparted to the said push-pins, as set forth.



2. In a wind musical instrument, the combination, with a perforated music sheet or strip arranged between jacks, levers, or key-moving rods on one side and push-pins on the other side, of a laterally-movable box or frame holding said levers, jacks, or rods and embracing the edges of said sheet or strip, substantially as herein shown and described, whereby the relative lateral positions of said jacks or rods and music-sheet are preserved, as set forth.

3. In a musical instrument adapted to be played by means of a moving perforated music-sheet, which controls the operation of valves to its reeds, pipes, or other sounding devices, the combination, with the jacks or levers E, pivoted in pivoted frame E', of the movable perforated block C, push-pins B, and connected levers and wind-regulating valve F, G, H, and I, respectively, substantially as herein shown and described.

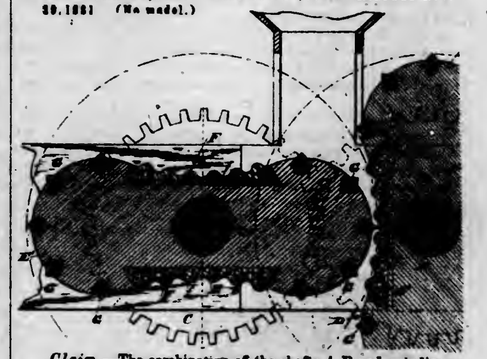
4. In a wind musical instrument, the combination, with the air-pressure chamber M, escape-tubes J, air-passages L', and pipe-connecting-tubes N, of the bellows valve or pallet L, having a spring, *m*, and arranged within said pressure-chamber against the mouth of the tubes N, substantially as herein shown, and for the purpose described.

5. In a wind musical instrument constructed and adapted to be operated mechanically or manually, the combination, with the air-pressure chamber K and escape-tube J, of the bellows valve or pallet L, provided with communicating supply and exhaust passage L', substantially as herein shown and described.

251,847. MACHINE FOR DRYING STARCH REFUSE AND OTHER SUBSTANCES. WRIGHT DUNTON, Glen Cove, N. Y. Filed Dec. 20, 1880. (No model.)

Claim.—1. The combination, in a drying-machine, of an upright trunk or cylinder divided at different heights by hollow floors, pipes for supplying a heating agent to said hollow floors, an upright hollow rotary shaft, blades or scrapers rotating with said shaft above said floors for distributing material upon said floors and for discharging it through openings in said floors, perforated pipes projecting radially from said shaft above said floors, and means for forcing air through said shaft and pipes, substantially as and for the purpose specified.

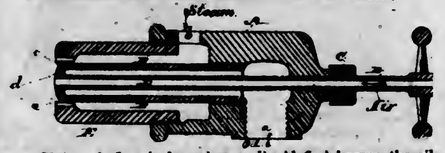
2. The combination, in a drying-machine, of an upright trunk or cylinder, divided at different heights by hollow floors having in them discharge-openings, an upright hollow shaft, perforated pipes projecting radially from said shaft above each floor, and means for forcing air through said shaft and perforated pipes, whereby the chambers between said floors may be filled with hot air, substantially as and for the purpose specified.



3. The combination, in a drying-machine, of an upright trunk or cylinder divided at different heights by floors having in them discharge-openings, an upright hollow rotary shaft, hopper-boys above each floor composed of perforated pipes projecting from said shaft, and blades or scrapers attached to said pipes, and means for forcing air through said shaft and pipes, substantially as and for the purpose specified.

4. The combination, in a drying-machine, of an upright trunk or cylinder divided at different heights by hollow floors having in them discharge-openings, pipes for supplying a heating agent to said hollow floors, an upright hollow rotary shaft, and pipes projecting therefrom for supplying air between said floors, blades or scrapers rotating with said shaft above said floors, and rotary screw-conveyers arranged below said floors for delivering material discharged from one floor to the center of the floor below, substantially as and for the purpose specified.

5. The combination of an upright trunk or cylinder, A, hollow floors B B', having discharge-openings *c*, the hollow rotary shaft E, the steam-jacketed compartment D, below the floor B', and having discharge-chutes K, the hopper-boys G G'G², comprising perforated pipes *g*, projecting from said shaft, and blades or scrapers A, and the blower H, all substantially as specified.

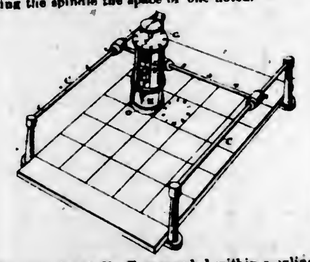


6. The combination of the hollow rotary shaft E and hopper-boys, each comprising perforated pipes *g* and blades or scrapers A, cut or slit transversely, and having the outer ends of the portions between the slits bent or deflected, as described, so that said portions stand at an angle to said pipes, substantially as specified.

251,848. CRUSHING AND GRINDING MACHINE. GEORGE DURYEA, Rahway, N. J. Filed Nov. 30, 1880. Renewed Nov. 30, 1881. (No model.)

Claim.—The combination of the shafts A B and grinding-heads E F, the latter being constructed and arranged as herein described, and provided on their salient extremities with removable angular teeth G and on their concave surfaces with removable corrugated plates F, said teeth G being carried over the surfaces of the corrugated grinding-plates F with a crushing and grinding action, as herein described and shown.

251,849. HYDROCARBON-BURNER. EVAN A. EDWARDS, San Buenaventura, Cal. Filed Aug. 31, 1881. (No model.)



Claim.—1. In a hydrocarbon or liquid-fuel burner, the oil-passage B, in connection with the oil-supply, and having a regu-

lating-valve, *d*, at its exit end, in combination with the steam-passage E, in connection with the steam-source, said steam-passage having its exit end provided with spiral or inclined grooves or passages *e*, opening out of the end of the burner separately from the said oil-passage, substantially as and for the purpose herein described.

2. The hydrocarbon-burner consisting of the casting A, with its apertures *a* and *b*, pipe B, with its valve-seat *c*, open-ended hollow stem D, with its valve *d*, and bushing C, and the pipe E, with its spiral or inclined grooves or channels *e*, when arranged substantially as and for the purpose herein described.

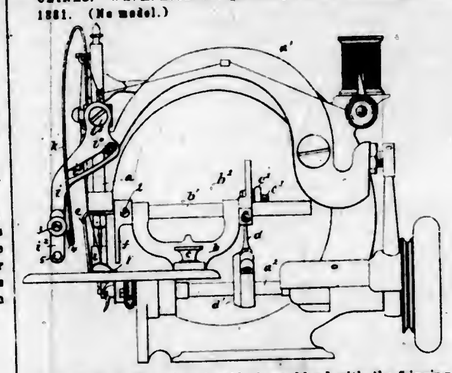
251,850. TALLY-MACHINE. JOHN W. ELLIOT, Toronto, Ontario, Canada. Filed June 21, 1881. (No model.)

Brief.—To record by canceling the proper figures on a card, so as to record separately the numbers of various articles or classes of merchandise. At each pressure on the button the notched plate or disk I is carried down. The following pawl, taking an angular position, drops into the adjoining notch. When the pressure is removed the plate rises, carrying the pawl to a horizontal position and turning the spindle the space of one notch.

Claim.—1. A spindle, F, suspended within a cylindrical casing, and having at one of its ends a pointed crank, H, in combination with a pivoted spring-pawl, M, acting against the notched block I, so that at each vertical movement of the spindle the pointed crank is caused to move a given distance in a circle, substantially as and for the purpose specified.

2. In a tally consisting of a spindle with a pointed crank so arranged within a casing that at each vertical movement of the spindle the pointed crank is caused to revolve a given distance in a circle, the combination of a vertical spring, L, acting against the flattened edge of the block I, in order to prevent the spindle revolving when it is being forced down, as and for the purpose specified.

3. In a tally consisting of a spindle with a pointed crank so arranged within a casing that at each vertical movement of the spindle the pointed crank is caused to revolve a given distance in a circle, the combination of a card divided into spaces, and held on the base-plate of an adjustable frame arranged to support the casing E, substantially as and for the purpose specified.

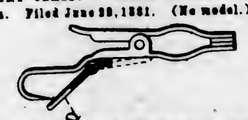


251,851. COMBINATION-TOOL. FRANK EHRENBERG, Jr., St. Louis, Mo. Filed Nov. 8, 1881. (No model.)

Claim.—1. The bow-shaped handle A, with sleak-tenderer C, consisting of cross-bars *c* and dividing-ribs *c'*, as set forth.

2. The combination of handle A, tenderer C, made as set forth, can-opener D, cross-bar B, corkscrew E, hook F, projection G, tack-extractor H, and tack-hammer I, all substantially as set forth.

251,852. FRINGING ATTACHMENT FOR SEWING-MACHINES. WM. A. ESTAVER, Cambridge, Mass. Filed Nov. 19, 1881. (No model.)



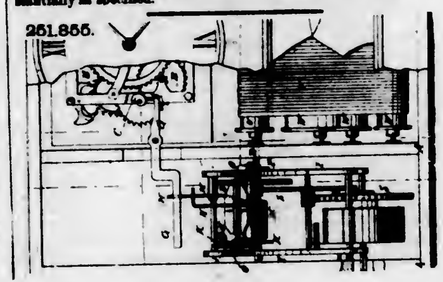
Claim.—1. The thread-guide *i*, combined with the fringing-hook *f* and heading-finger, to carry the fringing-thread backward under the presser-foot to be stitched in place, substantially as described.

2. The rocker-shaft, its arm, and link *d*, adjustably attached to it, and the fringing-hook and heading-finger carried by the said rock-shaft, combined with the thread-guide, the needle, needle-bar, and presser-foot, under which the fringing-thread is drawn, substantially as described.

3. The rock-shaft *b'*, bearings for it, and means to rock it, combined with the heading-finger and fringing-hook carried by the said rock-shaft, and made adjustable thereon relatively each to the other, substantially as described.

251,853. HAT-CLASP. WILLIAM EWING, Frankford, Philadelphia, Pa. Filed June 29, 1881. (No model.)

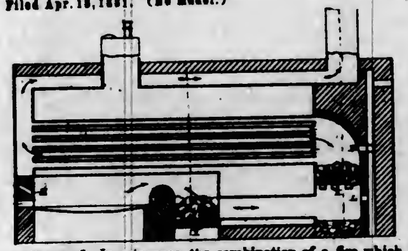
Claim.—As a new article of manufacture, a hat-clasp one end of the main jaw of which is made in hook shape and has also swiveled to it a ring, D, for the purposes set forth.



251,854. SHUTTER-FASTENER. HENRY J. FISHER, Jr., Point Pleasant, W. Va. Filed Nov. 12, 1881. (No model.)

Claim.—1. The long bar-fastening D, having the perforations *e* at one end and the journal-head *d* at the other, in combination with the pivot-bearing C and the spring-catch E, substantially as specified.

2. The combination, with the pivot-bearing C and the long vibratory fastening-bar D, journaled thereto and having the perforations *e*, of the eye-bar G, secured to the opposite blind, the channel or passage A in the framing, and the spring-catch E, substantially as specified.

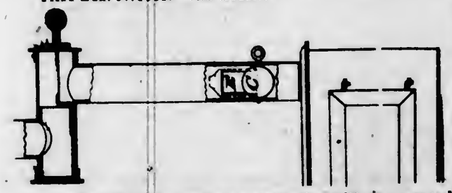


251,855.

251,855. ADVERTISING APPARATUS. EDWIN H. PITCHER-ALD, New York, N. Y. Filed May 27, 1881. (No model.)

Claim.—An advertising apparatus constructed substantially as herein shown and described, consisting of the clock-work B, the series of rollers U W, carrying an endless band, V, the spring-driven chain of gear-wheels S, the cam C, the lever G, the weighted catch-lever H, the arm N, the trip-arms O P and their shaft M, the gear-wheel K, having pin J, and the single-toothed ratchet-wheel Q, as set forth.

251,856. FURNACE. JOSEPH FLAUSNER, Philadelphia, Pa. Filed Apr. 18, 1881. (No model.)



Claim.—1. In a furnace, the combination of a fire which is made in the front end of the furnace with a bed of carbon through which the whole products of combustion of the fire in the front of the furnace pass, and a suitable flue, K L, for admission of air to the secondary fire, substantially as shown.

2. In a furnace, the combination of the fire made in the front end of the furnace, a bed of carbonate of lime through which the products of combustion pass, a suitable air-flue, K L, for the admission of air to support combustion, and a bed of carbon which forms an incandescent fire, and through which also the products of combustion and the gas disengaged from the carbonate of lime pass, substantially as described.

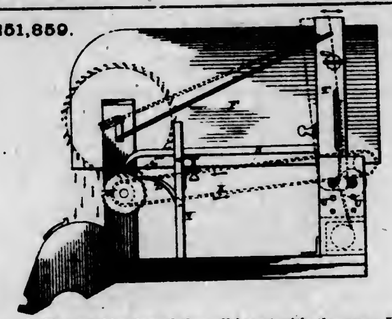
3. In a furnace, the combination of a fire in the front of the furnace, a vaporing-pan, a suitable flue for the admission of air to the secondary fire, and a secondary fire-chamber, substantially as set forth.

4. In a furnace, the process described of liberating carbonic-acid gas by passing the products of combustion through a bed of carbonate of lime, and then passing the gas thus liberated through a secondary fire, where it is made to mingle with atmospheric air above and below the grate, and thus converted into a combustible gas, substantially as specified.

251,857. STOVE-PIPE. ANDREW FLOHR, Sacramento, Cal. Filed Aug. 27, 1881. (No model.)

Claim.—In a stove-pipe, the combination, with an upper and lower vertical section of pipe, of a horizontal section provided with removable end caps and a cylindrical sliding damper having a discharge-opening, a draw-rod, and a knob having a slotted disk engaging a pin in the removable cap, substantially as specified.

251,858. HAIR-PIN. MARY T. FOOTE, Boston, Mass. Filed Apr. 11, 1881. (No model.)

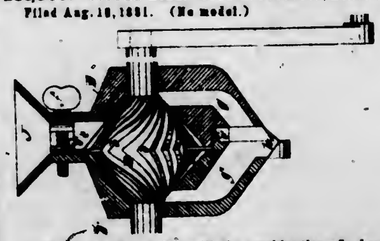


Claim.—A hair-pin having its ends A A bent inwardly toward each other from the outwardly-bent portions B B, substantially as and for the purpose described.

251,859. GOVERNOR FOR COTTON-GINS. LYCURGUS G. FERRIS, Stranger, Tex. Filed Oct. 24, 1881. (No model.)

Claim.—1. The combination of a roll-breast, an automatic regulating mechanism connected thereto, and means for suspending the roll-breast from above so that it can move in and out in relation to the frame according to the pressure in the roll-box, substantially as shown.

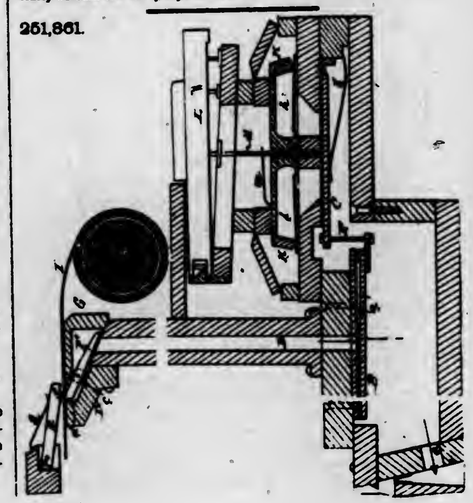
251,859.



2. The combination of the roll-breast with the ropes I and shaft K, substantially as described.

3. The combination of the movable roll-breast, the connecting-ropes I, the shaft K, provided with the pulleys J M, the scale and slide, and ropes which run from the pulleys M to the scale and slide, substantially as set forth.

4. The combination of the movable frame U with the rocking frame T, which is pivoted therein, the frame U being made adjustable upon the top of the gin-frame, substantially as specified.



251,860. COFFEE-MILL. SETH H. FOUNTAIN, Amite City, La. Filed Aug. 18, 1881. (No model.)

Claim.—1. In a coffee-mill, the combination of a burr having a prolate-spheroidal form and spiral ridges, gradually decreasing in size as they reach the smallest peripheries at the ends of said burr, with a correspondingly-ribbed grinding-casing having a throat over the largest periphery of the burr and an outlet at each end where the ridges are smallest, whereby the grain will first be broken and afterward be mainly ground at the small ends of the burr, as described.

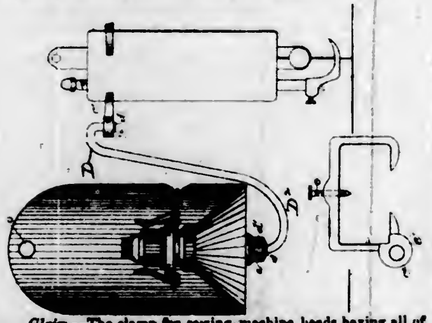
2. The parts D D' of the casing, formed with the discharge-openings *g* and *g'*, leading from the smallest ends of the chambers, in combination with the burr B and the hopper-throat J, substantially as and for the purposes set forth.

251,861.

251,861. MECHANICAL MUSICAL INSTRUMENT. ASHLEY POWELL, New York, N. Y., assignor to Moses Harris, same place. Filed May 13, 1881. (No model.)

Claim.—1. In a wind musical instrument adapted to be operated mechanically and manually, and containing sound-producing devices, such as reeds, the tracker-pins of the manual mechanism, provided with means for holding them in their normal position and holding them from contact with the reed-valves while said valves are being depressed or operated upon by the music-sheet or mechanically-operating mechanism, substantially as herein shown and described.

2. In a wind musical instrument provided with exhaust-bellows, the combination, with the pneumatic keys B, of the air-ducts D, valves F, spring-actuated levers H, and perforated music-sheet I, all arranged to operate substantially as herein shown and described, whereby the valves F are acted upon by the levers through perforations in the music-sheet to permit air to pass through the air-ducts to the pneumatic keys, as set forth.

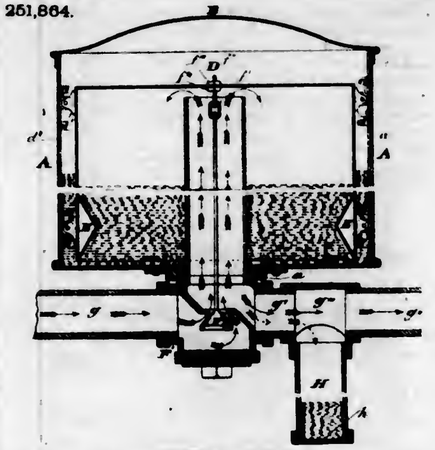


3. In a wind musical instrument adapted to be operated mechanically and manually, and containing sound-producing devices, such as reeds, and provided with exhaust-bellows, the combination, with the reed-valves C, the manual-keys L, and spring-supported tracker-pins M for manually operating the valves of the pneumatic keys B, arranged within the wind-chest, air-ducts D, valves F, levers H, and perforated music-sheet I, mechanically operating the valves, substantially as herein shown and described.

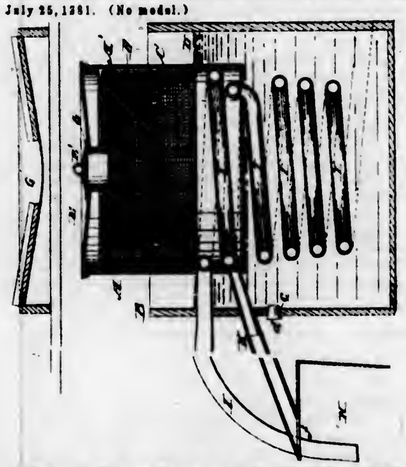
251,862. SNAP-HOOK. FRED FRAZER, Syracuse, N. Y. Filed Dec. 7, 1881. (No model.)

Claim.—A snap-hook having its hook, loop, and shank cast in one piece, with a cavity, *a*, having eccentric side flanges and inwardly-projecting lugs, a tongue, D, with downwardly-projecting curved hooks, and the coiled spring *c*, all constructed and adapted to operate substantially as set forth.

251,863. LAMP ATTACHMENT FOR SEWING-MACHINES. FRANCIS E. FARY, Springfield, Ohio, assignor of one-half to Luke Carles, same place. Filed Sept. 3, 1881. (No model.)



Claim.—The clamp for sewing-machine heads having all of its sides rigid, and provided with a set-screw for tightening it upon the head, and with the leg *c'*, having the socket *c²* projecting outside of the lines of the clamp, in combination with the bracket-arm D, having the spindles *d' d²*, and with the lamp A *a a'*, substantially as set forth.



251,864. GAS-GOVERNOR. NATHAN H. GARLAND, St. Louis, Mo., assignor of one-half to James S. Garland, same place. Filed Oct. 22, 1881. (No model.)

Claim.—A gas-regulator consisting of closed casing A B, having tracks *d' d²*, bell or receiver D, having brackets *d d* and rollers *d' d²* on its vertical sides, and provided with annular V-shaped air-chamber on its inside, near its bottom edge, collar *a*, two-way shell F' at bottom, having valve F, vertical tube C, supported in valve-shell, inlet and outlet pipes *g g'*, coupling *g''*, and cap H, for receiving condensation from the regulator, and the attached or connected system of gas-pipes through the outlet-pipe, as set forth.

251,864.

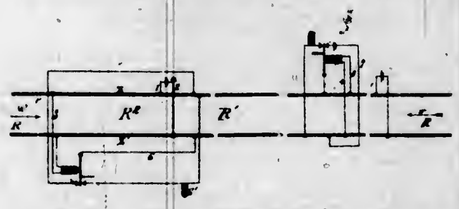
251,865. APPARATUS FOR THE MANUFACTURE OF TURPENTINE AND ROSIN. ALLEN GARDNER, Americus, Miss. Filed July 25, 1881. (No model.)

Claim.—1. The combination of the vessel A', the cylindrical wire screens C D, the concave cover E, having central opening, E', the superposed concave screen G, and the worm I, to strain the turpentine, as described.

2. The combination, with the condensing-tank B and still H, of the rectifier A, provided with screens C D and pipe K, and set within the said tank, and worm I, passed through said rectifier and tank, substantially as herein shown, and for the purpose described.

251,866. COATING METALLIC ARTICLES WITH VULCANIZED RUBBER. WILLIAM GARRITY, Malden, and NICHOLAS AVERY, Cambridge, Mass. Filed Nov. 23, 1881. (No specimens.)

Claim.—1. The herein-described process of coating metallic articles with vulcanized rubber, the same consisting in first coating the metallic article with muriate of tin, then applying thereto a layer of a composition formed of litharge, sulphur, and rubber cement, which will unite with the muriate of tin at the vulcanizing-heat, and finally applying the vulcanizable-rubber compound and vulcanizing the same, substantially as set forth.



2. As a new article of manufacture, a wringer-roll or other metallic article coated with rubber, formed by first coating the metallic surface with muriate of tin, over which is placed a layer of a composition formed of litharge, sulphur, and rubber cement, and then applying thereto the desired quantity of vulcanizable-rubber compound and vulcanizing the same, substantially as and for the purpose described.

3. In a wringer-roll or other metallic article coated with vulcanized rubber, the combination, with a metallic surface coated with muriate of tin, substantially as described, of a composition formed of litharge, sulphur, and rubber cement, united therewith by the action of the heat to which the article is subjected in the vulcanizing process, and a covering or coating of rubber compound vulcanized thereon, substantially as and for the purpose set forth.

4. In the process of coating metallic articles with vulcanized rubber, the employment of a composition formed of litharge, sulphur, and rubber cement for firmly uniting the vulcanizable-rubber compound to a metallic surface previously coated with muriate of tin, when the article is subjected to heat in the vulcanizing process, substantially as described.

251,867. ELECTRIC BLOCK SIGNALING APPARATUS. OSCAR GASSETT, Boston, Mass., assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed Oct. 22, 1881. (No model.)

Brief.—The signal-magnets *s s'* are only operated so as to cause the signals to indicate "safety" by the batteries at the opposite end of the section, respectively, from them, so that an approaching train from either direction cannot throw the signal to "safety" as long as the distant battery is short-circuited by a train on the section.

Claim.—1. A signal-magnet and a battery at one end of an insulated electrically-connected block-section and connected with one line of rails thereof, a like magnet and battery at the other end of the block and connected with the other line of rails thereof, in combination with a circuit-shifting apparatus substantially as described, whereby, on the approach of a train from either direction, a circuit will be formed embracing the signaling-magnet of the near station, the battery of the remote station, and the intermediate electrically-connected track-rails.

2. A section of railway-track electrically insulated at its ends and having each line of rails electrically connected between the ends, in combination with a signal connected with one line of rails at or near one end, and movable circuit-changer connected to the other line of rails at or near the same end, and a movable circuit-changer and a battery connected the one to one end and the other to the other of said lines of rails at or near the other end of the section, substantially as set forth.

3. A system of electrically-operated railway block signaling apparatus consisting of an electric circuit and make-and-break mechanism at one end of a section, adapted to actuate a moving circuit-changer by an approaching or passing train, and a rail-circuit embracing a signal at the near and a battery at the remote station, such second circuit being brought into operation by the make-and-break mechanism at the end of the block, substantially as set forth.

4. An electrical block signaling apparatus having in combination electrical rail-circuits through the whole or the greater part of the length of the block-section, a signal-magnet at each end of the block-section electrically connected the one with one line of rails and the other with the other line of rails, a battery at each end of the section electrically connected with the same lines of rails and in the same order, an armature at each end of the section electrically connected to the same lines of rails, but in a reverse order, two contact points or studs to each armature, one connected with the signal-magnet and the other with the battery, and an electrical circuit and break-and-make mechanism at each end of the block-section, adapted to be actuated by a passing train, substantially as set forth.

5. A rail-circuit block-section, B', electrically connected at each end by one wire with a battery, by another wire with a signaling-magnet, and by a third wire with an electrically-actuated circuit-changer, in combination with a make-and-break mechanism at each end of the section, adapted to be actuated by the passing train, substantially as set forth, with reference to the formation of a closed circuit extending through the track-rails from one station to the next, and with reference to the short-circuiting of each section while the train is passing from one to the other stations.

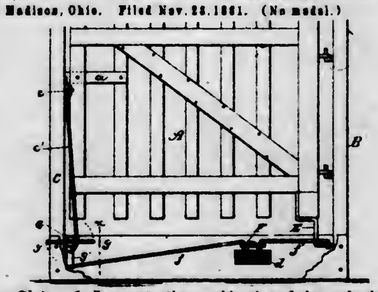
251,868. RAILWAY-TORPEDO AND DETONATING SIGNAL. FRANK GERNARD, Scranton, Pa., assignor of one-half to Edwin B. Sherwood, same place. Filed Nov. 17, 1881. (No model.)

Brief.—A metal-strap secured to the under side of the torpedo rests longitudinally upon the rail, and the shell or case is serrated or covered with a gritty substance.

Claim.—1. A railway-torpedo having its shell serrated or covered with gritty substance, substantially as set forth.

2. A railway-torpedo having its shell serrated or covered with gritty substance, and having holding-strap B and auxiliary strap C, secured permanently or detachably transversely to said holding-strap, as set forth.

251,869. CAR-AXLE BOX. GEORGE P. GOBLET, Philadelphia, Pa. Filed Nov. 17, 1881. (No model.)



Claim.—1. In an oiling device for car-axle boxes, a ring adapted to surround the axle-journal, and provided with nicks or buckets, substantially as set forth.

2. A lubricating ring or chain for car-axle boxes, having a series of buckets or rings on its inner diameter, and so formed or shaped that a portion of said buckets will convey oil to said journal when rotating in one direction, and the other or remaining portion of the buckets conveying oil thereto when said axle revolves in a contrary direction, substantially as shown and described.

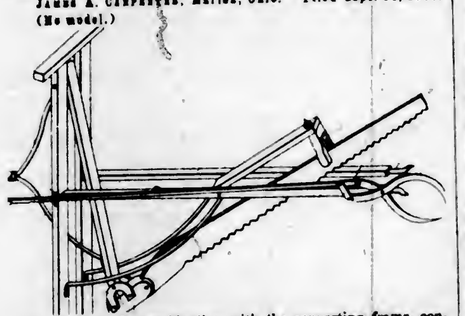
3. In a car-axle box, the combination of axle-journal B, the bearing C, having curved surface *c'*, the key or box top curved at *d*, and ring or chain E, said bearing being grooved at *c* to receive said ring or chain, substantially as shown and described.

4. The nicked or bucketed ring or chain substantially as shown, and for the purpose set forth.

251,870. AUTOMATIC GATE. RANDOLPH F. HAGEMAN, New Madison, Ohio. Filed Nov. 28, 1881. (No model.)

Claim.—1. In a gate, the combination of the rock-shaft G and its downwardly-extending arm *g'*, journaled horizontally between the base-boards D, with the vertically-acting connecting-rod *c'*, having its lower end pivoted to the arm *g'* and its upper to the rear end of the pivoted latch *c*, all arranged to operate as shown and described.

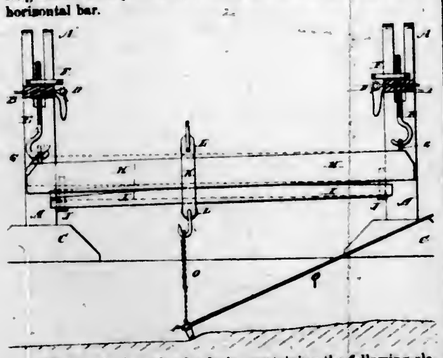
2. The combination of the horizontal rock-shaft G, its pedals *g*, and downwardly-extending arm *g'*, journaled between the base-boards D, with the connecting-rod *f*, reciprocating lever F, rod *f'*, and crank E, secured to the lower end of the pivot-post of the gate, all arranged and operating as set forth.



3. In a gate, the rock-shaft G, provided with operating-pedals *g*, and a downwardly-projecting arm *g'*, to which is pivoted the vertical connecting-rod *c'* and horizontal rod *f*, said rock-shaft being adapted to open and close the gate and to release the latch by means of the connecting mechanism, as hereinbefore described.

251,871. CLASP-REEL FOR RIBBONS, &c. SPENCER A. HALN, Harrison, assignor of one-half to Constantine Kelley, Harrisonville, Mo. Filed Aug. 10, 1881. (Model.)

Claim.—A ribbon or tape holder consisting of a roll, A, provided with slotted clasp D, buttons E, and spring G, the several parts being constructed and arranged to operate as set forth.



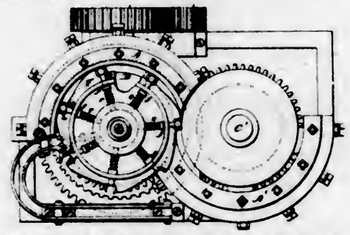
251,872. LOG-SAWING MACHINE. CLARK B. HALSTEAD and JAMES A. CARPENTER, Marion, Ohio. Filed Sept. 26, 1881. (No model.)

Claim.—In combination with the supporting-frame, constructed as described, and provided with prongs to enter the log, the oscillating sweep, carrying a saw working through a suitable slot in a hanger secured to a bar loosely connected to the supporting-frame and against a friction-roller mounted in an opening in said hanger, and the tongs and their operating mechanism adapted to work in connection with the prongs on the frame to hold the log, substantially as specified.

251,873. GRADER FOR DRAINS. GEORGE F. W. HARRIS, Woodburn, Ill. Filed May 11, 1881. (No model.)

Brief.—A straight horizontal bar is suspended by eyes at its ends to adjustable screw-hooks in trestles. A grading-tool with long handle is suspended by a chain to a carrier traveling on the horizontal bar.

Claim.—1. A grader for drains containing the following elements, namely: a rigid bar mounted upon suitable supports, with means for adjusting the bar to correspond with the intended grade of the bottom of the drain, and a grading-tool arranged to travel upon said bar and work the drain to the grade, substantially as set forth.



2. In a grader for drains, the combination, with the rigid gage-bar H, of the carrier K L and the grading-tool P, substantially as herein shown and described, whereby the bottom of the drain can be worked to a uniform grade, as set forth.

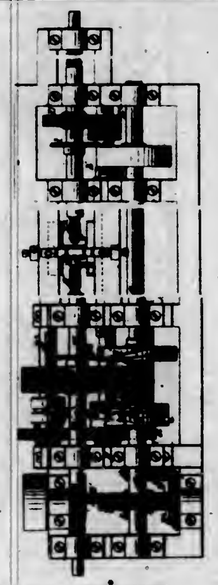
3. A grader for drains constructed substantially as herein shown and described, consisting of the trestles A B, the bar H, the adjustable screw-hooks E, carrier K L, and the chain and grading-tool O P Q, as set forth.

4. In a grader for drains, the combination, with the trestles A B and the straight bar H, of the screw-hooks E, substantially as herein shown and described, whereby the said bar H can be adjusted parallel with the grade of the drain, as set forth.

5. In a grader for drains, the combination, with the trestles A B, the screw-hooks E, and the bar H, of the carrier K L, the chain O, and the grading-tool P Q, substantially as herein shown and described, whereby the bottom of the drain can be opened to a uniform grade, as set forth.

251,874. MACHINE FOR ROLLING THREADS OF SCREWS OR BOLTS. HAYWARD A. HARVEY, Orange, N. J. Filed Aug. 23, 1881. (No model.)

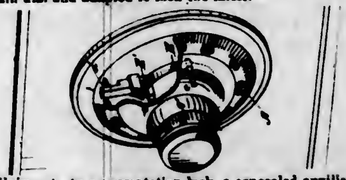
Claim.—1. In machines for rolling the threads of screws or bolts, a pair of dies consisting of a rotating die and a stationary curved die, said dies having ribs on their working-faces for forming the thread of a screw or bolt upon a blank passing between them, combined with a feed-channel for delivering blanks and a disk arranged above and revolving in a plane parallel with and concentric to said revolving dies, the periphery of said disk running close to the mouth of said channel, and constructed with recesses to successively receive blanks from said channel and present them to the passage between said revolving and stationary die, substantially as described.



2. In a machine for forming screw-threads, two or more pairs of dies, each pair consisting of a revolving die and a stationary curved die, the respective pairs having ribs on their working-faces, the ribs on the one pair varying in depth or width from those on the other pair, for the purpose of forming the thread of a screw or bolt by a series of two or more progressive operations, combined with a feed-channel to present a column of blanks to the first pair of dies, and spring-forks arranged to travel in a plane parallel with the revolving die of the first pair and to pass the mouth of said channel, and also arranged to move radially toward and from their center of motion, and mechanism, substantially such as described, to force said forks inward as they successively approach the mouth of the feed-channel and embrace the blank presented at the mouth of the channel and travel with the blank in its passage between the dies until the blank which they hold, passing from the first pair of dies, will be forced from the periphery of the first revolving die into contact with the ribbed surface of the second revolving die, substantially as described.

3. In a machine for forming screw-threads, two or more pairs of dies, each pair consisting of a revolving die and a stationary curved die, the respective pairs of dies having ribs on their working-faces, the ribs on the one pair varying in depth or width from those on the other pair, for the purpose of forming the thread of a screw or bolt by a series of two or more progressive operations, combined with spring-forks arranged to travel in a plane parallel with the revolving die of one pair, and also to move radially toward and from their center of motion, so that, receiving the blanks, they travel with the same in their passage between the dies until, the blanks which they hold passing from the pair of dies which work in connection with said forks, they will be forced from the periphery of the revolving die of that pair into contact with the revolving die of the next pair, substantially as described.

251,875. MACHINE FOR TAPPING NUTS. HAYWARD A. HARVEY, Orange, N. J. Filed May 27, 1881. (No model.)

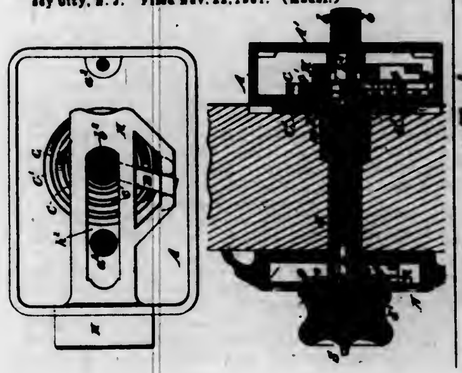


Claim.—In a machine for tapping nuts, two taps arranged in longitudinal alignment, for acting successively on the nut-blank from opposite sides thereof, and having the capacity of reciprocating endwise movement, and means for rotating and reversing the direction of rotation of the two taps, in combination with a feeding-tube or conveyer for a nut-blank, and means for holding the nut-blank in the path traversed by the tap successively, and means for discharging the finished nut after the two taps have operated upon it from opposite sides, substantially as set forth.

251,875.

251,876. PERMUTATION-LOCK. GEORGE H. HATHAWAY, Jersey City, N. J. Filed July 1, 1881. (Model.)

Brief.—An auxiliary permutation-lock is arranged within the main dial and adapted to lock the latter.

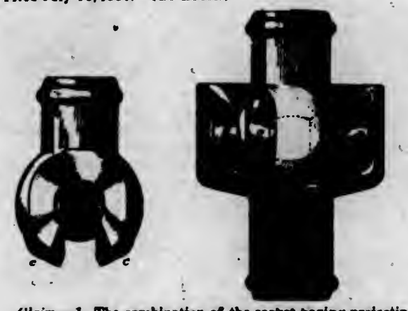


Claim.—1. In a permutation-lock, a concealed auxiliary permutation-lock within the main dial, and adapted to lock said main dial against manipulation, as and for the purposes set forth.

2. In a safe-lock, the combination of duplex dials, spindles, disks, and knobs, one concealed within the other and one adapted to lock the dial of the other when the combination is off, as specified.

3. The combination of the main dial A and knob A' and a main locking mechanism with the auxiliary locking mechanism, the bolt F, spindle G, and auxiliary knob and dial concealed within the knob A', and the duplex spring E, as specified.

251,877. PERMUTATION-LOCK. GEORGE H. HATHAWAY, Jersey City, N. J. Filed Nov. 23, 1881. (Model.)



Claim.—1. In a permutation-lock, a pawl-arm for moving and locking the bolt, combined with a socket-spring, whereby said arm is made to engage the operating-shaft, the recessed concentric rings, and the operating-ring adapted to permit said arm to manipulate said bolt, and the bolt provided with recesses and slot, as described, all arranged to operate as specified.

2. In combination with the lock-frame A, having a series of concentric recesses, C', the concentric rings C e e', the operating-ring F f, the pawl-arm B, and bolt H, provided with recesses and a slot, h', whereby the throw of said bolt is limited by the shank of the pawl-arm and socket-ing e', substantially as specified.

3. The combination, with the primary and secondary locks having concentric recesses and concentric rings, as described, of the connecting stem or shaft, the operating spring-arms, the operating-ring, and the slotted and recessed bolt in the secondary lock, all arranged to operate substantially as specified.

4. The main shaft E, having serration e, and the operating-ring F f, combined with the serrated screw, with the arm B, having serrations b', and with a spring, as set forth.

251,878. SHAFT-COUPLING. CALVIN G. HAYES, Sedalia, Mo. Filed July 16, 1881. (No model.)

Claim.—1. The combination of the socket having projecting bearings or bearings in the projections with the roller provided with or having inclined bearing-faces g g and e e and the arms, substantially as described.

2. The combination, with a socket and arms, of the wooden pins adapted to prevent undue crowding of the parts, substantially as described.

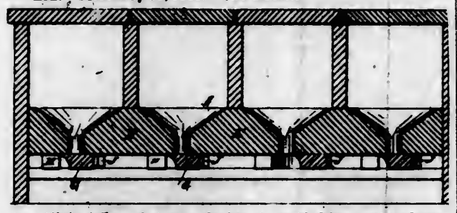
3. The combination of the arms, the roller, and the wooden pin projecting inwardly, whereby the roller is retained in place when set up, substantially as described.

4. The combination, with the socket part of the coupling, of the sleeve a, provided with central perforation, and projections or stops b b, arranged in opposite corners, substantially as described.

251,879. CORN-PLANTER. WILLIAM A. HAZELRIGG, Napoleon, Ind. Filed Oct. 1, 1881. (Model.)

Brief.—The frame carrying the planting devices is hinged to the rear of the main riding and lever frame. The lifting-rods have a spring-connection. There is a sliding rack, a lever, and seat for hill-dropping, which are all removable to convert the machine into a drill, and belts or chains for this purpose are placed upon the drums on each section. Divided hoppers for corn and fertilizer.

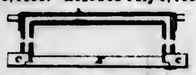
Claim.—1. In a corn-planter, the hinged frame or section A, carrying the double rack, adjusting-lever, rock-shaft, and connecting-rod, in combination with the frame C, carrying the double hoppers, the dropping-lever, sliding rack, feed-shaft, and the dropping-cups, and the hinge consisting of the shaft H' and the spring-arms K' K', substantially as specified.



2. In a corn-planter, the hinged frame A, carrying the double rack and adjusting-lever, in combination with the frame C, carry-

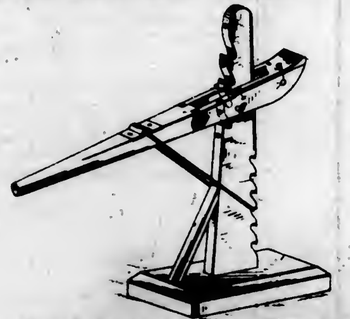
ing the double hoppers, the dropping-lever P, sliding rack O', the shaft M, having pinion O and dropping-cups N N, and the agitators Q Q', rods Q^2, rucking levers Q^3, and rods R, connected to the wheels H, substantially as specified.

3. In a corn-planter, the section A, provided with the gear T' upon its axle T, the hinge consisting of the shaft H', supported in bearings, as shown, and having spring-arms K' K^2, and the gears U U^2, in combination with the section C, carrying the double hoppers, the shaft M, having gear V and dropping-cups N N, and the chains W and Y, substantially as specified.



4. In a corn-planter, the section C, having the hoppers L, shaft M, double dropping-cups N N, and pinion V, and provided with the removable rack, lever, and seat, whereby it is adapted to be converted into a seed-drill, substantially as specified.

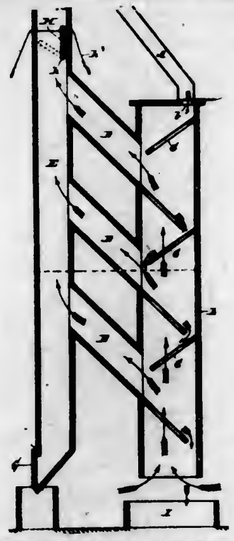
251,880. SHOT-CASE. CHARLES C. HENDERSON, Arkadelphia, Ark. Filed May 28, 1881. (No model.)



Claim.—In a shot-case, the box A, divided by a series of partitions into a number of compartments, each compartment being provided with a sample-recess upon its opposite sides and having glass fronts L, and the bottoms of the compartments perforated and constructed as shown, in combination with the stops H, pivoted valves G, springs J, and supporting-rail K, substantially as set forth.

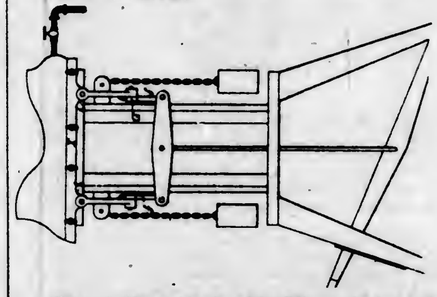
251,881. REFRIGERATOR. GEORGE C. HOGGSON, Allegheny, Pa. Filed Nov. 15, 1880. Renewed July 6, 1881. (Model.)

Claim.—In a refrigerator, the combination of the frame A, the support D, having the ribs i, the ice-box F, having perforated sides m, and provided with the door E, the box being made removable from the frame, and a space left all around the box for the free circulation of air, substantially as shown.



251,882. WAGON OR LIFTING JACK. LORA B. HOIT, Worcester, Mass. Filed Nov. 21, 1881. (No model.)

Claim.—In a wagon or lifting jack, a standard provided at its front edge with a re-enforcing strap and with notches opening downward, and at its rear edge with notches opening upward, the material about the latter being strengthened by rivets passed through the standard and strap, as described, combined with a slotted lever having a fulcrum adapted to rest in one of the notches at the rear edge of the standard, and with a loosely-hung shackle or link fitted to enter any of the notches at the front edge of the standard, substantially as specified.



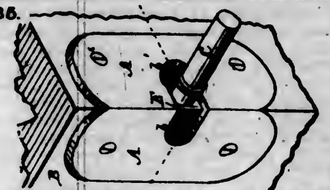
251,883. GRAIN-CLEANER. WILLIAM C. HOLMES, Indianapolis, Ind. Filed Aug. 3, 1881. (No model.)

Claim.—1. The combination of the cleaning-spout B, containing perforated inclines C and located above the hopper I, the suction-tube E, constructed as shown, and the tubes D, connecting said spout and said tube, all substantially as shown and described, and for the purposes specified.

2. The combination of the grain-spout A, cleaning-spout B, wire-netting inclines C, connecting-tubes D, and suction-tube E, having trap-door G and regulating-door H, all substantially as shown and specified.

251,884. APPARATUS FOR FORMING AND SHAPING CORSETS. JAMES ALFRED HOUSE, Bridgeport, Conn. Filed Nov. 23, 1881. (No model.)

Claim.—1. The combination of the sliding carrier-frames, the overarms pivoted to said frames, the holder-arms, the corset-clamps, and the form, substantially as and for the purpose hereinbefore set forth.

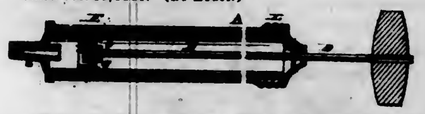


2. The combination of the vertically-sliding carrier-frames, the overarms independently pivoted thereto, the pivoted corset-holders, the corset-clamps, the form, and means for depressing the overarms, substantially as and for the purpose hereinbefore set forth.

3. The combination of the corset-holders, the vertically-sliding independently-adjustable carrier-frames to which said holders are pivoted, the overarms, the treadle, and the link connecting the overarms and treadle, these members being and operating substantially as hereinbefore set forth, to form the corsets of varying sizes at the hips and busts, as described.

251,885. GATE-HINGE. MILLER B. HUDSON, Canandaigua, N. Y., assignor of one-half to Oscar H. Crane, same place. Filed Oct. 24, 1881. (No model.)

Claim.—1. The combination, in a gate-hinge, of the case consisting of the V-shaped plates A A, fitting the corner of a post, provided with the cross-slot *b b'*, extending into both plates, and with the cross-bearings *d d* on the back side above and below the cross-slot, and the horizontal shaft C, supporting the roller, provided with the vertical pintle E, the shaft projecting out through

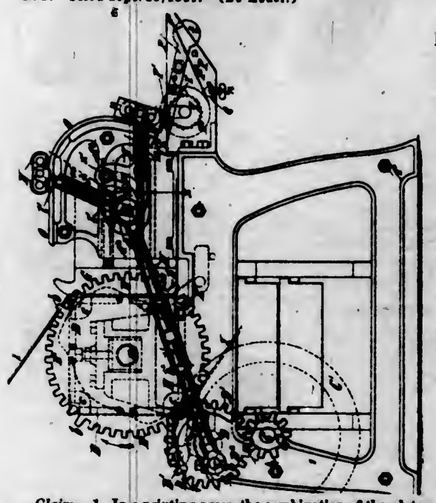


251,886.

the cross-slot and the pintle resting between the cross-bearings, as herein shown and described.

2. In a gate-hinge, the V-shaped case A A, provided with the cross-slot *b b'*, extending into both plates, and the cross-bearings *d d* on the back side above and below the cross-slot, as and for the purpose specified.

251,886. AIR-PUMP. HENRY HUMPHERVILLE, Mountville, Pa. Filed Oct. 25, 1881. (No model.)



Claim.—1. An air-pump provided with a convexo-concave bottom, in combination with a nozzle which extends into the pump-cylinder for a sufficient distance, as and for the purpose described.

2. The combination, in an air-pump designed to be used with atomizers, of cylinder A, elongated screw-cap L, bottom b, piston E, and nozzle C, extending into the pump-cylinder, substantially as described.

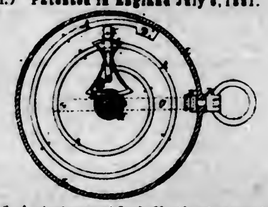
251,887. METHOD OF TREATING MAIZE OR OTHER GRAIN IN THE MANUFACTURE OF BEER, SPIRITS, GLUCOSE, GRAPE-SUGAR, AND OTHER PRODUCTS. HENRY C. HUMPHREY, New York, assignor to FRANZ C. MATTHIESSEN, Irvington, and WILLIAM A. WIECHERS, New York, N. Y. Filed July 9, 1881. (No specimens.)

Claim.—The mode of freeing the germs from corn herein described, which consists in treating crushed corn with hot acidulated water for a sufficient period to render the starch soluble, and to thereby form a suitably dense starch solution, in which the hulls and other undissolved portions of the corn will sink, while the germs float upon the surface, and in then skimming or otherwise removing the germs from the surface of the starch solution.

251,888. PRINTING-PRESS. JAMES HUMPHREY, Brooklyn, N. Y. Filed Sept. 28, 1881. (No model.)

Claim.—1. In a printing-press, the combination of the platen B, of square or polygonal form, the continuously-rotated crank-shaft D on one side thereof, the bed G, having an upright face arranged on the opposite side of said platen, the gear-wheel B' and the mutilated pinion D^1 on the shaft D, for rotating the platen intermittently, and connecting-rods H on opposite sides of the press, forming a direct connection between the shaft D and the bed, substantially as specified.

2. The combination of the platen B, having notched projections e, the pivoted stops E F, and the shaft D and cam s, for shifting the stop F, all substantially as specified.



3. In a printing-press, the combination of an intermittently-rotating platen, of square or polygonal form, a reciprocating bed movable toward and from the platen and having an upright face, a frame in which said bed is movable, an ink-distributing table supported on said frame, and a roller-carriage operated by the movement of the bed, and carrying inking-rollers which are caused to travel over said table and down over the form, substantially as specified.

4. The combination of the bed G, provided with wrist-pin *g'*, the crank-shaft D, and the connecting-rod H, fitting said wrist-pins, the distributing-table O above the bed, a roller-carriage fulcrumed on said wrist-pins, and having an arc-shaped slot or slots, a, and the fixed stud or studs *a'*, fitting therein, substantially as specified.

5. The combination of the bed G, provided with wrist-pins *g'*, the roller-carriage composed of the frames L, having arms *j j'*, and arc-shaped slots a, rollers M N, carried by said arms, and the fixed studs *a'*, all substantially as specified.

6. The combination of the ink-fountain P, the fountain-roller P', the movable fountain-bottom P^3, and the eccentric-roller Q, extending along said bottom, for adjusting the same and supporting it at all points in its length, substantially as specified.

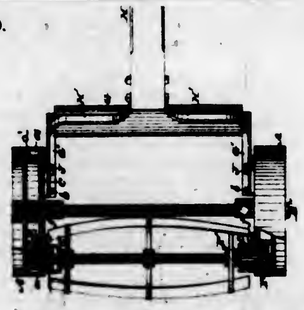
251,889. VOLUTE-TUBE THERMOMETER. HORITZ IMMISCH, London, County of Middlesex, England. Filed Aug. 1, 1881. (No model.) Patented in England July 6, 1881.

Claim.—1. An instrument for indicating temperatures, consisting of a volute tube hermetically sealed at both ends, fixed at one end and free at the other, combined with a dial, a pointer to move over said dial, and suitable means for connecting said pointer with the free end of said tube, whereby changes of temperature causing corresponding changes of tension of said tube and resultant movements of its free end will be indicated by said pointer.

2. The volute tube fixed at one end, exhausted of air, and hermetically sealed at both ends, combined with a surrounding space filled with highly-expansive heat-absorbing vapor, and suitable mechanism to move a hand or pointer over a suitably-divided dial when said tube expands or contracts.

3. The tube A, fixed at one end and at its free end attached to the pivoted segment-trunk T, combined with the pivoted segment B and the segment K, fixed thereto and in engagement with the segment I, and the indicator-bearing pinion C, as set forth.

4. The volute tube and the revolving indicator-hand, with suitable connecting mechanism, combined with a stop bearing-spring, wherein the spindle of said indicator is supported, and means whereby said spring may at will be depressed or released, and when said spring is released said spindle will be raised up and arrested in position.



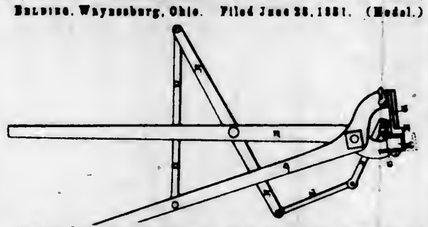
5. A volute tube and a revolving indicator-hand carried by a spindle controlled by the expansion or contraction of said tube, combined with the stop bearing-spring O, eccentric N, and means whereby said spindle and indicator may be arrested when raised up.

251,890. LAWN-MOWER. GEORGE F. JOHNSON, Philadelphia, Pa. Filed July 18, 1881. (No model.)

Claim.—1. In a lawn-mower, the rotary cutter and its shaft and the driving-wheel, in combination with the ratchet or clutch mechanism, consisting of a fixed ratchet and a loose pinion located side by side, both on said shaft, the pinion being on the outside and adapted to slide on the shaft, the driving-wheel limiting the sliding movement, substantially as set forth.

2. The driving-wheel with its toothed rim and the engaging-pinion, in combination with the box C, having a laterally-project-

251,890.



ing rim, *a'*, the portion *a''* whereof is segmental, substantially as set forth.

3. The driving-wheel A, box C, rotary cutter E and its shaft D, and the ratchet mechanism, in combination with the box *a'''*, secured to box C and inclosing the fixed part of said mechanism, and acting as bearings for said shaft, substantially as set forth.

4. The roller G, provided with arms G', the upper widened parts of which have segmental slots *c*, in combination with the bolts *b* J, the handle-braces H', and the boxes C, having curvilinear series of holes *d*, substantially as set forth.

251,891. ROOFING-SEAMER. ROBERT JONES and THOMAS C. BALDING, Waynesburg, Ohio. Filed June 28, 1881. (Model.)

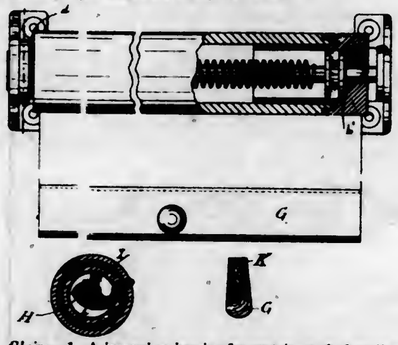
Claim.—1. The combination of the two jaws A E, pivoted together by means of suitable operating-levers, with a third folding-jaw, which closes downward against the inner side of the jaw A when the two levers are opened and rises upward as the levers are closed together, and which jaw I is operated by a series of rods or levers which are fastened to the levers B D, substantially as shown.

2. In a roof-seamer, an adjustable slide connected to one of the jaws, whereby the jaw can be extended in the direction in which the tool is being moved, substantially as set forth.

3. In a roof-seamer, the combination of the two jaws A E, pivoted together by means of suitable operating-levers, and provided with an extension and an extensible slide, substantially as specified.

4. In a roof-seamer, the combination of the two jaws A E, pivoted together by suitable operating-levers, in combination with a hinged jaw, which is fastened to the jaw A, and its connecting-rods and levers, for uniting it to the two operating-levers, substantially as shown and described.

251,892. BELT-STRETCHER. PETER H. KEIM, Dixon, Ill. Filed Nov. 21, 1881. (No model.)



Claim.—1. The belt-keepers A A, upon both ends of which are downwardly-projecting blocks or lugs *a*, which have upon their inner sides wedge-shaped grooves, in which slide the belt-wedges *a'*, adapted to hold the keepers firmly to the belt without slipping, said keepers being further provided upon the outer sides of the lugs *a* with pulley-blocks a^2, in which are journaled pulleys a^3, all arranged to operate substantially as and for the purposes specified.

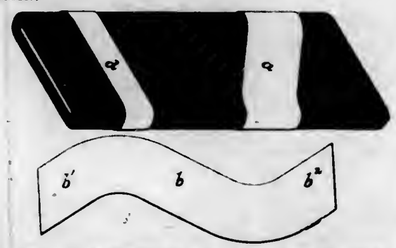
2. The keepers A and their pulleys a^3, in combination with the ropes B and windlass C, all arranged to operate as described.

3. The windlass C, provided with a ratchet, *c'*, pawl c^2, lever c^3, and ropes B, operating in combination with the keepers A A and their attachments substantially as and for the purposes specified.

251,893. SPRING-BALANCE SHADE-ROLLER. DANIEL E. KEMPTON, Boston, Mass. Filed Sept. 5, 1881. (No model.)

Brief.—The spindle, cam, and locking-cylinder are corrugated, and when the roller is taken from the brackets the action of the spring throws them in contact, locking the spindle. One of the journal-bearings of the roller is provided with a bushing of a material composed of cotton and rubber, and the friction created thereby, with the weighted shade-stick balancing the force of the spring, forms the curtain-stop. The stick is grooved on both sides, and the weight placed therein clamps the stick.

Claim.—1. A journal or bearing for curtain or shade rollers, having a bearing-surface of cotton and rubber, substantially as and for the purpose herein specified.

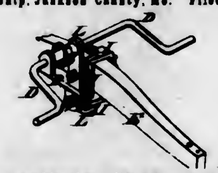


2. [illegible] spindle-cam H, having sides *h h'* and corrugations 1 2 3 *d*, [illegible], and pocket *a*, for the purpose set forth.

3. The locking-cylinder I, corrugated on its periphery, adapted to secure frictional contact, as represented and set forth.

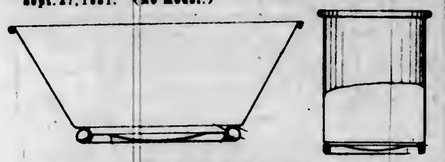
4. The shade-stick G, grooved on its edge and both of its sides to receive and hold the weight K, substantially as shown in Figs. 7, 8, and 9.

5. A metal weight for loading window-shade sticks, constructed as described, so as to clasp or clamp a portion of said stick and attach itself thereto without the necessity of any other fastening, substantially as shown in Figs. 7, 8, and 9.



251,894. LABEL-BAND FOR DRY-GOODS PACKAGES. BARTON E. KINSMAN, New York, N. Y. Filed Oct. 13, 1881. (No model.)

Claim.—1. In combination with a package of dry-goods, a label-band, *a*, crossing the package diagonally, as set forth.



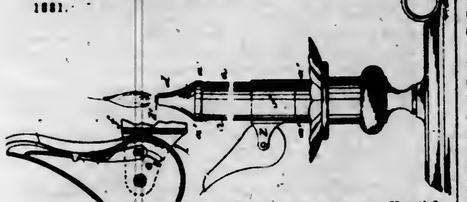
2. A label-band, *a*, for dry-goods packages, said band having the three inclined portions *b*, *b'*, and b^2, as shown, and adapted to cross the package diagonally, substantially as set forth.

251,895. COUPLING FOR SULKY-PLOWS. MICHAEL KITE, Prairie Township, Jackson County, Mo. Filed Oct. 24, 1881. (Model.)

Claim.—The combination, with a draw-bail, D, of a plow-beam clamp, I, bolt J, and bracket L O P, the clamp turning horizontally on the bolt and the bracket vertically on the bail, as and for the purpose specified.

251,896. ATTACHING BOTTOMS AND TOPS TO SHEET-METAL VESSELS. GEORGE W. KNAPP, Baltimore, Md. Filed Sept. 27, 1881. (No model.)

Claim.—1. A sheet-metal vessel with its head or end joined to the body by a coiled seam, the center of which is placed at or near the angle formed by the intersecting lines of the head and of the body, substantially as shown and described.

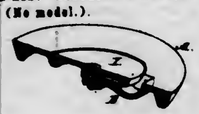


2. A sheet-metal vessel with its head or end joined to the body by a coiled seam, this seam being so located and placed that a portion of it shall be embraced within the lines of the head and the body and occupy a space in the interior of the vessel, substantially as shown and described.

251,897. RELIEF-VALVE. SYLVANUS R. KNEELAND, Boston, Mass. Filed Sept. 17, 1881. (No model.)

Claim.—The improved relief-valve described, consisting of the tube *m*, diaphragm D, annulus E, washer K, nut *z*, and screw-bolt F, in combination with the body A B, provided with the seat H and outlet I, substantially as and for the purpose specified.

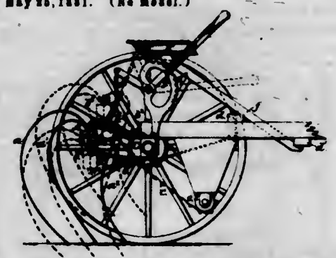
251,898. LAMP. EDUARD KÖHLER, Cameen, Prussia, Germany. Filed Nov. 2, 1880. (No model.) Patented in Germany Sept. 22, 1880, in Belgium Oct. 15, 1880, in England Oct. 15, 1880, in France Oct. 15, 1880, in Italy Oct. 15, 1880, in Sweden Dec. 1, 1880, in Austria-Hungary Dec. 11, 1880, and in Spain Jan. 6, 1881.



Claim.—1. A safety-lamp similar in form to a candle-stick, composed of an elongated tubular body or reservoir adapted to receive a vertically-sliding lighting attachment, a conical burner detachably fastened to the upper end of said tubular body and provided with a central wick-tube, and a supporting-plate at the lower end of the body, said body being divided below the burner by a perforated plate or screen into two parts, the lower part being filled with sponge or other porous material, while the part above the screen is filled with wadding or other material, by which the oil is transmitted from the lower part to the wick, substantially as described.

2. The combination, with a tubular reservoir, *a*, having a burner, *d*, and an upper shoulder or stop, *a'*, of a sliding sleeve, *f*, and a percussion lighting device pivoted to the brackets of the sleeve, substantially as described.

3. As an improvement in lighting devices for lamps, the combination, with a reservoir and burner, of an oscillating percussion lighting device provided with means for automatically striking the fulminate upon approach of the lighting device to the burner of the lamp, substantially as described.



251,899. STOVE-LID. BENJAMIN S. KOLL, Salem, Ohio. Filed June 23, 1881. (No model.)

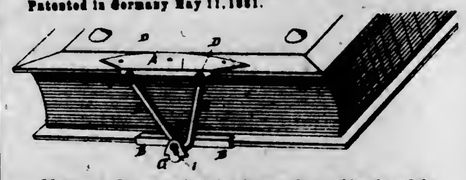
Claim.—1. In a two-part stove-lid, the combination, with the rim A, provided with the arm B, of the center plate, I, perforated centrally and secured to the arm B by a bolt and nut, substantially as specified.

2. In a two-part stove-lid, the combination, with the rim A, having the arm B, concave for a portion of its length, cut away at its edges, and perforated near its inner end, of the center plate, I, secured to the arm B by bolt and nut to form the ventilated lifter-socket, substantially as specified.

251,900. SULKY-HARROW. CHARLES LA DOW, Albany, N. Y. Filed May 25, 1881. (No model.)

Claim.—1. In a harrow, the combination, with an axle, B, supported by carrying-wheels, of a tooth-bar, A, vibratory spring-teeth thereon, and duplex hinged arms *b K*, for operation substantially as set forth.

2. In a harrow, the combination, with a supporting-axle, carrying-wheels, and a tooth-head hinged to said axle so that it will not cant or turn when being elevated or depressed, of two or more series of vibratory spring-teeth, which will be raised or depressed simultaneously, with the points of the teeth of one series on uniform horizontal planes, with the points of the teeth of the other series in every degree of elevation and depression, substantially as set forth, for the purpose specified.



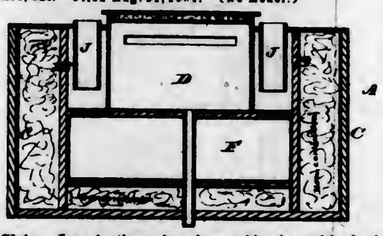
3. In a harrow, the combination, with a supporting-axle, vibratory spring-teeth mounted on a tooth-head, and duplex arms hinging said tooth-head with said axle, of a lever provided with a dog operating with a segmental rack attached to the axle or frame and a rod connecting said tooth-head to said lever, whereby the said tooth-head can be adjusted vertically and held set in position, substantially as and for the purpose set forth.

4. In a harrow, the combination, substantially as described, with a supporting-axle, carrying-wheels, and tongue or pole, of a sectional tooth-head hinged by duplex arms to said axle and provided with two or more series of vibratory spring-teeth, and mechanism by which said tooth-head will be elevated or depressed and held in any set position, substantially as set forth.

5. In a harrow, the combination, with axle B and sectional tooth-head A, carrying vibratory spring-teeth, of duplex yoked arms and eyes, as described, attaching said yoke-arms to the axle and tooth-head, respectively, whereby the sections of said tooth-bar will be held from swaying endwise in their hinged connection with said axle, substantially as set forth.

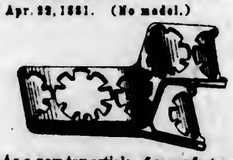
6. In a harrow, the combination, with a tooth-head, A, which is hinged rearward to an axle by duplex arms, which will hold said tooth-head from canting or turning when moved vertically, of two or more series or classes of spring-teeth, as described, each of different degrees of stiffness, and having the points of each series on the same horizontal plane during all stages of the oscillation of the tooth-head, substantially as and for the purpose set forth.

251,901. CLASP FOR ALBUMS. HERMAN LEDERERR, Offenbach-on-the-Main, Germany. Filed Sept. 23, 1881. (Model.) Patented in Germany May 11, 1881.



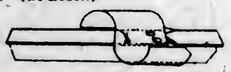
Claim.—1. In a clasp-lock for albums, the combination of the tube F and plate E with the plate G and inner tube, H, whereby the tube F and plate G operate as a knob to hold the hinged loop E when unlocked, substantially as shown and described.

2. A clasp-lock for albums and other purposes, constructed substantially as herein shown and described, and consisting of the stationary slotted tube F, the plate G, carrying the slotted inner tube, H, the pivot I, the ring J, having the lug L, and the spiral spring K, as set forth.



3. In a clasp-lock for albums and other purposes, the combination, with the looped plate B and the hinged loop E, of the stationary slotted tube F, the plate G, having slotted tube H, the pivot I, the ring J, having lug L, and the spiral spring K, substantially as herein shown and described, whereby the hinged loop and the looped plate can be readily fastened together and released, as set forth.

251,902. BOTTLE-COOLER. CHARLES H. LANPHOTTER, Sacramento, Cal. Filed Aug. 31, 1881. (No model.)



Claim.—In a bottle-cooler, the combination, with the ice-chamber D, water-chamber H, and cooling-chamber F, of the bottle-tubes J, secured in the top of the case A, and having their lower ends terminating above the top of the cooling-chamber, substantially as specified.

251,903. TOY FURNITURE. GEORGE W. LEWIS, Frankford, Pa. Filed Apr. 22, 1881. (No model.)

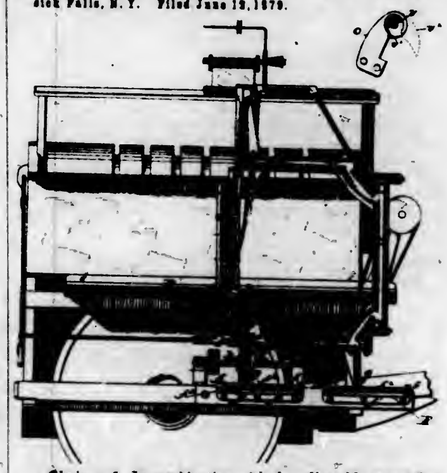
Claim.—As a new toy article of manufacture, the blank having a series of continuous apertures which indicate the points at which it is to be bent into the intended shape, and bent and folded upon itself continuously in the formation of the seat, legs, and back of the article, as shown and described.

251,904. FENCE-POST. MORTIMER G. LEWIS, Lewville, assignor of one-half to John E. Holford, New York, N. Y. Filed May 16, 1881. (No model.)

Claim.—1. In a fence-post of the character herein set forth, the anchor provided with projecting tongues adapted to enter corresponding openings cut in the flat side of the post, substantially as shown and described.

2. The herein-described fence-post, composed of the angular wrought-iron post and the angular anchor secured upon one side thereof by projecting tongues entering corresponding openings in the side of the post, (or by the described equivalent means,) the anchor being adapted to receive and transmit the force of the driving-blows, the whole constructed and arranged substantially as herein shown and described.

251,905. TIRE-TIGHTENER AND SPOKE-EXTRACTOR. GEO. W. LISCK, Kansas City, Mo. Filed June 27, 1881. (No model.)



Claim.—1. In a tire-tightener, the combination of a lever and a standard having a bearing for said lever, and connected by a link with a clamping-wedge, substantially as shown and described.

2. The standard A, provided with a backwardly-projecting seat, G, substantially as shown and described.

3. The lever E, provided with a plate, F, having prongs *f* and *g*, ribs *h* and *i*, and a rounded fulcrum-rib, *l*, for resting upon the standard-seat G, substantially as shown and described.

251,906. HARVESTER-BINDER. SYLVANUS D. LOCKE, Rockford Falls, N. Y. Filed June 13, 1879.

Claim.—1. In combination with the adjustable supporting-frame of the binding mechanism, the casting or castings F, having ears or lugs which serve as stops to limit the movement of said frame, and the removable traveler-rods *f'*, passing through and having their bearings in said lugs.

2. The casting F, formed with lugs for the reception or support of the traveler-rod, and a guard or flange for the initial reception and retention of the legs of the binding-frame.

3. The combination of the frame G, the continuously-rotating wheel C beneath the frame, the band-securing mechanism immediately driven by said wheel, the binding-arm, and the shafts and gears forming a direct train between said binding-arm and wheel, whereby the parts are driven by the latter and timed in unison.

4. In combination with a gaveling-arm, the oppositely-acting vertical spring compressor and separator supported from an overhanging portion of the frame.

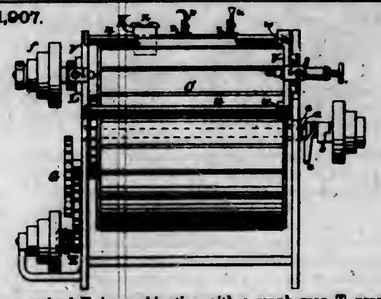
5. In combination with a rotary twister, the elastically-yielding snubbing and clamping plate *e*, underlying the arm or arms of said twister, substantially as described.

6. In combination with a rotary twister, the elastically-yielding snubbing and clamping plate, formed with annular depression *e*, gain or notch *e'*, and guide-grooves *e*³, substantially as described.

7. The combination of the twisting-hook, the spring snubbing and clamping plate *e*, the plate *r*, and the cutter *c*, substantially as described.

8. The continuously-rotating driving-wheel, an intermittingly-operating band-carrying arm driven by said wheel through a direct train-connection therewith, and intermittingly-operating band-securing devices immediately driven by said wheel, combined substantially as described.

9. The combination of the continuously-rotating driving-wheel, the supporting-frame having top and bottom horizontal arms joined by a vertical side arm or post, the three shafts contained in said arms and connected at the angles by beveled-gear wheels with a stop-motion in the train, and the needle or binding arm driven intermittingly thereby, substantially as described.



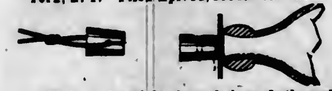
251,907. WOOD-TURNING MACHINE. GEORGE P. LOOMIS, Utica, N. Y. Filed Jan. 27, 1881. (No model.)

Brief.—A revolving knife-head carries a reciprocating slide with cutting-tools and adjustable gouging-tools. The head and tail stocks are adjustable toward and from this head.

Claim.—1. In a wood-turning machine, a slotted revolving cylinder or head for cutting-tools having one or more horizontal guides, H, adjustably secured thereto, and traveling heads bearing cutting-tools and operated by suitable mechanism, substantially as set forth and described.

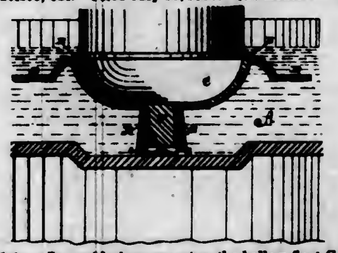
2. In a wood-turning machine, the revolving head having tubular bearings, through which passes an independent shaft, *a*, having gear-wheel F, in combination with a crank-gear, T, properly supported within the revolving head and connecting with case P, and the rocking lever N, connected with head K, substantially as set forth and described.

251,907.



3. In combination with the revolving head, the guide H, adjustably fixed thereto, the sliding head K, carrying cutting-tools, and connecting with a rocking lever held by an adjustable arm, O, said lever connecting with case P on shaft *a*, having gear-wheel F, and the crank-gear T, connected by rod S with case P, substantially as set forth.

4. In combination with the slotted revolving head, the knife-bearing standard *s*, having slots in its base, said slots extending in different directions, as and for the purpose set forth.



5. In a wood-turning machine, a lathe having a head or tail stock provided with a plate, *l*, and adjustable on a slotted plate, V, by means of screws *i* and *i'*, the said plate V being mounted on horizontal guides *u* and adjustable thereon, as herein set forth.

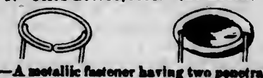
251,908. CORK FOR BOTTLES. THOMAS E. LOWDEN, New York, N. Y. Filed Apr. 18, 1881. (No model.)

Claim.—A cork having a hole made through it across its axis and a slit which is parallel with the said hole and reaches across the entire width of the cork and the entire depth from its bottom to the said hole for the reception of an extracting-cord, substantially as set forth.

251,909. SOLDERING APPARATUS. ALBERT LUSK, San Francisco, Cal. Filed July 16, 1881. (No model.)

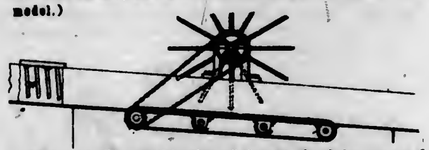
Claim.—In a soldering apparatus, the hollow float C, having its upper surface or rim fitted to receive the ends of cans, and provided with the rigid stem F, projecting from the bottom, in combination with a pot or bath, A, provided with the hollow vertical central guide-sleeve, E, to receive the stem, said sleeve having perforations at the bottom, through which the solder may flow in and act upon the bottom of the piston or stem F to assist in raising the float, and be ejected when the float is depressed, substantially as herein described.

251,910. BED-SPRING. CHARLES H. MCCREERY, Bradford, Ohio. Filed Oct. 8, 1881. (Model.)



Claim.—The springs A A, having their lower coils provided with interlaced hooks E, the ends of which are doubled in a horizontal plane, and turned slightly downward to form the points I, and smooth beveled ends, substantially as and for the purpose set forth.

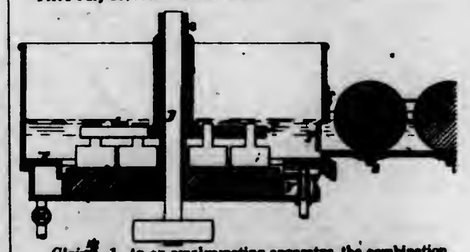
251,911. METALLIC FASTENER. GEORGE W. MCGILL, New York, N. Y. Filed Nov. 25, 1881. (No model.)



Claim.—A metallic fastener consisting of a staple made of round wire having its head flattened and its shanks pin-pointed and bent down at right angles from its flat head and passed for their entire length through two separate holes, *a a*, in the bottom of a metal cap, A, and secured thereto by means of a crown-piece, B, and the turned-over flange of the cap, substantially as and for the purposes herein shown and described.

251,912. METALLIC FASTENING. GEORGE W. MCGILL, New York, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—A metallic fastener having two penetrating-shanks of round wire of suitable length, pin-pointed at their outer ends, and their other end or head provided with a projecting clamping surface or surfaces integral with the shanks and at right angles thereto, in combination with a metal cap closed upon such projecting surface or surfaces, confining the shanks securely in separated parallel position and at right angles from the cap, substantially as and for the purposes herein set forth and described.

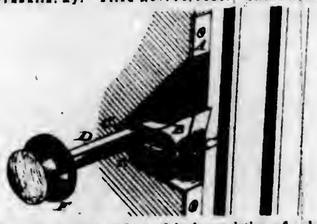


251,913. APPARATUS FOR CONCENTRATING ORES. HARRISON B. MUNGER, Chatham, N. Y. Filed Oct. 13, 1881. (No model.)

Claim.—1. The combination of the vat, the sluice arranged upon its top, a wheel arranged in the sluice, a connecting band or chain, and an endless apron which is moved by the wheel so as to drop its load in the tank, substantially as described.

2. In a concentrating-machine, the combination of a vat, a sluice arranged thereon and having its lower edge or bottom submerged in the water of the vat, an operating-wheel placed in the sluice and operated by the flow through the sluice, and moving device placed in the bottom of the sluice and operated by the wheel, the said moving device being submerged in the water of the vat, substantially as specified.

251,914. AMALGAMATOR. WILLIAM MOLLER, New York, N. Y. Filed July 16, 1881. (No model.)

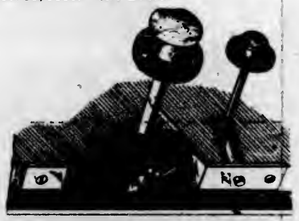


Claim.—1. In an amalgamating apparatus, the combination, with the pan, the vertical shaft B, the bed surrounding the shaft, and the revolving gravitating mullers, of the annular trough E, elevated above the plane of the bed on which the mullers travel, and arranged adjacent to the sides or vertical walls of the pan below the lateral outlet-orifice in the latter, all substantially as and for the purpose described.

2. The combination, substantially as hereinbefore set forth, of the amalgamating-pan constructed with the outlet-orifice in its side

and with the lateral branch or wing opposite to such orifice, having traps (one or more) in the bottom thereof, and the revolving cloth-covered rollers (one or more) arranged in said branch of the pan to dip into the traps, for the purpose specified.

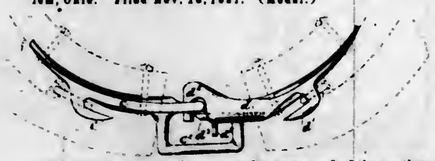
251,915. SASH FASTENER AND HOLDER. JOHN B. MONTAGUE, Franklin, Ky. Filed Nov. 18, 1881. (No model.)



Claim.—1. A sash holder and lock consisting of a slotted case or sheath, a slotted gravitating dog or eccentric seated therein, a locking-bolt sliding through the dog or eccentric, and a prismatic shank extending through said parts, substantially as described.

2. In a sash-holder, a case or sheath, A, provided with a curved seat, *a*, to receive the end of the dog or eccentric, as explained.

3. In combination with the case or sheath provided with arms *b*, having the circular-ended slots *c' c'*, a slotted dog or eccentric, a perforated locking-bolt sliding within the dog or eccentric, and an operating-shank passed through the slots and perforation and completely filling the latter, but free to turn in the enlarged end of the slots, as set forth.



4. The herein-described sash holder and lock, consisting of the case or sheath A, constructed as explained, slotted dog B, bolt C, shank D, and slotted plate F, all combined and operating as set forth.

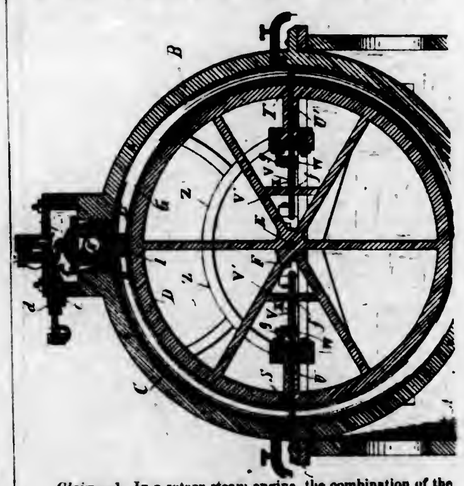
251,916. SASH FASTENER AND HOLDER. JOHN B. MONTAGUE, JAMES T. BOOKER, and ENOCH C. DINNING, Franklin, Ky. Filed Nov. 18, 1881. (No model.)

Claim.—The herein-described sash holder and lock, consisting of case A, dog B, provided with arms *b*, serrated block or eccentric D, pivoted in said arms, and spindle C, all combined and operating substantially as set forth.

251,917. HAME AND COLLAR COUPLER. JAMES MOSSMAN, Westerville, assignor of one-half to Harnell L. Bennett, Harlem, Ohio. Filed Nov. 10, 1881. (Model.)

Claim.—A collar or hame coupler composed of the section *c*, provided with hook *c'* and martingale-loop, and having formed in its lower end the eye or loop to receive the hook on section *d*, and section *d*, provided with hame-hook and formed at its lower end with hook *d'*, and having formed in it nearly opposite the end of the hook *d'* a longitudinal socket, in which is placed the bolt *d'*, beveled at its outer end and provided with thumb-piece *d'*, and a spring arranged in the socket to bear between base of socket and rear end of bolt and hold the same out against the end of hook, the said bolt being arranged to bear against the end of hook and secure the eye on section *c* in the loop thereby formed on section *d*, substantially as set forth.

251,918. COMPOUND FOR PRESERVING WOOD AND METAL. LORENZO D. MOTT, Marshalltown, Iowa. Filed Oct. 17, 1881. (No specimens.)



Claim.—The above-described composition of matter to be used for rendering wood and metal fire and water proof, consisting of gas-tar, sulphur, salt, yellow ocher, and brown mineral paint in about the proportions specified.

251,919. PROCESS OF REDUCING AND SEPARATING MAIZE. MARTIN L. HOWARD, Dayton, Ohio. Filed Oct. 3, 1881. (No specimens.)

Claim.—1. The process herein described of reducing Indian corn into grits, the same consisting in first reducing the corn to hominy, then separating the hull and flour, and then subjecting the broken kernels to continuous gradual and successive reductions and separations of the flour after each reduction until the harder or flinty portions of the kernels are reduced to grits deprived entirely of the softer portions of flour, substantially in the manner and for the purpose described.

2. The process herein described of treating maize, which consists in steaming the grain, hulling it, separating the flinty or harder portions from the flour, and then subjecting the flinty or harder portions of the kernel to gradual and successive reductions and separations of the flour after each reduction until the flinty or harder portions are reduced to grits deprived entirely of the softer portions of flour, all substantially in the manner and for the purpose described.

251,920. STEAM-ENGINE. ENOS W. HYDE and CARLOS D. BRADLEY, Macedonia, Iowa. Filed Oct. 6, 1881. (No model.)

Claim.—1. In a rotary steam-engine, the combination of the grooved stationary casing B C, the grooved wheel D G, and the packing-rings H H, forming portions of the casing, whereby, when said parts are united, the bore of the cylinder is formed, substantially as specified.

2. In a rotary steam-engine having the grooved casing and the rings H, the wheel D, carrying the stem-valves S T, having half-round points and stems passed through the boxes U U' and perforations *f* in arms V' between the spokes of the wheel D, the cross-heads W, and spiral springs X, to hold the valves to their normal positions when not actuated by the guides Z Z, substantially as specified.

251,921. MANUFACTURE OF PREPARED ROOFING. THOMAS NEW, New York, N. Y. Filed Nov. 21, 1881. (No model.)

Claim.—1. An improvement in the manufacture of prepared or ready roofing, the same consisting in inserting and rolling up with the roofing a layer of dry felt or paper, substantially as and for the purpose set forth.

2. As an improved article of manufacture, prepared or ready roofing provided with an extra layer of dry felt or paper, substantially as and for the purpose herein described.

251,922. BOTTLE-STOPPER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed June 23, 1881. (Model.)

Claim.—1. In a bottle-stopper, the combination of a screw-

251,922.

threaded tube-section attached to the flange B, and provided with a valve-seat, a screw-threaded tube-section engaging therewith and provided with a valve and with a horizontally-projecting spur, and a stop supported above the flange B and in the lateral path of the spur, substantially as set forth.

2. In a bottle-stopper, the combination of a screw-threaded tube-section attached to the flange B, and projecting both above and below said flange, and provided with a valve-seat, a screw-threaded tube-section engaging therewith and provided with a valve and with a horizontally-projecting spur, and a stop formed on the upwardly-projecting flange which is attached to said flange B, and in the lateral path of the spur, substantially as set forth.

3. In a bottle-stopper, the combination of a screw-threaded tube-section attached to the flange B, that portion which projects above the flange being screw-threaded internally and provided with a valve-seat, an externally screw-threaded tube-section engaging therewith and provided with a valve and with a horizontally-projecting spur, and a stop formed on the upper end of the cork-tube and in the lateral path of the spur, substantially as set forth.

4. The combination, in a bottle-stopper, of the internally screw-threaded tube-section projecting above the flange B, and having a central opening, *a*, with the externally screw-threaded tube-section E, closed at its lower end, and having one or more eccentric ports *c*, substantially as set forth.

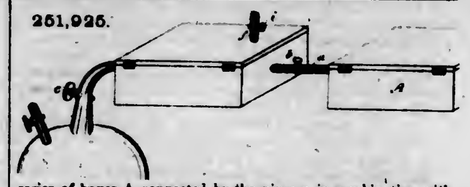
251,923. BOTTLE-STOPPER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed June 23, 1881. (Model.)

Claim.—1. In a bottle-stopper, a discharge-tube having at its upper end a flat circular plate provided with an eccentric port, in combination with a cap-plate having an eccentric port, and a downwardly-projecting flange mounted upon and secured to the upper face of the tube-plate by means of a groove and a projection which engages with the groove, and a stop which limits the rotation of the cap-plate, substantially as set forth.

2. In a bottle-stopper, a discharge-tube having at its upper end a flat circular plate, an eccentric port, and an eccentric vent-tube, in combination with a cap-plate having two eccentric ports, and a downwardly-projecting flange mounted upon and secured to the upper face of the tube-plate by means of a groove and a projection which engages with the groove, and a stop which limits the rotation of the cap-plate, substantially as set forth.

251,924. METHOD OF INLAYING HORN, &c., WITH PIGMENT COLORS. FRED. A. NICKERSON, Springfield, Mass., assignor to the Dickinson Hard Rubber Company, same place. Filed May 31, 1881. (No specimens.)

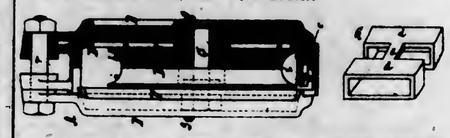
Claim.—The within-described improvement in the method of inlaying with colors the surfaces of horn, celluloid, and other rigid substances which are softened by heat, which consists in forming upon the surface thereof, while cold and rigid ornamental figures composed of colors adhesive to said cold surface, which, when dried, retain their form under heat and pressure, and in forcibly inlaying said colors into the surface of said materials by heating and pressing them after said colors shall have become dry and hard thereupon, substantially as set forth.



251,925. METHOD OF AND APPARATUS FOR DISINFECTING DEAD BODIES. JNO. D. NIETSCKE, Somerset, Ohio. Filed Sept. 7, 1881. (No model.)

Brief.—Carbonic-acid gas is generated in the retort and passed into the chambers for disinfecting bodies placed therein, where, by means of pipes and bellows, it may be forced from chamber to chamber, as desired.

Claim.—1. In the process of disinfecting corpses by means of gas, vapor, or fumes, the process of saving the gas, vapor, or fumes and using the same over again, consisting in forcing the gas, vapor, or fumes from one box or receptacle to another by means of bellows or other air-forcing device, substantially as described.



2. The apparatus herein shown and described for disinfecting by means of disinfecting vapors, gases, or fumes, consisting of the

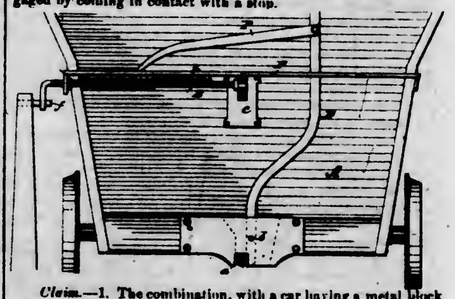
251,925.

series of boxes A, connected by the pipes *a*, in combination with the generator or retort B, the pipes being provided with the cocks *b* and the boxes being provided with the tubes *f*, having the cocks *i*, substantially as and for the purposes set forth.

251,926. TACKLE-BLOCK. JOSEPH W. HOUGHTON, Lockport, N. Y. Filed Nov. 15, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the inner metallic straps, the outer metallic frames or straps, the tubular projections extending from the outer frames or straps through openings in the ends of the inner straps, and the keys which extend through the tubular projections.

2. The combination, substantially as hereinbefore described, of the inner metallic straps, the outer metallic frames or straps, the tubular projections extending from the outer metallic frames or straps through openings in the ends of the inner straps, the H-shaped distance-piece, and the keys which extend through the tubular projections and through the H-shaped distance-piece.



3. The combination, with the inner and outer straps, of the lubricating-cup cast or otherwise attached to the inner surface of the inner strap, and covered at its open end by the fixed outer strap, the latter having a perforation communicating with the cup, which is closed by a removable plug, all substantially as and for the purpose described.

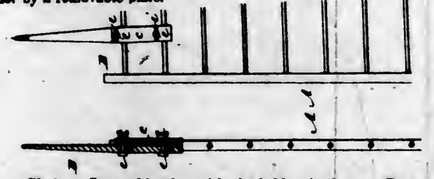
4. The cap *f*, connected with the inner surface of the inner strap, E, and projecting through the wooden cheek-piece F, in combination with the fixed outer strap, D, forming a cover to the cup and confining the wooden cheek-piece in place, substantially as and for the purpose described.

5. The combination, substantially as hereinbefore described, of the metallic rim A, the wooden disks fitting the interior of said rim, the pins *m m*, projecting from the rim, the straps *k*, extending diametrically across the disks, and provided with holes to engage with the pins *m m*, the hub *n*, extending from the first strap through the wooden disks and provided with a shoulder which bears the second strap, the pins *o o*, projecting from the hub, and the holes in the second strap to engage with said pins.

251,927. MEANS FOR CONNECTING AND DISCONNECTING CARS FROM THEIR TRACTION-ROPE. WILLIAM NORRIS, Cambridge, Ohio. Filed Oct. 28, 1881. (No model.)

Brief.—The car has a metal block having a notch formed in its lower side to receive the cable. A lever provided with a pawl which engages with an axially-moving tooth-bar is pivoted in said block to clamp the cable, is guided in a slotted bar, and is disengaged by coming in contact with a stop.

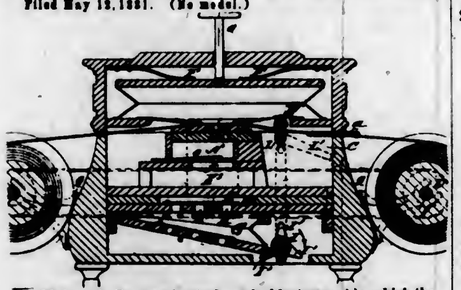
Claim.—1. The combination, with a car having a metal block with a notch, *a*, formed in its lower side to receive the cable, of



a lever having its end extended below the level of the notch to bear directly against and bite the cable in said notch, and means for holding the lever to its place, substantially as described.

2. The combination, with a coal-car and its traction-cable, of a clutch for connecting the two, and means, substantially as described, for disconnecting them automatically without stopping the rope, substantially as described.

3. The combination, with a coal-car and its traction-cable, of a clutch held to its place by a pawl, an axially-moving toothed bar for holding said pawl, and a stop or resistance for turning the said bar to throw its teeth from the pawl, substantially as described.



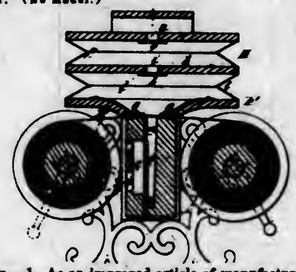
251,928. ATTACHMENT FOR LADDERS. JOSEPH D. HORTON and LEONARD H. HORTON, Leadville, Mass. Filed Oct. 5, 1881. (No model.)

Brief.—The arm is clamped to the upper rounds of the ladder by a removable plate.

Claim.—In combination with the ladder A, the arm B, secured to the two upper rounds of the ladder by the removable plate *c*, substantially as and for the purposes set forth.

251,929. MECHANICAL MUSICAL INSTRUMENT. ROBERT W. PAIN, New York, N. Y., assignor to Moses Harris, same place. Filed May 12, 1881. (No model.)

Claim.—1. In a mechanical musical instrument in which the operation of the sound-producing devices is controlled by one or more traveling perforated strips or sheets, and in which air under pressure is used to produce the necessary notes or sounds, the bellows which forces the wind to the reeds or other sounding devices of the instrument arranged within a box-cover over the tubes, said cover being hinged on the top of the action-board, substantially as herein shown and described.



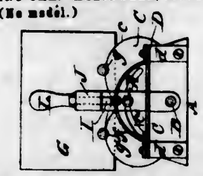
2. In a mechanical musical instrument in which the operation of the sound-producing devices is controlled by one or more traveling perforated strips or sheets, the combination, with the bellows or air-reservoir, of an attached key or push-pin, substantially as herein shown and described, whereby the tones of the reeds or other sounding devices may be changed in expression and crescendo, diminuendo, and tremolo effects produced, as set forth.

3. In a mechanical musical instrument in which the operation of the sound-producing devices is controlled by one or more traveling perforated strips or sheets, the combination, with the feeders or pumps G, of the rotating toggle-shaft I, provided with toggles I', substantially as herein shown and described, whereby said pumps are alternately moved to give a continuous supply of air to the bellows or air-reservoir, as set forth.

4. In a mechanical musical instrument in which the operation of the sound-producing devices is controlled by one or more traveling perforated strips or sheets, the combination, with a removable box-cover placed on top of the tube or action-board, of bellows or air-reservoir contained therein, for forcing the wind to the reeds or other sounding devices, substantially as herein shown and described.

5. In a mechanical musical instrument, a hinged cover inclosing the air-reservoir or bellows, which fits over the tubes D, and is adapted to be removed or opened for inserting the sheet of music, substantially as herein shown and described.

251,930. AUTOMATIC HARMONICA. ROBERT W. PAIN, New York, N. Y., assignor to Moses Harris, same place. Filed June 23, 1881. (No model.)

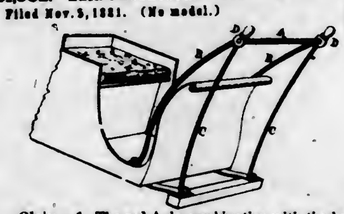


Claim.—1. As an improved article of manufacture, an automatic harmonica constructed substantially as herein shown and described, consisting of air pump or bellows secured over the air-ducts of an ordinary harmonica, which is supported in a suitable frame carrying a perforated music-sheet.

2. The combination, with a reed-plate fixed in a suitable air-chamber and carrying reeds riveted thereto, said chamber and plate being permanently fixed in supporting-standards, which latter also support drums carrying a perforated music-sheet, of a removable bellows and pump set on or over said reed-plate, substantially as shown and described.

3. The combination, with the harmonica A, of the open frame F, secured thereto by dowels *f f*, and having strips *g*, and the double bellows or pump H, firmly secured to the top of said frame, substantially as shown and described.

251,931. DUMPING-CAR. AARON PARE, Ottumwa, Iowa. Filed Aug. 2, 1881. (No model.)



Claim.—1. The truck-frame provided with the vertical plates C C, the upper edges of which are made heart-shaped, in combination with the car-box adapted to move upon said plates, as and for the purposes set forth.

2. The plates C C, formed with the curved edges and with the curved slots, in combination with the car-box G and the central rod, H, substantially as and for the purposes set forth.

3. The truck-frame provided with the rod B, the plates C C, formed with the curved slots *c' c'*, and the double-curved edges *e e*, in combination with the car-box resting upon the edges of the said plates and the rod H, and the link E, the rod H being placed in the said slots *c' c'*, as and for the purposes set forth.

4. The heart-shaped or double-curved plates C C, formed with the slots *c' c'*, in combination with the car-box G, rod H, levers L L, catches I I, and the plates *f f*, substantially as and for the purposes set forth.

251,932. REIN-PROTECTOR. CHARLES PARKER, Juneau, Ill. Filed Nov. 5, 1881. (No model.)

Claim.—1. The rod A, in combination with the knobs D and rods B and C, substantially as and for the purpose specified.

2. The rod A, having a screw-thread at each end, by which to attach it to the knobs D D, in combination with the rods B B and C C, having eyes at their lower ends, and the said knobs D D fastened to the upper extremities of said rods B B and C C, as and for the purpose specified.

251,933. CIGAR-LIGHTER. ERNEST A. PARKER, Meriden, Conn. Filed Oct. 18, 1881. (No model.)

Claim.—1. The combination, in a cigar-lighter, with one or more torch-receivers and torches and a lamp, of a body portion occupying a position between the torch receiver or receivers and the lamp-burner, and comprising a reservoir for supplying the torch-receivers with fluid and a separate fount for the lamp, substantially as specified.

2. The combination of the stand A, the torch-receivers C, the torches D, the fountain-reservoir B, and the lamp E, supported on said reservoir, having its oil-fount independent of said reservoir and adapted to be removed to permit the removal of the reservoir, substantially as specified.

3. The combination, in a cigar-lighter, of one or more torch-receivers and torches and a fountain-reservoir having at its lower end a contracted outlet-neck or tube and a vent-hole above the lower end or mouth of said tube, a single valve for closing both said outlet neck or tube and said vent-hole, and a petticoat or nozzle to surround said vent-hole and adapted to be sealed with liquid, substantially as and for the purpose specified.

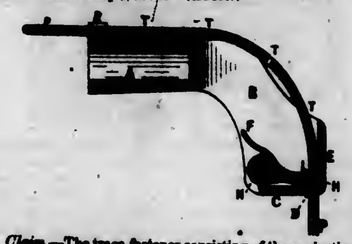
251,934. SULKY. MARTIN PAYEN, Troy, N. Y. Filed Sept. 16, 1881. (No model.)

Claim.—In a sulky-vehicle, the front and back braces, E E', clipped to the under side of the middle part of the axle, and the bifurcated side braces, G G', clipped to the top of the axle, in combination with the lateral seat-supports D, for connecting the seat C, and axle A, substantially as and for the purpose herein shown and specified.

251,935. THILL-COUPLING. HENRY T. PERHAM, Stamford, Ontario, Canada. Filed Aug. 29, 1881. (No model.)

Claim.—In a thill-coupling in which the end of the thill B is inserted in the usual way into the ordinary socket A, a coupling-pin, C, provided with a head, D, having a slotted groove, *a*, in combination with a detachable hook-bracket, F, and a ring E, one end of the latter fitting into a hole, *b*, in the detachable bracket F, and its other end slipped into the slotted passage-way *a* in the head D, the center of the spring being sprung over an elastic block, G, substantially as and for the purpose specified.

251,936. CLOTH-MEASURING REEL. JAMES H. PETERS, Meshesville, Tex. Filed Aug. 18, 1881. (No model.)

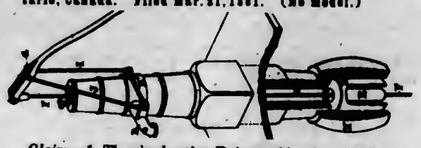


Claim.—1. The combination of a base-frame having two vertical standards, B B, a stock-roll, C, located in bearings in the bottom of the said standards, a reel-shaft, D, located in bearings in the top of said standards, the combined cutting-board and brace E, arranged in the standards between the roll C and reel D, and the measuring-roller G' and tension-rod F', located upon opposite sides of the said cutting-board, as described.

2. In a cloth-measuring machine, the combination, with the measuring-roller, its registering devices, and the stock-roller, of an adjustable cutting-board located to bear upon the cloth between the measuring-roll and stock-roll, as and for the purpose described.

3. The combination of the measuring-roller having tappet *h*, the toothed registering-wheel, and the detent I, adapted to be operated by the same tappet, *h*, that actuates the wheel, substantially as and for the purpose described.

251,937. TRACE-FASTENER. EUGENE A. POLLARD, Newport, N. H. Filed July 1, 1881. (Model.)

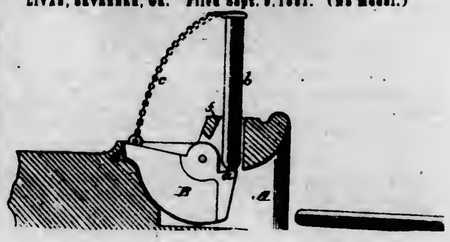


Claim.—The trace-fastener consisting of the projecting curved open frame B B, having the plate E, and end C, provided with the vertical slot or opening D, the pivoted tongue H, having the flanges L L and thumb-piece F, said fastener being provided with the socket A, having the lugs or loop R, all being constructed and arranged for securing and adjusting the trace P, having the holes T, substantially as shown and described.

251,938. PROCESS OF REMOVING FLOCCULENT MATTER FROM SPENT ACIDS. FRANK V. POST, Newark, N. J., assignor to the Celluloid Manufacturing Company, New York, N. Y. Filed Mar. 26, 1880. (No specimens.)

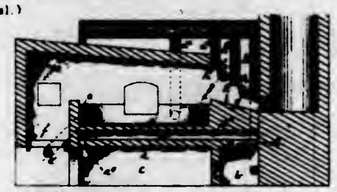
Claim.—The within-described process of removing flocculent matter from spent acids which have been used in the treatment of soluble fiber, which consists in introducing into the acid solution barium sulphate in powdered form and permitting the whole to stand until precipitation has taken place, substantially as set forth.

251,939. WOODEN PUMP. CHARLES POWELL, Toronto, Ontario, Canada. Filed Mar. 21, 1881. (No model.)



Claim.—1. The air-chamber D, in combination with the coupling X, having openings to receive the ends of the main pump-tubes, substantially as and for the purpose described.

2. In a pump in which the piston-rod reciprocates within its tubing, the air vessel or chamber D, placed within said tubing and provided with a central pipe inclosing the piston-rod, said pipe being of substantially the same internal diameter as the bore of the tubing, substantially as and for the purpose set forth.



3. In combination with the coupling X, having a central opening to receive the air-chamber D and the ends of the pump-tubes, the air-chamber D, closely fitting in said coupling, and provided with a central pipe, E, of substantially the same internal diameter as the bore of the pump-tubing, substantially as and for the purpose described.

251,940. CAR-COUPLING. CHARLES PRATT and JOHN A. SULLIVAN, Savannah, Ga. Filed Sept. 9, 1881. (No model.)

Claim.—In a car-coupler, the combination, with the draw-head, A, having the hole for the coupling-pin cut away, as shown at *f*, of the pivoted weighted latch B, provided with shoulder *a*, and connected to pin *b* by chain or cord *c*, substantially as and for the purpose set forth.

251,941. PUDDLING-FURNACE. BENJAMIN PROBERT and MICHAEL DAVIS, Allegheny, Pa. Filed Oct. 3, 1881. (No model.)

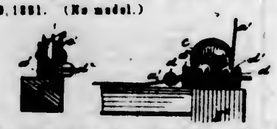
Claim.—1. In a puddling or boiling furnace, the combination, with the hearth and fire-box, of a false bottom or horizontal partition which divides the space below the hearth into two horizontal chambers that communicate with each other and with the ash-pit of the fire-box, a blast-pipe which delivers into one of said horizontal chambers, and a valve arranged to direct the blast into either of said chambers at the will of the operator, substantially as and for the purpose specified.

2. The combination, with the throat or cramps of a puddling or boiling furnace, of two blast-pipes arranged to deliver the blast in reverse directions, substantially as and for the purpose specified.

3. In a puddling or like furnace, the combination, with the throat thereof, of an axially-rotatable perforated blast-pipe and the recessed roof or cover, the elements relatively arranged substantially as described, whereby the pipe may be made to deliver a blast into the throat or over the hearth and away from the cover of the flue, substantially as and for the purpose specified.

4. In a puddling or boiling furnace, the combination, with the hearth *a'* and fire-box *f*, of the horizontal chambers a^3 *b c*, which communicate by ports a^2, a^4, and *b'*, the valve b^2, adapted to close either port a^2 or *b'*, and a blast-pipe which delivers into chamber *b*, substantially as and for the purpose specified.

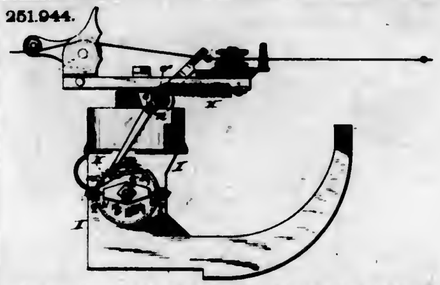
5. In a puddling or boiling furnace, the combination, with the fire-box *f*, hearth *a'*, and cramps *g*, of the series of air-chambers a^3 *b c*, having ports a^2 a^4 *b'*, and valve b^2, and the blast-pipe *d*, having the branch pipes *d'* d^2 d^3 d^4, which deliver into the cramps, hearth-chill, and air-chamber *b*, respectively, the elements being relatively arranged substantially as and for the purpose specified.



251,942. SHEET-MUSIC HOLDER. FRANK E. PUTNAM, Lowell, Mass. Filed Sept. 22, 1881. (No model.)

Claim.—1. The combination of the clamp A, bearing the post B, with the jaws C C, provided with ears *c*, through which the post passes, and the spring *m*, substantially as described.

2. The combination of the clamp A with the post B, and clasp D, which has jaws substantially parallel with the bearing-faces of the clamp, substantially as and for the purpose described.

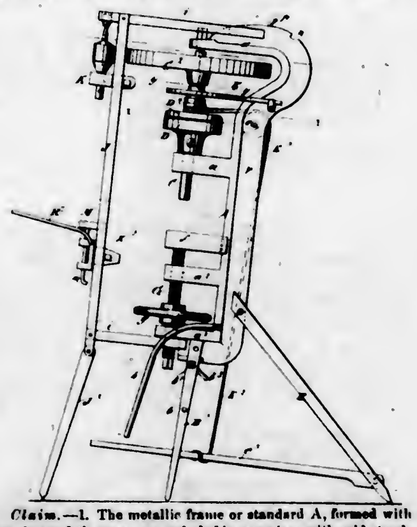


251,943. SASH-BALANCE. JOHN A. QUICK, Palestine, Tex. Filed May 20, 1881. (No model.)

Claim.—In a sash-balance, the combination, with pulleys *a a* and cords *a' a'*, of the pulleys *c c'*, which are arranged on the top of the lower sash and provided with horizontally-adjustable attachments *c'*, having hooks *d* and springs *d'*, substantially as shown and described, and for the purpose set forth.

251,944. CHECK-ROW CORN-PLANTER. EDWARD W. QUINCY, Decatur, Ill., assignor to Chambers, Baring & Quinlan, same place. Filed Dec. 11, 1880. (Model.)

Claim.—1. In a corn-planter, in combination with a seed-cup



wheel having a ratchet-wheel formed in one of its ends and periphery, and with a knotted check-row chain or wire, a rock-shaft with a pawl adapted to impart an intermittent rotary motion in one direction to the seed-cup wheel, substantially as and for the purpose specified.

2. In combination with the standard I, connecting the seed-box and runner, and with the seed-wheel located in the standard I, the cap P, adapted for removal for access to and removal of the seed-wheel, substantially as and for the purpose specified.

3. In combination with a rock-shaft adapted to receive an oscillating motion on its longitudinal axis from a knotted check-row cord or wire, a pawl, N, hinged to said rock-shaft, and adapted to act on a seed-wheel having radial seed-cups in its periphery, and ratchet-teeth on its end and periphery, substantially as and for the purpose specified.

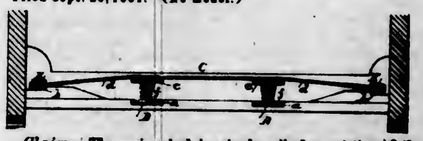
4. In combination with the runners and seed-boxes and seed-wheels having radial peripheral seed-cups and peripheral ratchet-teeth, the rock-shaft having a pawl at each end for imparting movement to the seed-wheels, and forked levers for receiving movement from a knotted check-row chain or wire, substantially as and for the purpose specified.

251,945. COMBINED LATHE AND DRILLING-MACHINE. JOHN F. RAKES, Greenup, Ky. Filed Mar. 21, 1881. (Model.)

Claim.—1. The metallic frame or standard A, formed with the web *c* and the arms *a a* and a^1 a^1 in one piece with said standard, as shown and described, for the purposes specified.

2. The combination, with the frame or standard A and arms *a a*, of the vertical shaft and drill-holder C and the fly-wheel C^2, provided with removable counterbalance-weights c^1, arranged as herein shown and described.

3. The combination, with the frame A and the shaft C, of the clutch D D^1, dogs *d d*, spring E, and rope or cord E^1, as shown and described, for the purpose specified.



4. The combination, with the frame A, shaft C, and clutch D D^1, of the rope or cord E^1, pulley *e*, treadle e^2, and diagonally-inclined rear leg, B, when arranged and operating as herein shown and described.

5. The removable and adjustable leg-frame consisting of the legs B^2 B^3, brace *b*, screw-rod or bolt b^2, and hand-nut b^3, in combination with the frame or standard A, provided with the web *c*, notch *n*, and hook or projection *p*, as shown and described, for the purpose specified.

6. The combination, with the frame A and arms *a' a'*, of the feeding device consisting of the table *f*, screw G, hand-wheel *g*, and curved lever *h*, arranged and operating as shown and described, for the purpose specified.

7. The combination, with the frame or standard A, of the lathe attachment consisting of the bar J, provided with the notched or forked arms *i i*, and carrying the lathe-heads K K^1, as herein shown and described.

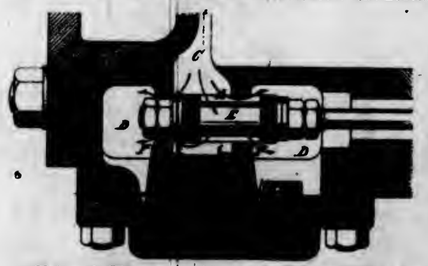
251,946. SPRING-BED. ANDREW B. RAMEY, Centril, Iowa. Filed Sept. 23, 1881. (No model.)

Claim.—The spring-bed herein described, consisting of the head and foot boards connected by the sides C, having recesses *a b*, the latter being at the extreme ends of the bed and elevated above the former, the slats D, set in the recesses *a*, the ends E, placed in the recesses *b* and connected by the wires *d*, and the slats *e*, carrying the springs *f*, substantially as set forth.

251,947. PAINT, WHITEWASH, AND OTHER BRUSHES. JAMES A. READ and CALVIN D. READ, Ayer, Mass. Filed Apr. 4, 1881. (No model.)

Claim.—1. A process of making brushes, consisting in cementing bristles to thin strips of rubber or its equivalent, in winding the strips so prepared onto the brush-handle, and in subjecting the whole to pressure, substantially as set forth.

2. A brush having its bristles secured in place by thin strips of rubber or its equivalent, substantially as set forth.



3. A brush having its bristles secured to a thin strip or strips of rubber or its equivalent wound around the base of the handle, substantially as set forth.

4. A brush having its bristles secured to a thin strip or strips of rubber or its equivalent wound around the base of the handle, the several layers of rubber being tightly compressed, substantially as set forth.

5. In a brush, the combination, with a handle having a notched base, of strips of rubber having bristles secured thereto and wound upon the notched base of a handle, substantially as set forth.

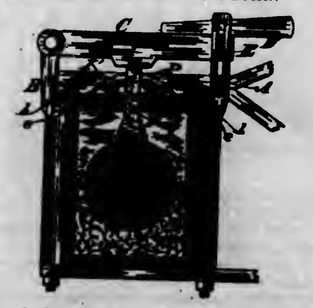
6. In a brush, the combination, with the bristles, of an outwardly-projecting flange formed of several layers of a thin rubber band tightly wound around the butts of the bristles, substantially as set forth.

251,948. EXHAUST-VALVE FOR STEAM-ENGINES. CHAS. B. RICHARDS, Philadelphia, Pa. Filed Nov. 7, 1881. (No model.)

Claim.—1. The combination of the exhaust-port C and exhaust-chest D of the cylinder of a steam-engine with the reciprocating slide-valve E, the pressure-frame F, interposed between a chamber, *f*, and the interior of the chest, and passages whereby a communication is opened at one time between the said chamber and the interior of the cylinder and at another time between the cylinder, chamber, and exhaust-chest, in obedience to the movement of the valve, all substantially as set forth.

2. The combination of the valve-chest D, valve E, and pressure-frame F with a block, A, extending into the opening of the said frame, substantially as specified.

251,949. STOVE-LEG. JAMES A. BISBEE, Genoa, Ill., assignor of one-half to Sidney A. Bisbee, Waltham, Mass. Filed Aug. 29, 1881. (Model.)

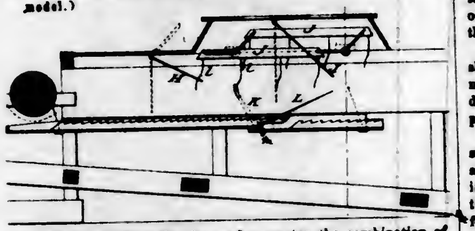


Claim.—1. The combination, with the spindle of a caster, of a leg provided with a guide-plate for the lower portion of the spindle and a combined socket and guide for the upper portion of the spindle, said parts being constructed to allow the spindle to be inserted in the socket and cause the weight to be supported by the caster, or to allow the spindle to be disengaged from the socket and inserted in the guide and cause the weight to be supported by the leg, substantially as set forth.

2. The combination, with a stove-leg having a guide or bearing near its lower end and a combined guide and socket near its upper end, of a caster-spindle supported in the lower guide of the leg and adapted to have its upper end placed either in the socket or in the guide, and a spring for upholding the caster when it is not desired for use, substantially as set forth.

3. The combination, with a stove-leg having a bearing or guide plate, E, and socket and guide F, the latter being provided with an opening, *i*, and a recess, *n*, and strengthened by a rib, *l*, of a caster-spindle adapted to enter either the opening *i* or the recess *n* and allow the weight of the stove to rest either on the foot H or on the wheel I, and a spring encircling the spindle and having its lower end resting on the plate E and its upper end bearing against a collar or projection on the spindle, substantially as set forth.

251,950. JACK FOR CAR-AXLE BOXES. EDGAR ROBINSON, Cincinnati, assignor of one-half to Henry B. Boymer, Cambridge, Ohio. Filed Nov. 10, 1881. (No model.)



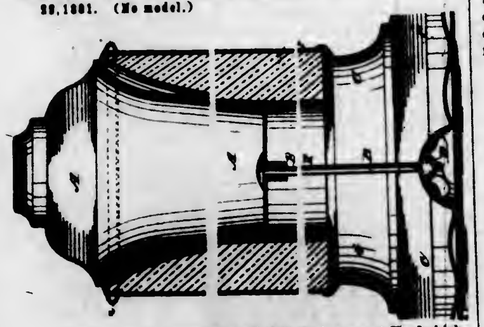
Claim.—1. A boxing for a car-axle, provided with lugs *b b*, the stud F, projecting through the boxing and adapted to receive the weight of the car by means of a lifting-tool applied to said lugs and pedestal, substantially as herein set forth.

2. In combination with a car-axle box, the stud F, passing through a slot in the boxing and adapted to be pressed down upon the axle, so as to transfer the weight of the car from the boxing to said stud, substantially as described.

3. In combination with a car-axle boxing and the supporting pedestal or stud F, loosely connected to said box, a lifting-tool composed essentially of pressure-bar C and hooked arms A B, adapted to clasp the said box and rest upon the stud, so as to transfer the weight of the car from the box to the axle, substantially as herein set forth.

4. In combination with the boxing of a car-axle, the stud F, passing loosely through the shell of box and suspended by spring F', to prevent the contact of said stud and axle when the lifting-tool is not in use, substantially as herein set forth.

251,951. COMBINED THRASHER AND SEPARATOR. FRANCIS W. ROBINSON, Richmond, Ind. Filed Feb. 14, 1881. (No model.)

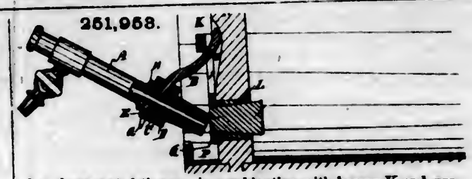


Claim.—1. In a thrasher and separator, the combination of the thrashing-cylinder, the picker-bars having curved front teeth, *l l*, and a sectional or slotted hinged apron or shield, H, arranged between thrashing-cylinder and concave and the forward ends of said picker-bars, substantially in the manner and for the purpose herein shown and described.

2. In a thrasher and separator, the combination of the thrashing-cylinder, the picker-bars, the sectional or slotted hinged apron or shield H, arranged between the thrashing-cylinder and concave and the forward ends of said picker-bars, and the sectional apron or shield I, extending across the machine about midway of the crank arms or shafts of the picker-bars, substantially as and for the purposes herein shown and described.

3. In a thrasher and separator, the combination of a series of picker-bars, a vibrating carrier arranged under said picker-bars, having a rake-head provided with lifting-fingers L, journaled thereto, and crank-arms K K, fulcrumed at their upper ends to the sides of the machine and adjustably connected at their lower ends to said rake-head, substantially as and for the purpose herein shown and described.

251,952. LAMP. CHARLES ROYLE, New York, N. Y. Filed Oct. 29, 1881. (No model.)



Claim.—1. In a lamp, the body E F, the inner part, E, of which is formed of cement molded into cylindrical form and inclosed in an ornamental shell of sheet metal or paper, F, in combination with the oil-chamber A, supported within the said body by its upper flange, and secured thereto by the bolt B and nut D, substantially as shown and described.

2. In a lamp, the combination, with the oil-chamber A, the base C, and the tie-rod B, of the body formed of a cement inner part, E, molded into shape, and a covering-shell, F, of ornamented sheet metal or paper, substantially as herein shown and described.

251,953. FAUCET. ALBERT REESE, New York, N. Y. Filed June 10, 1881. (Model.)

Claim.—1. A faucet constructed, substantially as herein shown and described, with an arm, B, and with a cam-ring, E,

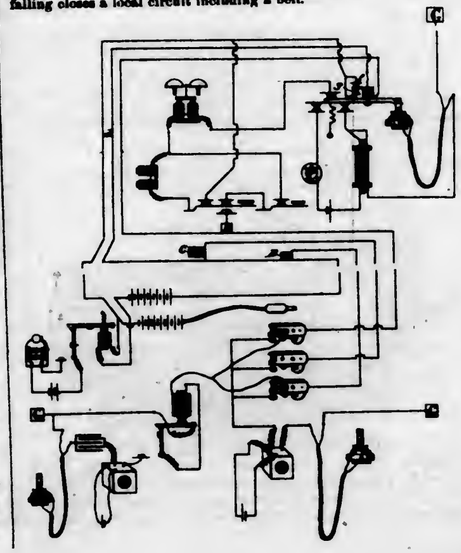
251,953.

loosely mounted thereon, in combination with keeper K and projection Q on the head of the barrel, as set forth.

2. The combination, with the faucet A, provided with the arm B, and the cam-ring E, having a handle, F, of the plate J, attached to the barrel, and provided with a beveled projection, Q, at the end of its bottom flange, P, and with a catch, K, at the upper end of the plate.

3. The combination, with the faucet A, of the arm B, the shoulders C and H, the packing-ring D, and of the ring E, loosely mounted thereon, and provided with a beveled cam, G, and a handle, F, substantially as herein shown and described, and for the purpose set forth.

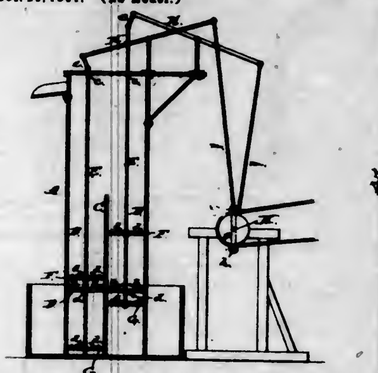
4. The plate J, attached to the head of a barrel, and constructed with a catch, K, at its upper end, a bushing, L, and with a bottom flange, P, with a beveled projection, Q, at its outer edge, in combination with the faucet A, provided with the arm B, and the cam-ring E, substantially as herein shown and described, and for the purpose set forth.



251,954. FLOUR-BOLT. CHARLES SCHACHT, Marine, Ill. Filed July 30, 1881. (No model.)

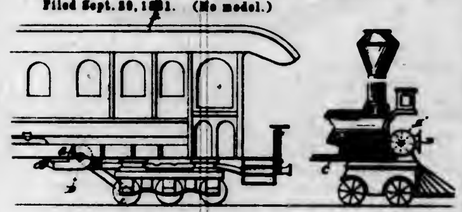
Claim.—The combination, with a reel-bolt, of one or more rods suspended within the bolting-chest and a series of flexible loops suspended from said rod or rods, to adapt them on the rotation of the reel-bolt to drag upon or against the bolting-cloth, substantially as and for the purpose described.

251,955. AUTOMATIC SIGNALING-CIRCUIT FOR TELEPHONE-EXCHANGES. CHARLES E. SCRIBNER, Chicago, Ill. assignor to the Western Electric Manufacturing Company same place. Filed Mar. 22, 1881. (No model.)



Brief.—Upon taking a subscriber's telephone from its support the automatic switch breaks the circuit for an instant if a closed circuit is employed or closes it if it be normally open, thereby dropping an annunciator at central office. The annunciator in falling closes a local circuit including a bell.

Claim.—1. The circuit breaking or closing arm c, in combination with the automatic switch and a normally open or closed return-circuit, and an annunciator and battery included in said circuit, whereby listening operator is notified when a subscriber takes down or hangs up a telephone.



2. The insulated arm attached to the switch-lever, in combination with a circuit including a battery and annunciator, whereby a signal is given automatically when the switch-lever is passing from either position to the other, as and for the purpose set forth.

251,956. PUMP. WALTER C. B. SHAFFER, Ayersville, N. C. Filed Oct. 20, 1881. (No model.)

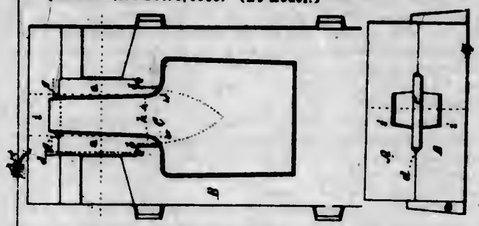
Claim.—The combination, with the double pump-stock, its horizontal valved partition D, and vertical partition C, dividing the working-barrels, of the vertical reciprocating valve-rods E, the pistons F G, links e, levers H, and the double-crank shaft K, its connections and band-wheel, substantially as shown and described.

251,957. CAR-VENTILATOR. JOHN SHEPHERD, Macon, Mo. Filed Sept. 30, 1881. (No model.)

Claim.—The combination, with the fan A, of pipe C, and supplemental fan D, having the pipes *d'*, leading into the car, substantially as and for the purpose set forth.

251,958. OPEN LINK. SOLOMON SHETTER, New Cumberland, W. Va., assignor of one-half to Thomas J. Gerlick, Elmer J. Shetter, and Andrew H. Shetter, all of same place. Filed Nov. 4, 1881. (No model.)

Claim.—In a connecting-link, the combination, with the part B, provided with the hook *b* and the upturned end *c*, of the part A, provided with the hook *a* and the eye *e*, the said hooks being fastened diagonally, substantially as and for the purpose set forth.



251,959. MACHINE FOR FILING SAWS. WILLIAM H. SHUTTS, Emporia, Kans. Filed Apr. 6, 1881. (Model.)

Claim.—1. The combination, with the clamp A and sliding carriage C, of the bent arm D, the block E, the block M', pivoted at e and provided with holes *e'*, the rod M', and the pawl M', substantially as described, whereby the feed is operated and graduated, as set forth.

2. In a saw-filer, the combination, with the pivoted arm D, of the file-frame-clamping block E, having vertical mortise A, provided with pivoting-point *i*, grooves *h'*, and set-screws *h*, substantially as herein shown, and for the purposes set forth.

251,960. MOLD FOR CASTING SHOVEL-BLANKS. EPHRAIM SMITH, Pittsburg, Pa., assignor to Hussey, Binns & Co., same place. Filed Dec. 1, 1880. (No model.)

Claim.—1. A mold for casting shovel-blanks, constructed in two parts, A B, having the wide or blade portion toward the bottom thereof and openings *f f* in the sides opposite to the narrow or strap portion, and provided with a core, C, supported in the narrow portion, the said core being composed of sand and a solid combustible material, in substantially the proportions set forth, all substantially as and for the purpose herein specified.

2. The combination of a combustible core such as herein described and a mold, A B, having its wide blade-forming part toward the bottom thereof, and the said core supported in its narrow strap-forming part, substantially as and for the purpose herein specified.

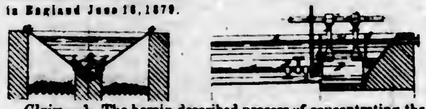
3. The mold A B, having vent-openings *f f* in its sides opposite to the narrow strap-forming interior thereof, in combination with the combustible core C, having its side edges resting opposite to the said vent-openings, substantially as and for the purpose herein specified.

4. The mold parts A B, having their upper ends or faces, *i i*, inclined from their outside downward to their inner walls, substantially as and for the purpose herein specified.

251,961. CULTIVATOR. JOHN SMITH and FERDINAND STEINER, Horicon, Wis. Filed Oct. 24, 1881. (No model.)

Claim.—1. The combination, in a cultivator, of a beam or drag-bar, a shovel-standard, a hub or boss, and an encircling annulus or band adapted to be contracted upon the beam, the boss and annulus being attached, one to the beam and the other to the standard, substantially as and for the purposes set forth.

2. In a friction device for cultivator-standards, the combination of a hub or boss and an encircling annulus or band provided with a clamping device, substantially as shown, one of said parts being stationary relatively to the other.



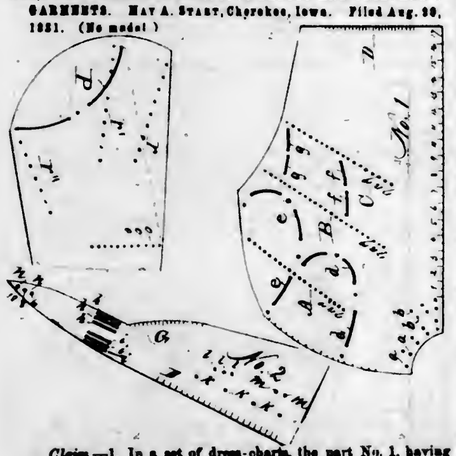
3. The standard A, having at its upper end the annulus or band D, open at one side, and provided with a bolt, whereby it may be contracted, substantially as set forth.

4. The shovel-standard A, provided with lips *q* and openings or holes *p*, substantially as and for the purpose set forth.

5. In a cultivator, the combination of a shovel-standard, A, provided with slots or openings *p* and lips *q*, a shovel point or tooth, F, a strap or band, G, passing around the shank of the tooth and through the slots, and means, substantially as described, for tightening the strap or band.

6. In combination with the standard A, provided with openings *p*, a shovel point or tooth, and a strap or band, G, adapted to straddle the tooth-shank and to pass through said openings, and notched as described, a pin or bolt, *t*, and wedge *u*, all combined and operating as set forth.

251,962. MANUFACTURE OF SODA. ERNEST SOLVAY, Brussels, Belgium. Filed Mar. 31, 1881. (No model.) Patented in England June 16, 1879.



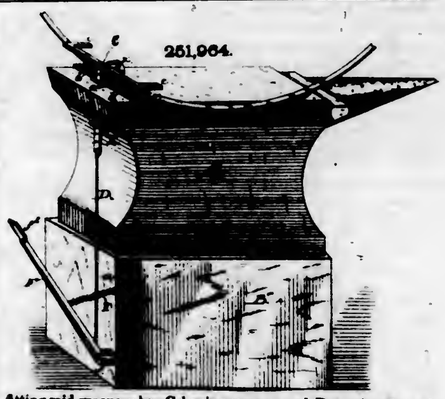
Claim.—1. The herein-described process of concentrating the waters obtained from the distillation of ammonia in the manufacture of ammonia soda, so as to collect therefrom the sea-salt and chloride of calcium they contain, the same consisting in the treatment of such waters in a vessel heated to a higher temperature in its upper than in its lower portion, and precipitating the salt in the cooler portion thereof, then driving the salt into a non-heated portion of the apparatus and separating the salt from the water, and then decanting the concentrated solution of chloride of calcium from the remaining water in the apparatus and from the salt, in the manner specified.

2. The combination, with the boiler, of the furnace arranged to heat directly the upper portion of said boiler, the concentrating and decanting apparatus at one end of the boiler, and devices for driving the salt to said end of the apparatus and for removing it therefrom, substantially as described.

3. The boiler A, comprising two parts, one being V-shaped in cross-section, with a semi-cylindrical bottom, and the other being made semi-cylindrical in shape, in combination with the devices for driving the precipitated salt from the first-named part of the boiler into the said second or semi-cylindrical part, and the rotary scraper P, arranged to throw out the salt from the semi-cylindrical part of the boiler, said apparatus being connected with a furnace so that the inclined walls only of its V-shaped part will be exposed to the direct action of heat, substantially as described.

251,963. CHART FOR DRAFTING LADIES' AND CHILDREN'S GARMENTS. MAY A. START, Cherokee, Iowa. Filed Aug. 30, 1881. (No model.)

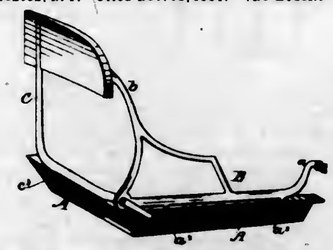
Claim.—1. In a set of dress-charts, the part No. 1, having lines of perforations *a b d e*, scales A, B, C, and D, and arm-size *f* and *g*, substantially as shown and described, for the purposes specified.



2. In a set of dress-charts, the part No. 2, having scales E and G, parallel slots *h* and *i*, and lines of perforations *h l m n*, substantially as shown and described, for the purposes specified.

3. In a set of dress-charts, the part No. 3, having arm-size P and lines of perforations *o r s*, substantially as shown and described, for the purposes specified.

4. The set of charts consisting of the form No. 1, having lines of perforations *a b d e*, scales A, B, C, and D, and arm-size *f* and *g*, the form No. 2, having scales E and G, parallel slots *h* and *i*, and lines of perforations *h l m n*, and the form No. 3, having an arm-size P, and lines of perforations *o r s*, substantially as shown and described, to be unitarily used for drafting garments, in the manner set forth.



251,964. TIRE-UPSETTER. CHARLES STEVENS, Randolph, Vt. Filed Dec. 9, 1880. (No model.)

Claim.—The combination, with an anvil having a transverse dovetail groove in its upper face adjacent to the channel E, and an anvil-block having at its rear end the brackets *f*, of a swage, *b*,

fitting said groove, a bar, C, having arms *e*, a rod, D, passing through the channel E and supporting the bar C, a lever, F, to which said rod is pivoted, and a spring connecting the lever with the anvil-block, substantially as described.

251,965. SHIFTING-RAIL FOR CARRIAGES. JOHN W. SUPPES, Trenton, N. J. Filed Nov. 16, 1881. (No model.)

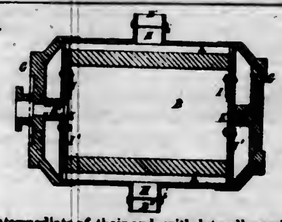
Claim.—1. The method of making shifting-rails of carriages herein set forth and described, which consists in casting them in a flattened condition and afterward finishing the attaching and connecting portions thereof, and then bending, shaping, and fitting the same, substantially as shown and described.

2. As an article of manufacture, the cast malleable-iron rail B, provided with the attaching-studs *a*, shoulder and stud *a'*, aperture a^3, brace b^2, and extension *b*, and arm *b'*, all of the curvatures therein being in a common plane, substantially as shown and described.

3. In a carriage shifting-rail, the combination of the rail B, provided with the screw-threaded aperture a^3, and the rail C, provided with the screw-thread c^2, substantially as shown and described.

4. The combination of the seat A, rail B, and rail C, the latter passing through the former and secured therein by a screw-thread, and both secured to the seat, substantially as shown and described.

251,966. TICKET-HOLDER. JAMES G. TAIT, Stockton, Cal., assignor to himself and Archimedes B. Wynkoop, same place. Filed Oct. 14, 1881. (No model.)

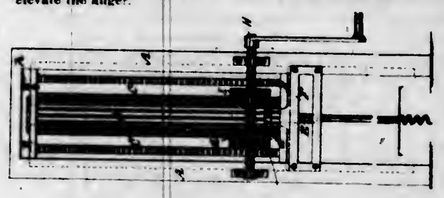


Claim.—As a new article of manufacture, the within-described ticket-holder, consisting of a piece of sheet metal formed tabular at one end, and having its opposite end bent backward or doubled upon the main body of the holder and adapted to receive and clasp a ticket, substantially as set forth.

251,967. PUMP. NICOLAS TALABE, Paris, France. Filed May 7, 1881. (No model.) Patented in France Dec. 30, 1878, and in England Dec. 7, 1880.

Claim.—1. In a pump for the purpose described, the cylinder B, formed integral with the longitudinal passages A A, which are

251,967.



provided intermediate of their ends with laterally-projecting inlet and outlet branches H H, in combination with the hollow covers forming closed ends to the pump, and valve-plates applied to the ends of the cylinder, and provided with suction and discharge valves, substantially as described.

2. In a pump for the purpose described, the cylinder B, formed integral with the longitudinal passages *h h*, which are provided intermediate of their ends with the laterally-projecting inlet and outlet branches H H, in combination with the hollow covers forming closed ends to the pump, and each divided into two chambers, and the plates K, attached to the ends of the cylinder and provided with valves I I', pivoted in position and acted on by springs, all substantially as shown and described.

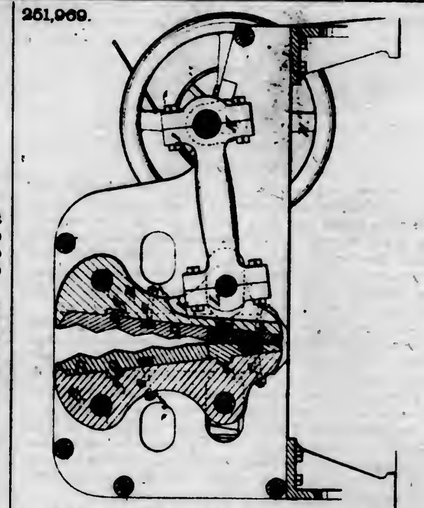
3. In a pump for the purposes set forth, the cylinder B, having within it the longitudinal passages *h h*, provided with laterally-projecting inlet and outlet branches H H, in combination with the two hollow covers G G, having ribs G', the valve-plates K, provided with horizontal hinge-pins, the valves I I', loosely pivoted on said hinge-pins, and springs acting on said valves, substantially as shown and described.

251,968. POST-HOLE DIGGER. THEOPHILUS TABNER and HERMANN H. FISCHER, Osage, Nebr. Filed June 24, 1881. (No model.)

Brief.—The auger-shaft is rotated through a bevel-gear on a horizontal shaft, meshing with a crown-wheel, which engages a cogged cylinder in a traveling frame, said horizontal shaft having sliding pinions, which engage rack-bars on the traveling frame to elevate the anger.

Claim.—The combination of the cross-heads B, tied together by vertical rack-bars C C, the cogged cylinder D, the vertical shaft E, carrying crown-wheel *d*, and the crank-shaft H, carrying the cog-wheel G, and movable pinions I I, all arranged as described, and adapted to be used as set forth.

251,969. ROCK AND ORE CRUSHER. JOSIAH TAYLOR, New York, N. Y. Filed Apr. 8, 1881. (No model.)



Claim.—1. In a rock and ore crushing machine, a pair of serrated or corrugated oscillating jaws separated at the top, each suspended on an independent bearing and provided with one or more rounds, with corresponding hollows forming equal arcs of circles drawn on equal radii running laterally across the face of the jaws, as shown and described.

2. In a rock and ore crushing machine, oscillating jaws provided with face-plates in two sections, one of which sections on each jaw is serrated or corrugated and the other made with hollows and rounds of equal extent, and consisting of equal arcs of circles drawn on equal radii, as shown and described.

3. In a rock and ore crushing machine, jaws with serrated or corrugated faces, with each serration or corrugation running laterally across the jaws, equal in extent to the throw of the crank which oscillates the jaws, the two lower projections and depressions consisting of equal arcs of circles drawn on equal radii, as herein shown and described.

4. In a rock and ore crushing machine, a pair of jaws the faces of which are provided at the lower extremities with one or more hollows and rounds formed of equal arcs of circles drawn on equal radii extending laterally across the jaws, and serrated or corrugated longitudinally, with the projections on one face opposed to the depressions on the other, as herein shown and described.

251,969.

5. In a rock and ore crushing machine, the combination of two oscillating jaws suspended apart at the top on independent bearings, and a link provided with boxes, sliding wedges, and set-screws, for the purpose of adjusting and maintaining in position the lower ends of the jaws, as herein shown and described.

6. In a rock and ore crushing machine, the combination of a metallic frame with a pair of oscillating jaws suspended therein apart at the top on independent bearings, having face-plates attached by flanges, bolts, and screws, serrated or corrugated laterally across the upper portion, and provided on the lower portion with hollows and rounds running across them, composed of equal arcs of circles drawn on equal radii and equal in extent to the throw of the crank, and links provided with boxes, wedges, and set-screws, with rods connecting the lower ends of the jaws, and pitman, crank, shaft, pulley, and balance-wheels, as herein shown and described.

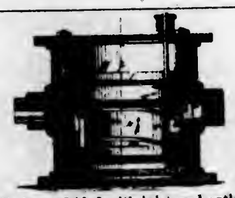
7. In a rock and ore crushing machine, a pair of serrated or corrugated jaws diverging from a given point upward in a hopper-like form and from the same point downward, having faces consisting of a series of hollows and rounds composed of equal arcs of circles drawn on equal radii and equal in extent to the throw of the crank, having the projections of the rounds on the two faces parallel with each other, as herein shown and described.

251,970. COATING AND INSULATING WIRE FOR ELECTRICAL PURPOSES. JAMES TAYLOR, Ansonia, Conn., assignor to the Electrical Supply Company, same place. Filed Nov. 9, 1881. (No specimens.)

Claim.—1. Wire or copper strips for electrical purposes, having the surface coated with benzoin, substantially as described.

2. Copper wire or strips for electrical purposes first coated with benzoin, then with a fibrous covering applied to the benzoin-coated surface while the benzoin is in an adhesive state, substantially as described.

3. Copper wire or strips for electrical purposes first coated with a fibrous material, then a fibrous covering coated with benzoin, substantially as described.

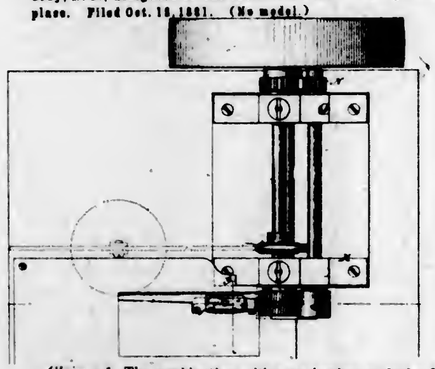


4. Copper wire or strips for electrical purposes first coated with a fibrous material, the fibrous material filled with paraffine, or a composition of which paraffine forms the base, then finally coated with benzoin, substantially as and for the purpose described.

251,971. PISTON WATER-METER. JAMES A. TILDEN, Hyde Park, assignor of one-half to Francis C. Hersey, South Boston, Mass. Filed July 20, 1881. (Model.)

Brief.—Inside the piston is a secondary piston, which acts as a valve to control the admission of water to the opposite ends of the first piston.

Claim.—1. The main cylinder provided with an inlet-passage and with internal depressions in the side thereof, combined with the main piston provided with secondary inlet-ports and a depression in its surface in connection with the said inlet-passage throughout its stroke, and acting in co-operation with the said depressions of the cylinder to connect the secondary inlet-ports with the said inlet-passage of the cylinder at definite points in the stroke of the main piston, substantially as described.



251,971.

2. The cylinder provided with inlet and outlet passages and with the internal depressions all in its sides, combined with the main piston provided with the secondary inlet-ports, and the secondary piston therein, the said ports and depressions being arranged, as described, to connect the interior of the main piston at each end with the corresponding end of the cylinder during a portion of the stroke of the main piston, substantially as and for the purpose set forth.

3. The main cylinder provided with an outlet-passage, and the main piston therein provided with a main outlet-port in connection with the said passage throughout its stroke, and with ports leading to the main cylinder at either end of the said piston, combined with the secondary piston provided with an external channel always in connection with the said main outlet-port and with main inlet-ports, arranged as described, whereby one of the said main inlet-ports is in communication with the port of the main piston leading to one end of the cylinder, while the corresponding port leading to the other end of the cylinder is in communication with the said external channel, substantially as described.

251,972. MACHINE FOR TURNING AND PRESSING WOVEN FABRICS. WILLIAM H. H. TRACY and GEORGE E. STILLMAN, Troy, N. Y.; assignors of one-third to Josiah L. Young, same place. Filed Oct. 18, 1881. (No model.)

Claim.—1. The combination, with a mechanism or device for turning over the edge of the fabric drawn through it, of means for drawing the turned-over fabric and at the same time flattening down the fold and breaking the edge thereof, substantially as set forth.

2. In combination with means for turning over the edge of the blank, a set of drawing and flattening rolls adapted to also exert a drawing tendency in the direction of the edge of the folded-over flap, so as to keep the said edge parallel with the hinge-line of the flap.

3. In combination with a set of rolls for flattening and crimping, means for smoothing out the folded and crimped portion of the blank, as set forth.

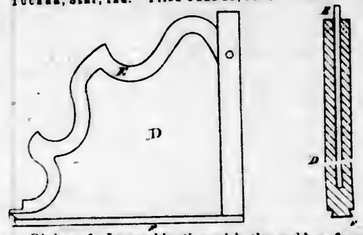
4. In a turning mechanism or device, a former adapted to contract in the direction of its thickness, substantially as and for the purpose set forth.

5. In a turning mechanism or device, a former adapted to yield bodily to permit the passage between its working-edge and the adjacent surface of its incasement of different thickness of material, as set forth

6. In combination with the former and the partially-surrounding case of a turning mechanism, a transparent top portion, in the manner and for the purpose specified.

251,973. LOOM-SHUTTLE. CHARLES M. TUCKER, Great Falls, assignor to himself and Frederick Demars, Somersworth, N. H. Filed May 31, 1881. (No model.)

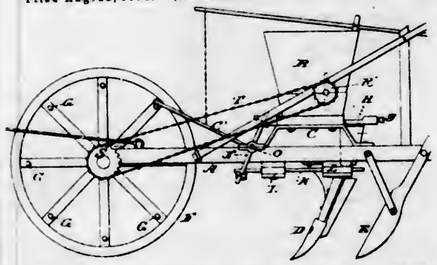
Brief.—The expander, placed within the split-spindle, is connected to a link pivoted in a metallic carrier-frame secured to the body of the shuttle. As the spindle is depressed the expander is retracted, and spreads the portions of the spindle apart to hold the cop placed upon it.



Claim.—1. The link or double crank E, arranged and combined substantially as set forth, with the shuttle-body, the expander, and the split or expansive spindle, all being essentially and to operate as specified.

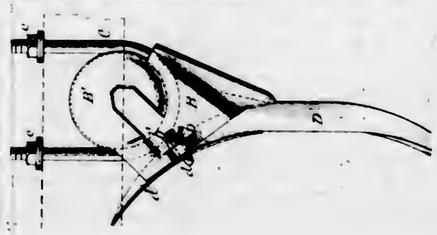
2. The link or double crank and its pivotal carrier inserted in the shuttle-body, in combination therewith and with the expansive spindle and its expander, all being adapted substantially as set forth.

3. The link or double crank, in combination and arranged with the shuttle-body, the expansive spindle, and its expander and operative spring, substantially in manner as shown and described.



251,974. FORMER FOR PLASTER-MOLDING. THOMAS B. TUCKER, Star, Ind. Filed June 29, 1881. (No model.)

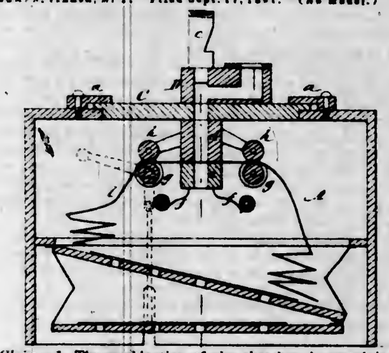
Claim.—1. In combination with the mold or former E, the support D, extending to near the outer edge of said former and supporting it on both sides, substantially as set forth.



2. The support D, cast with a central recess for the former E, and provided with the dovetail F, for the purpose of attaching the whole to the base A, substantially as set forth.

251,975. CORN-PLANTER. JAMES TURNER, Culpeper, Va. Filed Aug. 23, 1881. (No model.)

Claim.—In a corn-planter, the hopper B, having the partition, in combination with the slide H, having the openings *a b*, blocks *c d*, and set-screws *f g*, connected to the slide K, having opening M, by the lever N on the shaft O, the lever C', chain R, lever Q, and the supporting and operating wheel F, having the pins G, constructed, arranged, and operating substantially as specified.

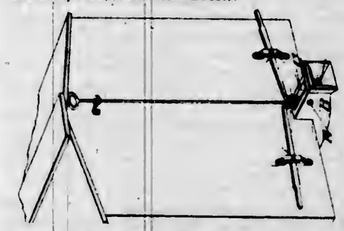


251,976. CULTIVATOR. DANIEL C. VAN BRUNT, Horicon, Wis. Filed Sept. 27, 1881. (No model.)

Claim.—1. A clamp for cultivator-teeth having hub B' and ears *b*, in combination with a tooth, D, staple *d*, and securing-nuts.

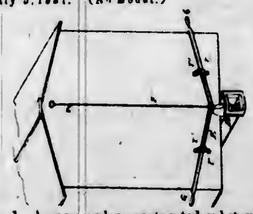
2. A cultivator-beam having concavity *a*, in combination with clamp having hub B', the staple C, and nuts, as set forth.

251,977. MECHANICAL MUSICAL INSTRUMENT. HENRY WREN, Ithaca, N. Y. Filed Sept. 17, 1881. (No model.)



Claim.—1. The combination of air-chamber A, containing feed-rollers *g* and apertured block *e*, with cover C, apertured block D, carrying reeds and pipes, apertured block *d*, and the feed-rollers A, secured to the under side of cover C, substantially as shown and described.

2. The removable cover C, carrying reed-block D, apertured block *d*, and rollers A, combined with the air-chamber A, block *e*, and rollers *g* in the chamber, substantially as shown and described.

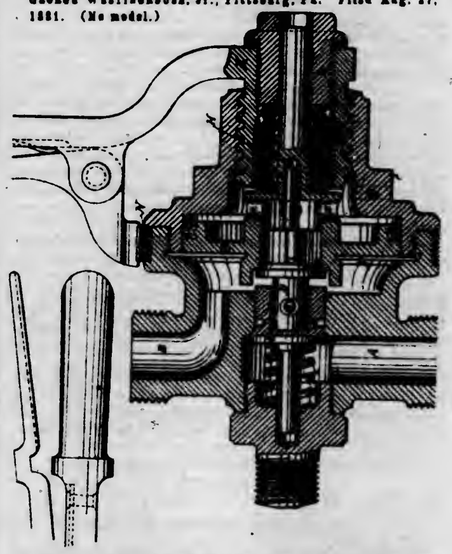


3. The springs *f* and apertured block *e*, supported upon said springs, combined with the stationary paper-rollers *g* and removable rollers *h*, and apertured block *d*, all arranged to operate substantially as shown and described.

251,978. CAR-COUPLING. HENRY WELLS, Glenwood, Iowa. Filed Sept. 28, 1880. (No model.)

Claim.—The combination, with the slotted draw-head B, of the coupling-hook C, having a forwardly-inclined front face, a concaved back face, a lengthened top, and a slot whose sides are parallel with the front face, said slot being provided with a pivotal pin, substantially as described, whereby the strain is borne by the upper shoulder of the draw-head and the coupling-hook is locked in place when the pin is broken, as set forth.

251,979. CAR-COUPLING. HENRY WELLS, Glenwood, Iowa. Filed July 5, 1881. (No model.)



Claim.—1. A car-coupler constructed substantially as herein shown and described, consisting of draw-bar B, having slots *b c*, provided with internal slotted triangular catch, C, and internal springs, D, and coupling-pin E, having shoulders *h i*, hooked finger *o*, and link-opening *p*, arranged and operated as set forth.

2. In a car-coupler, the draw-bar B, provided with T-shaped slot *b* and slot *c*, for admission of coupling-pin, and with triangular slotted block or catch C and springs D, for guiding and holding the coupling-link, substantially as herein shown and described.

3. In a car-coupler, the combination, with the draw-bar, of the coupling-pin E, having shoulders *h i*, flanged sides *k*, grooved edge *l*, bolt and nut *n' n²*, and hooked finger *o*, having nose *f* and opening *p*, substantially as herein shown and described.

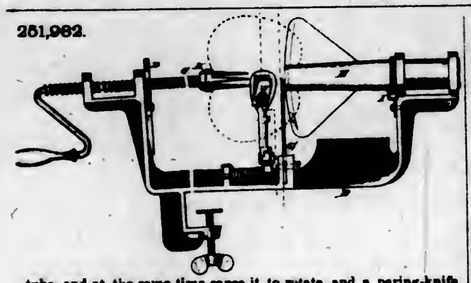
4. In a car-coupler, the combination, with the coupling-pin E, provided with groove *l* and a bolt-hole, *n*, of the bolt and nut *n' n²*, substantially as herein shown and described, whereby said coupling-pin is held in place, as set forth.

251,980. REGULATING-VALVE FOR RAILWAY-BRAKES. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed Aug. 27, 1881. (No model.)

Claim.—A regulating-valve for railway-brakes, having in combination the nozzles A B, valves C D, hollow piston E, having lateral ports *e*, escape-port G, springs *c* and H, handle K, and screw-plug *k*, substantially as set forth.

251,981. CYLINDER AND CONCAVE TOOTH FOR THRASHING-MACHINES. HENRY P. WHITE, Paw Paw, Mich. Filed Oct. 16, 1881. (No model.)

Claim.—The combination, with a thrashing-machine cylinder or concave-tooth, of a cutting-blade secured thereto, substantially for the purpose herein set forth.



251,982. APPLE PARER, CORER, SLICER, AND QUARTERER. DAVID H. WHITTEMORE, Worcester, Mass. Filed Oct. 26, 1881. (Model.)

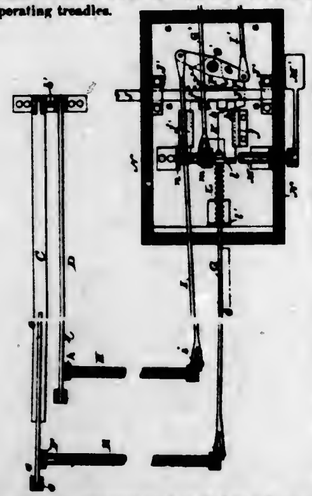
Brief.—The novelty consists principally in the rotating corer with or without radial quartering-blades.

Claim.—1. In an apple paring, coring, and slicing machine, the coring-tube E, having a tubular opening, in combination with frame B, provided with bearings for said coring-tube, in which it is adapted to rotate freely, and means to feed an apple positively against the cutting-edge of said corer, and at the same time give it a rotating movement, substantially as and for the purpose specified.

2. In an apple paring, coring, and slicing machine, the coring-tube E, having an open tubular passage-way for the core through the same, in combination with a frame provided on one end with bearings in which the coring-tube is adapted to rotate, and on the other with means to feed an apple positively against the coring-

251,982.

tube, and at the same time cause it to rotate, and a paring-knife located between said coring-tube and feed mechanism and hinged to the frame, substantially as and for the purpose specified.



3. A coring-tube for paring, coring, and slicing machines, which consists of a tube having an open tubular passage-way for the core through it, said tube being provided at the end farthest from the cutting-edge with a bearing portion and a flange at the end of said bearing portion next to the cutting-edge, and one or more edged cutters radiating from said tube upon its cutting-end, said tube and cutters being adapted to rotate as the rotating apple is brought into contact with the same, substantially as shown and described.

4. In a paring, coring, and slicing machine, the combination of the coring-tube E, supported in bearings at one end of the frame, and means to feed the apple upon the coring-tube and rotate the same secured to the other end of the frame, with a paring-knife, J, located between said coring-tube and feed mechanism, and a slicing-cutter, G, rigidly secured to the frame and located between the paring-knife and coring-tube, substantially as shown and described.

5. In an apple coring and paring machine, the frame B, with its bearings, in combination with the coring-tube E, adapted to rotate freely in said bearings, said coring-tube being provided with a flange and a holding-catch, I, to hold the flange of the coring-tube between itself and the bearings to prevent longitudinal movement of said tube, substantially as shown and described.

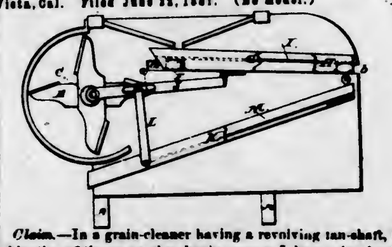
251,983. MECHANISM FOR OPERATING RAILWAY-SWITCHES. CHARLES C. WILLIAMS, Columbus, Ohio. Filed Aug. 30, 1881. (No model.)

Brief.—The releasing or unlocking treadles and the operating-treadles are arranged side by side, with the former in advance of the latter, and through rod, crank, and rock-shaft connections the switch is set from a passing train, having a wide roller, which acts upon said treadles. The switch is capable of hand operation through an unlocking foot-treadle and a vertical rotating shaft having connection with the throw-bar and lever-connection with the switch-operating treadles.

Claim.—1. The combination of the main-line rails, the switch, the releasing-lever pivoted at its end next the switch, the setting-lever close to the releasing-lever and correspondingly pivoted, the inclines of said levers arranged with the incline of the releasing-lever extending at its outer end farther from the switch than does the corresponding end of the incline of the setting-lever, and with the inner end of the setting-lever incline extending nearer to the switch than does the corresponding end of the releasing-lever incline, the rock-shaft, to which the said levers are connected, and the switch locking, releasing, and setting mechanism, with which mechanism said rock-shafts are connected, substantially as and for the purpose hereinbefore set forth.

2. The combination of the rails, the switch, the tread-bars on opposite sides of the switch, and the mechanism connecting the tread-bars with the switch, the said bars being provided with inclines and arranged in two sets or pairs pivoted at their ends next the switch, each pair consisting of a switch-releasing and a switch-setting bar, with the incline of the releasing-bar extending partly beyond and partly by the side of and close to the incline of the setting-bar, and with the setting-bar incline extending nearer the switch than does the releasing-bar incline, substantially as and for the purpose hereinbefore set forth.

3. The combination of the switch-releasing tread-bars C C′, the switch-setting tread-bars D D′, their pivots b′ f, the inclines c d d d′, arranged relatively to each other and to the switch as described, the rock-shafts E H, and the rods connecting said rock-shafts with the locking, releasing, and setting devices by the side of the switch, substantially as and for the purpose hereinbefore set forth.

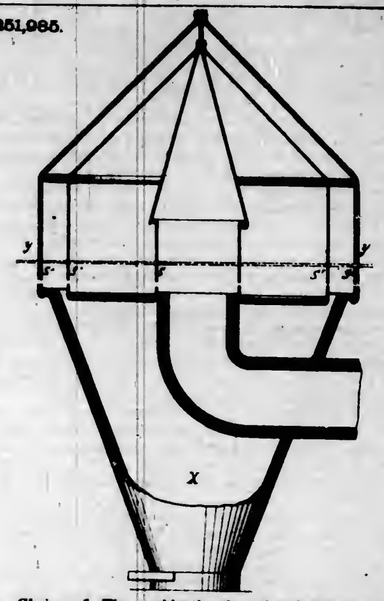


4. The combination of the switch throw-bar, the turning shaft O′, the rack thereon, the rack-bar on the throw-bar, the rock-shaft M, the detent engaging with the throw-bar and actuated by the rock-shaft, and the spring acting on the detent, substantially as and for the purpose hereinbefore set forth.

5. The combination, substantially as hereinbefore set forth, of the switch, the throw-bar, the upright shaft, the gearing connecting said shaft and the throw-bar, the hand-lever secured to said shaft, the spring-detent engaging with the throw-bar, the rock-shaft operating the detent, and the treadle or foot-lever secured to the rock-shaft, for the purpose described.

6. The combination of the switch-releasing tread-bars, the rock-shafts E, connected with said tread-bars, the switch-setting tread-bars, the rock-shafts H, with which they are connected, the switch throw-bar, the upright shaft geared therewith, the rods connecting said upright shaft with the rock-shafts H, actuated by the switch-setting bars, the spring-detent engaging with the throw-bar, the rock-shaft M, connected with the detent, and the rods connecting said rock-shaft and detent with the rock-shafts E, actuated by the switch-releasing tread-bars, substantially as and for the purpose hereinbefore set forth.

7. The combination of the single broad tread-roller Q, mounted upon the engine, and the tread-bars arranged in two sets or pairs and located between the main rails, each of said pairs consisting of a switch-releasing and a switch-setting tread-bar, pivoted at their ends next the switch and provided with inclines, the inner end of the releasing tread-bar incline and the outer end of the setting tread-bar incline being arranged side by side and close together, and the opposite ends of said inclines projecting respectively away from and toward the switch, substantially as and for the purpose hereinbefore set forth.

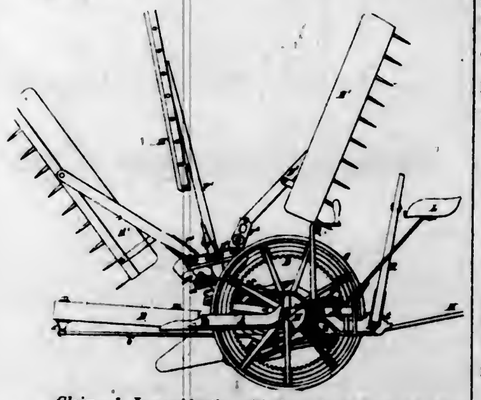


251,984. GRAIN-CLEANER. WILLIAM WILLIAMSON, Rio Vista, Cal. Filed June 13, 1881. (No model.)

Claim.—In a grain-cleaner having a revolving fan-shaft, the combination of the upper shoe having screen I, lower shoe having screen M, eccentrically-journaled rods J, having slots c, and hinged adjustable connecting-strips L, arranged substantially as and for the purpose herein described.

251,985. DUST-COLLECTOR FOR MIDDLINGS-PURIFIERS, &c. AUGUSTUS WOLF, Allentown, assignor of one-half to D. L. Hunsicker, East Hempfield, Pa. Filed Sept. 13, 1881. (No model.)

251,985.



Claim.—1. The combination, in a dust-collector for middlings-purifiers, of one or more suspended bags, a dust-supplying spout communicating with the interior of the same, and mechanism for imparting a vertical shaking or jerking motion to the said bag or bags, as set forth.

2. The combination of the dust-supplying spout, the inner bag, S, connected to the said spout at one end and open at the opposite end, the discharge-spout X, the outer bag, S′, closed at one end and connected at the opposite end to said discharge-spout X, and mechanism for shaking the bags, as specified.

3. The combination of the pivoted arm W, the bag or bags suspended therefrom, the crank-pin x, and the spring w, whereby a sudden movement is imparted to the arm W on its release from the control of the crank-pin, as set forth.

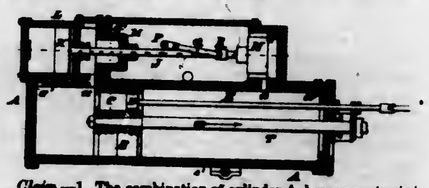
4. The combination of the suspended bag or bags forming the dust-collector and mechanism for imparting a vertical shaking or jerking movement to said bag or bags with whipping-cords y, as set forth.

251,986. HARVESTER. WILLIAM A. WOOD, Youngstown, Ohio, assignor to Frank Wood, Albany, N. Y. Filed Jan. 2, 1880. Renewed Oct. 6, 1881. (Model.) Patented in England Dec. 6, 1879.

Claim.—1. In combination with the main frame A and with the tilting frame which carries the platform and rakes, the eccentric J, adapted to operate directly upon the said tilting frame, said eccentric being fixed on the shaft a, on one side of the main supporting-wheel, and having a lever fixed to the opposite end of said shaft a, in described relation to the driver's seat, as set forth.

2. In a harvester, the combination, with the main frame A and tilting frame I, carrying platform H, and capable of being variously elevated or lowered in relation to said main frame, of the tilting shaft K, operating with the rearward end of said tilting frame, whereby said tilting frame may be variously inclined, substantially as and for the purpose set forth.

3. In a harvester, the combination of a main frame supporting the platform, rakes, and mechanism for revolving said rakes, a tilting frame, and devices for elevating and lowering said tilting frame, both in front and rear, from the driver's-seat side, said devices also supporting the tilting frame.



4. The combination of the main frame, supporting platform and rakes, and mechanism for revolving said rakes, with eccentric J on shaft a, and operating mechanism within reach of the driver, and with the shaft K and connections, whereby the frame may be tilted from front or rear by the driver, as set forth.

5. The combination, with the main frame A and tilting frame I, of the tilting shaft K, provided with crank q, operating with the rear end of said tilting frame, segmental toothed rack t, and lever R, carrying dog t′, substantially as and for the purpose set forth.

6. The depressing-way T, secured to the main frame, and shaft u, supported from platform H, and provided with the lever-arm u′, acting against said depressing-way, and with crank v′, operating with the pivoted lever V, carrying grain-wheel U, whereby the grain-wheel side of said platform will be made to assume a position uniformly the same with the opposite side, in the manner and for the purpose set forth.

7. In combination with the supporting-wheel C, the sleeve h, shaft l, provided at one end with cam n and at the other end with handle-lever m, projecting from the driver's side of said drive-wheel, dog o, and internal ratchet-wheel, p, made with the sprocket-wheel driving the revolving rakes, substantially as and for the purpose set forth.

251,987. MINING-ENGINE. BERNARD YOUS, West Belleville, Ill. Filed Sept. 24, 1881. (No model.)

Claim.—1. The combination of cylinder A, having ports a′ a′ at its extreme ends, and spring check-valves S, parallel with the cylinder and transverse of the ports, as set forth.

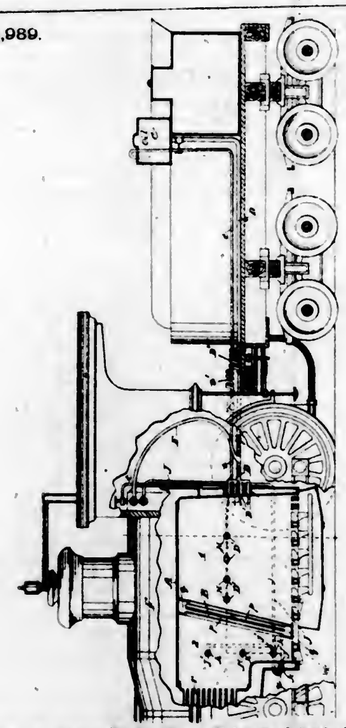
2. In a mining-engine, the combination of cylinder A, formed with induction-ports a′ a′, having spring check-valves S S, eduction-ports a a, valve-chest G, and piston B, as set forth.

3. The combination, with the drill-picks, of a scraper in contact with the drill in the forward movement and swung outward before the backward movement, for the purpose set forth.

4. The piston B, containing a cylinder, C, and piston D, operating the scraper W, substantially as set forth.

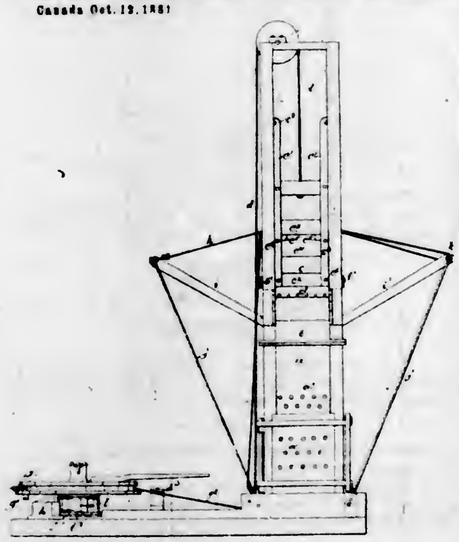
5. The piston B, containing a cylindrical bore, C, and piston D, with rod E, working through the head of cylinder A.

251,988. KNOB-ATTACHMENT. JOHN W. YOUNG, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Oct. 10, 1881. (No model.)



Claim.—The combination of the knob-shank having the recess e with the straddling saddle, the clamping-screw, and the spindle, substantially as hereinbefore set forth.

251,989. HYDROCARBON-FURNACE. MICHAEL ENOS, Pittsburg, Pa. Filed Sept. 16, 1881. (No model.)



Claim.—In the herein-described furnace, the combination of a primary combustion-chamber, 1, a secondary combustion-chamber, 2, the perforated wall or partition B, separating said cham-

251,989.

bers, with the pipes D, D', E, and H for supplying hydrocarbon, steam, and air to the primary combustion-chamber to effect a violent combustion in said chamber, and the pipes J, J', and *k* for supplying steam and air to the secondary chamber and effecting the consumption of the unconsumed products passing from the primary chamber, the whole being constructed and arranged substantially as described.

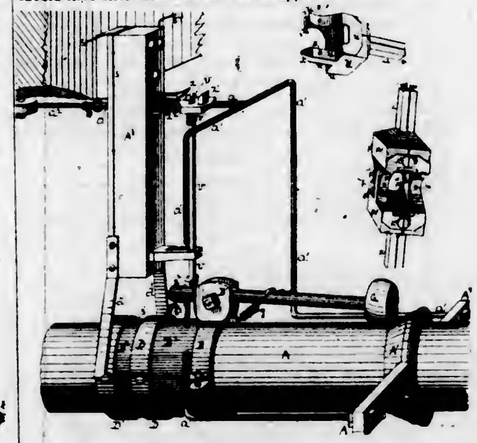
251,990. BALING-PRESS. GREENLEAF W. BATCHELDER, Boston, Mass. Filed Nov. 23, 1881. (No model.) Patented in Canada Oct. 19, 1881.

Claim.—1. The drum *l*, provided with the grade or incline *l'*, having the shoulder *l''*, and combined with the rope *k*, secured to the drum at the rear of the shoulder *l''*, whereby, as the drum rotates, said grade will so guide the second turn of the rope as to lay it above the first, as shown and described.

2. The capstan-shaft *m* and capstan-drum *f*, mounted loose thereon, combined with a second winding-drum, *l*, also loose on the said shaft, and arranged below the drum *f*, the drums being provided with clutch-projections *l' f'*, to enable them to be engaged with or disengage from one another, substantially as described.

3. In a beating-press for baling purposes, the combination, with the beater, of the tower having its walls perforated or provided with openings for the escape of air, dust, &c., to prevent the undue retardation or cushioning of the said beater thereby, and to cleanse the material of the bale, substantially as described.

4. The combination, with the tower, of the pressure-arms *i i'* and their actuating rope and pulleys therefor, the beater having recesses to receive the said arms, and the four arms or posts extending upwardly from said beater in the corners of the tower, whereby they are braced, and provided with pulleys to receive the portions of the said actuating-rope that extend across between the pressure-arms, substantially as and for the purpose set forth.



5. The combination, with the tower and the beater and its operating levers and ropes, of the drum *l*, having the projections *l'*, the drum *f*, arranged above the drum *l* and on the same shaft, and having the lugs *f'*, and means, substantially as described, to engage and disengage the projections *l' f'* of the drums, as and for the purpose specified.

6. In a baling-press, the herein-described beater, consisting of the four corner-posts *c'*, the top and bottom blocks, *c² c³*, recessed to receive the said corner-posts, and the front and rear blocks, *c⁴*, all united by bolts through the said corner-posts, and the detachable acting face *c⁵*, all substantially as described.

7. The feeding-door *b* and its fastening-hooks *b' b'* at each end, combined with the unfastening device *b² b³ b⁴* for simultaneously disengaging both the said hooks, substantially as described.

251,991. ELECTRIC GOVERNOR AND INDICATOR FOR FLUID-PRESSURE BRAKES. EDWIN S. BATCHELOR, Pittsburg, Pa., assignor to himself and Charles W. Batchelor, same place. Filed Sept. 14, 1881. (No model.)

Brief.—An alarm is given on the locomotive if the wheels should slide after the brakes have been applied.

Claim.—1. The combination of a centrifugal governor, a car-axle, an electrical make-and-break mechanism operated by the governor, an electrical circuit extending thence to the engine, and an audible or visual signal in such circuit in convenient position for signaling the engineer, substantially as set forth.

2. The combination of an electrical wire-circuit extending along any desired part of the train, an axle-governor, a make-and-break mechanism actuated by such governor, a valve-operating mechanism, and a make-and-break mechanism operated by the valve motion, substantially as set forth.

3. The combination, in a railway-train, of an electric-wire circuit, a centrifugal governor taking its motion from an axle, an electric make-and-break mechanism actuated by such governor, a spring tending to hold said governor to the axle, and a signal or alarm, substantially as set forth.

4. The combination, on a railway-train, of an electric-wire circuit, a centrifugal governor taking its motion from the axle, a make-and-break mechanism actuated by the governor, a valve-operating mechanism, a make-and-break mechanism operated by the valve-motion, and a bell-ringing and signaling circuit brought into operation by the breaking of the previously-closed train or main circuit, substantially as set forth.

5. The insulated collars D D' B and strips *d d'*, in combination with circuit-wires and with a centrifugal governor actuated from the car-axle, and a make-and-break mechanism actuated from such governor, substantially as set forth.

6. In combination with a centrifugal governor and axle, the draw-frame *a a'*, collar A', hook *s*, catch *s'*, and trip-bar *v*, as a means for testing apparatus of the class described, substantially as set forth.

7. The combination of a railway-train signal, a signaling electric circuit, a valve mechanism for applying fluid-pressure brake-power, and an electrical make-and-break mechanism operated in making and breaking the circuit by the valve motion, substantially as set forth.

8. An electrical coupling having in combination in each half a block, R, and pin *r'*, of non-conducting material, a metallic plate, *n*, on each side of the block, a leg, *n'*, having a projection, *e*, of each plate *n* lying along each opposite side of the pin *r'*, and a perforated leg, *n²*, of each plate *n* bent to a bow shape, so as to make contact with the opposite leg *n'* of the same half-coupling when the couplings are disconnected, but such legs *n²* being arranged to be separated by the pin *r'* of the other half-coupling when two half-couplings are united, and at the same time make electrical contact with the legs *n'* of such other half, substantially as set forth.

251,992. PROCESS OF MANUFACTURING GLYCERINE FROM SOAP-LIQUOR. JESSE P. BATTERSHALL, New York, N. Y. Filed Nov. 8, 1881. (No specimens.)

Claim.—1. In the manufacture of glycerine from waste soap-liquor, the processes of neutralization, evaporation, addition of carbonate of lime, means for removing rosin and fat, use of the centrifugal machine, and distillation, substantially as described.

2. The application of the centrifugal machine for the separation of glycerine from waste soap-liquor, substantially as hereinabove described.

3. In the manufacture of glycerine from waste soap-liquor, the use of the centrifugal machine in combination with the process of evaporation, substantially as hereinabove described.

4. In the manufacture of glycerine from waste soap-liquor, the combination of the use of the centrifugal machine with the process of evaporation and distillation, substantially as herein set forth.

5. In the manufacture of glycerine from waste soap-liquor, the combination of the use of the centrifugal machine with the process of neutralization, evaporation, and distillation, substantially as hereinabove described.

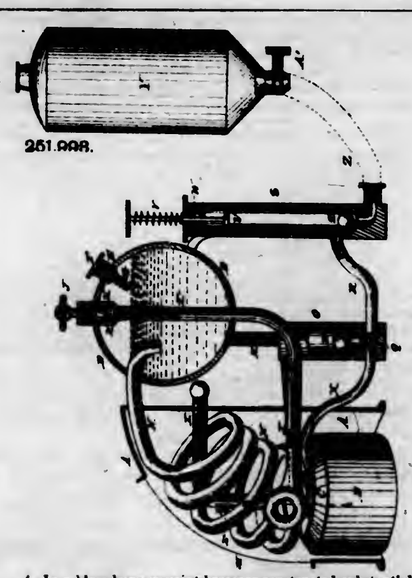
6. In the manufacture of glycerine from waste soap-liquor, the combination of the use of the centrifugal machine with the use of methylic or ethylic alcohol, substantially as hereinabove described.

7. In the manufacture of glycerine from waste soap-liquor, the use of the centrifugal machine with means for clarifying the products thereof, substantially as herein described.

8. In the manufacture of glycerine from waste soap-liquor, the use of carbonate of lime, substantially as hereinabove described.

9. In the manufacture of glycerine from waste soap-liquor, the combination of the use of the centrifugal machine with the process of separating rosin and fat by straining through cloth filter-bags, substantially as hereinabove described.

251,993. BLOW-LAMP. RICHARD T. BISHOP, St. Louis, Mo., assignor of one-half to Theodore Hunt, same place. Filed Sept. 16, 1881. (No model.)



Brief.—The burner-pipe may be swiveled so as to permit the direction of the flame to be regulated at pleasure.

Claim.—1. The combination of the casing A, lamp B, reservoir D, coiled pipe H, and burner-pipe I, all arranged and operating substantially as herein described, for the purpose set forth.

2. The combination of the reservoir, the lamp B, the heating-coil, and the burner-pipe I, having gage-cock J and perforations K, substantially as described, for the purpose set forth.

3. The combination of the casing, lamp, coiled pipe H, and the plunger-pump O S, the body of which, S, forms a handle to the device, the cylinder O, having a three-way cock, Q, and feed-pipe X, and a suitable tank, Y, and flexible tube Z, all arranged and operating substantially as described, for the purpose set forth.

251,988.

4. In a blow-lamp or paint-burner constructed substantially as described, the jointed or swiveled burner-pipe, as and for the purpose shown and specified.

251,994. WAGON-SPRING. NATHAN BEVERAGE, Lockport, N. Y. Filed May 31, 1881. (No model.)

Claim.—1. A spring for vehicles, consisting of the long spring *c*, secured to a bar, *a*, by a sleeve, *b*, and a strap, d^3, in combination with a shorter spring, *c'*, arranged a short distance from it and secured in a similar manner to a bar, *a'*, for the purposes specified.

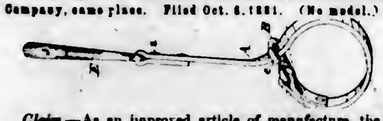
2. The bolster *f*, provided with the stakes *g*, the bar *a*, and spring *c*, secured thereto, substantially as specified, in combination with the spring *c'*, arranged a short distance from it and secured to the bar *a'*, substantially as and for the purposes described.

251,995. PAPER CAP. FRANK E. BUCK, Philadelphia, Pa. Filed June 17, 1881. (No model.)

Claim.—1. The sheet or strip A, having transverse cutting-lines *a*, substantially as shown and described.

2. The sheet or strip A, having lateral incisions on one side, producing flaps a^2, designed and adapted to form, by folding over one another, a crown for a cap, substantially as shown and described.

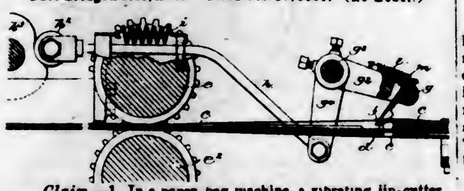
3. A cap of paper or equivalent material composed of a band or body and a crown, the latter consisting of overlapping flaps folded radially toward a common center and secured thereto, substantially as shown and described.



4. The combination, with the body or band A and flaps a^2 integral therewith, of the securing-disks C D, substantially as shown and described.

5. A cap of paper or equivalent material having a crown and a band forming the body, the ends whereof are secured by a pin, E, substantially as shown and described.

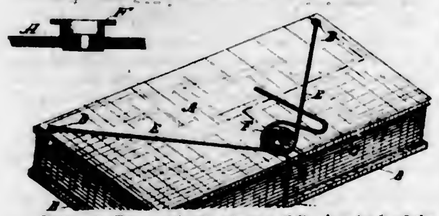
6. A cap of paper or equivalent material having a crown and a band folded longitudinally to produce a double thickness, substantially as shown and described.



7. A cap of paper or equivalent material having a folded band or double body and a crown composed of overlapping radial flaps secured to a common center, substantially as shown and described.

251,996. HOSE-CARRIER. CORNELIUS CALLAHAN, Chelsea, Mass., assignor to the American Fire Hose Manufacturing Company, same place. Filed Oct. 6, 1881. (No model.)

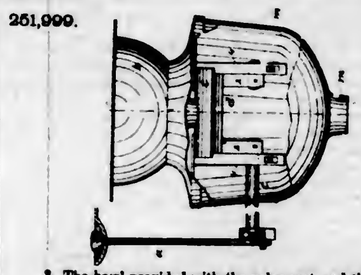
Claim.—As an improved article of manufacture, the hose-carrier composed of the strap A, the ladder-hook, and the loop B, opened at its rear side and opposite the direction of the opening of the ladder-hook, and provided with a projection, *a*, to extend across the edge of the strap A and hold it in the loop, all substantially as shown and described.



251,997. PAPER-BAG MACHINE. CLARENCE A. CHANDLER, East Bridgewater, Mass. Filed Oct. 17, 1881. (No model.)

Claim.—1. In a paper-bag machine, a vibrating lip-cutter adapted to strike and cut through the upper ply of and move forward with the moving tube until lifted therefrom, substantially as described.

2. The rock-shaft g^2, its arm, and lip-cutter *f*, pivoted thereon, and spring to control it, combined with the former and lip-support located within the tube, to operate substantially as described.

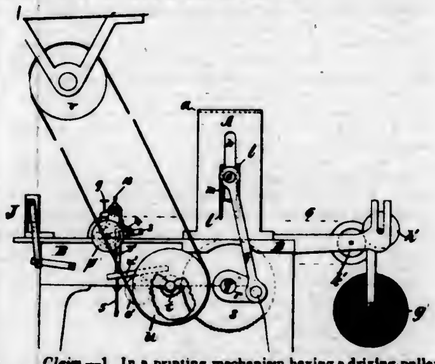


251,998. PORTFOLIO SCRAP-BOOK. ARTHUR L. COLTON, Hammond, N. Y. Filed June 13, 1881. (No model.)

Claim.—1. The combination, in a portfolio scrap-book, of the covers A and B and envelopes C, all provided with holes or eyelets D, and one of said covers being further provided with a belaying-pin, F, a string, E, passing through said eyelets, both ends of which are attached to the belaying-pin and are adapted to be wound around or unwound from the shank thereof, thus shortening or lengthening the available portion of the string, and a string, E', attached at one end to the string E and free at the other, and adapted to be wound around the belaying-pin, and thus secure the book together, all substantially as set forth.

2. The combination, with the cover B, of the belaying-pin F, secured thereto, and provided with lateral holes in its shank, adapted to receive and hold the ends of the string E, and having a head or flange under which the string E' may be wound, and thereby secured, substantially as described, and for the purposes specified.

251,999. WATER-CLOSET. JOHN C. DAGGETT, Hopkinton, Mass., assignor of one-half to John B. Farrar and Albert L. Kimball, both of Bradford, Mass. Filed Aug. 25, 1881. (No model.)



Claim.—1. The receiver *m* and its continually-open outlet *m'*, combined with the bowl *b*, provided with a valve-seat, and the slide-valve co-operating therewith, substantially as and for the purpose described.

2. The bowl and its valve-seat, combined with the slide-valve co-operating therewith, and the adjusting devices, whereby close contact is maintained between the valve and seat, substantially as described.

3. The bowl provided with the valve-seat, and the valve having lugs mounted on a rocker-shaft, combined with the slotted hangers and bearing-blocks for the said shaft, and the adjusting devices and their operating screw-rod, as and for the purpose described.

252,000. CHROMATIC-PRINTING PRESS. CHARLES W. DICKERSON, Belleville, and GEORGE HOWARD, South Orange, N. J. Filed Feb. 8, 1881. (No model.)

Brief.—A reciprocating plunger carries two chase-plates, one hinged to each side. As the plunger rises these chase-plates, carrying the forms, are oscillated upward to a vertical position, one on each side of the plunger. In this position the forms are inked in different colors. The plunger carrying the forms descends and makes the impression, that of one form being upon clean paper, and that of the other being upon a part already printed in one color. The paper is advanced by intermittently-moved rolls. A spring-blade strips the web of paper from the forms.

Claim.—1. In a printing mechanism having a driving-pulley therewith connected—as, for example, *a*—the combination, with a plunger and chase-plates, of mechanism, substantially such as described, adapted to change said plates from a horizontal to a vertical position, and mechanism, substantially such as described, connecting said plunger and said pulley, substantially as and for the purposes set forth and shown.

2. In a printing-machine, the combination, with a plunger connected with driving mechanism, of arms *f* and guides arranged to rock the chase-plates, and said chase-plates, substantially as and for the purposes set forth and shown.

3. In a printing-machine, the combination, with cheek-pieces and a plunger working therein, of rocking shafts *g*, arranged upon each side of said plunger and carrying chase-plates and guides, all arranged and operating substantially as and for the purposes set forth and shown.

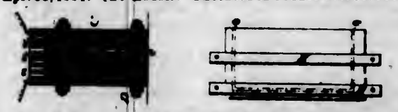
4. The combination, with cheek-pieces having the curved grooves *d* and grooves or sockets *j* therein, of the plunger and rocking chase-plates, sliding plates *h* and springs connected therewith, the arms *f*, and guides *e*, all arranged and operating substantially as and for the purpose set forth and shown.

5. In a printing-machine, cheek-pieces A, having therein a curved groove, *d*, adapted to receive guides *e* and to cause the chase-plates to change from a horizontal to a vertical position, tracks or ways A, adapted to engage with a vertically-moving plunger, and slots *b*, adapted to receive sliding plates, substantially as and for the purpose set forth and shown.

6. The combination, in a printing-press, with the plunger and chase-plates swinging thereon, of a plate lying between said chase-plates and adapted to strip the paper from the type, substantially as and for the purposes set forth and shown.

7. The combination, in a printing-machine, with a plunger carrying swinging chase-plates, of a plate secured between said chase-plates and working in a slot in the plunger, and a spring or springs connected with said plate and operating to hold the same against the paper after the return movement of the chase-plates has commenced, all the parts being arranged and operating substantially as and for the purposes set forth and shown.

252,001. PIPE-JOINT. JASON K. DIMMICK, Newport, Ky. Filed Apr. 8, 1881. (No model.)



Claim.—1. The combination of two pipe-sections, one provided with a mouth having a chamber for the reception of packing, and beyond that of regular internal taper or bevel, and the other with an end adapted to enter said mouth and to bear against the internally-tapering walls thereof on all sides.

2. As an improved article of manufacture, a pipe having one end formed or provided with a shoulder or bead and the opposite end formed with a mouth of regular internal taper.

3. A cast pipe formed at one end with a mouth chambered for the reception of packing, and beyond that of regular internal taper or bevel, and at the other end having a shoulder or bead adapted to enter a corresponding mouth in the next pipe and bear against the tapering walls thereof, to center and align the two pipes for the process of tamping or packing.

4. In combination with a pipe-section having a regularly-tapering as distinguished from a annular mouth, the entrance of which mouth is enlarged for the reception of packing, a second section having its end shouldered and correspondingly tapered and seated in said mouth against the tapering walls thereof.

252,002. POLARIZATION OR SECONDARY ELECTRIC BATTERY. CAMILLE A. FAURE, Paris, France, assignor to Societé Anonyme la Force et la Lumière, Brussels, Belgium. Filed Apr. 30, 1881. (No model.) Patented in France Oct. 30, 1880.

Claim.—1. As an improvement in secondary batteries, an electrode consisting of a support coated on one or more faces with an active layer of absorptive substance—such as metal or metallic compound applied thereto in the described condition—so as to be at once spongy, and thus capable of receiving and discharging electricity, as stated, in contradistinction to a metallic plate itself rendered spongy by the disintegrating action of electricity, substantially as and for the purpose set forth.

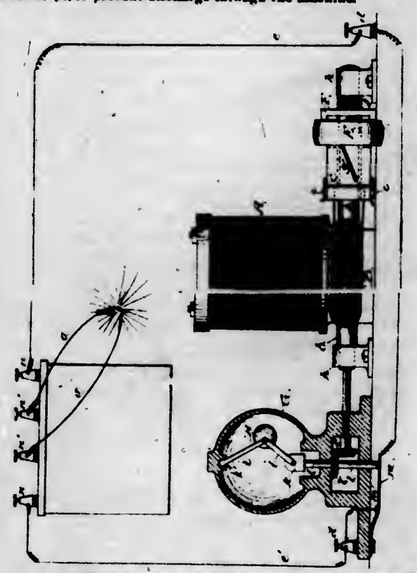
2. In a secondary battery, an electrode having a plate or support coated with an active porous layer of metal or metallic compound, with inert material—such as crushed coke—mixed or incorporated therewith, substantially as described.

3. In combination with the plate or support of an electrode and active spongy layer thereon, an open-work perforate or porous medium for holding said layer on the plate or support of the electrode, substantially as described.

4. In a secondary battery, a series of cells comprising each a pair of electrodes with an active spongy layer thereon, combined with non-porous partitions between adjacent cells, substantially as and for the purpose set forth.

5. An electrode for secondary batteries, comprising a support, an active spongy layer of metallic substance, and a holding medium through which the battery-fluids may pass, adapted to hold said layer on said support, said support, layer, and holding medium being all fastened together, so as to be capable of transportation, substantially as described.

6. A battery comprising a series of plates clamped together with strips of rubber or like material placed between every two plates near the edges, so as to form the bottom and ends of narrow troughs or cells with open tops, the sides of the troughs or cells being formed by the plates, and the latter being clamped firmly, so that liquid-tight joints are formed, substantially as described, the projecting edges of the plates, when metallic, being protected by insulation, substantially as described.



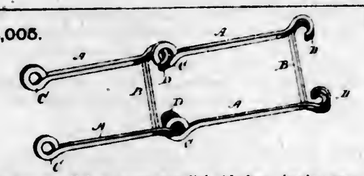
252,003. NUT-LOCK. WILLIAM HOUSE and JOSEPH R. DAVIS, Bellaire, Ohio; said Davis assignor of one-half his right to O. T. Blackburn. Filed May 31, 1881. (No model.)

Claim.—The band E, provided with the spring F and the keeper D, in combination with the bolts *b'* and *b''*, provided with the nuts C and *c*, all constructed to operate substantially as and for the purpose set forth.

252,004. AUTOMATIC CIRCUIT-BREAKER FOR SECONDARY BATTERIES. JAMES A. HALSEY and PEARL HUSSEY, Washington, D. C., assignors to the American Electrophore Company, same place. Filed Sept. 19, 1881. (No model.)

Brief.—Breaks charging-circuit when dynamo-electric machine stops, to prevent discharge through the machine.

Claim.—1. An automatic circuit-breaker consisting of the ball H, with its arms *i i*, and the shaft *l*, provided with the bevel-gear *l'*, in combination with the shaft of the armature B of the electric generator, and spring *m* and electric circuit, all constructed and operated substantially as and for the purpose set forth.



2. In combination with an electrophore or secondary battery and dynamo-electric generator, with their circuits, a governor or regulator operated by the direct motion of said generator, in combination with the spring *m*, substantially as and for the purpose set forth.

3. In combination with a dynamo-electric generator and electrophore or secondary battery, a governor or regulator consisting of the ball H, within a frame, G, and its connections with shaft *l*, spring *m*, and contact-point *m'*, substantially as described, and for the purpose set forth.

252,005. DRIVE-CHAIN. LEWIS H. RUMERY, St. Louis, Mo. Filed Dec. 7, 1881. (No model.)

Claim.—1. A link for drive-chains formed of spring metal,

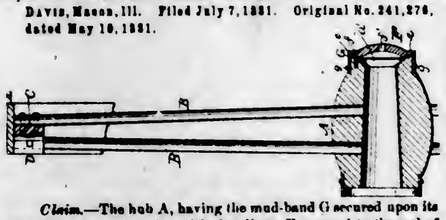
252,005.

with two parallel or nearly parallel side bars, having eyes at one end and hooks at the other, said hooks and eyes being at right angles to each other, and the side bars being connected by a cross-bar at one end only, substantially as specified.

2. A link for drive-chains formed of spring metal, with two parallel or nearly parallel side bars, having at one end eyes or loops formed thereon and at right angles thereto, and at the opposite end a cross-bar, and inwardly-bent projecting hooks in the same horizontal plane as the side and cross bars, and adapted to be coupled to similar links to form a chain, substantially as set forth.

3. A link for drive-chains formed of spring metal, square or rectangular in cross-section, having two side bars with eyes formed on the free ends thereof, and connected at the opposite end by a cross-bar, and provided with doubled projecting hooks, said hooks being in the same horizontal plane as the side and end bars, and the eyes at right angles thereto, substantially as set forth.

REISSUES.



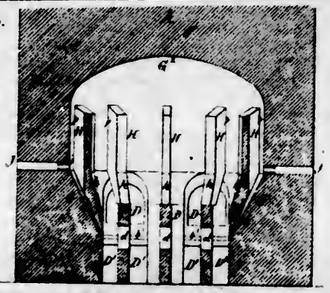
9,994. VEHICLE-WHEEL. CHARLES W. BALL and THOMAS DAVIS, Macon, Ill. Filed July 8, 1881. Original No. 241,276, dated May 10, 1881.

Claim.—1. In a vehicle-wheel, the combination, with the spokes B, of the tire and felly, each made in separate parts and forming a T-bar, and sockets secured on each side of said felly, substantially as shown and described.

2. In a vehicle-wheel, the combination, with spokes B, screwed at one end into hub A, of the tire E and felly C, constructed as described, with supporting-pieces D, secured on alternate sides of said felly, substantially as shown and described.

9,995. VEHICLE-WHEEL. CHARLES W. BALL and THOMAS DAVIS, Macon, Ill. Filed July 7, 1881. Original No. 241,276, dated May 10, 1881.

Claim.—The hub A, having the mud-band G secured upon its outer end, in combination with the oil-cap F, secured to the end of said hub within but independently of said band, and forming a tight joint with the latter, and having the lubricating-hole *f*, all constructed and arranged as and for the purpose set forth.



9,996. BAGASSE-FURNACE. WM. LITTLEJOHN, New Orleans, La. Filed Dec. 3, 1881. Original No. 208,476, dated Oct. 1, 1878.

Claim.—1. In combination with the combustion-chamber wall of a bagasse-furnace, the inwardly-projecting columns H, with broad spaces between them, and having broad inner faces and broad sides, whereby the bagasse is prevented from packing in the corners or angles *p*, formed between the wall and columns, and passages for the flame and air to ascend from below are maintained, substantially as and for the purpose described.

2. The combination of the pinnacle I, columns H, and longitudinal walls D, substantially as described.

3. In a bagasse-furnace, the central pinnacle, I, provided with

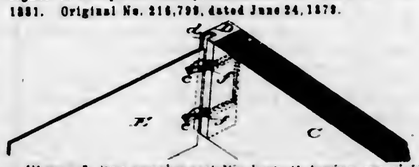
9,996.

columns or wings, having a space all around it between its columns and the outer wall, and said pinnacle having a grated or other suitable support, whereby the bagasse which is introduced into the furnace is radially divided and distributed and prevented from packing centrally in the angles or corners of said pinnacle, and whereby a central draft through the bagasse is secured, substantially as described.

4. In a bagasse-furnace, the combination of the doors D', the walls D, having openings *d*, and the bridge E, having passages *e*, substantially as and for the purpose set forth.

5. The combination of the grate or grates *b'* in a chamber or chambers provided with a draft door or doors, B', the ash-pit or ash-pits *b*, provided with a draft door or doors, F F', and the chamber of the furnace, provided with the pinnacle, the columns, the longitudinal walls, and draft door or doors D', substantially as set forth.

6. The walls D, provided with perforations *d*, in combination with the bagasse combustion-chamber provided with inwardly-extending columns H, having broad inner faces and also broad spaces between them, substantially as and for the purpose set forth.



7. The combination, with the bagasse combustion-chamber provided with the columns H, which have broad inner faces and also broad spaces between them, of a wall, D, and a grate, *b'*, the wall occupying a position about central of the grate, and the flame or fire from the grate caused to circulate on both sides thereof, substantially as set forth.

8. The ash-pit of a bagasse-furnace provided with longitudinal sustaining-walls D and bridge-wall E, whereby circulati -chambers *b* and passages *e e'* are formed and a firm support for the pinnacle I afforded, substantially as set forth.

9. The bagasse-furnace having inwardly-extending columns H on the inner surface of its bagasse combustion-chamber, and provided with walls D and M in its ash-pit section, which, in conjunction with the bridge-wall E, serve as a grating and for forming circulation-chambers *b* and spaces *e e'*, substantially as and for the purpose set forth.

10. The grate or fire-bed of the bagasse combustion-chamber, together with the air and flame circulation chambers *b*, of the ash-pit section of the furnace, formed by longitudinal walls D, which rise from the ground, extend up above grates *b'*, and terminate on the plane of the fire-bed surface of the bagasse combustion-chambers, said walls of themselves or together with a tie at E forming the grated support for the burning bagasse, thereby avoiding the use of transverse arched grated surfaces between the walls from end to end, as heretofore, substantially as described.

9,997. BLANK-BOOK. ALLAN J. MAXWELL, Boston, Mass., assignor to Joseph A. Yancey, Richmond, Va. Filed Nov. 22, 1881. Original No. 216,799, dated June 24, 1879.

Claim.—1. The angular metallic back B, having one rigid side *b*, and hooks or aprns *b'*, arranged opposite to and facing said rigid side, substantially as described.

2. The angular metallic back B, having one rigid side *b*, and the retaining-hooks *b'*, arranged opposite to and facing said rigid side, in combination with the grooved rigid back D, to which the tablet is secured, substantially as described.

3. The rigid backing D, to which the tablet is secured, provided with th -otches *c' c'*, in combination with the removable

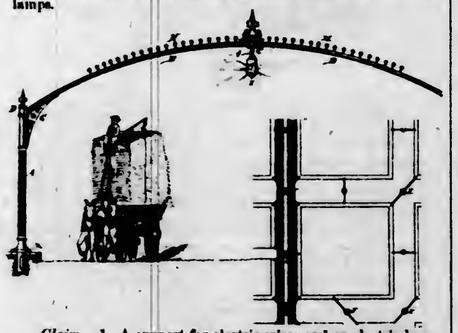
blotter, secured thereto by the elastic band *f* and the removable clips *e e*, substantially as described.

4. As a new article of manufacture, a renewable blotter-tablet consisting of a book or pad of paper provided with covers, and a blotter-sheet held by one or more spring-clips, *e*, flexibly attached by an elastic cord to the back of the binding, all in the manner described and shown.

9,998. SPRING-BOARD FOR VEHICLES. GEORGE E. NORRIS, Troy, assignor, by mesne assignments, to Wm. F. Bidwell, Glens Falls, N. Y.; said Bidwell assignor of two-thirds to said Norris and James K. P. Pine, same place. Filed Dec. 3, 1881. Original No. 154,392, dated Sept. 8, 1874.

Claim.—1. As an improvement in wagon spring-boards, the combination, with the board, of a central supporting spring or springs and longitudinal adjustable brace-rods, substantially as specified.

2. In combination with the wagon spring-board A, the crescent-shaped spring B, attached to the board about midway between its ends and adjustably connected with the board near the ends of the latter, substantially as herein shown and described.



3. In combination, the wagon spring-board A, the crescent-shaped spring B, firmly attached to the spring-board about midway between the ends of the latter, and the connecting brace-rods C C, connecting the arms of the spring with the board adjustingly at or near the ends of the board, substantially as shown and described.

4. In a wagon spring-board, the combination of the board A, the crescent-shaped spring B, the connecting-rods C C, the lugs *a a* upon the board, and the nuts *b b* upon the outer ends of the rods, as and for the purposes described and set forth.

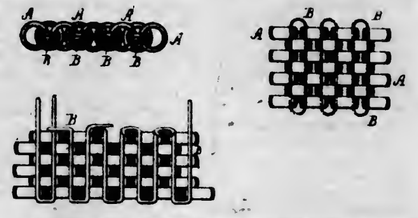
5. The combination of the board A, the crescent-shaped spring B, attached to the board, the spiral spring D, and the adjustable brace-rods C C, arranged to operate as herein shown and described.

9,999. SUPPORT FOR ELECTRIC WIRES AND LAMPS IN CITIES. WILLIAM C. ALLISON, Philadelphia, Pa. Filed Sept. 8, 1881. Original No. 241,179, dated May 10, 1881.

Brief.—Upon posts diagonally arranged at street-corners an arch or arches are sprung bearing insulated supports for wires and lamps.

Claim.—1. A support for electric wires and an electric lamp at a crossing of two streets, which consists of two simple arches or girders sprung diagonally from corner to corner and crossing in the middle, from which the electric lamp is hung, said arches being provided with insulated supports for the electric wires, substantially as and for the purpose specified.

2. In a support for electric wires and an electric lamp, the posts A, provided with caps D, furnished with lugs E, sections of tubular arches B, center casting, C, provided with lugs F, and insulated supports H on the sections B for the electric wires, substantially as shown and described.



3. In a support for electric wires, the tubular posts A, provided with caps D, or their equivalent, to support the tubular arch or girder B, in combination with one or more insulated wire-supports on the arch, substantially as and for the purpose specified.

4. A support for electric lamps and wires in cities, which consists of an arch or structure, substantially as described, supported from the diagonally-opposite corners of two crossing streets, in combination with an electric lamp hung from the middle of said arch and insulated therefrom, as and for the purpose specified.

5. In a system for lighting cities by electric lights, the combination of the two diagonally-opposite street-corners with an arch supported upon said corners and spanning the roadway diagonally, and an electric lamp suspended and insulated from the middle of said arch for the purpose of lighting up two streets from one point, substantially as and for the purpose specified.

10,000. CHAIN FOR WATCHES. GEORGE W. CLAMPITT, Attleborough, assignor to Henry F. Barrows, North Attleborough, Mass. Filed Nov. 29, 1881. Original No. 120,623, dated Nov. 7, 1871.

Brief.—The ends of the locking wires are clinched over adjacent links.

Claim.—1. In the manufacture of chains composed of a series of alternating interlocking wires or links united by wires passing through the links, the manner herein described of fastening the ends of these locking wires or devices, which consists in bending or clinching the same over adjacent links, substantially as explained.

2. In a chain, the combination of a series of interlocking rows of links or rings with the connecting devices concealed within such links or rings and secured therein by their points being clinched or bent, substantially as explained.

3. As a new article of manufacture, an ornamental chain composed of a series of rows of rings or links secured together by suitable fastening devices, the ends or points of which are secured by bending or clinching in lieu of being soldered, substantially as explained.

10,001. MACHINE FOR SOWING FERTILIZERS. EDWIN D. MEAD, Shorteville, N. Y., assignor of one-half to the Farmers Friend Manufacturing Company, Dayton, Ohio. Filed Aug. 8, 1881. Original No. 218,759, dated Aug. 19, 1879

Claim.—1. A fertilizer-distributer having a horizontally-rotating feed-wheel arranged in the bottom of the hopper and a discharge-orifice arranged near the periphery, in combination with a hinged or pivoted gate adapted to work over the mouth of the orifice to regulate the quantity to be discharged, substantially as set forth.

2. A fertilizing-distributer having a series of horizontally-rotating disks or feed-wheels arranged in the bottom of the hopper and a series of discharge-orifices arranged near the peripheries of

the feed-wheels, in combination with a series of hinged or pivoted gates adapted to work over the mouths of the orifices and pivoted to a common connecting-rod, substantially as set forth.

3. The combination, with a horizontally-rotating fertilizer-distributer and the bed-plate forming a bearing for the same, of a revolving scraper or cleaner mounted on an independent axis, substantially as described.

4. In a fertilizer-distributer, the sectional hopper-bottom B, having an annular bearing for the feed-wheel, and the bridge-tree B^1, substantially as herein set forth.

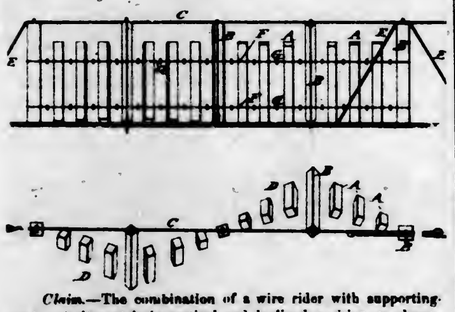
5. In a fertilizing-distributing device, the sectional bottom B, having the annular supports for the rotatory feed-wheel, and the bridge-tree B^1, or center for supporting the vertical axial journal on which the feed-wheel revolves, substantially as herein set forth.

6. In a fertilizing-distributing device, a series of sectional hopper-bottoms, B, having annular supports for the feed-wheels, and a bridge-tree for supporting the axial shaft of the feed-wheel, and sleeve-bearings for the horizontal transmitting-shaft, on which are a series of pinions respectively meshing with the cogs on the periphery of the feed-wheel, whereby rotatory motion is imparted to the feed-wheels, substantially as herein set forth.

7. In a fertilizer-distributer, the sectional hopper-bottom B having an annular support for the horizontally-rotating feed-wheel, and a bridge-tree attached to said sectional bottom, on which is supported the axial shaft-journal upon which said feed-wheel revolves, substantially as herein set forth.

8. A horizontal rotating fertilizing-distributer mounted on an axis, in combination with a revolving scraper or cleaner mounted on an independent axis, substantially as herein set forth.

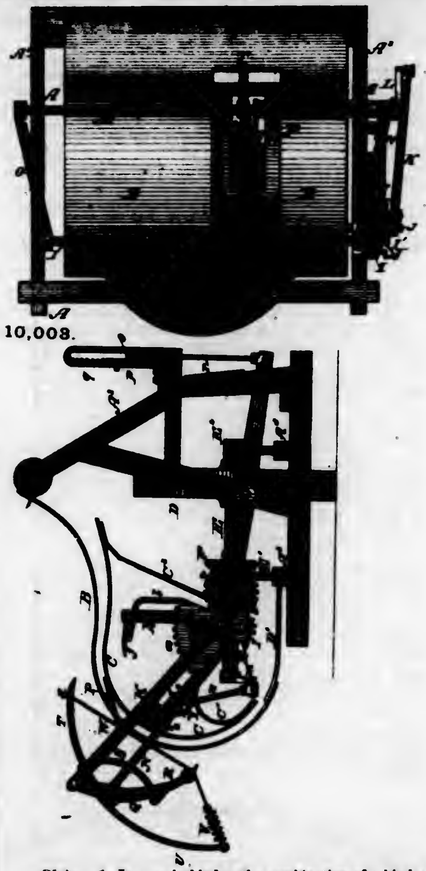
9. A fertilizer-distributer composed substantially of a horizontal rotating feed-wheel and a series of projections, C, arranged upon the upper space of the feed-wheel, in combination with the revolving scraper or clearer G, as set forth.



10. In combination with the horizontally-rotating wheel having a circular series of teeth-projections, C, the horizontally-revolving clearer-wheel G, provided with scraper-teeth *g*, which revolve eccentrically through the spaces between the teeth C of feed-wheel and the scraper-teeth *g* of the clearer-wheel, meshing with and being driven by the teeth of the feed-wheel D, substantially as herein set forth.

11. A fertilizer-distributer having the feed-wheel D, revolving clearer, and stir-pins O, arranged to serve in combination as herein specified.

12. In a fertilizer-distributer, the combination of a horizontally-rotating disk or feed-wheel arranged in the bottom of the hopper and a horizontally-revolving wheel having a beveled rim or edge revolving eccentrically over the surface of the disk or feed-wheel, and adapted to scrape and discharge the fertilizing material from the disk or feed-wheel into a discharge-chute, substantially as and for the purpose described.



13. In a fertilizer-distributer, the bottom of the feed-hopper composed of a series of sectional bottoms, B, and the series of horizontally-rotating feed-wheels supported upon the sections B, substantially as herein set forth.

10,002. PICKET-FENCE. ROBERT H. MCGINTY, Moulton, Tex. Filed Aug. 19, 1881. Original No. 144,630, dated Oct. 14, 1873; Reissue No. 9,570, dated Feb. 15, 1881.

Claim.—The combination of a wire rider with supporting-posts set alternately in vertical and inclined position, as shown and having their tops in alignment, substantially as described.

10,003. GRAIN-BINDER. DANIEL MCBRAYER, Caledonia N. Y., assignor to the McCormick Harvesting Machine Company, Chicago, Ill. Filed May 28, 1881. Original No. 183,813, dated Oct. 31, 1876.

Claim.—1. In a grain-binder, the combination of a bind ag-table which receives the grain, a binding-arm supported upon a vertically-rocking frame, and means whereby the binding-arm is positively depressed to pierce through the stream of grain and divide off and encircle the gavel as the rocking frame reaches the termination of its inward traverse and held in its depressed position during the outward traverse.

2. In a grain-binder, the combination of a binding-table which receives the grain, a pivoted frame rocking toward and from the delivery-point of the harvester, a binding-arm fast to a cranked rock-shaft carried by said frame, and mechanism positively actuating said rock-shaft to depress the binding-arm at the termination of the inward traverse of the rocking frame and lock it during the outward traverse.

3. In a grain-binder, the combination of a binding-table which receives the grain, a pivoted frame rocking toward and from the delivery-point of the harvester, a binding-arm carried by said frame, and means positively actuating said binding-arm to depress it at the termination of the inward traverse of the rocking frame and raise it at the termination of the outward traverse, and to lock it in its depressed or raised position during the intermediate movements of said frame.

4. In a grain-binder, the combination of a binding-table which receives the grain, a frame rocking on a horizontal pivot, a binding-arm carried by said frame, band-securing mechanism, also carried by said frame, and means whereby the binding-arm is brought down alongside the band-securing mechanism at the termination of the inward traverse of the frame to deliver the band material to said mechanism.

5. In a grain-binder, the combination of a binding-table which receives the grain, a frame rocking on a horizontal pivot, a binding-arm carried by said frame, band-securing mechanism, also carried by said frame, and means whereby the binding-arm is caused to descend to the band-securing mechanism at the termination of the inward traverse of the frame and held alongside thereof during the outward traverse.

6. In a grain-binder, the combination of a binding-table which receives the grain, a frame rocking on a horizontal pivot, a binding-arm carried by said frame, band-securing mechanism, also carried by said frame, means whereby the binding-arm is caused to descend to the band-securing mechanism at the termination of the inward traverse of the frame and locked alongside thereof during the outward traverse, and means whereby the band-securing mechanism is actuated during said outward traverse.

7. In a grain-binder, the combination of a binding-table which receives the grain, a frame rocking on a horizontal pivot, a rising and falling binding-arm carried by said frame, band-securing mechanism, also carried by said frame, and a series of gear-teeth concentric with the axis of movement of said frame, whereby the band-securing devices are actuated as the frame rocks.

8. In a grain-binder, a frame rocking on a horizontal pivot, a rising and falling binding-arm carried by said frame, band-securing mechanism, also carried by said frame, and a shield located immediately above said band-securing mechanism.

9. In a grain-binder, the combination, with the grain table or receiver, of a frame rocking on a horizontal pivot, a cranked rock-shaft carried by said frame, a binding-arm mounted upon said rock-shaft, and a pitman connecting the wrist-pin of the rock-shaft with a rotating crank so arranged and timed as to depress the binding-arm at the termination of the inward traverse of the frame and elevate it at the termination of the outward traverse while holding it substantially rigid with said frame between the two extremes.

10. The combination of the vertically-rocking frame, the cranked rock-shaft mounted thereon, the binding-arm carried by said rock-shaft, the pitman attached to its wrist-pin, and the stop-motion by which said pitman is driven.

11. The combination of the vertically-rocking frame, the binding-arm carried thereon, and the cranks and pitman for actuating said arm, the band-securing device, also carried by the rocking frame, and the stationary segment for actuating it.

12. In a grain-binder, the combination, with the binding-arm and band-uniting devices, of a gate-actuating mechanism closing said gate to shut off the access of the band material to the band-uniting device during the rise and inward movement of the binding arm, and means for opening it to admit said material as the arm descends and brings it around the gavel.

13. In a grain-binder, the combination, with a traversing binding-arm and concurrently-traversing band uniting mechanism, of a gate traversing therewith, means to close said gate during the rise of the binding-arm and inward traverse, to shut off the access of the band material to the band-uniting mechanism, and means to open it as the binding-arm descends and encircles the gavel, to admit said material.

14. The combination, with the band-uniting devices, of the bar or gate *g*, to admit or cut off access of the band material thereto, the trip by which said gate is opened, and the spring by which it is closed, substantially as described.

15. The tilting bar Z, supporting the binding mechanism, and means for operating it for changing the position of the binder relative to the delivery-point of the grain without changing the position of the binding parts relative to each other, substantially as specified.

16. The combination of the rocking receiver C with the main receiver B, substantially as and for the purpose specified.

17. The combination of the needle T with the twisting devices supported upon a tilting base adapted to tilt them in either direction, so as to bring the bands or ties in a proper position around the bundles, substantially as set forth.

18. The combination of the needle T, provided with an extension, U, with the cord W, spring V, pivoted arm R, and mechanism for controlling the latter, substantially as set forth.

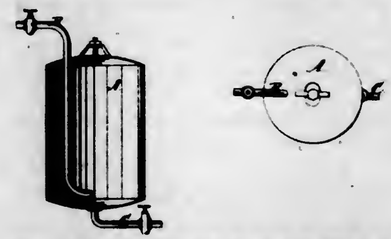
19. The combination of the arm Q and pivoted bar R with the link or rod S, needle T, and cord W, for compressing the bundle, substantially as specified.

20. The combination of the needle T and frame M, N, O, and I' with the crank *m*, pitman *n*, and post Y', for advancing and receding the needle, substantially as specified.

21. The concave opening *i* in the twister-head Y, in combination with the close-fitting twisting-hook *e*, substantially as and for the purpose specified.

22. The combination of the wheel *d* and sliding-bar *g* with the twisting-hook *e* and cutter *f*, for holding, twisting, and severing the wire, substantially as described.

23. The wheels H and I, in combination with the plate J, pitman K, crank L, and shaft M, for tilting the needle and forcing it through the grain, substantially as set forth.



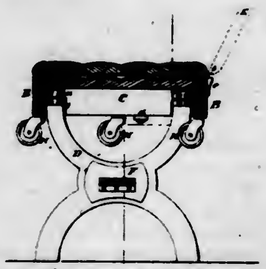
24. The combination of the wheel H, provided with the cogged and blank sections, with the wheel I, similarly provided, pins *w w*, and plate J, for giving intermittent movements to the pitman K, substantially as specified.

25. The combination of the lever *s* with shaft J' and pivoted binder-supporting bar Z, for tilting the binding apparatus in either direction, substantially as specified.

26. The combination of the lever *s* with the guide-post *q*, link *r*, tilting bar Z, upon which the binder is mounted, and lever *s*, for bringing the tilting within the control of the driver, substantially as specified.

27. The spring or yielding arm P, in combination with platforms B C, for preventing the return of the bundles, substantially as specified.

10,004. MANUFACTURE OF CREAM OF TARTAR. GUIDO SCHNITZER, Schwäbisch Hall, Wurtemberg, Germany, assignor, by mesne assignments, to the Royal Baking Powder Company, New York, N. Y. Filed Dec. 1, 1880. Original No. 163,507, dated Oct. 24, 1876.



Claim.—1. The improvement in the art of treating argols to obtain a solution of the same, which consists in subjecting the argols while being dissolved to the pressure of steam, substantially as described.

2. The improvement in the art of treating argols to obtain a solution of the same, which consists in subjecting the argols while being dissolved to the pressure of steam admitted near the bottom of the vessel containing the argols, substantially as described.

3. The improvement in the art of obtaining cream of tartar from argols, which consists substantially of dissolving the argols in water under steam-pressure, converting the tartrate of lime into bitartrate of potash by the aid of hydrochloric acid and chloride of potassium, and separating the cream of tartar after it has crystallized from the residual solution, substantially as described.

4. The process herein described of manufacturing cream of tartar by subjecting ground argols, together with hydrochloric acid and chloride of potassium, in a steam-tight vessel, to the direct action of compressed steam for the necessary length of time, and then allowing the solution to stand till the crystallization of the bitartrate of potash is complete, substantially in the manner specified.

10,005. COMBINED STOOL AND CHAIR. EMIL WOLFF, Washington, D. C., assignor to Herman L. Wattenberg, New York City; said Wattenberg assignor to Lemuel A. Chichester, Phoenicia, N. Y. Filed Nov. 16, 1881. Original No. 185,110, dated Mar. 26, 1878.

Claim.—1. A convertible high and low chair provided with legs hinged to the seat-frame, upon which legs the chair is immediately supported in its highest position, and with permanently-secured rollers which support the chair in its lowest position as a trundle.

2. In a convertible high and low chair, the combination of

rollers permanently fixed thereto and legs hinged to the seat-frame and adapted to move toward and from each other, whereby the chair may be raised to rest upon said legs and lowered to trundle upon said rollers.

3. In a convertible high and low chair, the combination of permanently-attached rollers, legs hinged to the seat-frame to approach and diverge from each other as the seat is raised and lowered, and a device to retain the legs rigidly in their upright position when the chair is elevated.

4. In a convertible high and low chair, the combination of permanently-attached rollers, legs hinged to the seat-frame and adapted to move toward and from each other as the seat is raised and lowered, and a device to firmly secure the legs in their folded position when the chair is in its lowest position and resting on the rollers.

THE HELIOTYPE PRINTING CO BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

PICKERING *et al. v.* MCCULLOUGH, DALZELL & CO.

Decided December 12, 1881.

1. PATENTABLE COMBINATION—MECHANICAL JUXTAPOSITION.

In a patentable combination of old elements all the constituents must so enter into it as that each qualifies every other, and together form either a new machine of a distinct character and function or produce a result due to the joint and co-operating action of all the elements, and which is not the mere adding together of separate contributions. Otherwise it is only a mechanical juxtaposition and not a vital union.

2. IMPROVEMENT IN MOLDING CRUCIBLES—AGGREGATION OF OLD DEVICES—PATENTABLE NOVELTY.

The alleged invention covered by the Nimmo patent of an improvement in molding crucibles, which consists of combining an old mode of presenting the "ball" to and supporting it under the action of the forming-tool and an old mode of shaping the inside of the crucible, *Held* to be a mere aggregation of old agencies and devoid of patentable novelty.

3. SAME—ANTICIPATED BY PATENTS OF WISE AND SMITH—CHANGE OF MATERIAL—MECHANICAL SKILL.

The alleged invention of Nimmo is also anticipated by prior patents to Wise and to Smith, embodying the principle of a former used in combination with a mold connected so that the former can be withdrawn in cases of vessels having a bilge without injury, although the machines described in said patents are mere paper-machines, it appearing that the machines could be made practically successful by mere mechanical skill without the exercise of the faculty of invention.

APPEAL from the Circuit Court of the United States for the Western District of Pennsylvania.

Mr. J. E. Maynadier for the appellants.
Mr. W. Bakewell for the appellees.

Mr. Justice MATTHEWS delivered the opinion of the Court.

This is a bill in equity, filed by the appellants, to restrain the appellees from infringing Reissued Letters Patent No. 6,166, dated December 8, 1874, to George Nimmo, for an improvement in molding crucibles, and for an account, the patent having been reissued to the complainants as assignees of Nimmo, the inventor and original patentee. The original patent, No. 49,140, was granted to Nimmo June 20, 1865.

The subject of the alleged invention is an improvement in the manufacture of molding crucibles and pots made of a plastic material composed of plumbago, or so-called "black-lead" and "fire-clay," used principally in the manufacture of steel. They were formerly made by hand on a common potter's wheel, the hand and eye of the skilled workman building them up, as the material revolved upon the wheel, in the desired shape. It is recited in the original patent to Nimmo that they had also been made in a mold by a pressing-instrument, for which reference is made to letters patent granted October 26, 1852, to John Akrill. It is stated also by Nimmo in the specification to his original patent that—

Difficulty has heretofore been experienced in removing the crucibles from the mold, in consequence of the adhesive nature of the black-lead compound or mixture employed for such crucibles. The amount of water also that is required to make the mixture sufficiently plastic causes the material frequently to crack and break in shrinking as it dries.

The following is the description of the invention as contained in the specification, referring to the drawings accompanying it:

The nature of my said invention consists in the manufacture of crucibles in a plaster mold, which gives shape to the pot externally and absorbs the moisture from the pot, causing it to dry uniformly and at the same time shrink away from the mold, preventing the air acting on the outside of the pot until after the moisture has been mostly absorbed, and prevents the pot from splitting or cracking from unequal contraction in drying. I mount my plaster mold in a revolving chuck, and employ a rib attached to a lever for spreading the plastic crucible material on the inside of the mold, and at the same time hardening, consolidating, and polishing the crucible on the inside by means of said rib.

In the drawings is a bed carrying the vertical spindle, on the upper end of which is the hollow chuck, into which the plaster mold fits, and these parts are revolved by a belt to a wheel and crank or by any other competent means. Near the chuck is an upright frame with rollers, over which the chain or rope passes, on one end of which is the counter-weight and on the other the lever having a handle at one end and carrying the rib. This lever is guided by the upright frame, and when not in use is drawn up by the weight. The crucible material is placed in the plaster mold and partially spread by hand or by a conical muller. The back end of the lever is then brought beneath the stop or fulcrum and pressed down until the lever takes a step. The rib on the lever smooths, compresses, hardens, and polishes the interior of the mold, forming a perfect crucible, possessing great strength and beauty. At the same time there is great uniformity in the crucibles made in this manner. The crucible and mold are to be lifted off the chuck and another mold introduced in the chuck and the operation repeated. The crucible and mold are set aside. When the plaster of the mold has absorbed the moisture from the crucible and the crucible has contracted away from the mold and become sufficiently dry to be exposed to the air without risk of cracking, the crucible is to be removed and dried in any usual manner, and may be baked or burned.

The claims are as follows:

What I claim, and desire to secure by Letters Patent, is—

1. Manufacturing crucibles in a plaster mold in the manner and for the purposes specified.

2. Lever *l* and rib *n*, applied in the manner specified to form the interior of a crucible contained within a revolving mold, as set forth.

3. The combination of the revolving chuck *c*, plaster mold *d*, lever *l*, and rib *n*, as and for the purposes specified.

4. Mounting the lever *l* and rib *n* in the frame *g* in the manner specified, in combination with the counterpoise *k*, fulcrum *o*, and stop *p*, for determining the size of the interior of the crucible, as specified.

It is conceded by counsel for the appellants that the claims in this patent were invalid, as being too broad, and that it was for this reason and for a more definite and limited description of the real invention intended to be claimed that it was surrendered and reissued.

The state of the art at the date of his original patent is described by Nimmo in the reissue as follows:

Long prior to said Nimmo's invention the mode of manufacturing certain articles of pottery by means of a rib or former to give the desired shape to the inside of the article and a revolving plaster vessel to properly present the "ball" (as the lump of tempered clay is called) to and support it under the action of the rib was well known; but this mode of manufacture was not applicable in the manufacture of crucibles, because the apparatus was such that the crucible would be injured or destroyed in removing the rib by the end of the rib striking the upper part of the crucible,

as will be plain to all skilled in the art of crucible-making and acquainted with the mode of manufacture above referred to.

Another mode of manufacturing certain articles of pottery-ware by means of a rib or former for the inside of the article and a revolving table, (a common potter's wheel,) which partially presented the ball to and supported it under the action of the rib, the workman using his hands to aid in presenting the ball to and supporting it under the action of the rib, is described in a French work published in 1857, entitled "Leçons de Ceramique," par M. A. Salvetat, volume 2, pages 121 and 122.

This last-named mode of manufacture was applicable to the manufacture of crucibles, the apparatus being such that the rib was guided so as to cause it to approach the axis of the pot where it was necessary that it should do so in order to prevent injury to the pot; but even if useful at all in that manufacture, it is without doubt very much inferior to the mode of manufacture invented by Nimmo and hereinafter described, the distinguishing difference between them being that the ball is presented to the rib and supported under its action not by a flat revolving metal disk, but by a vessel made of plaster, which takes the place of both the flat revolving disk and the workman's hands, performing all the functions performed by this disk and the hands of the workman, but in a much more perfect manner and in less time.

The invention of said Nimmo is in fact an improvement on the mode of manufacture, as well as on the apparatus, described in Salvetat's work, the improvement consisting in the different mode of presenting and supporting the ball; but we do not wish to be understood as claiming this mode of presenting and supporting the ball as the invention of said Nimmo, as his improved mode of manufacture is new solely because it is, as a whole, substantially different from the mode described by Salvetat and from the mode first above referred to. Indeed, as a short general description of Nimmo's improved mode, it may be said to be substantially the same as that described by Salvetat, so far as shaping the inside of the crucible is concerned, and substantially the same as the mode first above referred to, so far as presenting the ball to and supporting it under the action of the rib is concerned.

By Nimmo's improved mode of manufacture much labor and expense are saved, and, what is still more important, crucibles are produced which are superior to those made by any practical mode known prior to said Nimmo's invention in many very important respects.

The drawings are the same in both the original and reissued patent; but in the description of the machine, with reference to the drawing contained in the reissue, prominence is given to the mode of operating the rib after the crucible is formed, by which it can be withdrawn without striking and injuring the crucible, as to which no allusion was made in the original patent. It is admitted, however, that this mechanism is substantially the same as that described by Salvetat in the publication referred to.

The reissue expressly disclaims as the invention of Nimmo both the modes and both the apparatus above mentioned—that is, the use of a rib or former to give the desired shape to the inside of the article and the revolving plaster vessel or mold—and the mode and apparatus described by Salvetat—that is, the use of a rib or former, the apparatus being such that the rib is guided so as to cause it to approach the axis of the crucible when it was necessary that it should do so in order to prevent injury to it.

The importance of this feature in any apparatus of the kind becomes manifest from the fact that crucibles of the character of those intended to be made by this process usually have what is termed a "bilge"—that is, are smaller in circumference at the mouth or top than at some other point—so that, if the rib or former were lifted out perpendicularly from the position it occupies while in operation, it would necessarily strike against the interior surface of the crucible as it rose. To avoid this it has to be withdrawn from the position it occupies while in the act of forming the internal surface of the crucible to one nearer to the axis of rotation, so that, being lifted, it may pass upward through the mouth of the crucible without striking against the sides. And considering how characteristic is this feature of the apparatus and how essential it is to its profitable use, it is worthy of note that Nimmo in his original patent does not allude to it, although his claim for managing his rib includes it; and, equally so, that it does not seem to have suggested to him at that time its utility in connection with the manufacture of crucibles with a bilge, for his description does not distinguish between those which have and those which have not a bilge, and his drawing is that of a mold with a flaring mouth, for the making of which such a motion of the former in withdrawing it is not necessary. In addition, the mold itself, made of plaster, for vessels having a bilge, is required to be in two parts, in order that it may be removed from the crucible after the operation is complete—an adaptation which does not appear either in Nimmo's specifications or drawings.

Nimmo's actual claim as made in the reissue is as follows:

> The improved apparatus above described having the specific character, objects, and functions above explained, and consisting of the rib, the revolving mold, and the mechanism by which the rib is guided toward the axis of revolution of the mold as it is withdrawn, as set forth, these elements being claimed only in combination each with all the others, and no claim is made to any combination of any of them less than the whole.

It is admitted in argument by counsel for the appellants that the mold is old and the rib is old; but it is claimed that prior to Nimmo's invention the mechanism for combining the rib and mold into one machine was such that the rib could not be moved bodily toward the axis of the mold or away from that axis.

Besides a denial of the alleged infringement, the appellees maintained several defenses. They claimed that the reissued patent is void because the claim is too broad; because there is no coactive combination between the elements of the claim; because the state of the art, as set forth in the specification, shows that there is no novelty in the alleged combination; because the reissue is for a different invention from that described in the original patent, and because the alleged invention of Nimmo had been fully anticipated.

The anticipations set out in the answer and relied on were, first, by the Salvetat publication; second, by the Wise patent, being a patent granted to Jacob Wise and Freeman Wise, dated November 30, 1852, No. 9,437, for an improvement in the manufacture of stone and earthen ware; third, by the Smith patent, being a patent granted to William Smith, dated November 3, 1863, No. 40,506, for apparatus for making plumbago crucibles; fourth, by prior knowledge and use of the alleged invention at Kier's works in Pittsburg.

The decree below dismissed the bill, to reverse which this appeal is prosecuted.

The account given in the specifications of the reissued patent, of the state of the art at the date of the alleged invention, and the reference to Salvetat's publication, describing the method and apparatus referred to, and a comparison of that with the claims and disclaimers of the appellants, require a more particular examination of Salvetat's description of the device and its mode of operation as contained in his publication.

It will be observed that the reissue represents Salvetat as having fully described the rib or former and the mechanism which guides it so that it can be withdrawn from the crucible when completed without injury, even when it has a bilge, but as omitting in connection with it any use of a mold. The statement of the reissue is that while Salvetat described the use of the rib for forming the interior of the vessel, its external form was molded by the unassisted hand of the workman manipulating the ball while revolving on the flat disk of the common potter's wheel; and the alleged

invention of Nimmo consists merely in adding a mold to the apparatus described by Salvetat to form the combination which he claims as his invention.

An examination of the extract from Salvetat's publication descriptive of this apparatus and method, which is contained in the record, makes it doubtful whether the account of it given in the specification of the reissued patent is not a misconception. The drawings illustrating it, it is true, do not show a mold, and the text in referring to them says the vessel is supported by the wheel. But this, perhaps, is explained by the statement that it is intended to show merely how Messrs. Bourgon and Chalot, the originators of it, have arranged the rib in a very ingenious manner for hollowing out hollow ware with the rib itself. The whole article or chapter is entitled "Hollow-ware pressing in plaster molds," and its very purpose seems to be to explain the use and utility of molds in shaping the forms of pottery by pressing, and all the other processes and devices mentioned certainly refer to molds as used. If the rule "*noscitur a sociis*" applies, there would be little room to doubt that the one in question also contemplated their use, and it seems difficult to understand how the vessel can be shaped externally unless the mold is implied. But we assume for the purposes of this case that the account as contained in the reissued patent of this method and apparatus is correct, and that Salvetat does not describe the use of a mold in combination with the rib. There is, however, no doubt whatever that Salvetat describes the operation of a rib by means of a mechanism which directs it in the formation of the interior of a vessel while in motion on a revolving wheel, and guides it when the vessel is formed, even when it has a bilge, so that by bringing it into a proper relation with the axis of revolution it can be withdrawn from the side of the vessel which it has shaped and lifted through its mouth or top without touching and injuring its sides. This is conceded by the appellants and is admitted in the patent itself. It is also confessed that the use of the mold for supporting the ball while the rib or former presses it on the inside, and thus shapes its corresponding outside, is old, and is not of itself claimed as the invention of Nimmo. The alleged invention, then, consists merely in supplying to the apparatus described by Salvetat a mold for supporting the ball and giving shape externally to the crucible. We are clearly of opinion that this is not patentable. It comes plainly within the rule as stated by Mr. Justice Strong in *Hailes* v. *Van Wormer*, (20 Wall., 368,) where he said:

> All the devices of which the alleged combination is made are confessedly old. No claim is made for any one of them singly as an independent invention. It must be conceded that a new combination, if it produces new and useful results, is patentable, though all the constituents of the combination were well known and in common use before the combination was made. But the results must be a product of the combination, and not a mere aggregate of several results each the complete product of one of the combined elements. Combined results are not necessarily a novel result, nor are they an old result obtained in a new and improved manner. Merely bringing old devices into juxtaposition, and then allowing each to work out its own effect without the production of something novel is not invention.

"The combination to be patentable," said Mr. Justice Hunt in *Rickendorfer* v. *Faber*, (92 U. S., 357,) "must produce a different force or effect or result in the combined forces or processes from that given by their separate parts. There must be a new result produced by their union; if not so, it is only an aggregation of separate elements."

In Nimmo's apparatus it is perfectly clear that all the elements of the combination are old, and that each operates only in the old way. Beyond the separate and well-known results produced by them severally no one of them contributes to the combined result any new feature; no one of them adds to the combination anything more than its separate independent effect; no one of them gives any additional efficiency to the others or changes in any way the mode or result of its action. In a patentable combination of old elements all the constituents must so enter into it as that each qualifies every other. To draw an illustration from another branch of the law, they must be joint tenants of the domain of the invention, seized each of every part, *per my et per tout*, and not mere tenants in common with separate interests and estates. It must form either a new machine of a distinct character and function or produce a result due to the joint and co-operating action of all the elements, and which is not the mere adding together of separate contributions. Otherwise it is only a mechanical juxtaposition and not a vital union. In the case of this apparatus the mold was known, and a rib or former was known, and their use in combination was known. Salvetat described a rib so arranged that after it had performed its function in shaping the interior of the vessel it could be withdrawn through the top of the vessel, so as not to produce injury by striking against its side. This rib Nimmo substituted for the old one in the same combination. And this is the whole of the invention. Upon the principle stated there is no invention in it.

We are also of opinion that the invention claimed for Nimmo as described in the reissued patent is covered by the prior patents to Wise and to Smith. Undoubtedly they both embody the principle of a former used in combination with a mold, for the purpose of manufacturing crucibles, connected so that the former can be withdrawn in the case of vessels having a bilge without injury. It is objected, however, that the machines described in these patents are mere paper machines, not capable of successful practical working; but on examination it sufficiently appears, we think, that the objections can be sustained only as to minor matters of detail in construction, not affecting the substance of the invention claimed, and could be removed by mere mechanical skill without the exercise of the faculty of invention. In this view the Wise and Smith patents are not rendered inefficient as defenses in this suit by reason of the alleged imperfections of the machines described in them.

The bill of the appellants was dismissed by the court below on the ground of the prior knowledge and use of the alleged invention at Kier's works in Pittsburg. We are of opinion that the testimony sustains that finding.

We find no error in the decree, and it is accordingly affirmed.

Supreme Court of the United States.

EGBERT, APPELLANT, *v.* LIPPMANN *et al.*

Decided December 12, 1881.

1. PUBLIC USE—A SINGLE USE SUFFICIENT.

To constitute the public use of a patent it is not necessary that more than one of the patented articles should be publicly used. The use of a great number may tend to strengthen the proof of public use, but one well-defined case of public use is just as effectual to annul the patent as many.

2. SAME—SAME.

Whether the use of an invention is public or private does not necessarily depend upon the number of persons to whom its use is known.

3. SAME—SAME—USE WITHOUT RESTRICTION.

If an inventor, having made his device, gives or sells it to another, to be used by the donee or vendee without limitation or restriction or injunction of secrecy, and it is so used, such use is public within the meaning of the statute, even though the use and knowledge of the use may be confined to one person.

4. SAME—CHARACTER OF THE INVENTION.

A use of an invention is a public use within the meaning of the law if the inventor sells a machine of which his invention forms a part and allows it to be used without restriction of any kind, although, owing to the character of the invention, it can only be used when it cannot be seen or observed by the public eye.

5. SAME—CONSENT—PATENT INVALIDATED.

When the inventor made and gave to a person for use two pairs of corsets, imposing no obligation of secrecy or any condition or restriction whatever, and it appeared that the invention was at that time complete, and the donee used them for a series of years before the filing of the application for a patent in the manner and for the purpose designed by the inventor, *Held* that the patent was invalidated by virtue of the public use with the consent and allowance of the inventor for more than two years prior to the filing of the application.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. James C. Clayton and *Mr. A. Q. Keasbey* for the appellant.

Mr. J. B. Staples for the appellees.

Mr. Justice WOODS delivered the opinion of the Court.

This suit was brought for an alleged infringement of the complainant's Reissued Letters Patent No. 5,216, dated January 7, 1873, for an infringement in corset-springs. The original patent bore date July 17, 1866, and was issued to Samuel H. Barnes. The reissue was made to the appellant, Frances Lee Egbert, executrix of the original patentee. The specifications for the reissue declared—

This invention consists in forming the springs of corsets of two or more metallic plates placed one upon another, and so connected as to prevent them from sliding off each other laterally or edgewise, and at the same time admit of their playing or sliding upon each other in the direction of their length or longitudinally, whereby their flexibility and elasticity are greatly increased, while at the same time much strength is obtained.

The second claim was as folows:

A pair of corset-springs, each member of the pair being composed of two or more metallic plates placed one on another and fastened together at their centers, and so connected at or near each end that they can move or play on each other in the direction of their length.

The bill of complaint alleged that Barnes was the original and first inventor of the improvement covered by the reissued letters patent, and that it had not at the time of his application for the original patent been for more than two years in public use or on sale with his consent or allowance. The answer took issue on this averment and also denied infringement. The circuit court dismissed the bill, and the complainant appealed to this court. As to the second defense above mentioned, it is sufficient to say that the evidence establishes beyond controversy the infringement by defendants of the second claim of the reissued letters patent above set forth. We have therefore to consider whether the defense of the public use of the patented invention with the consent of the inventor for more than two years prior to his application for the original patent is sustained by the testimony in the record.

The sixth, seventh, and fifteenth sections of the act of July 4, 1836, (5 Stats., 117,) as qualified by the seventh section of the act of March 3, 1839, (5 Stats., 353,) were in force in 1866 when Barnes applied for his patent. The effect of these sections is to render letters patent invalid if the invention which they cover was in public use with the consent and allowance of the inventor for more than two years prior to his application for a patent. Since the passage of the act of 1839 it has been strenuously contended that a public use of an invention for more than two years before the application for a patent, even without the consent and allowance of the inventor, rendered the patent therefor void. It is unnecessary in this case to decide this question, for the alleged use of the invention covered by the patent to Barnes is conceded to have been with his express consent.

The evidence on which the defendants rely to establish a prior public use of the invention consists mainly of the testimony of the complainant herself, who is the executrix of the original patentee. She testifies that Barnes invented the improvement covered by his patent between January and May, 1855; that between the dates named the witness and her friend, Miss Cugier, were complaining of the breaking of their corset-steels. Barnes, who was present and was an intimate friend of the witness, said he thought he could make her a pair that would not break. At their next interview he presented her with a pair of corset-steels which he himself had made. The witness wore these steels a long time. In 1858 Barnes made and presented to her another pair, which she also wore a long time. When the corsets in which these steels were used wore out the witness ripped them open and took out the steels and put them in new corsets. This was done several times. It is admitted, and in fact is asserted, by complainant that these steels embodied the invention afterward patented by Barnes and covered by the reissued patent on which this suit is brought.

Joseph H. Sturgis, another witness for complainant, testifies that in 1863 Barnes spoke to him about two inventions made by himself, one of which was a corset-steel, and that he went to the house of Barnes to see them. Before this time, and after the transactions testified to by the complainant, Barnes and she had intermarried. Barnes said his wife had a pair of steels made according to his invention in the corsets which she was then wearing, and if she would take them off he would show them to witness. Mrs. Barnes went out and returned with a pair of corsets and a pair of scissors, and ripped the corsets open and took out the steels. Barnes then explained to witness how they were made and used.

This is the evidence presented by the record on which defendants rely to establish the public use of the invention by the patentee's consent and allowance.

The question for our decision is whether this testimony shows a public use within the meaning of the statute. We observe, in the first place, that to constitute the public use of a patent it is not necessary that more than one of the patented articles should be publicly used. The use of a great number may tend to strengthen the proof of public use, but one well-defined case of public use is just as effectual to annul the patent as many. For instance, if the inventor of a mower, a printing-press, or a railway-car makes and sells only one of the articles invented by him, and allows the vendee to use it for two years without restriction or limitation, the use is just as public as if he had sold and allowed the use of a great number. We remark, secondly, that whether the use of an invention is public or private does not necessarily depend upon the number of persons to whom its use is known. If an inventor, having made his device, gives or sells it to another, to be used by the donee or vendee without limitation or restriction or injunction of secrecy, and it is so used, such use is public within the meaning of the statute, even though the use and knowledge of the use may be confined to one person. We say, thirdly, that some inventions are by their very character only capable of being used where they cannot be seen or observed by the public eye. An invention may consist of a lever or spring hidden in the running-gear of a watch, or of a ratchet, shaft, or cog-wheel covered from view in the recesses of a machine for spinning or weaving. Nevertheless, if its inventor sells a machine of which his invention forms a part and allows it to be used without restriction of any kind, the use is a public one within the meaning of the law. So, on the other hand, a use necessarily open to public view, if made in good faith, solely to test the qualities of the invention and for the purpose of experiment, is not a public use within the meaning of the patent law. (*Elizabeth* v. *Pavement Company*, 97 U. S., 126; *Shaw* v. *Cooper*, 7 Pet., 292.)

Tested by these principles we think the evidence of the complainant herself shows that there was a public use of the invention, covered by the original patent to Barnes, for more than two years before the application for the patent, and by his consent and allowance. He made and gave to the complainant two pairs of corset-steels, constructed according to his device, one in 1855 and one in 1858. They were presented to her for use. He imposed no obligation of secrecy or any condition or restriction whatever. They were not presented for the purpose of experiment or to test their qualities. No such claim is set up in the testimony of complainant. The invention was at the time complete, and there is no evidence that it was afterward changed or improved. The donee of the steels used them for years for the purpose and in the manner designed by the inventor. They were not capable of any other use. She might have exhibited them to any person she pleased, or might have made other steels of the same kind and used or sold them without violation of any condition or restriction imposed on her by the inventor. According to the testimony of complainant the invention was completed and put to use in 1855. The inventor slept on his rights for eleven years. The patent was not applied for till March, 1866. In the meantime the invention had found its way into general and almost universal use. A great part of the record is taken up with the testimony of the manufacturers and venders of corset-steels, showing that before Barnes applied for his patent the principle of his device was almost universally used in the manufacture of corset-steels. It is fair to presume that having learned from this general use that there was some value in his invention, Barnes attempted to resume, by an application for a patent, what by his acts he had clearly dedicated to the public.

An abandonment to the public may be evinced by the conduct of the inventor at any time, even within the two years named in the law. The effect of the law is that no such consequence will necessarily follow from the invention being in public use or on sale with the inventor's consent and allowance at any time within two years before his application, but that if the invention is in public use or on sale prior to that time it will be conclusive evidence of abandonment, and the patent will be void. (*Elizabeth* v. *Pavement Company*, 97 U. S., *supra*.)

We are of opinion that the defense of two years' public use by the consent and allowance of the inventor before he made application for his patent is satisfactorily established by the evidence.

The decree of the circuit court is therefore affirmed.

"The word 'CLINKERLESS.'"

9,019.—BRANDING LIVE STOCK.—*Protective and Detective Association of Texas*, Dallas, Tex. Application filed December 17, 1881.
"The letter 'C' and the bar or shank on the upper arm of the letter."

9,020.—FURNISHING-GOODS FOR MEN'S WEAR.—*Steinfeld, Kornfood & Co.*, Baltimore, Md. Application filed December 20, 1881.
"The word 'EXCELSIOR.'"

9,021.—PRINTED PUBLICATION.—*Williams & Co.*, New York, N. Y. Application filed December 1, 1881.
"The letters and words 'THE ELECTRICIAN.'"

9,022.—OIL-PAINTS.—*James H. Worcester*, Detroit, Mich. Application filed July 15, 1881.
"The arbitrary word 'COTTAGE.'"

9,023.—CIGARS, CIGARETTES, CHEROOTS, PLUG, TWIST, AND FINE-CUT CHEWING-TOBACCO, SMOKING-TOBACCO, AND SNUFF.—*Leopold Wertheimer*, New York, N. Y. Application filed December 14, 1881.
"The arbitrarily-selected word-symbol 'PINOCLE.'"

LABELS.

2,585.—Title: "CHAMPAGNE-SODA" (FOR A BEVERAGE.)—*Edward A. Butts*, Alexandria, Va. Application filed December 12, 1881.

2,586.—Title: "DR. O. ARONSON & CO., EUROPEAN HOG AND CATTLE CURE."—*O. Aronson & Co.*, Davenport, Iowa. Application filed November 25, 1881.

2,587.—Title: "BARKER'S NERVE & BONE LINIMENT FOR MAN OR BEAST."—*Barker, Moore & Mein*, Philadelphia, Pa. Application filed December 8, 1881.

2,588.—Title: "LUSTER FINISH" (FOR A CLEANSING COMPOUND.)—*Alonzo Dow*, College Corner, Ohio. Application filed October 27, 1881.

2,589.—Title: "HINRICHS' UNIVERSAL LAUNDRY STARCH POLISH."—*Robinson & Hinrichs*, Manitowoc, Wis. Application filed December 12, 1881.

2,590.—Title: "DR. NIEMEYER'S ASTHMA TROCHES."—*Frederick Humburg*, Detroit, Mich. Application filed December 12, 1881.

2,591.—Title: "DR. WALTHER'S SWISS COUGH TROCHES."—*Frederick Humburg*, Detroit, Mich. Application filed December 12, 1881.

2,592.—Title: "RIZ EXTRA" (FOR CIGARETTE PAPERS.)—*May Brothers*, New York, N. Y. Application filed December 14, 1881.

2,593.—Title: "TIRE BOLTS."—*Russell & Erwin Manufacturing Co.*, New Britain, Conn. Application filed October 22, 1881.

2,594.—Title: "INNES PNEUMONIA CURE."—*Lucy J. H. Watson*, Cincinnati, Ohio. Application filed October 7, 1881.

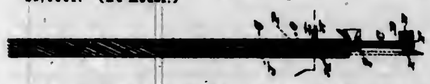
DISCLAIMER.

3,798, (Reissue.)—*Alfred Nobel*, Hamburg, Germany, assignor, by mesne assignments, to *The Atlantic Giant Powder Company*, San Francisco, Cal., dated March 17, 1874. IMPROVEMENT IN METHODS OF EXPLODING NITRO-GLYCERINE. Disclaimer filed December 28, 1881, by *The Giant Powder Company*, assignee of part interest of *The Atlantic Giant Powder Company*.

Enters its disclaimer to the following matter of description and claim in said reissue specification, to wit: "In printed specification on page 1 all of lines 29, 30, 31, 32, and the words 'produces the explosion' in line 33, and the words 'for this' in line 41; all of lines 42, 43, 44, 45, 46, 47, 48, 49, and the words 'explosion without such combination' in line 50; the words 'heat, or' in line 51; the words 'or by creating an impulse of explosion' in line 54, and all of lines 55, 56, 57, 58, 59, 60, 61, 62, 63, and the words 'charge of nitro-glycerine' in line 64; the words 'by the term impulse of explosion' in line 73, all of line 74, and the words 'explosion by suddenly-communicated force' in line 75; the word 'gun-cotton' in line 81; the words 'or gun-cotton' in line 89; the words 'which may be' and 'for' in line 94. On page 2 all of lines 1 and 2; the words 'open or closed at the top as may be preferred' in lines 6 and 7; all of lines 38 to 54, inclusive; the words 'to produce an initial' in line 55; the words 'explosion and a spark or by' in line 56; the words 'fire, heat, electricity, or' in lines 97 and 98, and the words 'means of' in line 103."

PATENTS

GRANTED JAN. 10, 1882.



252,006. BOTTLE-STOPPER. EDWARD ALDEN, Brooklyn, N. Y. Filed June 1, 1881. (No model.)

Claim.—1. As an improvement in bottle-stoppers, the combination, with a cork stopper, of a loop-shaped handle the ends of which pass at or near the center of the top part in an oblique direction through the cork, and then anchor to the sides of the cork, above the bottom of the same, substantially as set forth.

2. As an improvement in bottle-stoppers, the combination, with a cork or other stopper, of a loop-shaped wire handle the ends of which pass at or near the center of the top part in an oblique direction through the cork and anchor to the sides of the same, above the bottom, the upper looped portion being tightly twisted, substantially as and for the purpose set forth.

252,007. NEEDLE-THREADER FOR SEWING-MACHINES. FRANK G. ALTHAUS and FRED POEHNER, Edina, Mo. Filed Oct. 28, 1881. (No model.)

Claim.—1. The combination, with the needle-bar having inclined dovetailed groove B and auxiliary groove or recess I, of the spring J, having tooth O and thumb-piece N, and the rigid sliding rod C, having notches P Q and threading-tube D, as herein described, for the purpose set forth.

2. The combination of the grooved needle-bar A, having slot M, the slide D, having notches P Q, and the spring J, having tooth O, shank L, and thumb-piece N, the latter bent so as to come in front of the slide D, as herein described, for the purpose set forth.

252,008. FISHING-ROD. GEORGE P. ANDREWS, Staffordville, Conn. Filed Oct. 4, 1881. (No model.)

Claim.—The combination, with a fishing-pole composed of lengths or sections hinged together, of the spring fastening device H, for the purpose specified.

252,009. APPARATUS FOR MIXING AERIFORM FLUIDS. JOHN P. BARNES, Springfield, Mass. Filed May 31, 1881. (No model.)

Claim.—1. The combination, in an apparatus for mixing aeriform fluids, of a movable diaphragm connected with and operating two slide-valves whose apertures communicate with a common mixing pipe or chamber, and a valve-seat having a portion thereof movable and adjustable, to enlarge or diminish the aperture of one of said valves, substantially as and for the purpose described.

2. The combination, in an apparatus for mixing aeriform fluids, of a valve-chamber, a valve within said chamber, a valve-rod secured to and adapted to operate said valve, and extending through one side of said valve-chamber, a cup made upon the outside of said valve-chamber and around said rod and adapted to contain a sealing fluid, and an inverted cup made upon said rod and extending down into the cup to contain the sealing fluid, substantially as and for the purpose set forth.

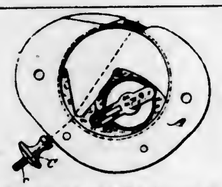
252,010. ACCORDION. RUDOLF BERGER, Gera, Reuss, Germany. Filed Oct. 15, 1880. (No model.) Patented in Germany Mar. 13, 1880.

Claim.—In an accordion provided with a second or additional row of reeds covered by a valve or damper adapted to be moved over the same, the controlling device for operating the damper, consisting of the combination of the springs *d d'*, levers *e e'*, crossbar *f*, and rod *h*, with knob *i*, with the damper-bar B, said rod *h* or knob *i* being arranged at or near the thumb-strap D, in the manner and for the purpose substantially as described.

252,011. BRICK AND OTHER KILNS. SAMUEL W. BICKLEY, Mexico, Mo. Filed Feb. 23, 1881. (No model.)

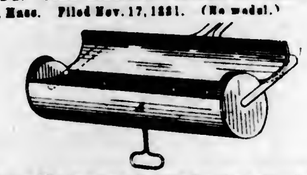
Claim.—1. The furnace B, provided with opening D, located at the base of the chamber C and in direct line with the fuel, in combination with the damper *a*, operated by means of a lever pivoted beneath the grate-bars of said furnace, as and for the purpose set forth.

2. In combination with the furnace B, provided with chamber C, the opening *d*, formed with a gradually-reducing size to the front and forming a flue for a hot draft above the fires, substantially as and for the purpose set forth.



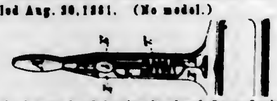
252,012. VALVE-SEAT FOR STEAM-ENGINES. ARNVAH BLOOD, Manchester, N. H. Filed Nov. 10, 1879.

Claim.—The combination, with the slide-valve, of the valve-seat and its ports, the said valve-seat being provided with transverse grooves undercut or dovetail-shaped in cross-section, as described, combined with independent strips or tenons fitted to slide longitudinally in the said grooves, substantially as and for the purpose set forth.



252,013. LUBRICATOR FOR SHUTTLE-RACES. JAS. BOLTON, Chicago, Ill. Filed June 28, 1881. (No model.)

252,013.

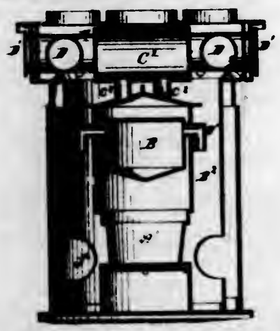


Claim.—In combination with shuttle-race A, provided with a threaded bore extending through from its outer to its inner periphery, a hollow screw-shaft, C, corresponding with it in size, length, and thread, adapted to extend the entire length of the bore and turn into and out of the same, and to hold a wick, *c*, longer than the bore, in order that its outer end may be fed with lubricating-oil by hand and that its inner end may feed the same to the shuttle and shuttle-race automatically, substantially as described.

252,014. FIRE-KINDLER. CHARLES K. BRADFORD, Lynnfield, Mass. Filed Nov. 17, 1881. (No model.)

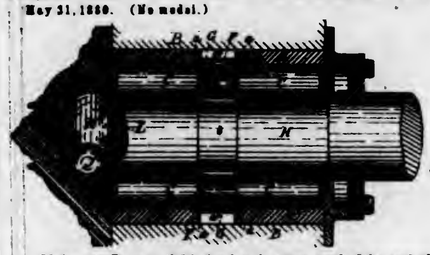
Claim.—The improved fire-kindler above described, consisting of a receptacle provided with a number of air-tubes and having an absorbent material packed around these tubes, substantially as described, and for the purposes set forth.

252,015. SNAP-HOOK. ANDREW M. BRASS, Pine Meadow, Conn. Filed Aug. 30, 1881. (No model.)



Claim.—1. A snap-hook having its shank formed with an open hollowed recess, with folding ears or lips E E at each end thereof, and carrying a spring-bolt, substantially as and for the purposes set forth.

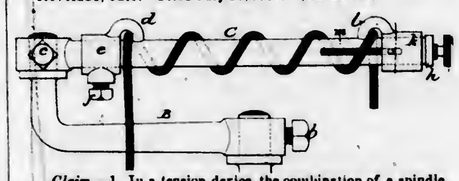
2. The combination, in a snap-hook, with a recessed or hollow shank provided with lips or ears E E, as described, of an inclosed separate bolt-tube, T, and bolt B and spring S, substantially as and for the purposes described.



3. The combination, in a snap-hook, with a recessed or hollowed shank, of a bolt-tube, T, bolt B, and spring S, substantially as and for the purposes set forth.

252,016. HOT-AIR FURNACE. WILLIAM P. BREWIS, Camden, N. J. Filed Apr. 16, 1881. (No model.)

Claim.—In a hot-air furnace, the combination, with the hollow deflector B, of the inlet elbow-pipes B' B' and outlet-pipes *e e*, both opening into the cold-air chamber B², superposed drum C², communicating with said deflector by pipes *c' c'*, and the drums D D, communicating with drum C² by pipe *d*, the several parts arranged relatively to each other substantially in the manner herein shown and described.



252,017. AXLE-BOX. ORRIL R. CHAPLIN, Boston, Mass. Filed May 31, 1880. (No model.)

Claim.—1. In an anti-friction bearing composed of the necked bearing-rolls C and separator-rolls D, the rings F and G, for holding them together, the outer ring, G, having an outer diameter no greater than the outer diameter of the circle of bearing-rolls, and the inner ring, F, having an inner diameter greater than the inner diameter of the circle of bearing-rolls, as and for the purposes set forth.

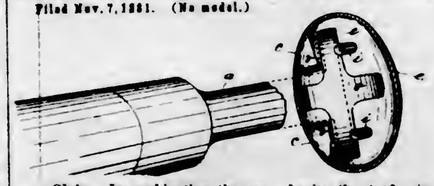
2. In an axle-box with anti-friction rolls C D, the ring G, of a diameter that will allow it to be inserted through the end of the box, in combination with the groove *a* in the box to prevent contact of ring G with the box when in use, as set forth.

252,018. TENSION FOR GRAIN-BINDERS. CHAS. COLAHAN, Cleveland, Ohio. Filed July 11, 1881. (No model.)

Claim.—1. In a tension device, the combination of a spindle about which the thread or cord is wound and means for adjusting the pitch of the coils of said cord prearranged thereupon to determine the friction with which it is pulled therefrom.

2. In a tension device, the combination of a rod or spindle about which the cord is wound, means whereby said spindle may be adjusted radially upon its support, and means independent of the first, whereby it may be adjusted bodily as to its distance from the source of cord-supply, substantially as and for the purpose described.

3. In a tension-device, a spindle about which the cord is wound, eyes at each end of the spindle, between which the coils are confined, and means for adjusting one of said eyes longitudinally of the spindle to increase or diminish the pitch of said coils.



4. The combination of the spindle C, the eyes *d* and *l* thereon, the sleeve *h*, and the adjusting-screw *g*, whereby the latter eye may be moved longitudinally of the sleeve.

5. The combination of the tension-spindle C, its pivotal support B, and the clamping-screw *e*, substantially as described.

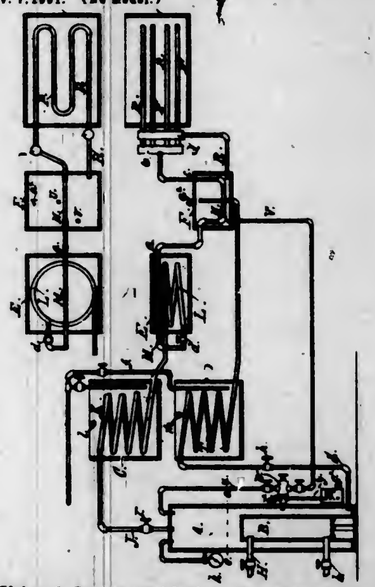
6. The combination of the tension-spindle C, its pivotal support B, and clamping-screw *e*, the standard A, to which the latter support is pivoted, and the clamping-screw *b*, whereby their connection is rendered fast.

7. The mode of preventing kinking or unraveling of the cord in its passage from the spool to the binder-arm, consisting in winding it about a tension-spindle in a direction having the described relation to the direction of its twist.

252,019. TRACE-LOCK. JAMES E. CORNELL, Portsmouth, N. H. Filed Nov. 7, 1881. (No model.)

Claim.—In combination, the case *e*, having the steady-pins *i* therein, the spring *o*, the slotted bottom plate, *c*, having the abutment *c* thereon, and the trace-bar *a*, provided with the cross-bar *a*, substantially as and for the purpose set forth.

252,020. COUPLING FOR TUBING. EDMUND C. CONVERSE, Pittsburg, Pa. Filed Oct. 22, 1881. (No model.)



Claim.—1. In couplings for tubing, a coupling-collar having an inner central ring, against which the ends of the tubing bear, an annular recess at each end for the reception of calking material, and a series of wings extending across the mouth of each annular recess to support the tube-section, substantially as set forth.

2. In couplings for tubing, a coupling-collar, B, having a central ring, *c*, and an annular calking-recess, *d*, at each end, having inwardly-flaring sides *f*, substantially as and for the purposes set forth.

3. In couplings for tubing, a coupling-collar, B, provided with an annular calking recess, *d*, at each end, and a series of wings, *h*, extending across the mouth of each annular recess, substantially as and for the purposes set forth.

252,021. ICE-MACHINE AND REFRIGERATING APPARATUS. THOMAS DAVIS and CHARLES E. DAVIS, Indianapolis, Ind. Filed Nov. 7, 1881. (No model.)

Claim.—1. In an ammonial refrigerating apparatus, the combination of the coil L and pipe M, having their interiors separably connected by a valve, *d*, and the chamber E inclosing both, substantially as described, and for the purpose set forth.

2. In an ammonial refrigerating apparatus, the combination of the absorption-chamber F with the pipe N, conveying ammonia to the distributing-pipes P, and pipe R, conveying ammonia from the distributing-pipes P, substantially in the manner and for the purpose set forth.

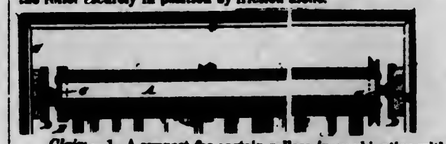
3. In an ammonial refrigerating apparatus, the combination of the above-described chamber E, inclosing the coil L and pipe M, with the condensing-tank C, coil K, and system of distributing-pipes P, for the purpose set forth.

4. In an ammonial refrigerating apparatus, the combination of the absorption-chamber F, having pipes N and R, in the manner above described, with the supply-pipe U, coil T, and cooling-tank D, for the purpose set forth.

5. In an ammonial refrigerating apparatus, the combination of the absorption-chamber F, provided with pipes N and R, in the manner above described, with the connecting-pipe V, injector W, and boiler A, for the purpose set forth.

6. In combination with the injector W, the pipe Y and closed overflow-receiver X, substantially as described, for the purpose set forth.

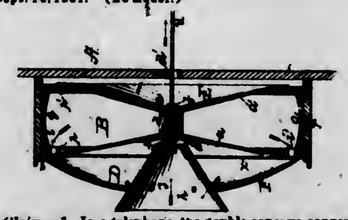
252,022. PLOW. CHARLES DONCOSKER, Austin, Tex. Filed Oct. 8, 1881. (Model.)



Claim.—1. The combination, in a plow, of the share A, concave in line from its point to its top or rear, and the high and narrow mold-board B, having its surface flat or without curve, as shown and described.

2. The combination, in a plow, of the share A, concave in line from its point to its top or rear, and the high and narrow mold-board, having its surface flat or without curve and forming the projecting corner *g*, substantially as specified.

252,023. CURTAIN-ROLLER SUPPORT. HUGH FARLEY, Philadelphia, Pa. Filed Oct. 24, 1881. (No model.)



Brief.—A spring of rubber or metal is interposed between the roller-brackets and the window-casing in such manner as to hold the roller securely in position by friction alone.

Claim.—1. A support for curtain-rollers, in combination with means to create a friction between said support and the window-frame, substantially as and for the purpose specified.

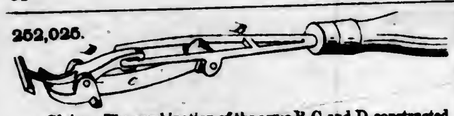
2. The combination of the roller A and pivot-projections C with pivot-recessed caps D, or their equivalent, and a spring, F, substantially as and for the purpose specified.

252,024. MECHANICAL TELEPHONE. GEORGE K. FARRINGTON and HOMER C. FARRINGTON, Kirkville, Mo., assignors of one-third to Bradford S. Potter, Shippensburg, Pa. Filed Sept. 14, 1881. (No model.)

Claim.—1. In a telephone, the double concavo-convex-shaped diaphragm, of the same size, material, and texture and degree of tension, in combination with the conducting-wire, buttons, adjusting screw-cap, and insulating-cork, substantially as described.

2. In a telephone, the combination of the diaphragms *a a'* and framing *p*, with openings *i*, forming the front and rear walls of an air-chamber, substantially as set forth.

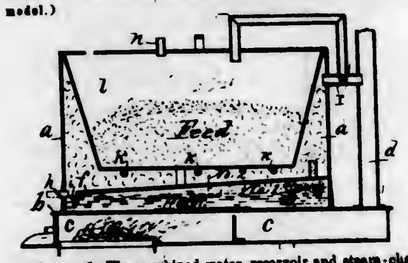
3. In a telephone, the combination, with the diaphragms *a a'* and framing *p*, with openings *i*, of a valve-plate for opening or closing the openings in the framing *p*, substantially as and for the purpose set forth.



4. In a telephone, the combination of the chambers D, B, and E, formed by the casing A, diaphragms *a a'*, and curved cover F, substantially as shown and described.

5. In a telephone, the combination, with the curved cover F, diaphragm *a*, and transmitting-wire, of the mouth-piece A, with its inner open end registering over the button *c* of the transmitting-wire, and provided with a plurality of openings, *j*.

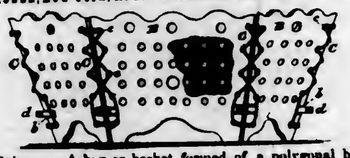
6. The combination, in a telephone, of the curved cover F, mouth-piece A, diaphragm *a*, perforated framing *p*, sliding valve *s*, diaphragm *a*, casing A, and transmitting-wire, substantially as described.



252,025. LIFTER. CHARLES F. FELLOWS, Chelmsford, Mass. Filed Oct. 14, 1881. (No model.)

252,025.

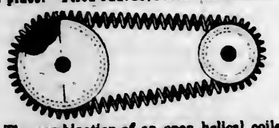
Claim.—The combination of the arms B, C, and D, constructed and operating substantially as described.



252,026. STEAM-GENERATOR AND AGRICULTURAL BOILER. JOHN FLEMING, HENRY J. FLEMING, and JAMES BROADBENT, Grand Junction, Iowa. Filed May 27, 1881. (No model.)

Claim.—1. The combined water-reservoir and steam-chamber composed of the walls *a*, the bottom *b*, the tank *l*, the bars *k*, and the inclined diaphragm *f*, having an opening, *i*, at its lower end and steam-tubes at its upper end, substantially as shown and described, for the purposes specified.

2. The improved steam-generator and agricultural boiler composed of the following elements, to wit: the walls *a*, the bottom plate, *b*, the furnace *c d*, the diaphragm *f i g*, the bars *k*, and the tank *l*, substantially as shown and described, to be operated in the manner set forth, for the purposes specified.



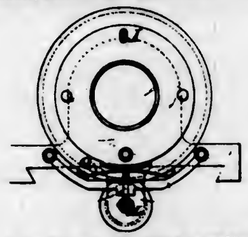
252,027. BOX OR BASKET. JOHN H. GARDNER and SAMUEL H. GARDNER, New York, N. Y. Filed June 25, 1881. (No model.)

Claim.—1. A box or basket formed of a polygonal bottom having projections at three or more of its corners, and a number of recessed and perforated sections corresponding to the number of sides upon the bottom, said sections receiving the said projections, and the whole being secured together by laces, substantially as specified.

2. The bottom A, having projections *d*, combined with the series of sections B, having perforations *c* and recesses *b*, and with the laces C, as and for the purposes set forth.

262,028. FLEXIBLE GEARING. ALONZO S. GEAR, New York, N. Y., assignor to the Perpetual Tension Propelling Belt Company, same place. Filed Jan. 28, 1881. (No model.)

Claim.—The combination of an open helical coiled wire or flexible worm with suitable concave toothed gear-wheels, for the purpose of transmitting motion, as set forth.

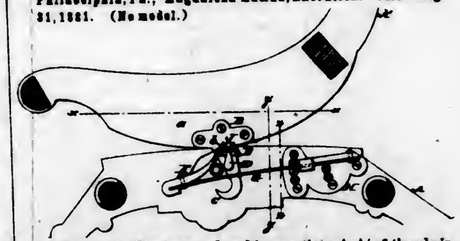


252,029. TREATING PHOSPHATES FOR FERTILIZERS. JOHN F. GIBBONS and GUSTAV A. LIEBIG, Baltimore, Md. Filed June 16, 1881. (No specimens.)

Claim.—1. The above-described process of treating ferruginous or aluminous phosphates by first mixing the crude phosphate with salts of soda, potash, or magnesia, then burning or calcining the same together, and then adding an acid to the calcined product, substantially as described.

2. The process of treating a ferruginous or aluminous phosphate by first mixing the crude phosphate with salts of soda, potash, or magnesia and carbonaceous matter, then burning or calcining the same together, and then mixing the product with an acid, substantially as described, and for the purposes set forth.

3. A phosphatic fertilizing compound consisting of superphosphates combined with acid salts of alkalies and lime, as set forth.



252,030. RAILROAD-CAR-AXLE LATHE. ALEXANDER GORDON, Cincinnati, Ohio. Filed July 18, 1881. (No model.)

Claim.—1. In double axle-lathes, the combination of a lathe-bed, two center stocks, one or both of which are adjustable upon the lathe-bed, two tool-carriages located between the said center stocks, and an open driving mechanism of the Clement type, as set forth, located between said tool-carriages, and provided with attaching-gibs for uniting it adjustably to the lathe-bed, substantially as and for the purpose set forth.

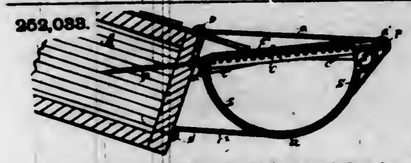
2. In lathe-drivers of the Clement or self-adjusting type specified, the combination of a circular self-adjusting driving-plate, and a yielding bearing located below said plate to prevent its periodical dropping, substantially as set forth.

252,031. ROCKING-CHAIR. WILLIAM E. HAMAN, (deceased,) Philadelphia, Pa.; Magdalena Haman, Executrix. Filed Aug. 31, 1881. (No model.)

Claim.—1. The base and rocking portions A A' of the chair, in combination with the springs G and rigid or inelastic arms F, the latter being connected to the ends of the springs and returned in the longitudinal direction thereof, and formed with sockets E, which are sustained on the studs D of one portion of the chair, substantially as and for the purpose set forth.

2. The base and rocking portions of the chair and the connected springs, in combination with the arms F, having cups J, and the supports D, said cups communicating with the sockets of the arms F and the supports D entering said sockets, substantially as and for the purpose set forth.

252,032. COMBINED SHOULDER AND NECK PAD FOR HORSE COLLARS. JAMES R. HAMILTON, Hilo, Iowa. Filed July 19, 1881. (No model.)



Claim.—The improved horse-collar pad consisting of the sections *a* and *a b*, constructed substantially as shown and described, to apply and operate in the manner set forth, for the purpose specified.

252,033. EAVES-TROUGH HANGER. WARREN HATCH, Plainfield, Ill. Filed Aug. 4, 1881. (No model.)

Brief.—The cross-bar is flanged, and is provided with a central longitudinal elevation for the passage through it of the pin. The pin has an eye in its head, through which the wire passes.

252,033.

Claim.—1. The cross-bar *c*, with its central elevation and its flanges *c'*, in combination with the eaves-trough S, substantially as and for the purpose set forth.

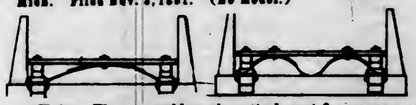
2. The combination of the cross-bar *c*, having its flanges *c'*, and a central longitudinal elevation, with the pin or spike F, having an eye or groove, *e'*, the eaves-trough S, and the wire *a*, all constructed and applied as and for the purpose set forth.

252,034. RESERVOIR PEN-HOLDER. THOMAS A. HEADEEN, Greenwich, County of Kent, England. Filed Sept. 23, 1881. (No model.) Patented in England Mar. 31, 1881.

Claim.—1. The combination, with an ink-holder provided with an air-tube, of the pen and the thin flexible nozzle inclosing the pen except at the points of its nibs, substantially as and for the purpose hereinbefore set forth.

2. The combination of a barrel-pen with a flexible sheath or nozzle, substantially as described, so that the barrel of the pen, with the sheath or nozzle surrounding it, may be inserted fluid-tight into the end of an ink-holder.

3. The combination, with the inner end of the air-tube of a reservoir-pen, of a chamber into which the inner end of the air-tube enters, such chamber having a small hole at the bottom to allow air to pass from it into the interior of the ink-holder.

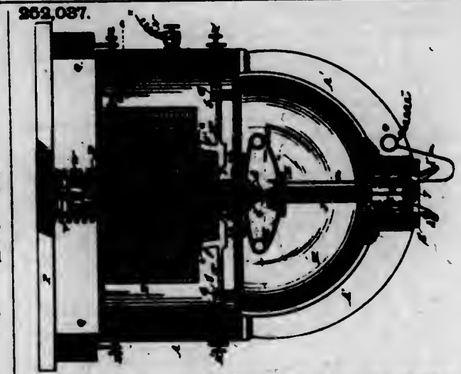


252,035. WAGON-SPRING. SAMUEL G. HILL, Muscatine, Iowa. Filed Mar. 22, 1880. (Model.)

Claim.—1. In means for hanging the bodies of vehicles, the combination of the bolsters having their ends projecting beyond the sides of the vehicle-body, and having fitted thereon vertical standards or posts surrounded by spiral springs, and the transverse straps with shouldering extensions A, bolted to the bottom of the vehicle, with its projecting ends fitting over the standards or posts of the bolster, substantially as described.

2. In means for hanging the bodies of vehicles, the combination of the bolsters D D' with vertical standards *e* and coil-springs *g*, the transverse straps *f f'*, with shouldering extensions A, and the cross-pieces A', fitted on the bolsters, substantially as and for the purposes set forth.

252,036. BOLSTER-SPRING. CHARLES A. HOWARD, Pontiac, Mich. Filed Nov. 3, 1881. (No model.)



Claim.—The removable spring attachment for a wagon, consisting of notched side pieces, a longitudinal semi-elliptic spring upon each side piece, a cross-bar parallel to the bolster uniting the tops of the springs, and a semi-elliptic cross-spring beneath the bar, and adapted to be thrown into or out of gear by rotating it about its point of attachment to the said bar, substantially as and for the purposes described.

252,037. ELECTRIC LAMP. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Atlantic and Pacific Electric Manufacturing Company, Camden, N. J. Filed June 17, 1881. (No model.)

Claim.—1. In an electric lamp, a carbon in combination with a tube through which it is fed, and means to feed both the carbon and tube in the same direction at the same time, all substantially as and for the purpose specified.

2. In an electric lamp, a carbon in combination with a tube, through which it is fed, and mechanism to feed both the carbon and tube, said mechanism being constructed substantially as described, whereby the tube and carbon are fed in the same direction, the carbon moving at a greater velocity than the tube, so that as it is burned the end of the tube is always at or about the same distance from the point of the carbon, substantially as and for the purpose specified.

252,037.

3. In an electric lamp, a carbon arranged to fall by gravity, in combination with a tube or its equivalent, also arranged to fall by gravity, and means to regulate both the descent of the carbon and tube, the movement of said tube controlling the movement of the carbon, all substantially for the purpose set forth.

4. In an electric lamp, a carbon in combination with a tube, through which it is fed, means to feed both the carbon and tube in the same direction, and operating as described, whereby the carbon moves at a greater velocity than the tube, so that as it is burned the end of the tube is always at or about the same distance from the point of the carbon, a lower carbon, a presser adapted to descend as the carbon is burned, and a conductor from the presser to the binding-post, substantially as and for the purpose specified.

5. In an electric lamp, an upper carbon arranged to descend, and a follower electrically connected with one binding-post and arranged to follow the point of the carbon, in combination with a lower stationary carbon and its presser, electrically connected with the other binding-post, said presser being arranged to descend, always keeping at or about the same distance from the point of the carbon, all substantially as and for the purpose specified.

6. In an electric lamp, a stationary lower carbon and an upper carbon adapted to descend, in combination with devices, substantially as described, whereby the current is conducted to and from the carbons near the arc, and mechanism to feed said devices forward, substantially as set forth, and for the purpose specified.

7. In an electric lamp, an electro-magnet provided with a core having two attracting-faces, in combination with a carbon, a pivoted armature arranged to oscillate vertically and be reciprocated horizontally, and means for counteracting the horizontal attraction of said armature by the electro-magnet, and for withdrawing said armature from said carbon upon the power of said electro-magnet decreasing below a given point, substantially as and for the purpose specified.

8. In an electric lamp, the upper carbon, adapted to be fed by gravity, in combination with an electro-magnet and its armature, said armature being arranged to move both horizontally and vertically by the attraction of the electro-magnet, adapted to clamp or unclamp the carbon or its holder by a direct withdrawal of said armature from said carbon, breaking contact directly, in contradistinction to tangential freeing of the carbon by the armature, and a spring to draw said armature away from the electro-magnet, as and for the purpose specified.

9. The lower stationary carbon, J, and frame A', provided with an opening through its lowest part, in combination with a holder to support said carbon, adapted to be operated from the outside of the globe, said holder consisting of jaws K K, pivoted at *h*, provided with arms *h'* and clamping-springs *h''*, substantially as and for the purpose specified.

10. The lower stationary carbon, J, in combination with a holder adapted, to be operated from the outside of the globe, consisting of jaws K K, pivoted at *h*, provided with arms *h'*, and clamped against the carbon by springs *h''*, said clamping device being arranged within a piece, S, screwed or otherwise detachably secured to frame A', as and for the purpose specified.

11. In an electric lamp, the combination of tube D, carrying wheels I I', carbon E, cord *i*, attached to the small wheel I and carbon E, cord *i'*, attached to the frame A' at the bottom, passed

around the large wheel I', and secured to a tension-screw or its equivalent, as and for the purpose specified.

12. In an electric lamp, the lower stationary carbon, J, in combination with a preceding conductor, L, adapted to descend as the carbon burns, always remaining at or about the same distance from the point of said carbon, a conducting-cord, *m*, springs *l*, or their equivalent, and means for lowering said preceding conductor, substantially as and for the purpose specified.

13. In an electric lamp, an electro-magnet having its core provided with a horizontal face and a vertical curved face, in combination with an armature provided with a corresponding horizontal face and vertical curved face, and a spring or equivalent means to draw said armature away from the electro-magnet to separate the vertical faces, substantially as and for the purpose specified.

14. In an electric lamp, the combination of the electro-magnet B, having a core, C, provided with a lateral attracting-face, *c*, a holder for the carbon E, armature F, provided with edge *f* and arm *f'*, slot *g*, or its equivalent, pin G, spring H, and means to regulate the power of the spring, substantially as and for the purpose specified.

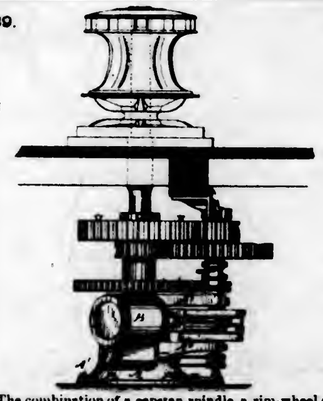
15. In an electric lamp, the combination of the electro-magnet B, having a core, C, provided with a lateral attracting-face, *c*, tube D, carbon E, means to feed said carbon down through said tube, armature F, provided with edge *f* and arm *f'*, slot *g*, or its equivalent, pin G, spring H, and means to regulate the power of the spring, substantially as and for the purpose specified.

16. In an electric lamp, the combination of the electro-magnet B, having a core, C, provided with a lateral attracting-face, *c*, tube D, carbon E, means to feed said carbon down through said tube, armature F, provided with edge *f* and arm *f'*, and slot *g*, or its equivalent, pin G, spring H, with lower stationary carbon, J, preceder L, and conducting-cord *m*, or its equivalent, substantially as and for the purpose specified.

17. In an electric lamp, the carbon E, arranged to be fed downward, tube D, the end of which is always at or about the same distance from the point of said carbon, in combination with lower stationary carbon, J, preceder L, connected with and operated by the tube D, from which it is insulated, said tube D conducting electricity to one point of the carbons, and the preceder receiving it from the other, and means for feeding the upper carbon and its tube, substantially as and for the purpose specified.

18. The combination of board P, springs Q and W, and an electric lamp, substantially as shown and described.

252,038. APPARATUS FOR UNLOADING COAL. WILLIAM ILETT, Chicago, Ill. Filed Nov. 8, 1881. (No model.)



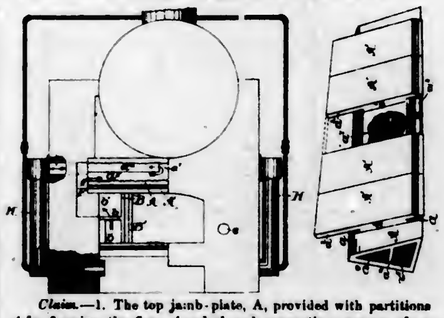
Claim.—1. A pendant, F, made in two parts, the lower part being hinged to the upper part, in combination with a traveling bucket provided with a holding device arranged to come in contact with and be tripped by such pendant, substantially as and for the purpose specified.

2. A bucket, G, having its lower end weighted, and provided with a bail hinged at one side of and above the center of gravity, in combination with a holding device hinged to the bail, and having an extension or arm, *e*, adapted to come in contact with the lower end of a pendant, substantially as and for the purpose specified.

3. A carriage, h, provided with a hook, p, and tightening-nut q, for the purpose of securing the carriage to the cable I, substantially as and for the purpose specified.

252,039. COMBINED STEAM AND HAND POWER CAPSTAN. HENRY J. JOHNSON, Providence, R. I., assignor to Henry W. Gardner, same place. Filed Dec. 1, 1881. (No model.)

Claim.—1. A capstan and wild-cat carrying spindle, having its lower end supported upon a frame carrying suspended therefrom steam-cylinders, for driving said spindle around through gearings, substantially as shown and described.



2. The combination of a capstan-spindle, a rim-wheel secured thereto, with a hub and keys, as described, and transmitting-gears mounted loosely upon said spindle, with gears mounted upon an independent shaft and meshing with the rim-wheel, and with the gear mounted loosely upon the capstan-spindle, substantially as and for the purposes described.

3. The combination of a spindle carrying a capstan and wild-cat, a hollow bed-piece provided with brackets A^1, to carry a vertical crank-shaft, and brackets A^3, with steam-cylinders suspended therefrom, substantially as described.

4. The combination of a capstan-spindle, a hollow bed-piece, steam-cylinders secured thereto, and a vertical crank-shaft connected therewith, with an independent shaft in the axis of the crank-shaft, gear-wheels mounted loosely upon the capstan-spindle, and transmitting-gears, substantially as and for the purpose set forth.

252,040. STEAM-BOILER FURNACE. MILTON C. JONES, Green Island, N. Y. Filed Sept. 16, 1881. (No model.)

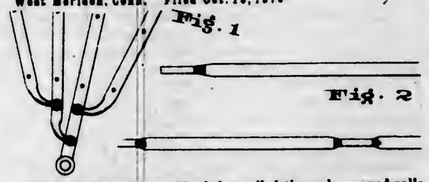
Claim.—1. The top jamb-plate, A, provided with partitions a' for forming the flues a' and a^2, and connecting-passage a^3, as herein described, in combination with protecting-plates A', of fire-brick or other suitable heat-repelling material, detachably connected to said jamb-plate, as herein specified.

2. The combination, with the side jamb-plates, B, revertible flues *b'*, and inlet air-openings *c*, of the top jamb-plate, A, provided with flues a^2 and a^4, connected to the flues *b'* by means of the flues F, and to the hot-air-escape pipes H, as and for the purpose herein specified.

3. In a steam-boiler furnace, the combination, with top and side jamb-plates for the furnace-door, made separately and connected, as herein described, to form continuous air-circulating flues extending from the air-inlet openings to the hot-air-escape pipes, of the hot-air-escape pipes H, provided with steam-pipes K, arranged in relation to said escape-pipes as herein described, for the purpose of forcibly injecting currents of mingled hot air and steam into the furnace, as herein specified.

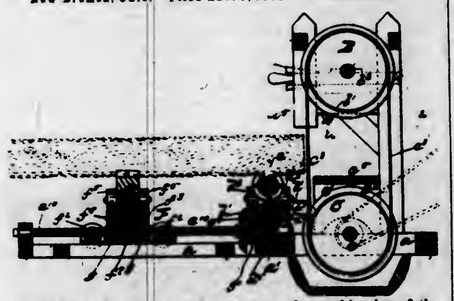
252,041. ROTARY BLOTTER. WILLIAM H. KELLY, New York N. Y. Filed Nov. 2, 1881. (No model.)

Claim.—1. In a rotary blotter, the combination of a rolled web of blotting-paper and pasted strips, substantially as described.



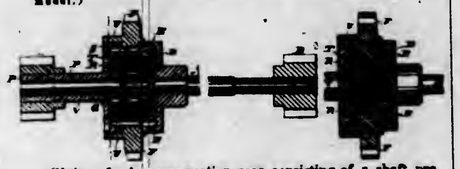
2. The combination, with a rolled web of blotting-paper, of

252,041.



pasted tearing-strips, as described, each interposed between two layers of a web of blotting-paper, the edge of each strip overlapping the edge of the next succeeding tearing-strip, substantially as set forth.

252,042. BAR OF SLAT-IRON BLANKS. SILAS W. KENT, Meriden, assignor to the Beecher Manufacturing Company, West Meriden, Conn. Filed Oct. 13, 1879.

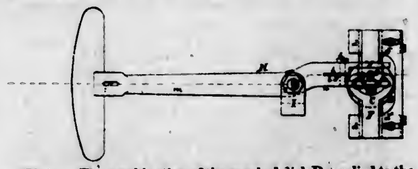


Claim.—The slat-iron-blank bar rolled through grooved rolls to give it the shape shown in Figs. II and III, from which the several sections of a slat-iron frame are cut, ready to be finished and put together to form the completed slat-iron shown in Fig. I.

252,043. BAND-SAWING MACHINE. LEWIS F. KEUTLER, New Bremen, Ohio. Filed Nov. 5, 1881. (No model.)

Claim.—In a band-sawing machine, the combination of the truck d^3, mounted on the blocks D, operated by the pinion d^5, engaging with the rack-bar d^4 of the truck f^3, traversing the carriage F, and the pinion f^5, engaging with the rack-bar f^6 of the bevel-gear wheel d^6, meshing with gear-wheel d^7, crank d^8, and hand-lever d^9, roller E, and shaft d^{10}, the whole operating as herein shown, and for the purpose set forth.

252,044. COMPENSATING-GEAR FOR ROAD-ENGINES. F. P. LANDIS, Waynesborough, Pa. Filed May 10, 1881. (No model.)



Claim.—1. A compensation-gear consisting of a shaft provided with a stationary pinion, a wheel carrying intermeshing pinions meshing with two cogged disks, one disk rigidly and the other loosely mounted on said shaft, the loose disk carrying a pinion upon its sleeve, substantially as shown and described.

2. In a compensation-gear, a wheel, F, provided with intermeshing pinions, substantially as shown and described.

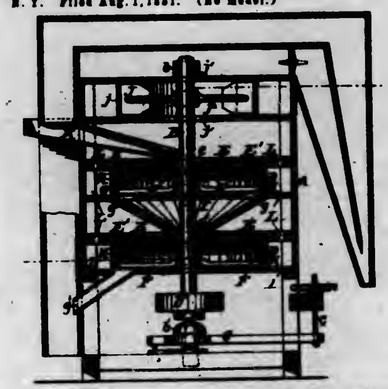
3. The shaft A and cogged disk D, in combination with the wheel F, provided with intermeshing pinions, and sleeve P, provided with cogged disk E, substantially as shown and described.

4. In a compensation-gear, intermeshing pinions revolving within chambers within a body loosely mounted upon a shaft, said pinions meshing at their outer ends with gearing, substantially as shown and described.

252,045. SHUTTLE-DRIVER FOR SEWING-MACHINES. GEO. W. LORD, Boston, Mass. Filed Oct. 21, 1881. (No model.)

Claim.—The combination of the cranked disk D, applied to the shaft C, as described, with the slide-plate F, having the curved slot *e*, and with the slide G and the forked lever H, all being arranged and to operate substantially as and for the purpose set forth.

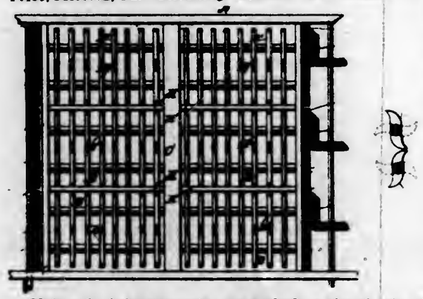
252,046. FAUCET. THOMAS HACKEL, Pawtucket, R. I. Filed Sept. 8, 1881. (No model.)



Claim.—In a faucet for tapping barrels and other receptacles of fermented liquors, and for drawing the contents thereof, the combination of the cylinder *a a*, made of one piece of metal, the fluted plunger *d*, having an attached guard at its end *e*, the nut and packing *f f'*, and collar and shoulder *h k*, all in the manner and for the purposes substantially as described and shown.

252,047. HOG-NOSE RING. REUBEN MAUK, Macon County, Ill. Filed Nov. 12, 1881. (No model.)

Claim.—The herein-described ring for hogs' noses, consisting of a single uniform-sized piece of rounded metal, having the projection *c* formed of the same piece, bent at right angles to the body of the ring, substantially as set forth.



252,048. GRAIN-SCOURER. DANIEL MAUS, West Winfield, N. Y. Filed Aug. 1, 1881. (No model.)

Claim.—1. In a grain-scouring machine, the combination, with two revolving disks, D, provided with the furrows *d*, *d'*, and d^3, as herein described, and secured one above the other, and the shaft B, of the stationary brushes E, arranged in tangential lines whose obliquity is reversed to the tangential lines of the furrows in the disks D, and the radial sweeps F, all constructed and arranged to operate as herein specified.

2. The combination, with the revolving disks D, provided with tangentially-arranged furrows, as herein set forth, of the stationary brushes E, arranged in tangential lines having an opposite angularity to the lines of the disk-furrows, the said disks and brushes being arranged in relation to each other and to operate as herein specified.

252,049. FURNACE-GRATE. WILLIAM MCCLAVE and JOHN A. PAGE, Scranton, Pa.; said McClave assignor to Samuel Price, Pittston, Pa. Filed Aug. 31, 1881. (No model.)

Claim.—1. A furnace-grate composed of a series of pairs of revolving ⟋⟍-shaped grate-sections connected together by continuous gearing, so as to operate simultaneously, each pair operating at each half-revolution to cut out positively the lower portion of the mass which they support and discharge it into the ash-pit below and present a new upper supporting-surface similar to the one turned down, substantially as described.

2. A furnace-grate composed of a series of pairs of revolving ⟋⟍-shaped grate-sections connected together by continuous gearing, so as to operate simultaneously, each pair operating to cut out the lower part of the mass which they support at each half-revolution and present a new supporting-surface similar to the one turned down, and having a separating-bar or short partition between each pair, substantially as described, for the purpose specified.

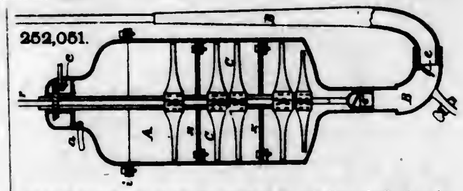
3. In a furnace-grate, a double series of revolving ⟋⟍-shaped grate-sections geared together in pairs and journaled at their inner ends in a central supporting-bar and at their outer ends in a suitable supporting-frame, and having the operating-gearing applied to their outer ends, and a separating-bar or short partition between each pair of sections, substantially as described.

4. In a furnace-grate, the combination of a series of revolving sections connected together by continuous gearing and acting to cut away ashes and refuse in pairs, and having an additional gear-wheel applied to the journal of one of the sections of each pair, with a longitudinally-moving rack-bar for operating upon said additional gear-wheel, whereby to turn all the sections simultaneously, substantially as described.

5. In a furnace-grate, the combination of a series of revolving sections geared together in pairs, and having an additional gear-wheel applied to the journal of one of the sections of each pair, with a longitudinally-moving rack-bar adapted to engage with said additional gear-wheel, and means for throwing said rack-bar into or out of engagement, substantially as described.

6. In a furnace-grate, the combination of a series of revolving grate-sections geared together and having an additional bevel-gear wheel applied to the journal of each alternate grate-section, with a longitudinal bar having bevel-gear wheels for operating upon said bevel-gear wheels on grate-sections, whereby all the sections may be turned simultaneously, substantially as described.

252,050. DANDY-ROLL FOR PAPER-MACHINES. DAVID MCKAY, Holyoke, Mass. Filed Sept. 10, 1881. (No model.)



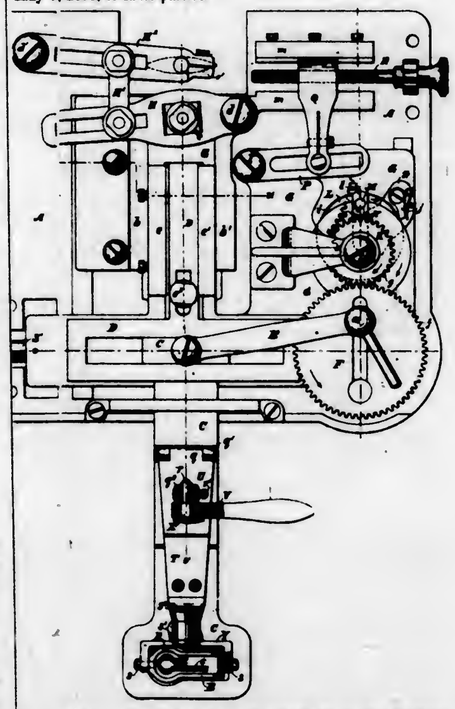
Claim.—The catch-pan A, Fig. 5, to be hung in the inside of and upon the center shaft of the dandy-roll in paper-machines, to be kept in position by its own weight, for the purpose of cleaning dandy-rolls, substantially as set forth in the above specification.

252,051. AMALGAMATOR. LINCOLN A. HERRIAM, New York, N. Y. Filed Oct. 8, 1881. (No model.)

Claim.—1. In apparatus for extracting the precious metals from their ores, the amalgamator A, having the cross-plates *x*, the expanding induction-pipe B, the check-valve *c*, and the mixer C, constructed, arranged, and operating in the manner and for the uses specified and shown.

2. In apparatus for extracting the precious metals from their ores, the amalgamator A, having the perforated plates *x*, the induction-pipe B, the check-valve *c*, the mixer C, rotating on a hollow shaft, the piston-valve *c'*, the connecting reciprocating rod *r*, constructed and operating in the manner and for the purposes shown and described.

252,051.



3. In apparatus for extracting gold and silver from their ores, the amalgamator A, having the induction-pipe B, the check-valve *c*, the piston-valve *c'*, the connecting reciprocating rod *r*, and mixer C, rotating on a hollow shaft, arranged and operating in the manner and for the uses specified and described.

4. In apparatus for amalgamating the precious metals, the amalgamator A, separable at *i*, and having the perforated plates or flanges *x*, the mixer C, rotating on a hollow shaft, the expanding induction-pipe B, with the check-valve *c*, and the piston-valve *c'*, constructed and operating in the manner set forth and shown.

5. In apparatus for amalgamating the precious metals from their ores, the amalgamator A, separable at *i*, having the perforated plates *x*, the induction-pipe B, the check-valve *c*, the mixer C, rotating on a hollow shaft, the piston-valve *c'*, the connecting reciprocating rod *r*, the overflow *a*, and pipe *b*, constructed and operating in the manner and for the uses substantially as set forth, specified, and shown.

252,052. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. GUSTUS M. MORRIS, Cohoes, and JOSEPH P. HALLENBECK, New York, assignors, by mesne assignments, to the National Machine Company, Troy, N. Y. Filed July 30, 1878.

Brief.—Improvement on Letters Patent No. 203,287, dated May 7, 1878, to same parties.

Claim.—1. In a button-hole attachment for sewing-machines, the combination, with the crank-wheel F, of a second wheel, K, proportioned and geared with the crank-wheel to revolve just twice to the crank-wheel's once, a rotary driver, L, having its axis eccentric to the axis of said second wheel, the self-adjusting crank-connection engaging said second wheel with said driver, and means for revolving said driver, all substantially as set forth.

2. The combination, with the crank-wheel F, second wheel, K, proportioned and geared with the crank-wheel to revolve twice to the crank-wheel's once, rotary driver L, eccentric to said second wheel, and self-adjusting crank-connection engaging said second wheel with the driver, substantially as described, of the ratchet *i*, driving-pawl *j*, and means for operating said driving-pawl, substantially as set forth.

3. The combination, with the feed-bar C, crank-wheel F, and means for imparting to-and-fro movements to the feed-bar from the crank-wheel, substantially as set forth, of the second wheel proportioned and geared with the crank-wheel to revolve twice to the crank-wheel's once, rotary driver eccentric to said second wheel, self-adjusting crank-connection engaging said second wheel with said driver, and means for rotating the latter, substantially as described.

4. The combination, with the feed-bar C, crank-wheel F, and means for imparting to-and-fro movements to the feed-bar from the crank-wheel, substantially as set forth, of the second wheel, K, proportioned and geared with the crank-wheel to revolve twice to the crank-wheel's once, rotary driver eccentric to said second wheel, self-adjusting crank-connection engaging said driver with said second-wheel, ratchet *i*, pawl *j*, and means for actuating the latter, substantially as described.

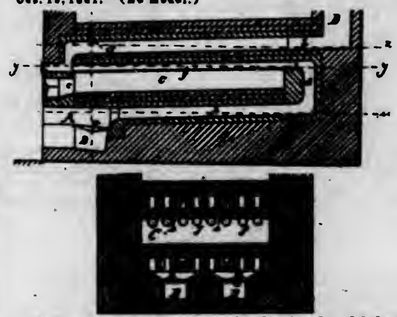
5. The combination, with the feed-bar C, crank-wheel F, and means for imparting to-and-fro movements to the feed-bar from the crank-wheel, substantially as described, of the second wheel, K, proportioned and geared with the crank-wheel to revolve twice to the crank-wheel's once, rotary driver eccentric to said second wheel, self-adjusting crank-connection engaging said driver with said second wheel, and mechanisms for imparting step-by-step rotary motion to said driver and reciprocating movements to the feed-bar to form over-edge stitches, all substantially as set forth.

6. The combination, with the feed-bar C, crank-wheel F, and means for imparting to-and-fro movements to the feed-bar from the crank-wheel, substantially as specified, of the second wheel, K, proportioned and geared with the crank-wheel to revolve twice to the latter's once, rotary driver L, eccentric to said second wheel, self-adjusting crank-connection engaging said second wheel with said driver, plate G, means for operating the latter, and means for imparting step-by-step rotary motion to the driver L from the plate G, all substantially as set forth.

7. The combination, with the bed-plate A, plate G, means for operating the latter, and rotary driver L, of the ratchet *i*, lever O, having the pawl *j* and toothed arc *k*, lever P, having the toothed arc *l*, and the fulcrum-arm Q, mounted on said bed-plate, all substantially as set forth.

8. The combination, with the feed-bar C, crank-wheel F, and devices for imparting from said crank-wheel to the feed-bar to-and-fro movements to feed a button-hole lengthwise and movements transverse thereto to change the stitching from one side of the button-hole to the other, substantially as described, of the wheel K, proportioned and geared with said crank-wheel to revolve twice to the latter's once, rotary driver eccentric to the wheel K, self-adjusting crank-connection engaging said driver with the latter wheel, and means for rotating said driver, substantially as set forth.

9. The combination, with the feed-bar C, having standards q' q^2, and arm U, hinged to the standard q' and carrying the feed-foot, of the depressing-cam V, cam-supporting pivot X, stem *r*, fast on and eccentric to said pivot, and fitting and adapted to be turned in a socket in the standard q^2, and a screw, *r'*, by which the stem *r* can be fastened with the pivot X at various heights in respect to said socket, all substantially as set forth.

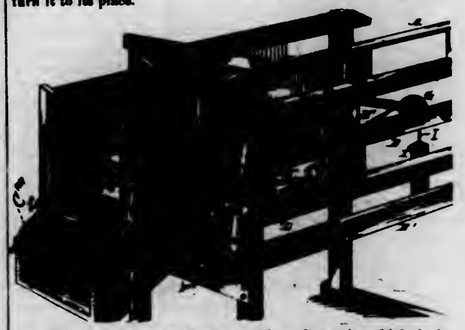


10. The combination, with the feed-bar C, having a standard, q', arm U, hinged to that standard, and means for depressing said arm various degrees, substantially as described, of the part s^2, spring T, fast at one end to said arm and at the other end to the part s^2, forked piece Y, united to the part s^2 by pivot-joint *s'*, and foot B, secured at its ends by pivots *s s* to the arms of said forked piece, all substantially as set forth.

252,053. BOOK-RACK. RICHARD W. HYDE, New York, N. Y. Filed June 9, 1879. Renewed Nov. 19, 1881. (Model.)

Claim.—A rack or book-case consisting of two or more perforated shelves, hollow standards or columns, threaded tie-rods D, the heads of which form legs for the rack or case and support the lower shelf and turn into head-pieces E, substantially as shown and described.

252,054. BAKER'S OVEN. EDUARD A. C. PFEIFFER, Chicago, Ill., assignor of one-half to Henry Piper, same place. Filed Oct. 19, 1881. (No model.)



Claim.—1. A baker's oven having heating-flues *b* below the hearth and iron return-flues *f* placed underneath the ceiling of and within the baking-chamber, both flues *b* and *f* communicating through vertical flues *d*, all substantially as described and shown.

2. A baker's oven consisting of baking-chamber C, fire-chambers A, flues *b d g*, iron return-flues *f*, extending longitudinally through said baking-chamber, and chimney D, all constructed and arranged substantially in the manner and for the purpose set forth.

252,055. COAL-CHUTE. JAMES D. PETTIT, Burlington, Iowa. Filed Aug. 3, 1881. (No model.)

Brief.—The gravitating chute runs upon inclined ways, and is held in place while being loaded by a latch-bar pivoted to a standard on the frame. When in position to unload the chute projects from the frame. When emptied counterpoise-weights return it to its place.

Claim.—1. In combination with a frame in which it is mounted, a coal-chute adapted to be carried forward and project from the frame over a locomotive tender or receiver by means of the force of gravity of the loaded chute.

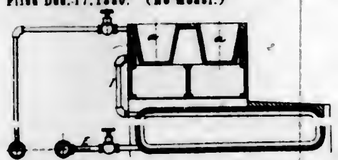
2. The combination, with the gravitating chute or box and supporting-frame, of a latch, K, and catch *j*, for holding the chute in a position projected from the supporting-frame, substantially as and for the purpose specified.

3. In combination with the supporting-frame and gravitating chute, having counterpoise-weight I', and guide-bar J, having notches *j j*, the gravitating latch K, adapted to engage the notches *j j* and to slide upon the bar J, substantially as and for the purpose specified.

4. In combination with the gravitating chute having a bar, J, fixed thereto, with notches *j j* in its ends, a latch, K, adapted to engage said notches, substantially as and for the purpose specified.

5. In combination with the chute C and hinged door C'', the latches D D', adapted to engage the side boards, C''', to hold the door C'' closed and their adjacent ends overlapped, so that raising the outer end of one will release it and also act upon the other to release it, substantially as and for the purpose specified.

6. In combination with the chute, hinged door, and latches D D', the gravitating latch E, hinged to one of the latches, D or D', and adapted to engage a catch on the side of the chute, substantially as and for the purpose specified.



252,056. COMBINED MATCH-BOX AND CIGAR-CUTTER. CHARLES F. PIERCE, Providence, R. I. Filed July 22, 1881. (No model.)

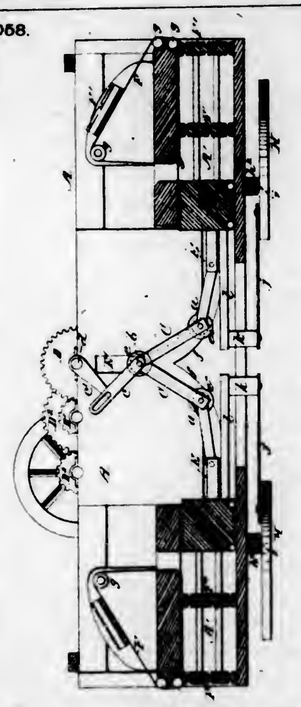
Claim.—1. In a match-box, the box B, provided with an orifice, *e*, and combined with a cover, C, a spring, *s*, having a start, *s'*, and catch *s'*, and a cutting-blade, *b*, as shown.

2. The spring *s* and cutting-blade *b*, combined with a box, B, provided with an orifice, *e*, and operating as shown and described.

252,057. COOKING-RANGE. WILLIAM E. PRALL, New York, N. Y. Filed Dec. 17, 1880. (No model.)

Claim.—1. A cooking-oven constructed with a continuous channel-way or pipe, arranged to receive superheated water from the generator under pressure, so as to conduct it in a continuous stream around the oven, and provided with a valve to control the discharge of the water from the oven, and also the pressure, constructed and operating substantially as and for the purpose set forth.

2. A cooking-oven constructed with a continuous channel-way or pipe surrounding it, arranged to receive superheated water from the generator, and provided with a cock for controlling the discharge of water therefrom, in combination with a hot-water tank arranged to receive the water therefrom, as shown and described.



3. In a system for supplying superheated water as a heating medium for culinary purposes, the combination of a series of cooking apparatus, each constructed as described and independently controllable as to its heat-supply, an apparatus for superheating water, and pipes leading therefrom to the cooking apparatus and from the cooking apparatus to other vessels to be warmed, and thereby adapted to supply heat thereto and conduct it therefrom, substantially as described.

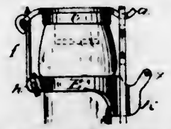
4. In an apparatus for cooking by means of superheated water, the combination of a local heater, a street pipe or pipes connected thereto to convey the superheated water therefrom, a pump for circulating the water therein, service-pipes for conveying the water therefrom, and arranged to radiate the heat into cooking ovens or chambers, and provided with cocks or valves for controlling the flow of water thereto or therefrom, substantially as shown and described.

5. A cooking apparatus provided with a connected water-heating vessel, combined with an apparatus for supplying superheated water, pipes for distributing such water to the cooking apparatus, and pipes by which, after its heat is utilized in the cooking apparatus, it is conducted into or through the said water-heating vessel to impart heat to its contents, substantially as described.

6. In an apparatus for cooking with superheated water, the water-heating apparatus, the circulating-tubing connected thereto, a force-pump or its equivalent for circulating the water therein, branch pipes for conveying the water to the ovens, cocks or valves for controlling the discharge of water therefrom, and the meter, combined to operate substantially as set forth.

252,058. BALING-PRESS. GORDON E. RICH, Brookfield, Mo. Filed Nov. 10, 1881. (No model.)

Claim.—1. In a baling-press, the combination, with plungers adapted to work in chambers, of toggle-joints and levers connected to the driving-power and adapted to work in a vertical slot having diverging horizontal slots, substantially as and for the purpose set forth.



2. In a baling-press, the combination, with two plungers and endless belts and gates arranged as described, of operating mechanism, substantially as shown and described, whereby the simultaneous baling and delivery of two bales at one operation are accomplished.

3. In a baling-press, the combination, with the plungers B, working in chambers A' and adapted for joint operation, they having a toggle-joint and lever connection with a common driving-point, and their adjuncts adapted to travel in a vertical slot, E', having horizontal branched slots E upon flanged rolls *e e'*, to effect the simultaneous baling of the hay or straw in two bales at one operation and the delivery thereof from the press, substantially as set forth.

4. In a baling-press, the plungers B and chambers A, in combination with the feeding-plunger G and its trough or chamber A', the cam-slotted lever H, connected by a link to plunger B, and the slide A^2, connected to the plunger G, and having a stud or pin, *i*, working in the slot on lever H, substantially as and for the purpose specified.

5. In a baling-press, the combination, with the frame A, having the chambers A' and the plunger B, of the endless belt F, having the gates F', of any desired number, adapted to successively enter the aforesaid chamber by the action of the incoming mass of hay or straw, substantially as and for the purpose set forth.

252,059. BOTTLE STOPPER AND FASTENER. AUGUSTUS E. RICH, Fall River, Mass. Filed Aug. 19, 1881. (Model.)

Claim.—1. A bottle-stopper-fastening device consisting of a neck-band with an outwardly and upwardly projecting latch, in combination with a slotted lever arranged to engage detachably with the ear of a stopper-cap, said cap being linked to the neck-band, and the lever operating with a downward and inward motion, sliding upon said latch, but not detachable therefrom, all arranged substantially as and for the purposes set forth.

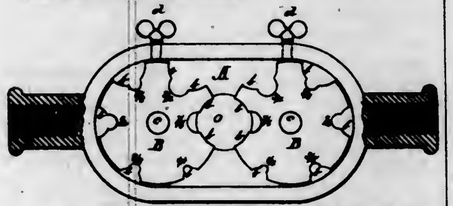
2. The metal cap-piece with ears *a* and *b*, one ear being linked to the neck-band of a bottle, in combination with a flexible valve-stopper having an elastic teat, substantially as and for the purposes set forth.

3. In combination, a flexible stopper with upwardly-projecting and self-supporting teat formed in one piece with cap-piece, having indent through its center, a means for connecting the cap-piece to the bottle-neck, and a neck-band having an outwardly and upwardly projecting latch or horn, with slotted lever arranged to detachably connect with cap-piece and said latch or horn, all substantially as and for the purposes set forth.

4. In combination with the flexible stopper and cap-piece, the link *f*, neck-band *e*, latch or horn *h*, and slotted lever D, having means for detachably engaging the cap-piece, substantially as and for the purposes set forth.

5. A stopper linked to a neck-band of a bottle, in combination with a detachable slotted lever operating on an upwardly and outwardly projecting latch or horn, the horn being attached to the neck-band, all arranged substantially as and for the purposes set forth.

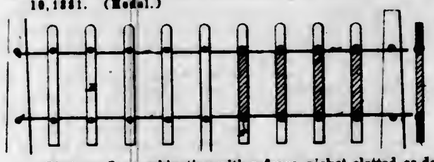
6. A neck-band having an upwardly and outwardly projecting latch or horn, in combination with a slotted lever arranged to detachably engage or hook to the stopper and slide upon the horn, substantially as and for the purposes set forth.



7. The metal cap-piece B, in combination with the flexible valve-stopper having an elastic teat supported by cross-bars, arranged as and for the purposes set forth.

8. A flexible stopper consisting of a rim to fit the mouth of a bottle and an upwardly-projecting teat supported by bars across the bottom, all molded or formed in one piece, substantially as described.

9. In a flexible stopper, a valve consisting of an upwardly-projecting elastic teat supported by cross-bars, said teat made to fit the hole in the downwardly-projecting metal top, all arranged substantially as described.



10. The combination of a flexible stopper having an elastic valve and a supported elastic teat with a metal cap-piece having an aperture, substantially as and for the purposes set forth.

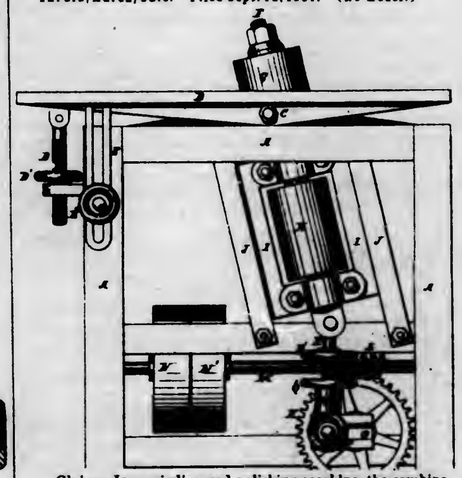
252,060. SCREW-CUTTING DIE. JOHN SHERMAN, Cleveland, Ohio, assignor of one-half to Leonard H. Burt, same place. Filed Jan. 17, 1881. (No model.)

Claim.—The revolvingly-adjustable disks B B, having the several different-sized cutting-recesses provided with cutting-teeth *b b* in their periphery, in combination with the plate A, having set-screws *d d* and sockets for handles, substantially as described.

252,061. FENCE. NOAH SMITH, Kirkeville, Mo. Filed Aug. 10, 1881. (Model.)

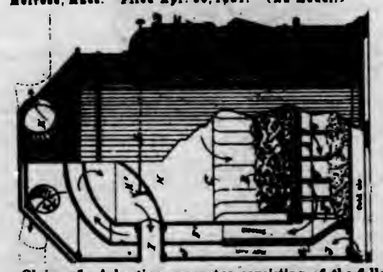
Claim.—In combination with a fence-picket slotted as described, a supporting wire or wires bent or looped to receive the securing nail or pin and the securing-nail, substantially as described.

252,062. STAFF AND JEWEL PROTECTOR FOR WATCHES. SAMUEL P. STOVER, Parksale, Pa. Filed Oct. 7, 1881. (No model.)



Claim.—1. A staff and jewel protector for watches, which consists of a strong open frame supported upon the watch-frame and extending above the staff and jewels to prevent the case being pressed in upon them, substantially as and for the purpose specified.

2. A staff and jewel protector for watches, which consists of a ring provided with means to support and secure it to the watch-frame, said ring being adapted to encircle the staff and prevent any pressure upon the staff and jewels due to the crushing in of the case, substantially as and for the purpose specified.

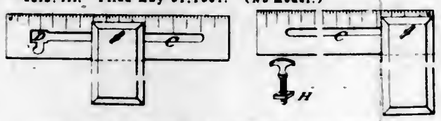


3. In a staff and jewel protector for watches, the disk J, supporting the ring E and having aperture B, in combination with a flange, K, or its equivalent, part of said flange being cut away at C to allow the adjustment of the regulating-lever, and the disk and flange being cut away at D for the admission of the bridge of the watch, substantially as and for the purpose specified.

252,063. GRINDING AND POLISHING MACHINE. JOHN L. TAPLIN, Akron, Ohio. Filed Sept. 12, 1881. (No model.)

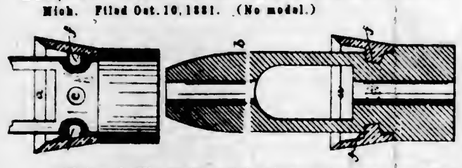
Claim.—In a grinding and polishing machine, the combination of the following elements, to wit: a frame, A, a tilting table, B, pivoted near or at its center thereon, devices for tilting and clamping the table in position, an inclined shaft, F, carrying the pulley H, and an inclined grinding-cylinder G, a sash or frame, I, carrying the cylinder-shaft, the inclined guides J, between which the sash or frame moves in an inclined plane, and an adjustable pitman also adjustably connected with a crank-shaft on the axis of a driving-wheel, K, said members being constructed and arranged to operate substantially as and for the purposes described.

252,064. HEATING APPARATUS. LYELL T. TURWILLIGER, Melrose, Mass. Filed Apr. 30, 1881. (No model.)



Claim.—1. A heating apparatus consisting of the following elements arranged in the order shown and described, viz: a central fire-pot through which a downward draft is maintained, a smoke chamber or passage for the heated products of combustion at each side of said fire-pot and opening from the base thereof, and a hot-air chamber outside of said smoke-chamber and separated therefrom by the radiator G, which receives at its base the direct caloric-current, whereby the air for respiration is warmed in passing upwardly, substantially as set forth.

2. A heating apparatus constructed, as described and shown, with oblique openings extending upwardly and outwardly from the base of the fire-pot, smoke-flues ascending therefrom, and an air-chamber outside said flues, adapted to be heated by the radiator which separates the flue from the air-chamber, substantially as set forth.



3. An open grate or fire-place having a central open fire-pot, a flue at each side thereof adapted to receive the products of combustion at or below the fire-pot level and communicating with the chimney, and a hollow column adjoining each flue and provided with a cold-air inlet at its bottom and one or more hot-air pipes at top, substantially as and for the purpose set forth.

252,065. BEVEL AND TRY SQUARE. CARROLL THOMAS, Lincoln, Ill. Filed May 31, 1881. (No model.)

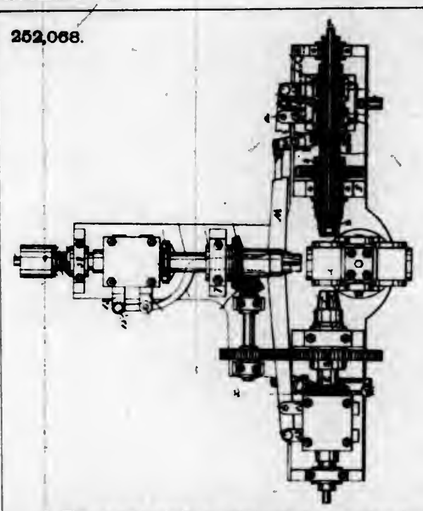
Claim.—The blade of a try-square or bevel constructed in manner and form as herein described, in combination with thumb-screw and adjustable nut H, as described and set forth.

252,066. PUMP-PISTON. JOHN A. TUNER, Three Rivers, Mich. Filed Oct. 10, 1881. (No model.)

Claim.—1. The packing of the plunger of a pump, consisting of an encircling sleeve or band of india-rubber or its compounds, constructed with a series of lugs or teats on its inner side, the said lugs adapted to fit into a corresponding series of openings in the outer surface of the plunger for the purpose of retaining the packing in place, substantially as described.

2. The combination, in a common well-pump, of the plunger *b*, and the encircling rubber band or sleeve *a*, the latter provided with a series of teats or lugs, *f*, arranged to fit into a corresponding series of openings, *e*, in the plunger and retain the band or sleeve in place while the pump is being operated.

252,067. CLOTHES-BOILER. CORNELIUS B. VERDERY, Athens, Ga. Filed Nov. 24, 1880. (No model.)



Claim.—In a clothes-boiler attachment, the combination, with an inverted-cup-shaped plate provided with a perforated depending flange and a hollow telescopic standard, of a flat perforated plate attached to the hollow standard above the cup-shaped plate, said flat plate provided with an upright annular flange and braces *a'*, connecting the outer edges of the flat and cup-shaped plates, substantially as set forth.

252,068. MACHINE FOR TAPPING AND REAMING. CALEB C. WALWORTH, Boston, Mass. Filed Apr. 19, 1880. (Model.)

Claim.—1. In a machine for tapping, substantially such as described, two or more rotating spindles and taps, combined with rods and heads adapted to positively move the cutters or dies outward and retract them independently of the movement of the spindles, substantially as described.

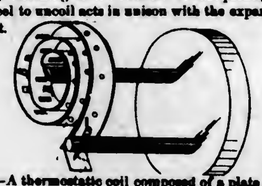
2. The rotating spindle, cutting devices, head, and rod r^2, a catch-box attached to the rod, a releasing device, and a spring to act upon the catch-box and withdraw the said rod to retract the cutters, combined with a series of levers and links operatively connected with one or more rods, *r*, of other spindles, to automatically retract the cutting devices of the other spindles, substantially as set forth.

252,068.

3. The rotating spindle provided with the screw-threads and the half-nut, combined with the wedge having the two shoulders and flat surfaces to lift the half-nut and obviate retrograde motion of the wedge by reason of pressure upon the half-nut, substantially as described.

4. The rotating spindle having screw-threads of different pitch, combined with half-nuts having screw-threads of like pitch, and means to move the half-nuts to engage either of them with its co-operating screw-thread of the spindle, according to the pitch of the thread desired for the fitting.

5. In a tapping-machine, a series of tapping-spindles having screw-threads, a series of half-nuts, and wedges to move them, and a lever to simultaneously operate the wedge for each spindle and its operative half-nut, substantially as described.

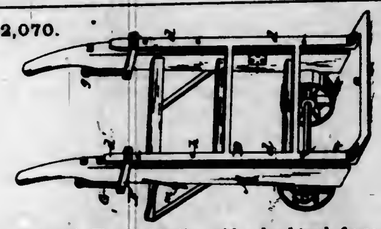


6. The continuously-rotating shaft B, its clutch splined thereon, and means to move it at the proper time, combined with the hollow shaft and its attached gears, two or more rotating spindles, and means to connect and rotate them in unison, substantially as described.

7. The lever M, to operate the wedges that lift the half-nuts, combined with the bar a^3, connected with the said lever, a tripping device to engage and hold the bar and lever in one of its extreme positions against the action of a spring, and means to disengage the tripping device from the said bar before the cutters are retracted and prior to moving the spindles, substantially as and for the purpose described.

8. In a tapping-machine, two or more tapping-spindles having radially-movable cutters, combined with mechanism to rotate the said spindles continuously in one direction both when the spindles are being moved forward to cut a thread and when being retracted, substantially as described.

252,069. THERMOSTATIC COIL. HARRIS W. AXFORD, Chicago, Ill. Filed Jan. 20, 1881. (Model.)



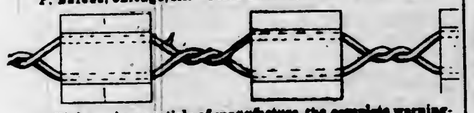
Brief—The steel and rubber are riveted together and afterward coiled by softening of the rubber. Consequently, the tendency of the steel to uncoil acts in unison with the expansion of the rubber by heat.

Claim.—A thermostatic coil composed of a plate of hard rubber and a plate of spring-steel, the hard rubber being bent so as to hold the spring-steel in a coiled form, that it may constantly tend to enlarge the coil and give increased sensitiveness to the thermostat, as and for the purpose specified.

252,070. WEIGHING ATTACHMENT FOR HAND-TRUCKS. THADDEUS W. BOYLE, Augusta, Ga. Filed May 20, 1881. (No model.)

252,070.

Claim.—1. The combination, with a hand-truck frame, of a weighing-frame resting upon the upper surfaces of the side pieces of said truck, and provided at its lower end with a suitable lifting-piece, one or more weighing-springs connected with the truck and also with said weighing-frame, and a suitable index, substantially as and for the purpose described.



2. The combination, with the side pieces of the truck, of the weighing-frame having the side bars, *d*, and lifting-piece *e*, loops F, and the springs G, connected at one end with said loops and at the other end with the side pieces of the truck, substantially as described.

3. The combination, with the side pieces of the truck and the weighing-frame having the side bars, *d*, of suitable anti-friction devices arranged between said side bars and the side pieces of the truck, substantially as and for the purpose set forth.

4. The combination, with the side pieces of the truck, having the recesses B and plates C, partially overhanging said recesses, of the weighing-frame, having its side bars, *d*, provided with friction-rollers *i*, playing in said recesses under said plates, substantially as described.

5. The combination, with the side pieces of the truck and the weighing-frame having its side bars, *d*, arranged above said side pieces, of the friction-rollers *h'*, arranged under said side bars, substantially as and for the purpose set forth.

252,071. WARNING-STRIP FOR BARBED FENCES. ORLANDO F. BRIGGS, Chicago, Ill. Filed Nov. 14, 1881. (No model.)

Claim.—As an article of manufacture, the complete warning-strip for barb-wire fences, consisting of thin flat metal tablets rigidly secured to two stringer-wires, substantially as specified, constituting a continuous strip capable of being readily spooled and handled.

252,072. BAG OR SACK FOR STORING OR TRANSPORTING FERTILIZERS. C. ELTON BUCK, Wilmington, Del., assignor to Walton Wharn & Co., same place. Filed Oct. 6, 1881. (No specimens.)

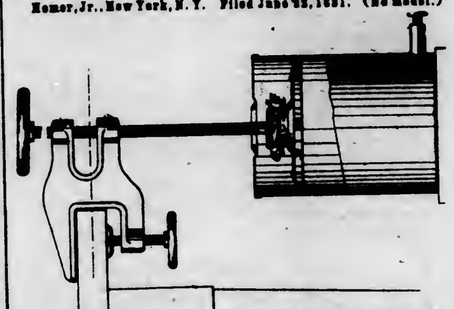
Claim.—As a new article of manufacture, a textile or fibrous sack or inclosing integument for inclosing phosphates, guanos, and fertilizers, the threads, fibers, or substance of which is coated, saturated, or impregnated with a soluble silicate.

252,073. CHECK-HOOK FOR HARNESS. HENRY C. BUELL, Rome, N. Y. Filed June 18, 1881. (No model.)

Claim.—1. A harness check-hook consisting of the main hook *a*, base *b*, and auxiliary hook *c*, rising centrally from said base, its end extending backward and terminating nearly on a line with the main hook *a*, and provided with the shoulder *r*, all substantially as specified and described.

2. A harness check-hook consisting of the main hook *a*, base *b*, and auxiliary hook *c*, rising centrally from said base, its end extending backward and terminating nearly on a line with the main hook *a*, adapted to receive and retain a strap, *c*, and provided with the shoulder *r*, substantially as specified and set forth.

252,074. STATIONARY WASH-STAND AND FIXTURES. PETER H. BURNS, Brooklyn, N. Y. Filed May 24, 1881. (No model.)



Claim.—1. A stationary wash-stand composed of a supporting-slab, a basin provided with outlet and overflow openings, and an inlet-opening in the wall of the basin, and a valve constructed, as described, to allow the flow of hot or of cold water, or of hot and cold water mixed, said valve being supported by the slab and below the same, and provided with a stem or key projecting through the slab but flush with the upper surface thereof, all arranged as set forth, so as to leave the top of the stand free from obstructions of any kind.

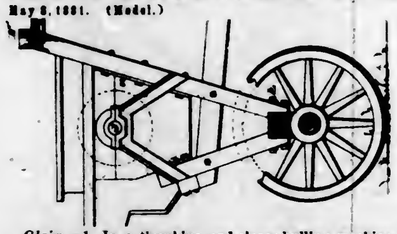
2. A stationary wash-basin constructed, as described, with outlet and overflow openings, and with an inlet-opening in its wall, inclined as shown, to prevent the water from sparting across the basin, all arranged as shown, so as to leave the inner surface of the basin free from projections or obstructions.

3. A valve for a wash-basin constructed of a hollow spud and inclosing-barrel, two inlet-openings in the barrel for hot and cold water, corresponding inlet openings or opening in the spud, and discharge-openings in the side and bottom of the spud and barrel, all as set forth, so that independent streams of hot and cold water may be admitted into the hollow chamber of the spud, and may be discharged separately or mixed through either or both discharge-openings.

252,075. SCREW-PRESS. WILLIAM D. CARTER, Brooklyn, assignor to Lawson Valentine, Henry C. Valentine, and Charles S. Homer, Jr., New York, N. Y. Filed June 22, 1881. (No model.)

Claim.—1. A screw-press for a paint-can, constructed with a loosely-fitted screw-cap at one end of the screw-shaft thereof, and also with a jaw and clamping-screw, as a new article of manufacture.

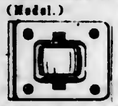
2. In a screw-press for a paint-can, a screw-rod provided at one end with a loosely-fitting screw-cap, as and for the purpose described.



252,076. CAN FOR IVORY-BLACK, &c. WILLIAM D. CARTER, Brooklyn, assignor to Lawson Valentine, Henry C. Valentine, and Charles S. Homer, Jr., New York, N. Y. Filed May 9, 1881. (No model.)

Claim.—1. A can for ivory-black and other substances, provided with an internal and vertically-adjustable diaphragm, with an aperture through its center surrounded by a projecting nozzle, with screw-threads on its exterior, through which the can may be filled, and by which the diaphragm may be vertically adjusted by means of a screw-press, substantially as and for the purpose described.

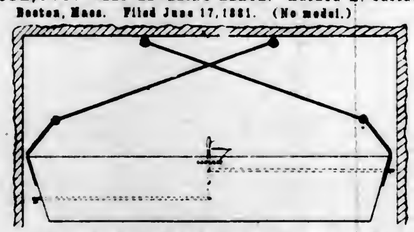
2. In a can for containing ivory-black, &c., an interior and vertically-adjustable diaphragm provided with a threaded nozzle projecting through the head of the can, in combination with a screw-cap, G, substantially as and for the purpose described.



252,077. THRASHING AND CLOVER-HULLING MACHINE FRAME. CONSTANTINE G. CASE, Battle Creek, Mich. Filed May 6, 1881. (Model.)

Claim.—1. In a thrashing and clover-hulling machine, the combination, with a bolster, of beams secured thereto in an upwardly-inclined direction, said beams being held in place by sills and a transverse brace and adapted to support the cylinder, substantially as set forth.

2. In a thrashing and clover-hulling machine, the combination, with a bolster and upwardly-inclined beams secured thereto, said beams being held in position by sills and a transverse brace, of metallic end pieces having flanges by which they are secured to the said beams, and a yoke, the said end pieces and yoke adapted to support the shaft carrying the cylinder, substantially as set forth.

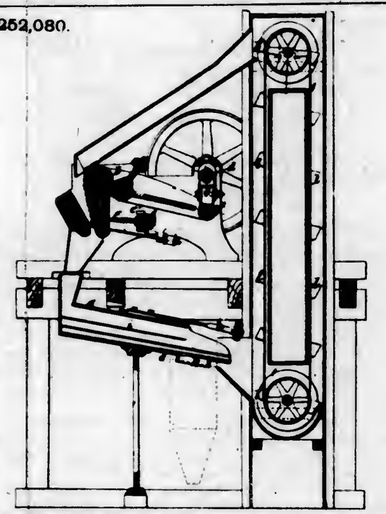


252,078. TRUNK-CASTER. JOHN J. CAWELL, Newark, N. J. Filed Feb. 12, 1881. (Model.)

Claim.—1. In a caster having two plates rigidly secured together and an aperture therethrough for the reception of a roller, the combination, with one of said plates, of ears projecting outwardly therefrom, said ears and plate being perforated to receive the axle of the roller, which axle is held in position by joining the said two plates, substantially as and for the purposes set forth.

2. In a caster having two plates rigidly secured together in close contact, except over the axle, and provided with an opening therethrough for the reception of a roller, a roller having an axle which is held in position by the joining of the said plates, substantially as and for the purposes set forth.

252,079. SELF-LEVELING BERTH. ARTHUR H. CROSBY, Boston, Mass. Filed June 17, 1881. (No model.)

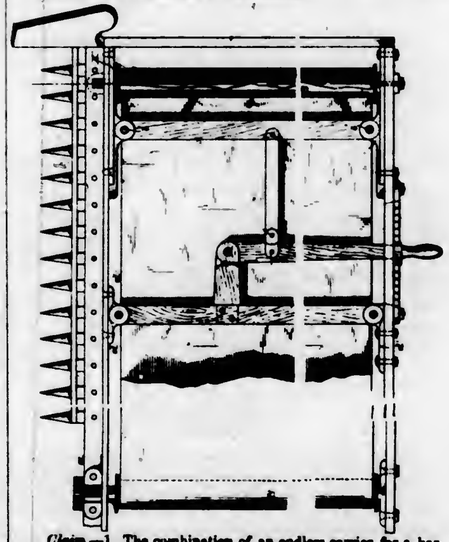


Claim.—A self-leveling berth or other structure for ships, suspended by four oblique rods or rigid hangers arranged in pairs, the rods of each pair extending diagonally from a single point in the center of one end of the berth, and pivoted independently to points of support beyond the transverse axis and on opposite sides of the longitudinal axis of the berth, as set forth.

252,080. MACHINERY FOR CRUSHING ORES, &c. GEORGE DALTON, Leeds, County of York, England. Filed Oct. 24, 1881. (No model.) Patented in England Jan. 27, 1880.

Claim.—1. The combination, with the fixed and movable jaws and operating-shaft of a crusher or reducing apparatus, of a rigid lever fulcrumed in the machine-frame, means for connecting it with the movable jaw and shaft, as explained, for imparting an up-and-down movement from the latter to the former, toggle-blocks, and one or more toggles arranged between stationary toggle-blocks and said movable jaw, so as to cause the latter to approach the fixed jaw by the downward movement thereof, substantially as described.

2. The combination, with the movable jaw and operating-shaft of a crusher or reducing apparatus, of a lever fulcrumed between the said jaw and shaft and pivoted at one end to said jaw,



252,080.

connecting-rod, crank on said shaft, one or more toggles, and stationary toggle-blocks, substantially as described.

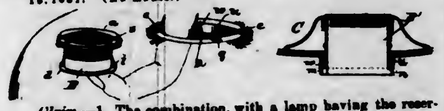
3. The combination, with a crusher or reducing apparatus comprising fixed and movable jaws, and mechanism, as explained, for imparting to the movable jaw a movement up and down, and of approach to and recession from the fixed jaw, of a sieving apparatus located with reference to said crusher or reducing apparatus as shown, and an elevator arranged to lift and deliver between the jaws of the crusher the material too large to pass through the sieving apparatus, substantially as described.

252,081. GRAIN-CARRIER. JOHN S. DAVIS, Toledo, Ohio, assignor to the Toledo Mower and Reaper Company, same place. Filed Oct. 15, 1881. (No model.)

Claim.—1. The combination of an endless carrier for a harvester, the supporting-rollers for the carrier, located at the ends of the carrier-frame, the adjustable supporting mechanism between said rollers, and between the upper and lower portions or opposite surfaces of the carrier, and means for positively adjusting and securing said mechanism, substantially as and for the purpose herein before set forth.

2. The combination of the cross-heads provided with bearings the carrier-supporting roller mounted in said bearings, the guide

ways for the cross-heads, and the adjustable bar connecting the cross-heads, substantially as and for the purpose hereinbefore set forth.



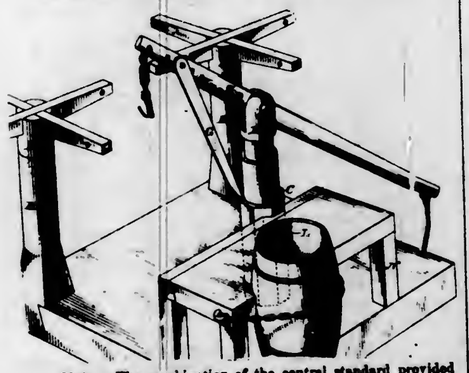
3. The combination of the carrier, its supporting-rollers, the sliding boxes or cross-heads provided with bearings for one of said rollers, the cross-bar between the upper and lower portions of the carrier, with which bar the cross-heads are jointed, and the adjusting-lever linked to said bar, substantially as and for the purpose hereinbefore set forth.

4. The combination, substantially as hereinbefore set forth, of the adjustable carrier-supporting roller, the sliding boxes, the guideways, the resilient bar having jointed connection at its ends with said sliding boxes, the adjusting-lever, the link or connecting-bar, and means for securing the lever in its adjusted position.

5. The combination of the platform, the carrier, the roller mounted in fixed bearings, the adjustable roller, the cross-heads provided with bearings for said adjustable roller, the bar connecting said cross-heads, the link-rod, the lever, and the cross-bar with which said lever has pivotal connection, these members being and operating substantially as hereinbefore set forth.

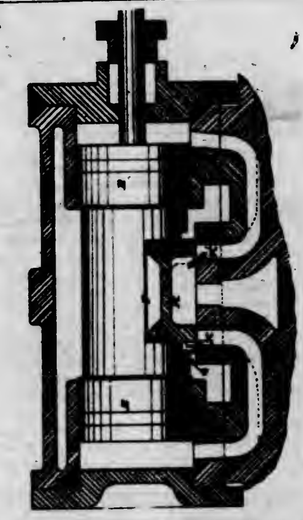
6. The combination of the platform, the adjustable carrier-supporting roller, the adjusting and supporting mechanism therefor, the slotted back board, and the rack with which the detent of the adjusting-lever engages, substantially as and for the purpose hereinbefore set forth.

252,082. LAMP. JOHN M. DEXTER, Elmira, N. Y. Filed May 16, 1881. (No model.)

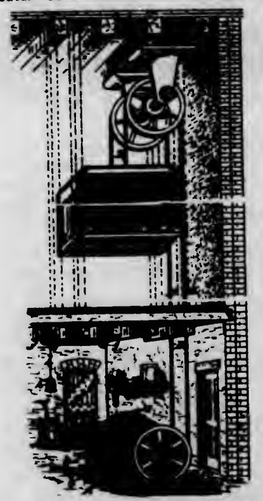


Claim.—1. The combination, with a lamp having the reservoir-opening *a*, grooves *c*, threaded tube with lower flange, *d*, and lugs *i*, and ring C, of a packing, *c'*, arranged substantially as set forth.

2. The combination of the threaded tube B', its lugs *a m*, the reservoir with its flange, grooves *c* and *q*, and notch *w*, and threaded ring C, substantially as set forth.



3. The ring C, formed with a sunken shoulder, *s*, and notch *t*, in combination with a cap-plate flush with said ring when down, a spring for holding down said cap-plate, and means for attaching said ring to the lamp-reservoir, substantially as set forth.



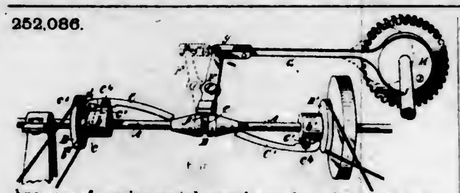
252,083. BUTCHERING APPARATUS. GEORGE F. DICKINSON, Orland, Ind. Filed Nov. 17, 1881. (No model.)

Claim.—The combination of the central standard provided with the swivel-cap and notch C, the lifting-lever and its brace, the recess L, and the table supported therein, the scalding-barrel connected with the table, and posts provided with the pivoted caps and cross-arms, constituting an improved portable butchering apparatus, substantially as and for the purpose described.

252,084. DEVICE FOR STOPPING THE REVOLUTIONS OF THE DRUM IN ELEVATING MACHINERY. GEORGE DAYDEN, Boston, Mass. Filed Oct. 17, 1881. (No model.)

Claim.—1. In an elevating-machine, the mode of stopping the revolving of the drum upon the elevator-car being hung up and the cable holding said car becoming loose by means of a loose worm-gear upon the drum-shaft, with pawls attached to said worm-gear, said pawls operating in connection with a ratchet-gear, said ratchet-gear being attached to an auxiliary drum, said auxiliary drum being made fast to the main drum and operating a brake, substantially as described.

2. In combination with an elevator-car, the drum A, the cable B, the drum-shaft *d*, the loose worm-gear *g*, with pawls *e* attached thereto, the ratchet-gear *b*, the auxiliary drum *a*, with brake-cord *h*, pulleys *j*, and weight *h'*, and the worm-shaft shown at the point *f*, constructed and arranged substantially as described and shown, and for the purpose set forth.

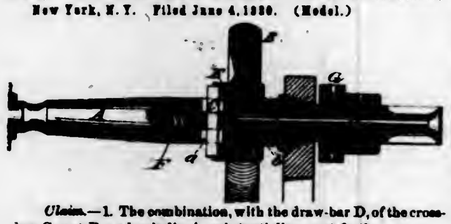


252,085. DEVICE FOR RENDERING A PULLEY TIGHT OR LOOSE UPON A SHAFT. GEORGE DUDLEY, Boston, Mass. Filed Oct. 17, 1881. (No model.)

Claim.—1. In an elevating-machine, the mode of rendering a pulley practically tight upon a shaft and in turn loosening the same

252,086. AUXILIARY PISTON VALVE FOR STEAM-ENGINE. GEORGE E. DOW, San Francisco, Cal. Filed Aug. 6, 1881. (No model.)

Claim.—The auxiliary piston E, recessed at F, in combination with the main and auxiliary valves G H, fitting said recess and moving coincidently, the main valve being made shorter than the auxiliary valve, substantially as and for the purpose herein described.

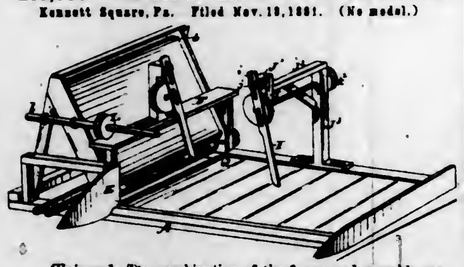


252,086.

by means of a spring carried around over the periphery of the pulley-hub and inside of a sleeve, which sleeve is keyed fast upon said shaft, the two ends of said spring holding it firmly in and to said sleeve, said spring to be operated by a slotted lever-bar, the end of said lever-bar being raised and lowered by a loose tapering slotted sleeve, said latter sleeve to be moved back and forth by means of an eccentric, and an oscillating lever forming the connection between the eccentric-rod of said eccentric and said loose annular slotted sleeve, substantially as described and shown.

2. In combination, the pulleys B and B', with hubs b^2, the two corresponding springs e, with ends or lips e^2 and e^3, the corresponding sleeves b and b', with lips c', the corresponding levers C and C', with tapering slots d, the worm-shaft A, the tapering loose sleeve D, with annular slot e, the oscillating lever F, provided with the stud f, the cross-head g, the eccentric H, with eccentric-rod G, and the shipping-shaft J, operated by the shipping-cord, all constructed and arranged substantially as described, and for the purpose set forth.

252,087. WATCH-MAKER'S LATHE. FREDERIC ECAUBERT, New York, N. Y. Filed June 4, 1880. (Model.)



Claim.—1. The combination, with the draw-bar D, of the cross-key C, nut B, and spindle A, substantially as set forth.

2. The combination, with the spindle A, of the draw-bar D, key C, spring F, washer E, having a flange or rim to retain the key, and the nut B upon the screw-threaded spindle, substantially as set forth.

3. The combination, in a lathe, of the spindle A, chuck-base G, chuck, draw-bar D, key C, spring F, flanged washer E, and nut B, substantially as set forth.

4. The chuck-base G, having peripheral holes for the hold-fast H, in combination with the chuck and the spindle A, into which spindle the chuck-base is screwed, substantially as set forth.

252,088. HARVESTING-MACHINE. DAVID W. ESTERLY, Kennett Square, Pa. Filed Nov. 18, 1881. (No model.)

Claim.—1. The combination of the frame and movable conveyer of a harvester with a movable arm or slotted lever suspended over said conveyer, and operating mechanism to cause it to advance or press the grain upon said conveyer in the direction of the path of the latter, substantially as and for the purpose described.

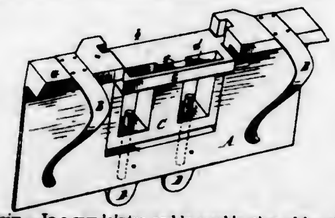
2. The combination of the conveyer, the elevator, the foot-board of a harvester, and the horizontal arm J', with a standard upon the end of said arm, a pulley provided with a crank-pin, and a slotted lever adapted to sweep over the conveyer in the direction of the path of the latter, substantially as and for the purpose described.

3. The combination of the frame and conveyer of a harvester with a slotted lever provided with a yielding bearing, p, a crank, and operating mechanism, substantially as and for the purpose described.

4. The combination of the frame and conveyer of a harvester with a crank, a slotted lever adapted to swing over said conveyer, and a shoe, I', pivoted to the lower end of said lever, substantially as and for the purpose described.

252,089. EXPANSION COMB OR REED FOR WARPING OR BEAMING MACHINES, &c. THOMAS C. ESTWICKLE, Lowell, Mass. Filed Sept. 27, 1881. (No model.)

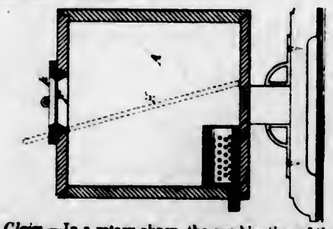
Brief.—The comb or reed, which is composed of sections hinged together, is set upright on the base-plate of the comb-box. The comb-box is provided with two rails, one of which is fixed to the base-plate, while the other is movable thereon. When the movable rail is caused to move toward the fixed rail the comb, which is placed between the two, is made to expand; but when the said rail is moved in an opposite direction the comb is caused to contract by means of the spiral springs, which are connected to the adjoining sections.



Claim.—1. An expansion comb or reed for warping-machines and other purposes, consisting of a series of dent-carrying sections hinged together, substantially as and for the purposes hereinbefore set forth.

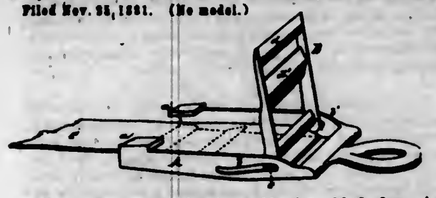
2. The comb-sections hinged together and provided with dents or teeth, in combination with springs connected to adjoining sections, substantially as and for the purposes hereinbefore set forth.

3. An expansion-comb composed of sections hinged together and armed with dents or teeth, in combination with a comb box or holder, and means, substantially as described, for setting the comb-sections at varying angles with respect to one another, substantially as and for the purposes hereinbefore set forth.



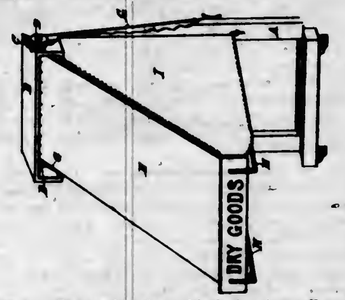
4. The comb-sections provided with dents and hinged together, in combination with a comb-box having one side or rail movable to and from the other, so as to narrow and widen the box, means for adjusting the same, and springs which move the comb-sections in a direction opposite to that in which they are moved by the movable box side or rail.

252,090. SAW-JOINTING DEVICE. HARVEY FERGUSON, Lestaville, Mich. Filed May 25, 1881. (No model.)



Claim.—In a saw-jointer, and in combination with a plate, A, thereof, provided with a flange, a, and springs B, the adjustable slide provided with a slotted flange, b, and a thumb-screw, D, substantially as and for the purposes specified.

252,091. CHURN. JAMES F. FERGUSON, Burlington, Vt. Filed Jan. 14, 1881. (Model.)

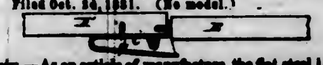


Claim.—In a rotary churn, the combination of the revolving body A with the platform H, notched to fit the opening F in the top of the body, substantially as shown and described.

252,092. STRAP-HOLDER. PETER PAGEN, Cleveland, Ohio. Filed Nov. 28, 1881. (No model.)

Claim.—In a strap-holder, the combination, with the frame A, provided with the cross-pieces a d', inclined legs a a', and slots b, of a sliding piece, B, having legs c, adapted to the slots b, and constructed, substantially as described, so that its free end will be secured upon a strap under the legs a a', substantially as set forth.

252,093. AWNING. LEWIS FOX and SPENCER WERRINK, Cleveland, Ohio. Filed Aug. 26, 1881. (No model.)



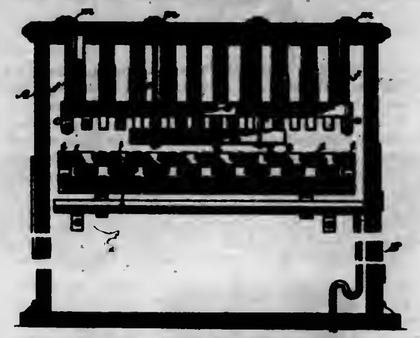
Claim.—The combination, with the housing, roller, and pulleys, of the awning E, end board, F, cord G, and braces H, hinged at one end to the window-frame and at the other end to the end board, substantially as and for the purpose set forth.

252,094. VALVE. WILLIAM GARDNER, Troy, N. Y., assignor of one-half to Hilton G. Jones, same place. Filed Aug. 1, 1881. (No model.)

Claim.—The combination, with a valve, B, provided with a slot, b', or other similar device for receiving a detachable grinding-tool, of the stem b, jointed to the valve B and provided at its axial center with an opening, C, for the admission of a detachable grinding-tool, as herein described, the opening C being adapted to receive a stopper, D, as and for the purpose herein specified.

252,095. BURGLAR-ALARM. JEROME GILES, South Bend, Ind. Filed Oct. 24, 1881. (No model.)

Claim.—As an article of manufacture, the flat steel U-shaped spring A, the short leg of which is provided with the nipple B and screw-hole c, and the long leg of which is provided with the aperture d, and arranged, when not under strain, to rest upon the nipple B, substantially as shown and described.

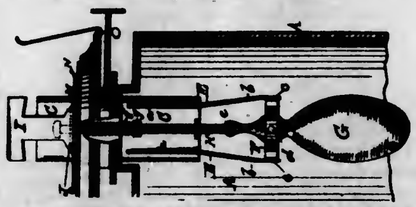


252,096. MANUFACTURE OF SHEARS AND SCISSORS. ROBERT A. GOODFELLOW, New York, N. Y. Filed Sept. 29, 1881. (No model.)

Claim.—The steel blade having a plate or tang, 2, with a hole in it, in combination with the metal handle having a pin, 4, upon the outside of the shank, substantially as set forth, so that the steel of the blade comes outside of the shank of the handle in welding the parts together, substantially as set forth.

252,096.

252,097. REFRIGERATOR. HENRY C. GOODELL, Atchison, Kans. Filed May 7, 1881. (No model.)



Claim.—1. The described cage, consisting of the beams c d e, bars a b, and suspending-rods, substantially as described.

2. The combination, with the ice-cage and the refrigerating-chamber, of the sliding frame E and door C, substantially as described.

3. The draining apparatus consisting of the side bars, n and o, notched as described, and the drain-boards arranged on said bars, as set forth.

4. The combination of the bars n and o, notched and provided with the dowel-pins, as described, with the three series of drain-boards arranged on said bars, as set forth.

252,098. SAFETY CAR-LAMP. CHARLES E. GRANNISS, New Haven, Conn. Filed July 28, 1881. (No model.)

Claim.—1. The combination of the pendulum or weight G, having recess e in its top, ring F, trunnions or pivots c d, rods or plates E, rod H, and encircling spring f, and the hooded extinguisher I, pivotally connected to the top of the rod H, substantially as and for the purpose set forth.

2. The combination of weight G, ring F, pivots c d, spring-rod H, hooded extinguisher I, and hinged lever M.

3. The combination of the weight or pendulum G, having recessed upper end, the spring-rod H, adapted to rest within the recessed portion of said weight, the rods or plates E, flaring at their lower ends, the ring F, pivoted at c to said rods, and having pivots d, upon which the weight or pendulum G is supported, the hooded extinguisher I, secured to the top of the rod H, and the hinged lever M, substantially as and for the purpose set forth.

252,099. CUFF-HOLDER. JOSEPH P. GUIGNON, St. Louis, Mo. Filed Apr. 16, 1881. (No model.)

Claim.—The band A, having button *a* on inner side of one end, stud *b* on outer surface of same end and inclined therefrom, loop *a'*, inclosing both ends, slot *b'*, and ornamental button *b²* on overlapping end, in combination with cuff B, substantially as shown and described.

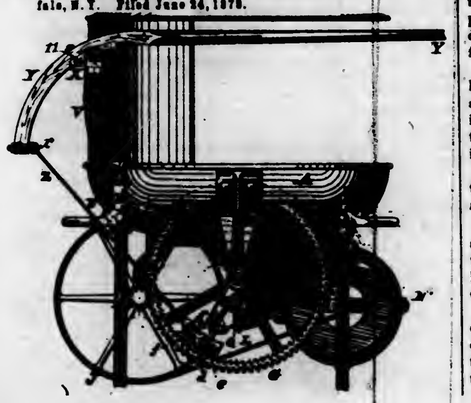
252,100. ADJUSTABLE CLASP FOR BOOKS. ALFRED C. HAPGOOD, New York, assignor to William C. Horn, Brooklyn, N.Y. Filed May 31, 1881. (No model.)

Claim.—1. In a clasp adapted to be secured to a book, the combination, with the two-part extensible clasp A *l*, of a right and left hand screw and thumb-wheel, substantially as set forth.

2. In a clasp adapted to be secured to a book, the combination, with the two-part extensible clasp A *l*, of the right and left hand screw and thumb-wheel and the cap-plate *t*, through a slot in which cap-plate the thumb-wheel projects, substantially as specified.

252,101. POCKET TAPE-MEASURE. EDWARD P. HAPP, Brooklyn, N.Y. Filed Aug. 16, 1881. (No model.)

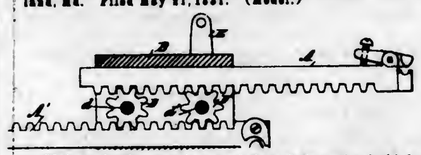
Brief.—Combines a tape-measure, a mirror, and a pin-cushion.



Claim.—The combination, in pocket tape-measure, of the spun sheet-metal case A, provided with the interior shoulder, *a*, the looking-glass B, forming the cover of the case and secured by the inturned edge *a'* of the metal part A, the moving parts contained below the shoulder *a*, and the disk E, interposed between the looking-glass and the moving parts, said disk resting upon the shoulder *a* and supporting and protecting the looking-glass, substantially as described.

252,102. CUFF ADJUSTER AND SUPPORT. ANDREW J. HALSEY, Newark, N.J. Filed July 14, 1881. (No model.)

Claim.—The combination, with the cuff, of the elastic band, arranged and secured within the said cuff, and the button or stud *a*, passed through perforations in said cuff and band and holding said parts intact, the whole being arranged and adapted to operate substantially as and for the purposes set forth and shown.



252,103. PORTABLE FORGE. CHARLES HAMMELMANN, Buffalo, N.Y. Filed June 24, 1879.

Claim.—1. In forges, the combination, with the handle Y, pivoted within the fork X on the standard V, and provided with an eyebolt, *z*, of the rod Z, hung to said eyebolt at one end and provided with a double eye, *g*, engaging the flange *f* on the socket *e* at the other end, the stud *d*, arm D', pawl, ratchet-wheel, and forge-operating mechanism, substantially as described, for the object stated.

2. The combination, with the arm D', having the stud *d* and the pawl engaging the serrated or ratchet wheel, of the socket *e*, having a flange, *f*, formed integral therewith and provided with an aperture at right angles with the aperture in said socket *e*, pin or bolt *f'*, double eye *g*, rod Z, handle Y, bearing-piece 11, fixed to said handle Y, swivel-fork X, and support *y*, as and for the object specified.

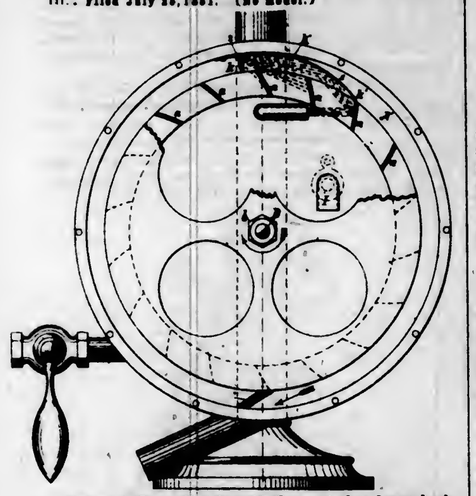
252,104. WIRE-STRETCHER. SIMON P. HARBAUGH, Cumberland, Md. Filed May 21, 1881. (Model.)

Claim.—A wire-stretcher consisting of the racks A A', having a wire-clamp at one end, the sleeve-frame B, having extensions *a a* with studs *c*, the shafts *d d'*, of which one carries a hand-crank, E, and the pinions D D', the whole adapted to be used in putting up a wire fence, as described.

252,105. BOOT AND SHOE HEELING MACHINE. WILLIAM J. HAPPERMAN, Lynn, Mass., assignor of fifty-seven one-hundredths to Horace R. Burdick, Nicholas J. Mooney, Edward L. Morris, William D. Robertson, and Walter M. Tomlinson, all of Boston, Mass.; said Morris assignor to said Burdick, Mooney, Robertson, and Tomlinson. Filed Aug. 16, 1881. (No model.)

Claim.—1. In a heeling-machine, the combination of a gang of nail-holders supported by a rotary frame or head, a gang of drivers adapted to move vertically in guides above said nail-holders, and normally elevated above the nail-holders by a spring or its equivalent, a cam to depress the driver-bar and force the drivers into the nail-holders, and a fixed inclined surface adapted to partially depress the driver-bar before it is acted on by the cam, as and for the purpose specified.

2. In a heeling-machine, the combination of a series of gangs of nail-holders supported by a rotary frame or head, a last to support the boot or shoe, a series of gangs of drivers corresponding with the gangs of nail-holders and elevated above the same by springs, so that normally the nail-holders will be unobstructed by the drivers, a fixed inclined surface adapted to partially depress the driver-bar of each series before said bar comes into operative position over the last, and a cam adapted to further depress the driver-bar when the same comes to its operative position, as set forth.



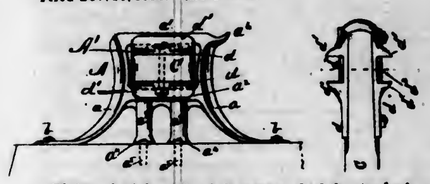
3. In a heeling-machine, the combination of a gang of nail-holders with a frame for said holders, constructed to permit of the adjustment of each of said holders radially in and out, and clamping devices for securing the holders in adjusted position, whereby the holders are adapted to be set for placing the nails uniformly in heels of different sizes, substantially as described.

4. The combination of the gang-holding frame composed of the connected top and bottom plates, A A, having radial slots B, and the nail-holders adjustable in said slots, as set forth.

5. The nail-holders, each composed of a block, *a*, reduced in size where it enters the slots in the holding-plates and screw-threaded at its upper end for the accommodation of a nut, and having a longitudinal nail-receiving aperture, *c*, and spring-jaws *c a*, substantially as described.

6. The combination, with a nail-holder, of the spring-jaw D, extending down under the said holder and arranged to bear against one side of the point of the nails, so as to give the nail an inclination corresponding somewhat to the inclination of the outside of the heel, substantially as described.

252,106. WATER-MOTOR. GEORGE A. HARRINGTON, Decatur, Ill. Filed July 28, 1881. (No model.)



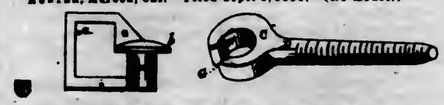
Claim.—1. In combination with the penstock and open-bucketed wheel, the inside jet-tube, J, placed within the inner circle of the wheel in the manner shown, so that the jet, after operating upon each bucket in succession, as the wheel revolves around it, will pass out through that portion of the wheel containing the buckets and against the scroll K, as and for the purpose set forth.

2. The combination, with the penstock, case, and inside jet-tube, of the wheel having buckets open at each end, with parallel sides by which they are secured to the wheel, each forming an evolute curve, by means of which the angle presented to the jet is constant for all positions, substantially as and for the purpose specified.

3. In combination with the penstock, case, transverse shaft, and wheel, the covered air-duct having an adjustable outer cover, *i*, substantially as set forth.

4. The combination, with the open-bucketed wheel and penstock, of the irregular scroll K, having lower projections, *h*, and forward projection, *h'*, for the purpose of further utilizing the otherwise dead water, as herein shown and described.

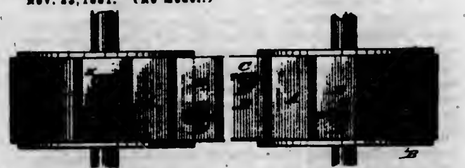
252,107. SLED. CHARLES M. HINMAN, Sauk Centre, Minn. Filed Nov. 23, 1881. (No model.)



Claim.—1. A knee for sleds, composed of the standards *a a*, having their lower ends flared outward on the top of the runner, and having the cross-bars *a' a²* arranged to provide an eye or opening, A', to receive the end of the beam, and having one or more supports, *a³*, under the cross-bar *a²* and resting on the runner, substantially as set forth.

2. The combination, with the knee A, provided with an eye or opening, A', and the beam C, of the beam-plates *d d*, provided with jaws *d' d'*, arranged to embrace the upper and under cross-bars of the knee and hold the end of the beam, substantially as set forth.

3. The beam-plates *d d*, constructed with the jaws *d' d'*, and with the transverse convex bearing-surface d^3 in the space or channel between the jaws, in combination with the beam C and knee A, provided with an eye or opening, A', the said knee being held so that it has a rocking or swinging motion on the end of the beam, substantially as set forth.

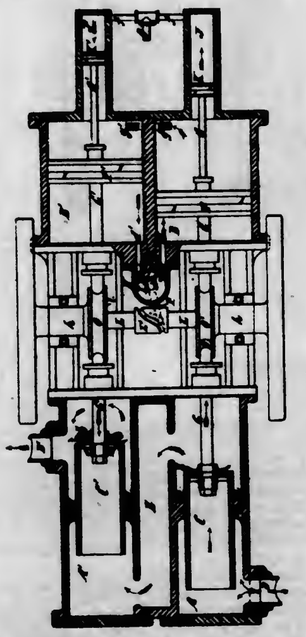


4. A sled-knee constructed to hold the end of the cross-beam, and provided with a horn or curved projection, a^3, arranged about on a level with the upper side of the cross-beam, substantially as set forth.

252,108. HARNESS AND TRACE COUPLING. GEORGE W. HUNTER, Merced, Cal. Filed Sept. 6, 1881. (No model.)

Claim.—The link A, with its bolt *a*, having the head *b*, as shown, in combination with head C, provided with the shank D, said head having the hole F, made eccentric to its circumference, and the slot G, so that the bolt may be introduced and tightened by turning within the hole, substantially as and for the purpose herein described.

252,109. DRIVING-BELT. THOMAS JACK, Auburn, N.Y. Filed Nov. 25, 1881. (No model.)



Claim.—1. A drive-belt consisting of alternate imperforate or solid and perforated plates, the perforations being arranged alternately on opposite sides of a longitudinal central line, substantially as set forth.

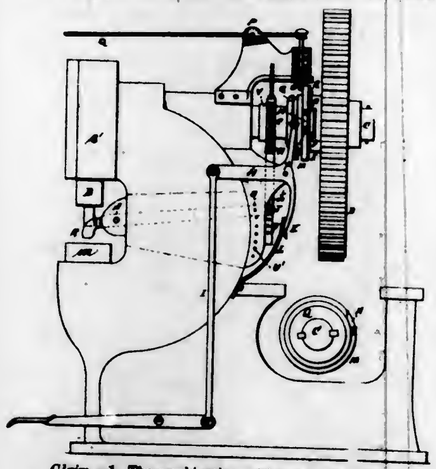
2. The combination, with the driving-pulleys having radially-projecting lugs or studs arranged alternately on opposite sides, of a driving-belt consisting of alternate solid and perforated plates, the perforations being arranged alternately on opposite sides of a central longitudinal line, so as to engage the studs of the driving-pulleys, substantially as set forth.

3. In a drive-belt, the plates B, having perforations surrounded by upward-projecting flanges, substantially as and for the purpose set forth.

252,110. PUMPING-ENGINE. HENRY A. JAMIESON, Brooklyn, N.Y. Filed May 4, 1881. (No model.)

Claim.—1. In a pumping-engine, the combination, with two single-acting pump cylinders and pistons arranged side by side, and having water-passages and valves arranged to provide for the

discharge of water from one cylinder into and through the other, of two single-acting actuating-cylinders and pistons connected by separate piston-rods one with each of said pump-pistons, and a valve for admitting steam or other motive agent to said actuating-cylinders alternately for making the working-stroke of the pump-pistons, substantially as and for the purpose specified.



2. In a pumping-engine, the combination, with two single-acting pump cylinders and pistons arranged side by side, and having water-passages and valves arranged to provide for the discharge of water from one cylinder into the other, of two single-acting actuating cylinders and pistons connected by separate piston-rods one with each of said pump-piston, a valve for admitting a motive agent alternately to said actuating-cylinders for making the working-stroke of the pump-pistons, and other actuating cylinders and pistons connected with the pump-pistons for effecting their return-stroke, substantially as and for the purpose specified.

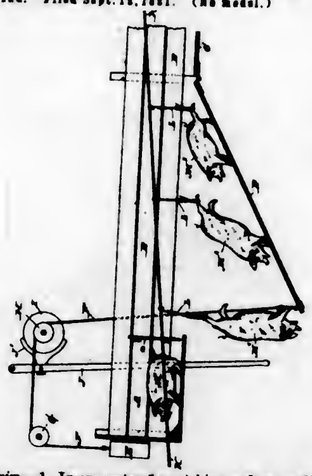
3. In a pumping-engine, the combination, with two single-acting pump cylinders and pistons having water-passages and valves arranged to provide for the discharge of water from one cylinder into the other, of two single-acting actuating-cylinders and actuating-pistons connected with said pump-pistons, a valve for admitting a motive agent to said actuating-cylinders alternately, a fly-wheel shaft, and two pairs of wheels in engagement or gear with the piston-rods, and having portions of reduced radius, which permits each rod to make its return-stroke free, but transmit motion to the fly-wheel shaft during its working-stroke, substantially as and for the purpose specified.

4. The combination of the pump-cylinders A A′ and pistons C C′ with their valves, the actuating-cylinders B B′ and pistons F F′, the piston-rods G G′, the smaller actuating-cylinders J J′, the pistons K K′ upon said rods G G′, the fly-wheel shaft L, and the pairs of wheels O in engagement or gear with said piston-rods, and having portions O′ of reduced radius, substantially as specified.

5. The combination of the two single-acting actuating-cylinders B B′, the pistons F F′, the valve I, the shaft L, carrying a grooved cam, L′, and the lever I′, engaging with said cam and fixed to said valve, substantially as specified.

252,111. PUNCHING-MACHINE. JOHN M. LONG and CHARLES E. MCILVAIN Hamilton, Ohio. Filed July 11, 1881. (No model.)

Claim.—1. The combination, with a punching-machine having a stripper-lever pivoted to the body of the machine, of the abutment-pin U′ and series of abutment-cuts U, for supporting the idle end of the stripper-lever, substantially as set forth.



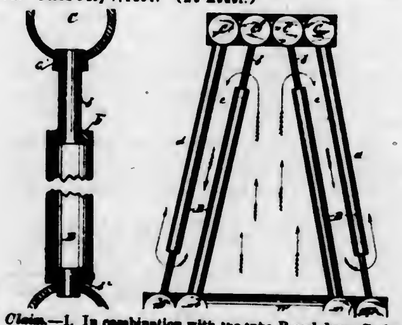
2. The combination, with a punching-machine having a rotary actuating-shaft, of the clutch-gear D, sliding clutch G, with levers to close it and spring L to open it, of the spring-pin O and the collar M, having the notch N, substantially as and for the purpose specified.

3. The combination, with a punching-machine having a rotary actuating-shaft, of the clutch-gear D, sliding clutch G, with levers to close it and spring L to open it, and spring-pin O, of the notched collar N M, fixed on the sliding clutch G, and the device for adjusting said collar around said clutch, substantially as and for the purpose specified.

4. The combination, in a punching-machine, of a driving-shaft, a clutch-wheel loose on said shaft, a sliding clutch splined on said shaft, a spring to hold the clutch out of engagement, a treadle or lever to throw the clutch into engagement, a pin arranged to drop behind the clutch and maintain its engagement, and a hand-lever for removing said pin and permitting the clutch to disengage, substantially as set forth.

5. The combination, with spring-pin O, of clutch-collar M, having notch N, with beveled side C, substantially as and for the purpose specified.

252,112. APPARATUS FOR CATCHING AND SUSPENDING HOGS. GEORGE A. LOWRY and MOSES CRAWFORD, Indianapolis, Ind. Filed Sept. 12, 1881. (No model.)



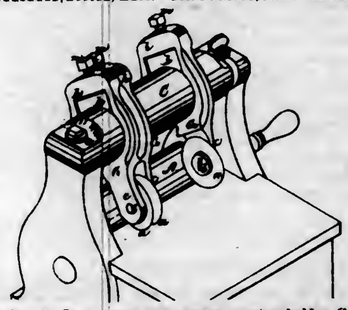
Claim.—1. In apparatus for catching and suspending hogs, a passage-way or chute a portion of the bottom of which consists of a movable hinged door, and a pen, A, for containing a decoy-hog, located at or near the front or free end of said hinged door, and the bottom of which is substantially a continuation of said door when in level position, substantially as set forth.

2. The combination, with the trap-like floor-section and its counterbalancing-weight and the rope and pulleys therefor, of a brake, J′, and brake-lever J, by which the same may be held in position or allowed to ascend and descend more or less gradually, substantially as set forth.

3. The combination, with the chain L, having hooks F and F′, of the spring P, slide P′, and catch P″, substantially as shown and described, and for the purpose specified.

4. The combination of the chute B, floor C, trap D, suspending mechanism E, F, G, H, I, and J, bar K, and suspending-chain L, forming an apparatus for catching and suspending hogs, substantially as set forth.

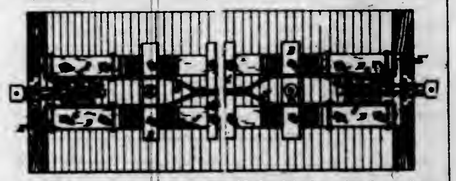
252,113. STEAM-BOILER. SHERON F. MASON, Brandy Station, Va. Filed July 7, 1881. (No model.)



Claim.—1. In combination with the tube B and drum C, the tapering thimble d′, having the longitudinal slit d″ and the copper strip d‴, substantially as shown and described, and for the purpose set forth.

2. In combination with the drums C and D, the series of inclined tubes B, having reduced portions, as described, and so arranged as to form draft-passages at the upper and lower ends of said series alternately, which shall communicate with flues between the series, as and for the purpose specified.

3. The combination of the tubes B, having double-threaded plug b′, reduced section b, having threaded collar b″, and the thimble d′, having slit d″ and copper slit d‴, substantially as shown and described, the said tubes being arranged in alternately-reversed series and combined with drums so as to form flues between the said series, as set forth.



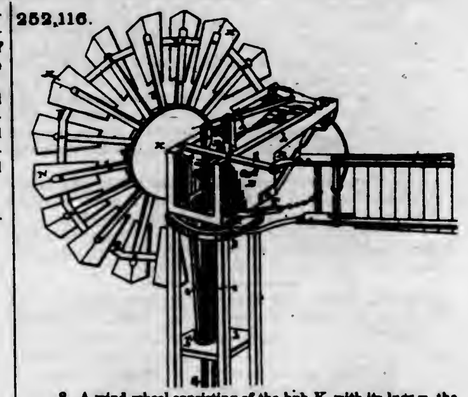
252,114. MACHINE FOR SCORING AND CUTTING PAPER. JAS. C. MARSHALL, Boston, Mass. Filed Feb. 14, 1881. (Model.)

Claim.—1. In a rotary paper-cutter, a cutter-holder, G, provided with a slot, 6, cut from the circular bearing-opening, and a set-screw, m, as shown, in combination with an inserted sliding block, k, having its lower face curved, the bar C, and the rotary cutter c, all constructed, arranged, and operated substantially as described.

2. In a machine for scoring and cutting paper, the combination, with a cutter holder or holders, of a cutter-bar or carrier-shaft, C, pivoted at one end at d, in order to allow of its being swung to one side to enable the cutter holder or holders to be placed thereon or removed therefrom, and provided at its opposite end with a clamping or fastening device for holding .. firmly in place when returned to its proper working position, substantially as described.

252,115. DRAFT AND BUFFING APPARATUS FOR RAILWAY-CARS. FRANK W. MARSTON, Boston, Mass. Filed Aug. 4, 1880. (Model.)

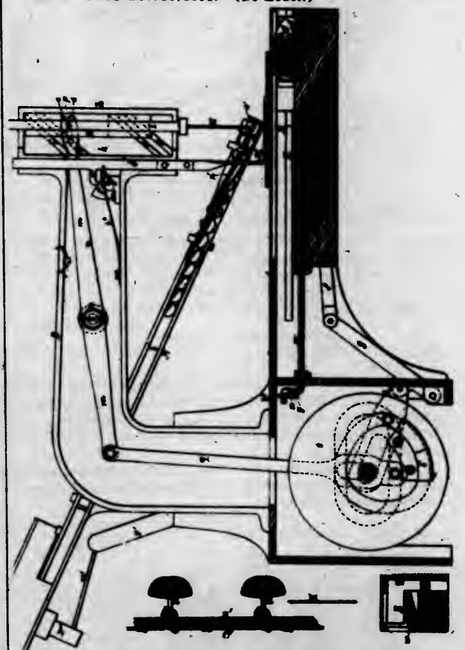
Claim.—1. A car-frame provided with draw-heads, springs, and follower-plates, in combination with two continuous metallic resistance-pieces for said follower-plates to bear upon, said resistance-pieces being secured to the inner face of the draft-timbers, substantially as set forth.



2. A car-frame provided with independent draft and buffing apparatus at each end, in combination with metallic resistance-pieces rigidly connected or extending continuously from end to end of the sills, and applied directly to the sides and ends of the draft-timbers, substantially as set forth, and for the purposes stated.

3. The continuous or rigidly-connected metallic resistance-pieces E E′ e, located in the horizontal plane of the draw-heads and secured to the sides and ends of the draft-timbers, so as to transmit to them the tractional strains incident to the movement of a single car, while the traction of the train is borne by said continuous resistance-pieces and the draft apparatus which they connect, substantially as and for the purpose set forth.

252,116. WINDMILL. THOMAS E. MARTIN, San José, Cal. Filed Oct. 3, 1881. (No model.)



Claim.—1. The improved blade for windmills, consisting of two halves of a parallelogram of timber divided on a diagonal line, p, and secured together with their narrow ends coincident, as described.

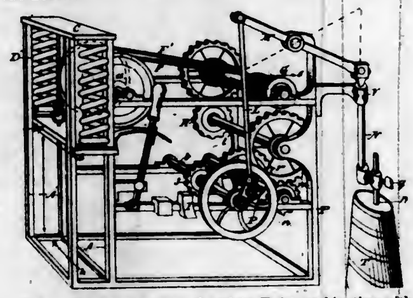
252,116.

2. A wind-wheel consisting of the hub K, with its lugs m, the face-plate M, arms L, blades or fans N, constructed as described, and the sinuous or interwoven strap P, when arranged and combined as herein described.

252,117. MACHINE FOR AND METHOD OF SEWING BUTTONS TO CLOTH, &c. JOSEPH MATHESON, Lynn, assignor to himself, Charles B. Lancaster, Boston, and William D. Allen, Lynn, Mass. Filed Nov. 18, 1881. (No model.)

Claim.—1. The method of securing buttons to cloth or other material, which consists essentially in automatically feeding the buttons from a receptacle to the material, then drawing a loop of thread up through the material and the eye of the button, next forcing the loop down through the material outside of the eye of the button, and then passing the thread through said loop and tightening the stitch by drawing upon the thread passed through said loop, and finally withdrawing the button from the feeding device simultaneously with the operation of tightening the stitch, all substantially as set forth.

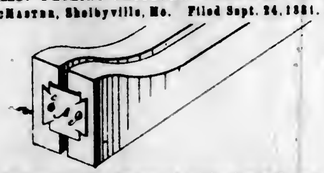
2. The mechanism for operating the shuttle-driver, the same consisting of the combination, with the driver F, of the arm f, lever g, slotted arm h, provided with a stud, the cam i, and driving-shaft G, all constructed, arranged, and operating as set forth.



3. The work-feeding device consisting of the combination of the vibrating lever m, the needle H, needle-bar I, feeder K, having tongues k', head k, having tongues i', and the side plate, r, having friction-pads u u, all constructed, arranged, and operating substantially as described.

4. In combination with the stitch-forming mechanism of a sewing-machine, the chute N, provided with a slotted race turned at its lower end, as described and shown, into a position to present the eye of the button directly under and in the path of the needle, in the manner specified.

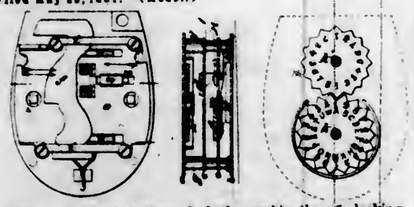
5. The combination of the button-feeder N, standard x', tongue a', guides b' b', lever v', link u', arm t', spindle r', and bristles s', all constructed and operating as and for the purpose set forth.



6. The combination of the springs p' q' with the button-feeding chute, provided with the discharge-port o' and the button-eye-guide slot n', all being arranged as explained.

252,118. MOTOR FOR CHURNS. WILLIAM MCLACHLAN and ALLAN MCFARLAND, Wilkinsburg, Pa. Filed Jan. 20, 1881. (No model.)

Claim.—In churn-motors, the plate E, in combination with the standards A A and A' A', springs D D', flexible cords F F', cylinder G, wheel H, gearing k w r s, shaft t, crank K, shaft L, beam M, and bar N, substantially as specified.



252,119. PACKING-FASTENER FOR FURNITURE. MARION E. MCMASTER, Shelbyville, Mo. Filed Sept. 24, 1881. (Model.)

Claim.—1. As an improved article of manufacture, a packing-fastener for tying two or more articles of furniture together for transportation, consisting of a plate, A, formed with two or more points or barbs, a a, and two or more holes, b b, substantially as described.

2. A packing-fastener formed with the central fold, d, and with the barbs or points a a and the holes b b, substantially as and for the purposes set forth.

252,120. INDICATOR-LOCK. JOHN MCMURRER, New York, N. Y. Filed May 28, 1881. (Model.)

Claim.—1. In an indicator-lock, the combination of a locking-bolt, d, a second principal locking-bolt, f, check-springs for each of said bolts, and the wedge-shaped sleeve n, to depress the check-springs m m, substantially as described.

2. In an indicator-lock, the combination of the locking and unlocking wedge n with the check-springs m m and the lever p, substantially as described.

3. In an indicator-lock, the combination of the registering-wheels h h', the bolt d, and the principal locking-bolt f, substantially as described.

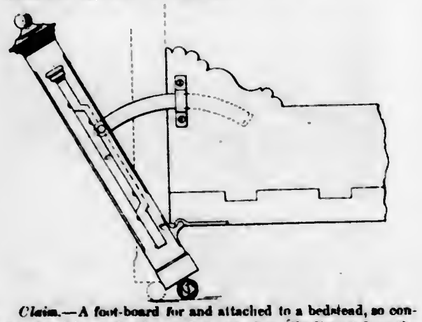
4. In an indicator-lock, the combination of the registering-wheels h h', the bolt d, the principal locking-bolt f, and the respective check-springs to said bolts, substantially as described.

252,121. FLOOR-COVERING. CHARLES T. MEYER and VICTOR E. MEYER, Jersey City, N. J. Filed June 21, 1881. (No model.)

Claim.—1. As an improved article of manufacture, a floor-covering made substantially as herein shown and described, and consisting of a layer of canvas or another base, on which a layer or layers of a mixture of ground leather or skins, mineral fiber, pigment, and a binding material, such as copal or other varnish, are spread, as set forth.

2. A compound for spreading on canvas for floor-coverings consisting of a mixture or paste of copal or other varnish and ground leather or skins, substantially as herein shown and described, and for the purpose set forth.

3. A compound for spreading on canvas for floor-coverings consisting of a mixture or paste of copal or other varnish, ground leather or skins, and a mineral fiber, substantially as herein shown and described, and for the purpose set forth.



252,122. FLOOR-COVERING. CHARLES T. MEYER and VICTOR E. MEYER, Jersey City, N. J. Filed June 21, 1881. (No model.)

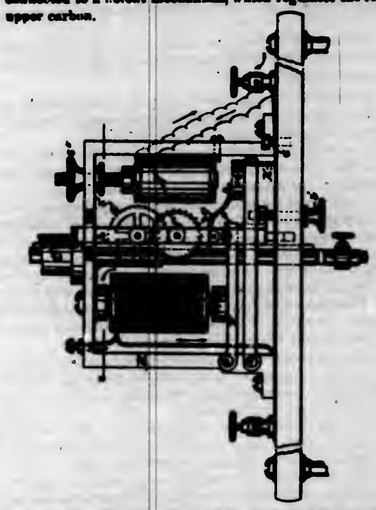
Claim.—1. As an improved article of manufacture, a floor-covering made substantially as herein shown and described, and consisting of a layer of canvas or another base, on which a layer or layers of a mixture of ground wood or other vegetable fiber, either plain or dyed or colored mineral fiber, and a binding material, such as copal or other varnish, are spread, as set forth.

2. A compound for spreading on canvas for floor-coverings, consisting of a mixture of ground wood, either plain or dyed or colored, with copal or other varnish, substantially as herein shown and described, and for the purpose set forth.

252,123. BEDSTEAD. WARREN P. MILLER, Brooklyn, N. Y. Filed Nov. 15, 1881. (No model.)

Claim.—A foot-board for and attached to a bedstead, so constructed and hung that it may be swung laterally distant from the mattress, substantially as shown, and for the purpose specified.

252,124. CAR-BRAKE. WILLARD F. MILLS and THOMAS IRWINE, Cleveland, Ohio. Filed July 5, 1881. (No model.)



Claim.—1. In a car-brake, the combination, with the casing M, of the frames I and J and disk N, substantially as set forth.

2. In a car-brake, the combination, with the casing M, of the frames I and J, disk N, and bearing H, substantially as set forth.

252,125. ELECTRIC LAMP. RICHARD B. MOFFATT and SYLVESTER CHICHESTER, Brooklyn, N. Y. Filed July 21, 1881. (No model.)

Brief.—An electro-magnet of low resistance in the arc-circuit establishes the arc, and another of high resistance in a shunt-circuit automatically makes and breaks said shunt, its armature being connected to a detent mechanism, which regulates the feed of the upper carbon.

Claim.—1. In an electric lamp, in combination with the carbon-holder, the electro-magnet M, its armature m, the escapement-wheel f', and escapement g, the latter arranged so that it will be forced into and out of gear by the movement of the said armature, the magnet N, located in a by-pass or derived circuit, its armature n, and the contact-point k, for making and breaking said circuit, substantially as herein specified.

2. In an electric lamp, the combination of the electro-magnet N, located in a by-pass or derived circuit, its armature n, the escapement g, and device for breaking said circuit when the armature is attracted by the electro-magnet N, and allowing the armature to return and close the circuit again, said movement causing the operation of the escapement and the arc to be regulated as the carbons are consumed, substantially as herein specified.

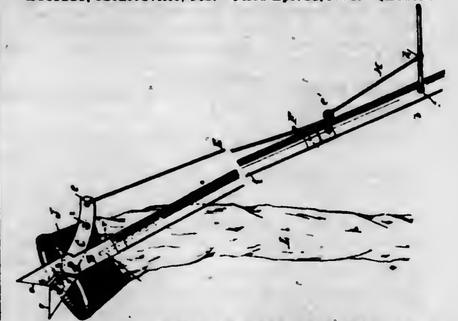
3. In an electric lamp, the combination of the armature n, the contact-point k, the spring o, or its equivalent, the escapement g, the escapement-wheel f', a by-pass or derived circuit around the arc, and mechanism for regulating the movement of the carbon-holder by the breaking and closing of said by-pass or derived circuit extending around the arc, substantially as herein specified.

252,126. TRACE-CARRIER. DAVID S. HOGAN, Omaha, Nebr. Filed Apr. 9, 1881. (No model.)

Claim.—A back-strap loop or buckle, A, having rigid loops or eyes B, and provided with a flexible holder, C, carrying a T-shaped fastener, D, adapted to receive and hold the eyeboye, substantially as and for the purpose described.

252,127. TONGUE-DEPRESSOR. EDWIN G. MERRILL, Norwalk, Ohio. Filed June 23, 1881. (No model.)

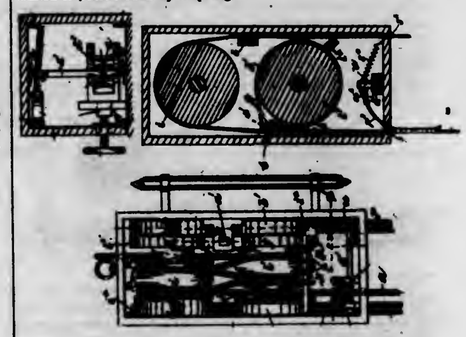
Claim.—1. A tongue-depressor provided with a holder for a removable protecting-envelope, substantially as set forth.



2. The combination, with a tongue-depressor, of an envelope-retaining device pivoted thereto, substantially as set forth.

252,128. VEGETABLE-CUTTING MACHINE. MARION C. MORSE, Mohawk, N. Y. Filed Apr. 18, 1881. (Model.)

Claim.—As an improvement in cutting-machines, the combination of the detachable teeth J, having triangular shanks, with the transverse bar H, having correspondingly-shaped recesses, in which the teeth are secured by top and bottom plates, K K', substantially as and for the purpose shown and specified.



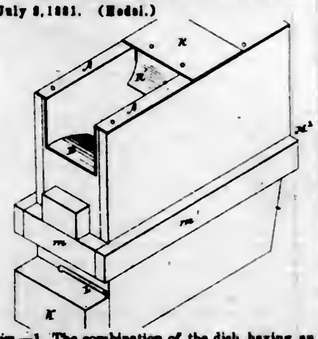
252,129. FRUIT-PICKER AND TREE-TRIMMER. WILLIAM MUSTARD, Jacksonville, Fla. Filed Apr. 23, 1881. (Model.)

Claim.—A fruit-picker constructed substantially as herein shown and described, and consisting of a pole or rod, A, carrying a fixed jaw, B, movable jaw C, pivoted to the fixed jaw, said jaws B and C having two angular cutting-edges, b b and c c, to sever the stem, and inclined edges c c to open the jaws, a fruit-receptacle, J, and conduit L, the whole combined and arranged for joint operation as set forth.

252,130. FIRE-ESCAPE. JOHN F. NEWTON, Jr., Boston, Mass. Filed June 24, 1881. (No model.)

Brief.—The pulleys have alternating grooves and coinciding bearing-surfaces, upon which a brake presses, which is operated by an adjusting-screw. A pair of clamping-rollers are located at the lower end of the frame, which are regulated by an adjusting-screw. The straps by which the seat is suspended pass up over the pulleys and act as brakes upon them. Attached to one of these straps is a short strap, which is fastened to a pivoted bar that, when the seat is weighted, is pushed against the rope, and when the weight is released is pulled back by a spring.

Claim.—1. In a fire-escape, the combination of a box or frame having the pulleys *i i'*, provided with alternating grooves and coinciding bearing-surfaces, a brake adapted to press simultaneously upon said bearing-surfaces to retard the movement of said pulleys, and an adjusting-screw to regulate the pressure of the brake.



2. In a fire-escape, the combination of a box or frame having openings in its opposite ends for the passage of a rope, a pair of pulleys, *i i'*, journaled in said box, a brake provided with an adjusting-screw to retard the movement of said pulleys, and the pair of clamping-rollers located at the lower end of the box and having an adjusting-screw, as set forth.

3. In a fire-escape, the combination of the box or frame having the pulleys *i i'*, the seat *g*, and the supporting-straps adapted to act as band-brakes on the pulleys *i i'*, substantially as and for the purpose set forth.

4. In a fire-escape, the combination of the box or frame having the pulleys *i i'*, adapted to receive upon their peripheries a rope, *a*, passing through said box, the seat-supporting straps adapted to act as band-brakes on said pulleys, and the pivoted lever or bar *d'*, connected with the seat-supporting straps, and adapted to press the rope *a* against a roller journaled in fixed bearings, substantially as and for the purpose set forth.

5. In a fire-escape, the combination of the box or frame having the pulleys *i i'*, adapted to receive upon their peripheries a rope, *a*, passing through said box, a screw-adjusted brake adapted to bear upon portions of the peripheries of said pulleys, the seat-supporting band-brakes adapted to bear upon other portions of the pulleys, and the pivoted lever or bar *d'*, connected with the band-brakes and adapted to press the rope *a* against a roller journaled in fixed bearings, as set forth.

252,181. **MOUSE-TRAP.** HENRY L. NORTON, Middletown, Conn. Filed July 8, 1881. (Model.)

Claim.—1. The combination of the dish having an inclined side and three vertical sides and the ears D, supporting a tipping-plate bottom having the block G and curved piece I, an inclosing-box provided with the resting-shoulders *m*, partition N, removable bottom P and wire L, and a baiting device, substantially as described.

2. The combination, with the dish having an inclined side and three vertical sides, and provided with the ears D, of the tipping false bottom F, hinged to D, and provided with the block G and weight H, the partition N, and an inclosing-box provided with the resting-shoulders *m*, substantially as described.

3. In combination with a hollow dish constructed as described and provided with a tipping-bottom plate, the baiting-hooks T, suspended from the plate R, the protecting-bars S, and plate R', substantially as described.

252,182. **TELEPHONE-TRANSMITTER.** JOS. OLMSTED, New York, N. Y. Filed Oct. 14, 1881. (No model.)

Claim.—1. The combination, in a telephone-transmitter, of a contact-electrode carried by the diaphragm, and a series of independently-pivoted simple electrodes resting independently and by their own weight against the electrode carried by the diaphragm.

2. A compound electrode for a telephone-transmitter, consisting of a series of independently-yielding variable contact-electrodes, in combination with a common adjustable support for said electrodes.

3. A compound electrode for a telephone-transmitter, consisting of a number of simple freely-pivoted electrodes resting by the action of gravity upon the opposite electrode, in combination with a common adjustable support upon which said electrodes are pivoted.

4. A compound electrode for a telephone-transmitter, consisting of a series of parallel independently-pivoted carbon plates fixed upon a common support.

5. The combination of a series or parallel independently-pivoted carbon plates and an adjustable common support upon which said plates are pivoted.

6. A compound electrode for telephones, consisting of a number of parallel plates independently pivoted and resting with their edges upon the opposite electrode.

7. A compound electrode for a telephone-transmitter, consisting of a number of parallel pivoted plates formed of carbonized card-board, paper, or equivalent material.

8. An electrode for a telephone-transmitter, consisting of parallel plates strung upon a conducting-rod.

9. The combination, with an electrode connected with the diaphragm of a transmitter, and having a curved contact-surface, of an electrode consisting of a thin sheet of conducting material resting with its edge against the diaphragm-electrode.

10. A contact-electrode for a telephone-transmitter, consisting of a thin sheet of carbonized paper or thin card-board, said electrode being mounted so as to rest with its edge against the electrode with which it makes contact.

11. A contact-electrode for a telephone-transmitter, consisting of a carbonized plate of paper or card-board, in combination with a supporting-rod of metal passing through said plate.

12. The combination, substantially as described, of a pivoted-plate electrode resting with its inclined edge against its opposite electrode, and an adjustable support for the first electrode, all combined as described, so that by adjusting the support of the pivoted electrode the angle of impingement of the second electrode may be varied.

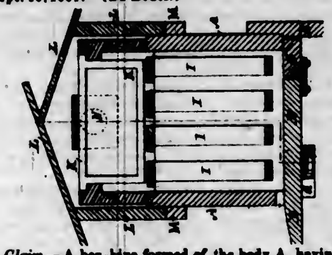
13. The combination of a compound electrode consisting o a series of pivoted parallel plates, an electrode connected to a diaphragm, against which electrode the parallel plates bear with inclined edges, and an adjustable support for said pivoted electrodes, adjustable to and from the electrode connected with the diaphragm.

14. The combination of a series of parallel pivoted plates, a cross-bar connected to a diaphragm, against which bar the edges of the pivoted plates rest, a conducting-bar upon which the pivoted plates are strung, and supporting-rods for said conducting-bar, connected at right angles thereto, and adjustable longitudinally.

15. The combination of rod E, attached to the diaphragm cross-bar G, pivoted plates H, resting upon the bar, with their lower edge inclined thereto, rod I, and adjustable rods L, substantially as described.

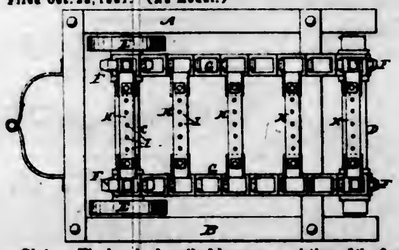
16. The combination of a pivoted electrode, and an adjustable support for the same, adapted to be moved to and from the electrode against which said pivoted electrode bears, so as to vary the initial pressure in the manner described by shifting the point upon the pivoted electrode at which it makes contact and is partially supported.

252,183. **AUTOMATIC RELIEF DEVICE FOR PUMPS.** GILBERT J. ORR, New York, N. Y. Filed Oct. 11, 1881. (No model.)



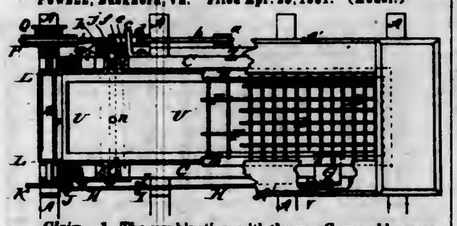
Cla —1. The combination, with the air-vessel and pump, of telescopic tubes at the junction of the pipe and air-vessel, and a yielding resistance—such as a spring—to hold the air-vessel in place, but allow it to move under the unequal pressure and discharge of water from the pump, substantially as set forth.

2. The combination, with the air-vessel and the tubes *a b*, of the cylinder *f*, sleeve *i*, spring *s*, and packing *i*, substantially as set forth.



3. The combination, with the air-vessel, the pipe *a*, and cylinder *f*, of the pipes leading to the suction-ways of the pump, the packing *i*, and the tube *b*, entering into the tube *a*, and provided with holes, substantially as set forth.

252,184. **BEE-HIVE.** EVAN L. T. OWENBY, Subligna, Ga., assignor to himself and James C. Nix, same place. Filed Sept. 10, 1881. (No model.)

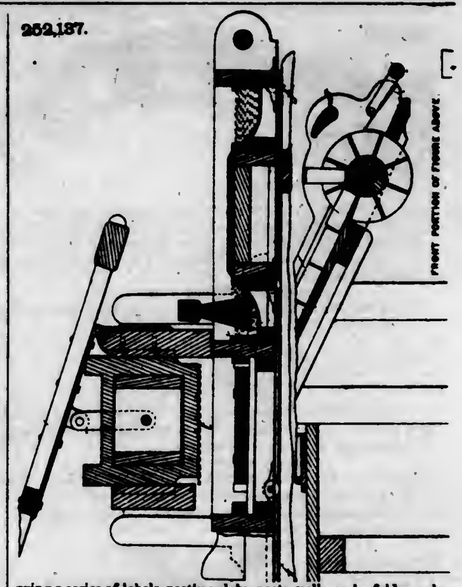


Claim.—A bee-hive formed of the body A, having cleats M near the upper edge and on the outside, the cap L, resting at its lower edge on the said outside cleats, the main frame I and chamber J, supported on the upper edge of said body, and the surplus-honey frames K, supported on inward projections of chamber J, as shown and described.

252,185. **HARROW.** G. ADOLPHUS PADDOCK, Trenton, Wis. Filed Oct. 25, 1881. (No model.)

Claim.—The herein-described harrow, consisting of the frame A B, having mounted therein two axles, C D, the front axle, C, having supporting-wheels E, and sprocket-wheels F mounted thereon, and the rear axle also provided with sprocket-wheels, and endless chains passing over said sprocket-wheels, and carrying a series of drag-bars having teeth adapted to engage the ground, the several parts arranged relatively to each other, substantially as shown and described, whereby the endless chains are operated directly through the medium of the supporting-wheels, which also regulate their rotation, as specified.

252,186. **PEANUT PICKER AND CLEANER.** EVERETT E. POWELL, Buckhorn, Va. Filed Apr. 26, 1881. (Model.)



Claim.—1. The combination, with the case C, movable screen E F, bar *b*, shoe U, fan Y, traveling apron M, and rollers L N, all arranged within the case, as specified, of the following parts, which are arranged on the side of the latter, to wit: the rotating gear R, pinion Q, pulleys P *d e*, band *h*, vertical rock-shaft A, connected with said pulley *d* and bar *b*, the rod H, and wheel K, as shown and described, for the purpose specified.

2. The combination, with case C, the vibrating shoe U, its attached bar *b*, and rollers supporting the same, of the rock-shaft A, having cranks *g* and *j*, the pulley *d*, crank *e*, connecting-rod *f*, and the mechanism for imparting rotation to said pulley, as shown and described, for the purpose specified.

252,187. **PACKET-LABELING MACHINE.** GEO. PRITCHARD, Seaforth, near Liverpool, County of Lancaster, assignor to Robt. Spear Hudson, Liverpool, England. Filed Sept. 17, 1881. (No model.) Patented in England Mar. 29, 1881.

Claim.—1. In a labeling-machine, the traveling platform carrying a series of labels, pasting-slabs, paste-wells, and a folder, substantially as described.

2. The combination, with the traveling platform and pasting-slabs thereon, of the vertically-sliding taking-off blocks or plungers, substantially as described.

3. The combination, with the traveling platform and taking-off blocks or plungers, of the folder and lever-grips, substantially as and for the purpose described.

4. In a labeling-machine, the combination, with the traveling platform, of the pocketed drum operated by the movement of said platform, substantially as described.

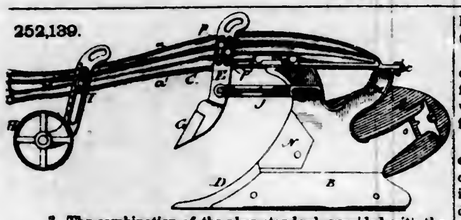
5. The combination, with the traveling platform and parts connected therewith, of the folder supported on a sliding bed-plate, substantially as described.

6. A labeling-machine comprising a traveling platform, pasting-slabs, paste-wells, and folder carried by said platform, a pocketed drum, and taking-off blocks or plungers, all combined and operating substantially as described.

252,188. **SASH-FASTENER.** ALFRED GILBEY, Dow, N. H. Filed Mar. 28, 1881. (Model.)

Brief.—The bolts are provided on their upper sides with inclined projections engaging corresponding projections on the face-plate, they being held in engagement by means of a spring and washer under said bolts. The object of these devices is to keep the bolts in close contact with the window-frame, and thus prevent rattling.

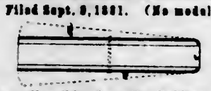
Claim.—In a sash-lock, the casing A and face-plate H, having upon its under side the inclined lug *a*, in combination with a suitable spring, *c*, and racks C D, formed with bolts E F and inclined lugs *g*, the racks provided with means for operating them, substantially as and for the purpose set forth.



252,189. **PLOW.** JOHN S. ROBINSON and EDSON C. ROBINSON, Canandaigua, N. Y. Filed Jan. 27, 1881. (No model.)

Brief.—Jointer-standard with sides double beveled. Either side may be brought down to the beam and turn the point to or from land. A rubber cushion in the jointer-brace. Wheel-standard adjustable to or from land by shouldered recesses and furnished with a registered scale.

Claim.—1. The combination of the double-faced jointer-standard and the brace J, substantially as described.



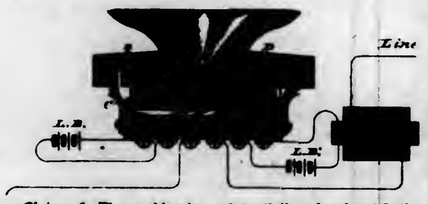
2. The angular or double-faced and double-slotted jointer-standard E, in combination with the bolt *g*, passing through the plow-beam, substantially as described.

252,139.

3. The combination of the plow-standard, provided with the diamond-shaped rib *g*, and the point D, having on its under side the corresponding diamond-shaped groove *h*, substantially as and for the purposes set forth.

252,140. CIGARETTE-HOLDER. GABRIEL RODRIGUES, Matanzas, Cuba. Filed Sept. 9, 1881. (No model.)

Claim.—The collapsible cigarette-holder consisting of stiff side portions, *a*, and folded covering *c*, provided with elastic band *b*, substantially as shown and described.



252,141. ELECTRIC TELEPHONY. ALLEN W. ROSE, New York, N. Y., assignor to Charles A. Cheever, same place; said Cheever assignor to himself as Trustee. Filed Oct. 26, 1880. (No model.)

Claim.—1. The combination, substantially as herein set forth, of a case, a magnet secured therein, a diaphragm, a conductor of electricity vibrating with the diaphragm, and magnetic filings in a loose state interposed in a magnetic field between the magnet and conductor.

2. The combination, substantially as herein set forth, of a telephone-case, a guideway therein, a magnet and diaphragm connected with the case, a conductor of electricity movable in the guideway and vibrating with the diaphragm, magnetic filings interposed in a magnetic field between the magnet and conductor, yielding connections supporting the conductor, and a spring or yielding connection interposed between the conductor and the diaphragm.

252,142. ELECTRIC SPEAKING-TELEPHONE. ALLEN W. ROSE and CHARLES A. CHEEVER, New York, N. Y.; said Rose assignor to said Cheever; said Cheever assignor to himself as Trustee. Filed Nov. 13, 1880. (No model.)

Claim.—1. The combination, substantially as herein set forth, of an electric circuit, a battery, an inducing-helix, a non-magnetic conducting-surface, a diaphragm, and magnetic filings interposed in the magnetic field between said conducting-surface and diaphragm.

2. The combination, substantially as herein set forth, of an inducing-helix, a conducting-surface, a diaphragm, magnetic filings interposed between the helix and diaphragm, and a high resistance between the diaphragm and conducting-surface to maintain the continuity of the magnetic circuit.

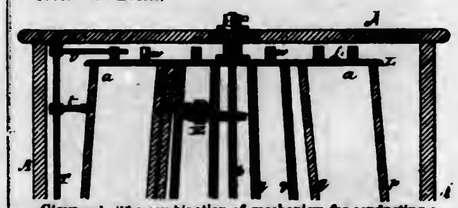
3. The combination, substantially as herein set forth, of the local circuit, its battery, the inducing-coil without a core in the local circuit, and the magnetic filings, whereby the filings are maintained in a constant magnetic field.

4. The combination, substantially as herein set forth, of an electric circuit, a conducting-surface, a diaphragm, and magnetic filings interposed between the conducting-surface and diaphragm, with an inducing-coil and an independent battery and local circuit for keeping the coil charged.

5. The combination, substantially as herein set forth, of an electric circuit, a battery, an inducing-helix without a core in said circuit, a diaphragm, and magnetic filings interposed between the inducing-helix and diaphragm, the filings being acted upon inductively by the helix and the diaphragm being vibrated by the movement of the filings.

6. The combination, substantially as herein set forth, of two independent but adjacent inducing-coils without cores, a diaphragm, and magnetic filings interposed between said diaphragm and coils.

7. The combination, substantially as herein set forth, of a local circuit, its battery, an inducing-coil without a core for maintaining a constant magnetic field, a conducting-surface, a diaphragm, magnetic filings interposed between the helix and diaphragm, a local battery in the primary circuit of an induction-coil, in which primary circuit the magnetic filings are included, the secondary helix of said induction-coil constituting a portion of the line-wire, and an independent inducing-coil, also included in the line-wire, in proximity to the local inducing-coil.



252,143. DEVICE FOR HANDLING COOKING-PANS. JOHN W. ROSE, Santa Clara, Cal. Filed May 26, 1881. (No model.)

Claim.—1. A holding device, A, adapted to be attached immediately on the side of a cooking or baking pan, and constructed with an opening, *c*, and a bearing, *e*, depressed below the opening, arranged to receive laterally and hold any ordinary stove-lid lifter so that the pan may be readily handled by such lifter, substantially as and for the purposes described.

2. A pan for cooking or baking purposes, provided immediately on the side with the holding device A, having the opening *c* and the bearing *e* depressed below the opening, arranged to receive laterally an ordinary stove-lid lifter, so that the pan may be readily placed in and removed from the oven of a stove, substantially as and for the purposes described.

252,144. DUST-COLLECTOR FOR MIDDLINGS-PURIFIERS &c. WILLIAM S. RUSSELL, Northfield, Minn. Filed Aug. 5 1881. (No model.)

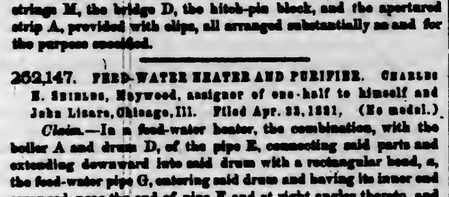
Claim.—1. The combination of mechanism for conducting a blast against and through a screen, mechanism for rotating said screen, mechanism for isolating a portion of said screen, mechanism for jarring said isolated portion, and mechanism for isolating the substances thus separated from the blast and conducting them away from the influence of said blast, all substantially as shown and described.

2. The combination of an induction-pipe, a hopper, and a gate-case having an upper receiving part or aperture and a lower oppositely-disposed discharging part or aperture, and an inclosed rotating gate adapted to register alternately with said parts or apertures, all substantially as shown and described.

3. The combination of an induction-pipe, a hopper, a gate for closing the outlet of the hopper, a rotating reel having an upper closed head and a lower open head and sides arranged in compartments, and cushions or guards which isolate successive compartments with mechanism for jarring such isolated compartments, all substantially as shown and described.

4. The combination of a rotating reel or screen formed in compartments, a stationary inner guard or cushion and a stationary lower guard or cushion, and a strap attached to the reel-head, substantially as shown and described.

5. The combination of the shaft T, adjustable arm *v*, adjustable knockers *t t*, and adjustable coiled spring *s*, substantially as shown and described.



6. The combination of frame A, non-rotative shaft *b*, adjustable arms E, and cushion or guard R with the reel L and rotative shaft *c*, substantially as shown and described.

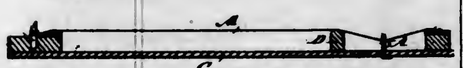
7. The combination of the reel L, knockers *t*, and guards R *r* with means, substantially as shown and described, for their operation, substantially as and for the purpose set forth.

8. The combination of the reel or screen L, hopper *g*, connected therewith, the shaft *c*, and the gate-case K and gates *j j*, substantially as shown and described.

9. The combination of the reel or screen L, provided with pins *w*, and rotated about the fixed bar *b*, supported in frame A, with said frame and the knocker-shaft T, supported in said frame and provided with the arm *v*, substantially as shown and described.

252,145. MAGAZINE FIRE-ARM. ALOIS SCHNEIDER, San Francisco, Cal. Filed June 27, 1881. (No model.)

Claim.—1. In a magazine-gun, a vertically-moving breech-block provided with a downwardly-projecting leg, in combination with an operating-lever provided with a head, D, pivoted between the downwardly-projecting leg and the forward wall of the frame, and provided with a leg, F, adapted to bind against the forward wall of the frame and steady the breech-block when the breech is closed, substantially as and in the manner described.

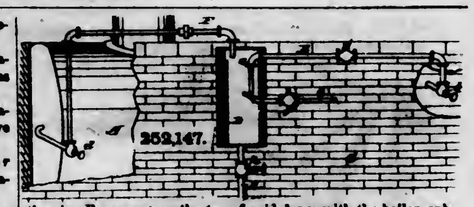


2. The rear wall of the frame, provided with a vertical slot and vertical inserted spring I, in combination with the pivoted guide-bar J and vertically-moving breech-block C, all constructed as set forth.

3. The vertically-moving breech-block C, having the shell-extractor moving in a chamber on one side of the breech-block opening and the cocking-arm upon the opposite side, in combination with the actuating-head D of the lever, having a single supplemental pin, K, extending through from side to side, so as to operate both the cocking-arm and to start the extractor, substantially as herein described.

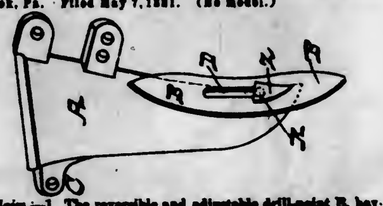
4. In combination with the frame provided with a groove in which moves the head of the extractor, the slide L, connected with and moved by the hammer in its fall, so as to close the end of said groove in the frame into which the head of the extractor moves to clear cartridge, substantially as herein described.

5. The rotating cartridge-locking rod P, having a projection at the end, by which it may be turned, in combination with the lug B, pivoted at 3 to the forward part of head D, so that the travel of its projecting spur 5 is past the projection on the end of rod P, and adapted to be thrown down and kept from operating the rod, substantially as herein described.



252,146. PIANO SOUNDING-BOARD ATTACHMENT. JOHN O. SEIBELS, Montreal, Quebec, Canada. Filed Apr. 26, 1881. (Model.)

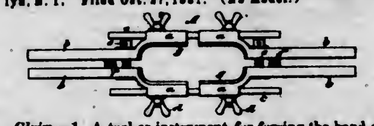
Claim.—The combination, with a sounding-board, C, of the strings M, the bridge D, the hitch-pin block, and the apertured strip A, provided with clips, all arranged substantially as and for the purpose specified.



252,147. FEED-WATER HEATER AND PURIFIER. CHARLES H. SHIBLES, Holywood, assignor of one-half to himself and John Lisare, Chicago, Ill. Filed Apr. 23, 1881. (No model.)

Claim.—In a feed-water heater, the combination, with the boiler A and drum D, of the pipe E, connecting said parts and extending downward into said drum with a rectangular head, *a*, the feed-water pipe G, entering said drum and having its inner end arranged near the end of pipe E and at right angles thereto, and

the pipe F, connecting the top of said drum with the boiler, substantially as shown and described, the said drum being provided with a suitable blow-off pipe, as set forth.

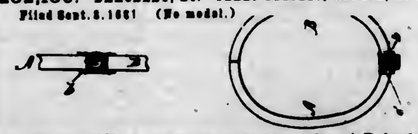


242,148. GRAIN-DRILL POINT. DANIEL J. SHULTS, Spruce Creek, Pa. Filed May 7, 1881. (No model.)

Claim.—1. The reversible and adjustable drill-point B, having the extra long slotted eye D in its middle, and secured detachably to a drill-boot, A, by a screw-bolt, E, in the manner as and for the purposes substantially set forth.

2. The slot-shielding washer N P, in combination with the drill-point B D and bolt E, all applied to a drill-boot, A, substantially as and for the purposes set forth.

252,149. BRUSH-MAKING TOOL. ALBERT P. SMITH, Brooklyn, N. Y. Filed Oct. 27, 1881. (No model.)



Claim.—1. A tool or instrument for forcing the band or ferrule on a brush, made extensible longitudinally and expansible laterally, and provided with an internal flange to engage the ferrule while it is being forced, constructed and arranged to operate substantially as set forth.

2. A tool for forcing the band or ferrule on a flat brush, made from four like parts or sections, *a b*, arranged to slide on rods *c*, whereby the tool is made capable of extension and adjustment longitudinally, and provided with expanding-screws, whereby the tool is made capable of expansion and adjustment laterally, substantially as and for the purposes set forth.

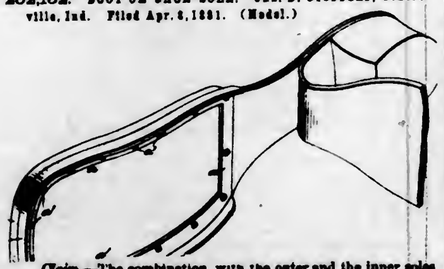
3. The combination, to form a tool for forcing a band or ferrule on a brush, of the curved parts *a a*, provided with flange *g*, the handles *b b*, the extension-rods *c c*, and screws *e*, all constructed and arranged substantially as set forth.

252,150. BRACELET, &c. JAMES STARLEY, Newark, N. J. Filed Sept. 8, 1881. (No model.)

Claim.—1. The combination, with the sections A B, having cogged extremities, of a screw engaging with said extremities and adapted to cause said sections to open and close, substantially as and for the purpose herein set forth and shown.

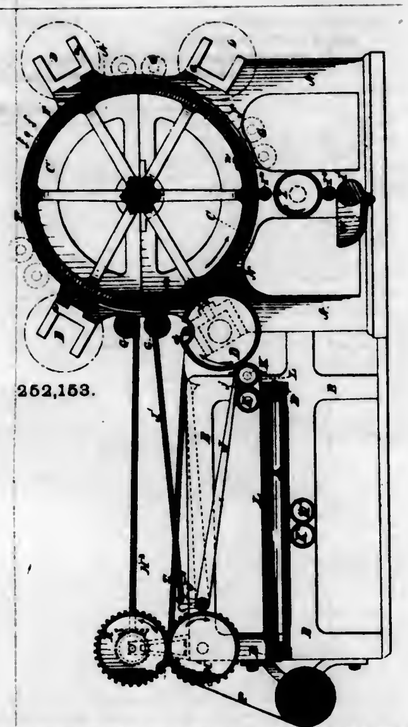
2. The combination, in a bracelet, with sections A B, one or both of which have a cogged extremity, of means, substantially as described, having teeth engaging with said cogged extremity, adapted when operated upon to cause the opposite extremities of said sections to come together or separate, substantially as and for the purpose set forth and shown.

3. As a new article of manufacture, a bracelet composed of the pivoted sections A B, having cogged extremities which engage with the screw *c*, the whole being arranged and combined with the box *b* and operating substantially as and for the purposes set forth and shown.



252,151. MANUFACTURING AND DECORATING ARTISTIC ARTICLES. HARALD F. L. STARCKE, Paris, France. Filed Nov. 1, 1881. (No model.) Patented in France Sept. 23, 1881.

Claim.—1. The slab *a*, combined with the projecting metallic ribs or plates *b*, forming cells, and with the filling of cement contained in said cells, substantially as specified.



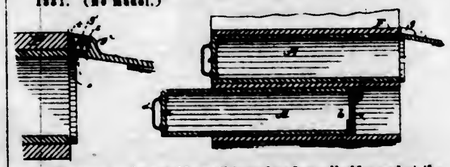
2. The method herein described of ornamenting the surfaces of slabs or the like, which method consists in first attaching metallic ribs by adhesive cement to said slabs, and in then filling the spaces between said ribs flush with the outer edges thereof with colored cements, substantially as herein specified.

252,152. BOOT OR SHOE SOLE. JNO. D. STODDARD, Centreville, Ind. Filed Apr. 8, 1881. (Model.)

Claim.—The combination, with the outer and the inner soles of a boot or shoe, of the metallic sole-protector composed of a bed-plate, *a*, with upward and downward flanges, the pins for securing the sole-protector and the soles together, and the water-proof filling arranged between the inner sole and the metallic sole-protector, substantially as described.

252,153. PERFECTING PRINTING-MACHINE. JOHN H. STERNBERG, Erie, Pa. Filed Apr. 16, 1881. (No model.)

Claim.—1. In a perfecting printing-press, the combination, with the impression-cylinder thereof, of a sheet receiving and re-delivering apparatus consisting of a rack or table which receives the sheet head foremost as it leaves the impression-cylinder after the first impression and while holding said sheet changes its position, substantially as described, and re-presents the said sheet tail foremost directly to the gripers for a second impression, substantially as set forth.



2. In a perfecting printing-press, the combination, with the impression-cylinder thereof, of a sheet receiving and redelivering apparatus consisting of a vibrating rack or table which receives the sheet as it leaves the impression-cylinder after the first impression head foremost and while holding said sheet by vibrating lifts it from the lower to the upper side of said cylinder and presents it tail foremost directly to the gripers for a second impression in a manner substantially as described.

3. In a perfecting printing-press, the combination of an impression-cylinder, a pair of folding-rollers, and a vibrating sheet receiving and redelivering rack or table which is provided with a starter-projection on its lower side, said parts being constructed and arranged to operate in the manner and relation and for the purposes substantially as set forth.

4. In a printing-press, the type-cylinder C, in combination with the ink-plate N and bar *c*, with inwardly-beveled edges, and turtles *f*, with outwardly-beveled edges, substantially as and for the purposes mentioned.

5. In a perfecting printing-press, the combination, substantially as shown, of the following elements: the type-cylinder C, with turtles *f f*, and ink-plate N, impression-cylinder D, feeding-rollers H H', with cut-off knife A, sheetway T, tilting rack or table J, with starting and deflecting projection *j*, and folding-rollers K K' K''.

252,154. POST-OFFICE BOX. PERCIVAL R. TEMPLE, Everett, and GEORGE W. PIERCE, Boston, Mass., assignors to the Yale Lock Manufacturing Company, Stamford, Conn. Filed Apr. 30, 1881. (No model.)

Claim.—1. A portable mail-box closed on all sides and at the outer end, and provided with a suitable fastening for securing the box in a pigeon-hole, and having a door at the inner end for the admission of mail-matter, substantially as described.

2. A portable mail-box closed at the outer end, and provided with a handle for withdrawing and carrying it, and having a door and a lock for fastening the door at the inner end, substantially as described.

3. In combination with a pigeon-hole or a series of pigeon-holes open at both ends, a portable supplemental mail-box or series of boxes, (each with a metallic front and with a door at its inner end,) secured removably within the same, forming a complete metallic facing or frontage while open for the reception of mail-matter from within, substantially as described.

4. In combination with a pigeon-hole open at both ends, a portable mail-box provided with a door at its inner end hinged to the box and projecting so as to be struck by one of the partition-walls of the pigeon-hole, and closed by the act of withdrawing the box from the pigeon-hole, substantially as described.

5. The combination of the box *g*, the bell-crank lever *t*, the door, the rod *p*, and the spring *s*, substantially as described.

6. The combination of an inclined shelf, an apertured partition, and a strip or stop, whereby a portable mail-box may be supported in an inclined position for securely depositing its contents within a post-office, substantially as described.

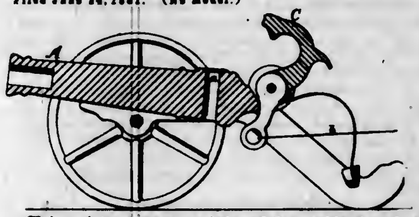
252,155. RECOVERY OF GLYCERINE FROM SOAP-LYES. CHARLES THOMAS, WILLIAM J. FULLER, and STERRY A. KING, Bristol, England. Filed Nov. 4, 1879. Patented in England Mar. 31, 1879.

Claim.—The process above described for recovering glycerine from soap-lyes, which consists in throwing down from the lyes by applying heat thereto the greater proportion of the salts suspended therein, then boiling the liquor with an excess of fatty acid to effect the combination with the acid of the remaining salts, and, lastly, filtering the glycerine-liquor to remove therefrom the gelatinous and other impurities, all substantially as specified.

252,156. CARRIAGE-BUTTON. WILLIAM H. TUPTS, Washington, D. C. Filed June 17, 1881. (No model.)

Brief.—The head is provided with a stem which has a slot in it for a pin. This stem is set down into the body and a sleeve slipped over the body, which is then screwed into the carriage-frame.

Claim.—1. The combination, in a carriage-button, of the movable head B', provided with stem *f* and slot *e*, with the hollow body *c* and the pin *d*, as and for the purpose herein set forth.



2. The combination, in a carriage-button, of the movable head B', provided with stem *f* and slot *e*, with the hollow body *c*, the pin *d*, and the screw *a*, as and for the purpose specified.

3. The combination, in a carriage-button, of a body, *c*, a head, B', movable therein, a screw-stem, and a sleeve, *b*, as and for the purpose set forth herein.

4. The combination, in a carriage-button, of the movable head B', provided with stem *f* and slot *e*, with the hollow body *c*, the pin *d*, and the sleeve *b*, substantially as set forth.

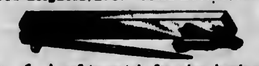
5. The combination, in a carriage-button, of the movable head B', provided with stem *f* and slot *e*, with the hollow body *c*, the pin *d*, and screw *a*, and the sleeve *b*, as and for the purpose herein set forth.

252,157. TOY CANNON. ANDREW TURNBULL, New Britain, Conn., assignor of one-half to James A. Swanston, same place. Filed June 24, 1881. (No model.)

Claim.—A toy cannon consisting of the combination of an imitative cannon-barrel, A, having the barrel proper, *a*, extending transversely through its breech end, the hammer C, and a suitable frame upon which the barrel is mounted and sustained in position with the muzzle of the barrel *a* pointing downward, so as to prevent it from being fired in any other direction, substantially as described, and for the purpose specified.

252,158. GRINDING-MILL. STEPHEN P. WALLING, South Edmeston, N. Y. Filed July 28, 1881. (No model.)

Claim.—1. In combination with a mill-spindle, a bridge-tree, a yoke supported thereon, a step suspended from said yoke, and a cage supported above the step, encircling the spindle, and provided with adjustable bearing-blocks, substantially as shown and described.



2. In combination with a mill-spindle, a stationary box or chamber provided with radial set-screws, a bridge-tree extending on opposite sides of the same, a yoke supported upon the bridge-tree, a step suspended from the yoke, and a cage encircling the spindle and supported above the step, and provided with radially-moving bearing-blocks adapted to be adjusted by the set-screws, as set forth.

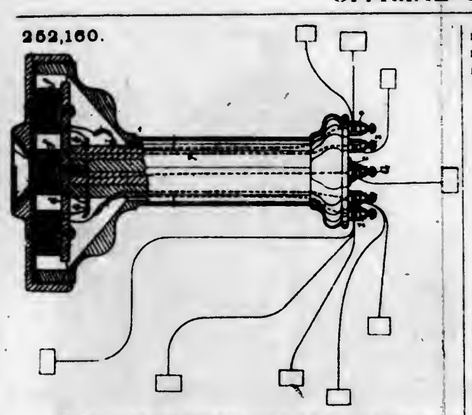
3. The herein-described support for mill-spindles, consisting of a yoke, a step-plate suspended therefrom by headed rods seated in sockets in the yoke and plate, and a rocking bearing-plate seated in the step-plate, substantially as shown.

4. In combination with the step having a cavity provided with recessed sides, the rocking bearing-plate provided with ribs or feathers to enter said recesses, and thereby prevent the plate from turning.

5. In combination with the curb *c*, the rods Q, seated in the columns *c*, the elastic cushions *p*, the washers *o*, resting upon said cushions, the top or cover M, provided with ears *n*, resting upon the washers, and nuts *q*, applied to the rods above said ears, substantially as shown.

252,159. SAFETY-CATCH FOR PINS. GEORGE W. WASHBURN, West New Brighton, N. Y. Filed Nov. 22, 1881. (No model.)

Claim.—1. A safety-catch for pins, having a guard-tube adapted to slide longitudinally within an outer tube to inclose the point of the pin and to release the same, and adapted to expand within said outer tube to hold itself in its different positions, substantially as herein specified.



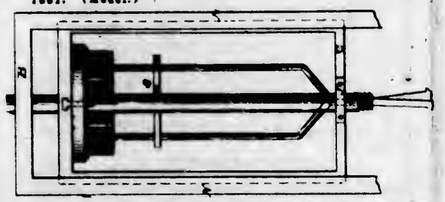
2. The combination, in a safety-catch for pins, of a fixed scroll-catch adapted to sustain the pressure of the pin, an outer tube fixedly attached to said scroll-catch, and having an opening in its back corresponding with the opening of said scroll-catch to receive the point of the pin, and a guard-tube adapted to slide longitudinally within said outer tube to inclose the point of the pin and to release the same, and adapted to expand within said outer tube to hold itself in its different positions, substantially as herein specified.

3. In a safety-catch for pins, a self-holding guard-tube composed of two half-tubes with an embracing-ring and a terminal "shot" at one end united therewith, said half-tubes being sprung apart at their free ends, as herein described, for the purpose set forth.

252,160. COMPOUND TELEPHONE. THOMAS A. WATSON, Everett, assignor to the American Bell Telephone Company, Boston, Mass. Filed Apr. 29, 1880. (No model.)

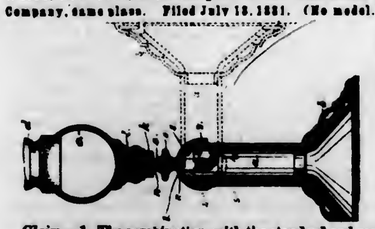
Claim.—1. The combination, with a telephone having two or more independent helices, of a series of independent circuits greater in number than said helices and divided into groups, each group being connected with one of said helices or coils, substantially as described.

252,160.



2. In a compound telephone, two or more separate helices and cores attached to a base-plate and energized by a common permanent magnet, in combination with means, such as binding-posts, for connecting said helices in separate circuits, substantially as described.

3. The combination, in a compound telephone with two or more separate helices and cores, of a vibratory plate or diaphragm having portions adapted to vibrate independently, substantially as described.

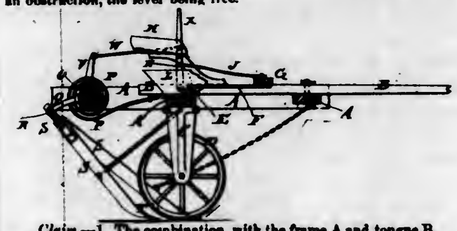


4. The vibratory plate or diaphragm for a compound telephone, formed of a divided plate held in place, substantially as described, so that the portions are adapted to vibrate independently, as set forth.

252,161. DRILL. J. WESLEY WARREN, New York, N. Y. Filed Jan. 8, 1876. Renewed Oct. 25, 1880. Again renewed June 14, 1881. (Model.)

Claim.—The combination, with the drill-shaft and the pattern-cam, of the cutters and cutter-levers, connected to one another and to the drill-shaft by a single pivot, and the slotted arms S, substantially as described.

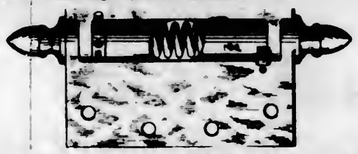
252,162. BRACKET AND STANDARD LAMP. JAMES H. WHITE, New York, N. Y., assignor to the Manhattan Brass Company, same place. Filed July 13, 1881. (No model.)



Claim.—1. The combination, with the standard and reservoir, of the yoke *c*, pivot-bar *f*, nut *h*, screw *n*, and cap *s*, having the recesses 2 and 3, substantially as and for the purposes set forth.

2. The yoke *c*, pivot-bar *f*, and arm *u*, in combination with the standard *a*, reservoir *b*, and screw *n*, substantially as set forth.

252,163. CULTIVATOR. FRANCIS O. WILLIAMS, North Cohocton, N. Y. Filed Aug. 26, 1881. (No model.)



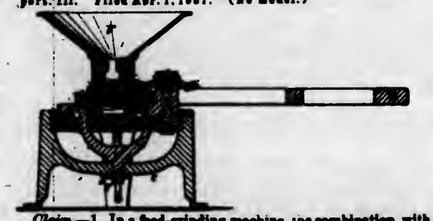
Brief.—Wheels upon swiveled standards with cranks and connecting-rods, so as to be turned in either direction by foot or hand lever. The standards are raised by turning an armed rock-shaft, and are held down to work by a spring coiled around the shaft, which also forces the shovel-standards back when raised by an obstruction, the lever being free.

Claim.—1. The combination, with the frame A and tongue B, of the wheel-standards swiveled to said frame, and provided with rigid arms E, the connecting-rods F, the foot-lever G, the rod J, and the hand-lever X, as and for the purpose described.

2. The combination, with the shaft O, having arms Q V, the lever X, and the connecting-rod W, of the coil-spring P on said shaft, the standards S, connected with the frame by adjustable chains V, and the rods R, as and for the purpose specified.

252,164. SPRING-HINGE. WILLIAM H. WILLIAMS, Brooklyn, N. Y. Filed Aug. 18, 1881. (Model.)

Claim.—1. In a spring-hinge, the combination, with a hinge-pintle or its equivalent and suitable tension devices, of a detachable spring-sleeve and a lower spring-lug, which bears on one leaf of the hinge, and to which the sleeve is locked against independent rotation, substantially as described.



2. In a spring-hinge, the combination of a hinge-pintle or its equivalent, suitable tension devices, a detachable sleeve for inclosing the spring, provided with a hole or recess near one end, and a spring-lug housed within the sleeve and provided with a pin or stud, which projects through said sleeve and engages with the adjacent leaf of the hinge, substantially as described.

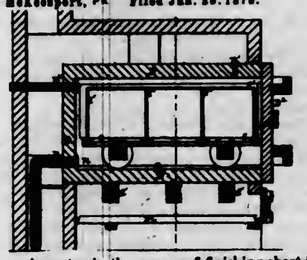
3. In a spring-hinge, the combination of a hinge-pintle or its equivalent, a spring-inclosing sleeve, a pintle-socket tension device located between one end of the sleeve and an ear of the hinge, and a spring-lug at the opposite end of the spring, which is locked to said sleeve for preventing independent rotation thereof and bears upon one leaf of the hinge.

4. In a spring-hinge, the combination of a hinge-pintle or its equivalent, a spring-inclosing sleeve, a pintle-socket tension device located between one end of the sleeve and an ear of the hinge, and a spring-lug bearing on one leaf of the hinge, housed within and locked to said sleeve, and provided with a pin or stud projecting through the sleeve, substantially as described.

5. In an adjustable spring-hinge, the combination of a hinge-pintle or its equivalent, a spiral spring, a pintle-socket tension device located between one end of the spring and an ear of the hinge, and a spring-lug at the opposite end of the spring, bearing upon an ear of the hinge and provided with a fixed pin or stud for engaging with one of the leaves of the hinge, substantially as described.

252,165. FEED-GRINDING MILL. OSWALD H. WITTER, Freeport, Ill. Filed Apr. 1, 1881. (No model.)

Claim.—1. In a feed-grinding machine, the combination, with a middle double-faced non-rotating burr having a slight lateral play in its supports, of two revolving burrs co-operating with said middle burr, whereby the space between the burrs is automatically regulated, substantially as described.



2. In a feed-grinding machine, the adjustable revolving burrs, in combination with the automatically-adjustable stationary center burr, substantially as and for the purposes set forth.

3. In a feed-grinding machine, the combination, with the revolving burrs, of the stationary but laterally-adjustable double-faced grinding-burr having an opening at the top through which the material to be ground may pass directly to the bosom of the burrs, substantially as and for the purpose specified.

4. The stationary double-faced burr, thinner where the grain is introduced and gradually thickened to a point at or near the completion of the circuit, in combination with the co-operating revolving burrs, substantially as described.

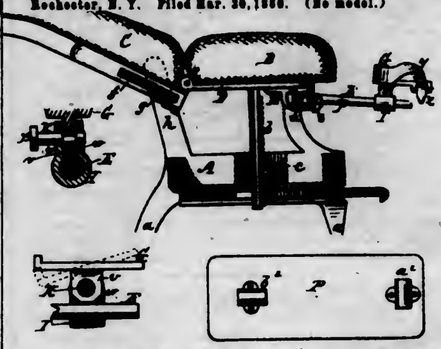
5. The stationary double-faced burr, the furrows of which are deeper at the point where the grain first comes in contact with it and grow gradually shallower to a point at or near the completion of the circuit, in combination with the co-operating revolving burrs, substantially as described, for the purpose specified.

252,166. MANUFACTURE OF SHEET-IRON. W. DOWNS WOOD, McKeesport, Pa. Filed Jan. 25, 1878.

Claim.—As a step in the process of finishing sheet-iron, subjecting the sheets in a close exteriorly-heated chamber to the action of a hydrocarbon vapor or gas and superheated steam, substantially as set forth.

252,167. HANDLE FOR MANURE-FORKS AND ANALOGOUS TOOLS. JOHN M. YOUNG, Baltimoreville, N. Y. Filed Aug. 4, 1881. (No model.)

Claim.—The handle H, composed of metal tubing, and having its upper end split longitudinally and distended, as shown, for the purpose of receiving between its extremities the spool *s* or other cross-piece, substantially as shown and set forth.



252,168. HAY AND GRAIN CAP. JAS. W. ACKUS, Macon, Mo., assignor of one-half to John Shepherd, same place. Filed Nov. 26, 1881. (No model.)

Claim.—1. In a stack-covering, the side rods or wires, *a*, having the top connection, *c*, and the adjustable hooks *d*, having the under bends or catches, *h*, and the eyes *g*, arranged on said rods or wires, substantially as specified.

2. The stack-covering consisting of the hook rods or wires *a*, connected in pairs at their upper ends, the adjustable hooks *d*, having the under bends or catches, *h*, and the lapped boards, held in place by said hook-rods and the adjustable hooks, substantially as specified.

252,169. GYNECOLOGICAL CHAIR. SIDNEY W. ARCHER, Rochester, N. Y. Filed Mar. 30, 1880. (No model.)

Claim.—1. In an operating-chair, the combination of the chair A, having standards h h, provided with inwardly-projecting studs *g g*, and the seat B and back C, hinged together, the back provided with side slots, *f f*, which receive the studs and allow the back to slide forward and back, the seat being raised and lowered by the rack *b* and pinion *c*, as herein shown and described.

2. In an operating-chair, the combination of the vertically-moving seat B, the back C, hinged thereto and having a free sliding motion, the rack *b*, to which the seat is attached, the pinion *c*, engaging with the rack and operating the same, and the chair-frame A, having standards provided with studs *g g*, which enter slots *f f* of the back, as shown and described, and for the purpose specified.

3. In an operating-chair, the combination of the arm E, the foot-rest G, the socket-piece I, to which it is pivoted to allow vertical adjustment, said socket-piece resting on the arm, the vertical tongue *e* of the foot-rest resting between lugs of the socket-piece and having a polygonal end resting upon the arm, and the tightening cam or eccentric K, as shown and described.

4. In an operating-chair, the combination, with the chair A and the arms E, attached thereto, of the separate cushion P, provided on its under side with the two socket-pieces *d' d'*, one standing transversely and the other longitudinally to the cushion and sliding upon the arms, whereby said cushion can be made an extension to the seat in different positions, as specified.

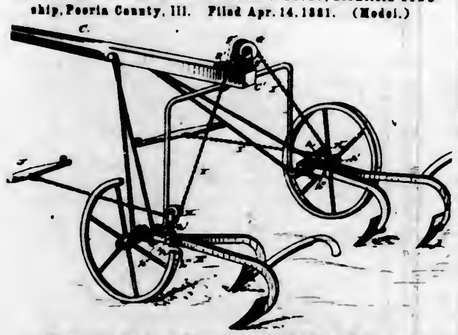
252,170. BURIAL-CASE. JOSEPH ASKINS, Westfield, Mass. Filed June 15, 1881. (Model.)

Claim.—The combination of the sheet-metal recessed cover A, the wooden cross-pieces C' C', the cross-piece C², covers D D, and glass plates C C, whereby a tight joint is secured at the points where plates are placed, substantially as set forth.

252,171. PAINT FOR ROOFS. JAMES B. BARNARD, Carrettsville, Ohio. Filed Sept. 15, 1881. (No specimens.)

Claim.—The above-described composition or roof-paint, consisting of residuum, resin, naphtha, and oxides of iron, substantially in the manner and for the purposes above set forth.

252,172. STONE-CUTTING MACHINE. WILLIAM BIRGS, Long Cove, Tenant's Harbor, Me. Filed July 23, 1881. (No model.)



Claim.—In a machine for cutting or dressing stone, the combination of the sliding carriage B, having central dovetailed button, *p*, and guide-studs *f f* on opposite sides of said button, pintle *n*, and circular top part, B', having segmental slots *f f*, and central circular dovetailed recess, *o*, as shown and described, for the purpose set forth.

252,173. VEHICLE-SPRING. CHARLES C. BISHOP and JOSEPH A. BISHOP, Nashville, Tenn., assignors to Caswell C. Bishop, same place. Filed Oct. 13, 1881. (No model.)

Claim.—The springs F, composed of an upper section, a, adapted to be bolted at one end to the vehicle-body, and a lower section, b, upwardly curved at both ends, one of which ends is secured to the outer end of the upper section, while the opposite end is curved backward and attached to the under side of the upper section, substantially as and for the purpose shown and described.

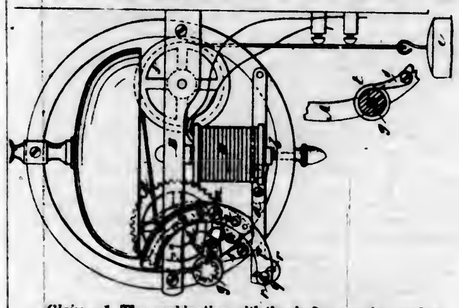
252,174. CULTIVATOR. OSSIAS O. BOOTH, Brimfield Township, Peoria County, Ill. Filed Apr. 14, 1881. (Model.)

Claim.—1. In a cultivator, in combination with an axle or frame, and plow-gangs hinged thereto, a cord or wire, with its median portion passed over a pulley journaled to the upper part of the axle or frame, and its ends passed beneath pulleys secured to the plow beams or gangs in rear of the axis on which they swing vertically, whereby the force of the draft-animals, which are connected to the ends of the cord or wire, may be partly utilized in exerting an upward force on the plow beams or gangs, for the purpose specified.

2. In a cultivator, in combination with the axle and plow beams or gangs, and a projection, C', in rear of the axle, a cord or wire, I, passed over a pulley, G, journaled on the part C', and under pulleys H, journaled to the plow beams or gangs in rear of the axis on which they are oscillated vertically, and its ends extending thence forward for the attachment of the draft-animals, substantially as and for the purpose specified.

3. In combination with the axle, plow beams or gangs, wheels, and tongue having its rear end extended in rear of the axle, pulley G, journaled on the rear-extended end of the tongue, and pulleys H, journaled to the plow beams or gangs, in rear of the axis on which they turn to oscillate vertically, the cord I, passed over the pulley G and under the pulleys H, substantially as and for the purpose specified.

4. In combination with the axle, wheels, plow gangs or beams, projections C' in rear of the axle, pulleys H, and cord I, the pulley G, adjustably secured to the extension C', substantially as and for the purpose specified.



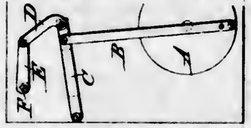
5. In combination with the axle, wheels, plow gangs or beams, projection C' in rear of the axle, pulley G, and cord I, the pulleys H, adjustably secured to the plow beams or gangs, substantially as and for the purpose specified.

6. In combination with the axle, wheels, plow gangs or beams, pulley G, and cord I, the pulleys H, adjustably secured to the plow beams or gangs, substantially as and for the purpose specified.

7. In combination with the axle, wheels, plow gangs or beams, pulley G, and cord I, the pulleys H, hinged to the plow beams or gangs, so that they may align themselves to the cord I when the plow-beams are oscillated vertically or laterally, or adjusted at different distances from each other, substantially as and for the purpose specified.

252,175. STRIKING MECHANISM FOR ELECTRIC BELLS. GEORGE H. BOWERS, Pittsburg, Mass. Filed Sept. 3, 1881. (Model.)

Brief.—A semicircular hammer, E, is revolved by a motor controlled by an electro-magnet. Said hammer is in two pieces, pivoted at m, so that the striking end is thrown outward by centrifugal force and strikes the bell; but its motion being thus arrested the end drops out of line with the edge of the bell and is free to make its revolution.

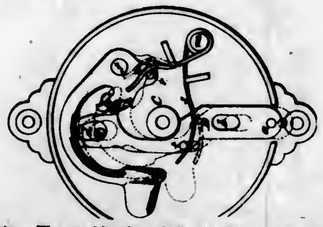


Claim.—1. The combination, with the shaft g, carrying ratchet-wheel k, of the hammer E, hung loosely on arm i, projecting from shaft g, the stop-pin n, passing through a cross slot or hole in the hammer-tail p, the spring o, and the pawl l, pivoted on said arm i, whereby the hammer is adapted to be operated with respect to the bell, as described.

2. The combination of segment-hammer E, propelling-shaft g, arm i, tail-piece p, provided with pin g, and the armature-lever a, provided with legs r, substantially as shown and described.

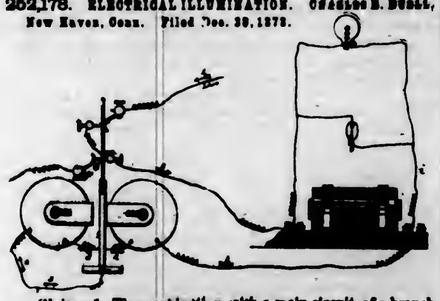
3. The combination of the impelling-shaft g, ratchet k, pawl l, arm i, pivoted hammer E, and stop-lever a, substantially as shown and described, for operation as set forth.

252,176. MECHANICAL MOVEMENT. RICHARD H. BRIDD, Pittsburg, Pa. Filed Sept. 5, 1881. (No model.)



Claim.—1. In a mechanical movement, the combination of the following elements: a rock-shaft having a suitable arm, a connecting-link, an oscillating lever, a pitman, and a driving-wheel, the link being arranged to connect the arm of the rock-shaft with the oscillating lever, which is in turn connected with the driving-wheel by means of the pitman, whereby the rotary movement of said wheel imparts a semi-rotation to the rock-shaft, substantially as specified.

2. The combination, with the rock-shaft F, having arm E, and the wheel A, having pitman B, of the oscillating lever C and link D, substantially as and for the purpose shown and described.

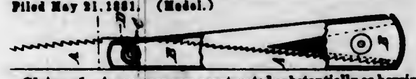


252,177. GONG-BELL. FREDERICK W. HAECKSIEPER, New Haven, Conn., assignor to Sargent & Co., same place. Filed Oct. 31, 1881. (Model.)

Brief.—The novelty consists in the cam on the hammer-lever, which produces lateral motion of the slide, whereby said hammer-lever is released.

Claim.—The combination of the slide D, arranged for longitudinal movement in a plane parallel with the plate, and also for lateral movement in the same plane with the hammer-lever, the said slide constructed with a projection, i, to engage the corresponding projection, h, on the hammer-lever, the said hammer-lever constructed with a finger, n, to operate as a cam to impart a lateral movement to the slide, and a spring operating to force the parts into their place of rest, substantially as described.

252,178. ELECTRICAL ILLUMINATION. CHARLES S. BUSH, New Haven, Conn. Filed Dec. 30, 1878.



Claim.—1. The combination, with a main circuit, of a branch or loop light circuit, an automatic circuit-changer arranged to operate an induction apparatus, said induction apparatus being included in said branch or loop circuit, whereby an induced current is produced without breaking, appreciably varying the tension or changing the general direction of the current on the main line, essentially as set forth.

2. The combination, with one normally-closed electric circuit, of a series of stations, each provided with an induction apparatus having its primary coil forming part of said electric circuit, and its secondary coil arranged to maintain electric illumination, and devices adapted to automatically affect the current in the primary coil of the induction apparatus for producing induced currents in the secondary circuit thereof without changing the direction of the currents charging the main circuit in its entire length, or interrupting the continuity of said main circuit, or appreciably disturbing the tension thereof, substantially as described.

3. The combination, with one normally-closed main electric circuit, of a series of stations, each provided with an induction apparatus having its secondary circuit arranged to maintain electric illumination, and with devices adapted to alternately shunt and interpose the primary helix of the induction apparatus in said main circuit without interrupting the continuity thereof, as set forth.

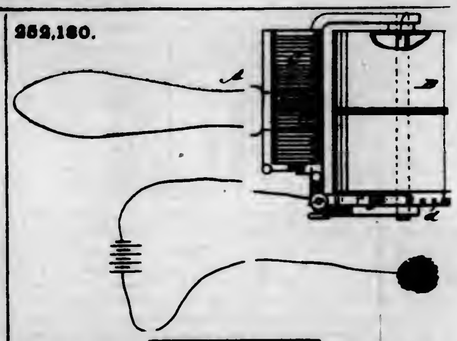
4. The combination, with one main electric circuit, of a series of stations, each provided with an induction apparatus having two primary helices, and devices adapted to separately and alternately interpose and withdraw the primary helices without interrupting the continuity of the main circuit or appreciably disturbing its tension.

252,179. COMPASS-SAW. CHARLES BUSH, New York, N. Y., assignor to himself and Alexander L. Whitelaw, same place. Filed May 21, 1881. (Model.)

Claim.—1. A compass-saw constructed substantially as herein shown and described, consisting of the blade A, tapered from the center toward each end and curved transversely with a curve gradually decreasing in size from the center toward each end, the handle B, and the clamping-screw C D, as set forth.

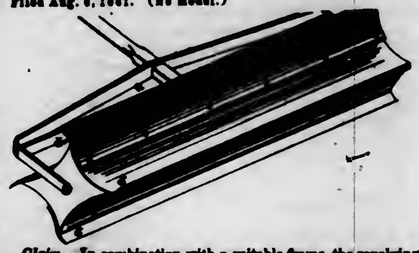
2. In a compass-saw, the saw-blade A, tapered from the center toward each end and curved transversely with a curve gradually decreasing in size from the center toward each end, substantially as herein shown and described, whereby larger and smaller curves can be cut with the same saw, as set forth.

3. In a compass-saw, the combination, with the saw-blade A, tapered from the center toward each end and curved transversely with a curve gradually decreasing in size from the center toward each end, of the handle B, grooved upon its opposite edges, and the clamping-belt C D, substantially as herein shown and described, whereby the saw-blade can be reversed to continue a kerf in a curve in the opposite direction, as set forth.



252,180. ELECTRICAL APPARATUS FOR MEDICAL USE. JOHN BUTLER, New York, N. Y. Filed May 20, 1881. (No model.)

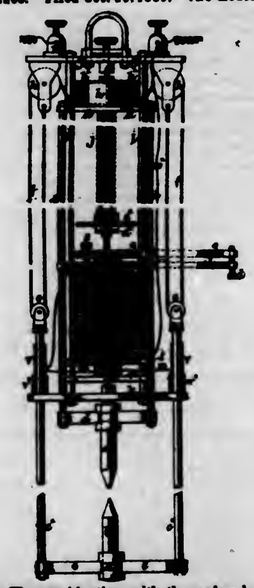
Claim.—1. The combination of roller B, provided with contact-breaker d, wire coil or helix C, and handle A, substantially as shown and described.



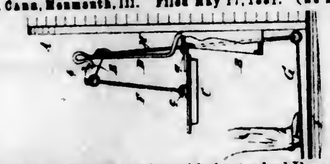
2. In electrical apparatus for medical use, the combination of a wire coil or helix with a roller-electrode and connections to a battery, substantially as shown and described.

3. In electrical apparatus, the double electrode consisting of roller B, made of two insulated portions, substantially as shown and described.

252,180.

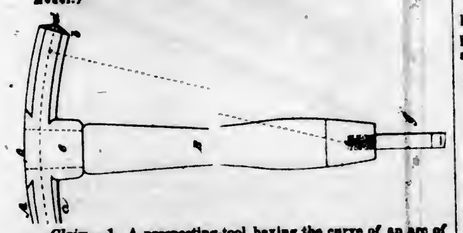


252,181. STALK-CUTTER. HENRY S. CADY, Pine Bluff, Ark. Filed Aug. 6, 1881. (No model.)



Claim.—In combination with a suitable frame, the revolving cutter A, composed of a block of wood recessed between its edges to form radial wings, to which are bolted cutters, all as and for the purpose set forth.

252,182. ELECTRIC LAMP. ALEXIS JEAN BAPTISTE GAUGE, Paris, France. Filed Oct. 26, 1881. (No model.)

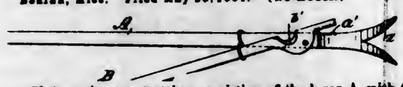


Claim.—The combination, with the carbon-holders, the motor-weight A and its contained nut, of the screw j, having a prolongation, p, and an attached toothed wheel, d', the coil m and its hollow core n, the rods r and lever d' b', the frame d', fitted loosely to the screw j, the pinion f', escapement-wheel f', and stop-spring k', substantially as and for the purpose herein described.

252,183. DEVICE FOR OPENING FURNACE-DOORS. JUDSON A. CASS, Monmouth, Ill. Filed May 17, 1881. (No model.)

Claim.—The combination, with the standard D, secured at its lower end to the door-frame B and provided at its upper end with the hook *b*, of the lever E, suspended from said hook, rod H, secured at its upper end to one end of the lever E and attached at its lower end to the free end of the treadle, treadle G, pivoted to the floor, and rod F, secured at its upper end to the opposite end of the lever E and at its lower end to the eye *c* of the door C, opening upwardly and overbalancing the weight of the treadle and rod H, whereby the furnace-door can readily be opened by the operator by placing his foot on the treadle and automatically closed by removing his foot therefrom, substantially as described.

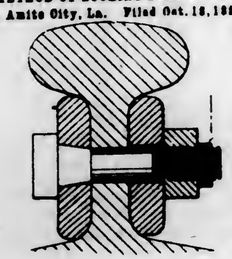
252,184. PROSPECTING-TOOL FOR MINERS, &c. JAMES B. THORNTON CHASE, Pueblo, Colo. Filed June 18, 1881. (No model.)



Claim.—1. A prospecting-tool having the curve of an arc of a circle and constructed with its pick portion tapering on all sides to a sharp point, and its heel made with a central projecting point, substantially as shown and described, and for the purpose set forth.

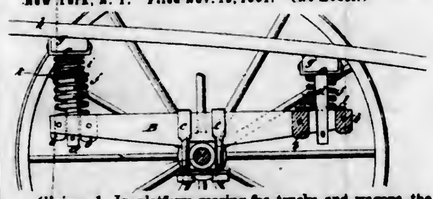
2. In prospecting-tools, the tool A, so curved that its longitudinal center shall form the arc of a circle having the pick *a*, tapering on all sides to a sharp point, and its hammer *b*, terminating in a pyramidal point, *d*, in combination with handle B, having hook *g* removably secured in its outer end, substantially as shown and described, and for the purpose set forth.

3. In prospecting-tools, the hammer end *b*, formed with a pyramidal or pointed end, as and for the purpose set forth.



4. The combination, with a prospecting-tool and its handle, of the climbing-hook *g*, substantially as shown, and for the purposes set forth.

252,185. WIRE-STRETCHER. CHARLES T. CHRISTMAN, Lake Beulah, Miss. Filed May 23, 1881. (No model.)

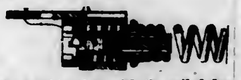


Claim.—A wire-stretcher consisting of the lever A, with the laterally curved and forked end *a*, the cutting-edge *c*, and the serrated face *a'*, and the lever B, hinged to the upper face of lever A and formed with the serrated head *b* and cutting-edge *b'*, as shown and described.

252,186. METHOD OF LOCKING NUTS UPON BOLTS. ALBERT R. CLARK, Amite City, La. Filed Oct. 18, 1881. (No model.)

Claim.—The method herein described of locking nuts upon screw-bolts, consisting in first flattening one side of the bolt near the face of the nut and then casting a metal ring around the bolt, so that a portion of the ring will rest in the flattened portion of the bolt, substantially as described.

252,187. PLATFORM-GEAR FOR WAGONS. EDWARD CLARK, New York, N. Y. Filed Nov. 19, 1881. (No model.)

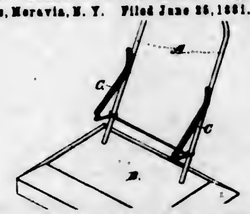


Claim.—1. In platform-gearing for trucks and wagons, the apertured side bars, B, posts *d*, provided with head-plates *e*, spiral springs *f*, and cross-bars *g*, substantially as shown and described, combined for operation as set forth.

2. In platform-gearing, the light spiral springs *i*, in combination with the posts *d*, head-plates *e*, and main springs *f*, substantially as and for the purposes set forth.

3. The combination of the arched truck-floor A, cross-bars *g*, head-plates *e*, supporting-posts *d*, springs *f*, and connected side plates, *a a*, separated by pieces *b*, substantially as shown and described.

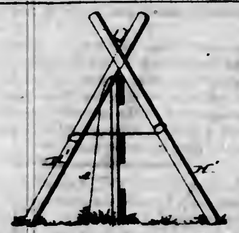
252,188. DOOR-SPRING. CHARLES B. CLARK, Detroit, Mich. Filed Aug. 8, 1881. (Model.)



Claim.—The combination, with the coiled door-spring, of the upper bracket, formed with a cam-projection and having an annular chamber containing a coiled spring, the pin having longitudinal ribs and channels, and also having notches formed in the under side of its head, and the collar fitted upon the ribbed and channeled portion of the pin, substantially as described.

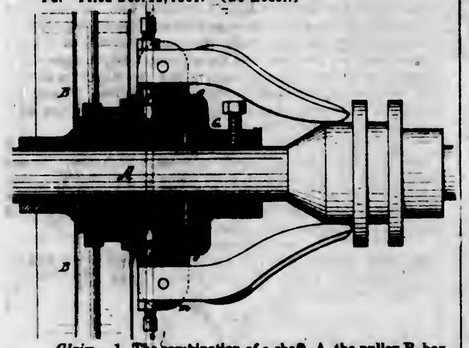
252,189. LABEL-HOLDER. HENRY E. CLIFTON, Augusta, Ga. Filed Nov. 5, 1881. (No model.)

Claim.—The label-holder consisting of a wire fastening-frame herein described, having the marginal fastening-loops *d e*, the transverse branch *c*, having the loop *h* at the bend and the terminal eye *g*, and the spring terminal arm *l*, having the hook *k*, bent downward to engage the loop *h* and adapted to pass through and hold the label, substantially as specified.



252,190. STAND FOR DISPLAYING SCARFS. FRANK W. COLLINS, Moravia, N. Y. Filed June 25, 1881. (No model.)

Claim.—The hereinbefore-described stands for displaying scarfs, consisting of the frame A, secured within the base B, and provided with the sliding clamp C, substantially as and for the purpose specified.



252,191. FENCE. ISAAC COLVIN, Hillsborough, Ohio. Filed Oct. 10, 1881. (No model.)

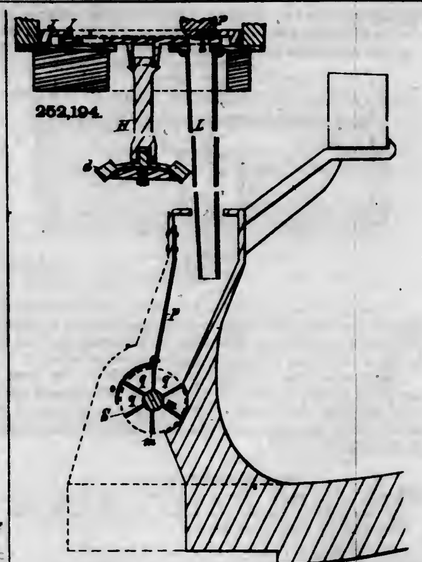
252,191.

Claim.—In a portable fence, the panels D, consisting of the uprights H, rails G, and posts A, secured together by bolts, the said posts and rails projecting beyond the uprights, forming rabbets *b*, in combination with the panels B, consisting of uprights H and rails G, projecting beyond said uprights, substantially as specified.

252,192. FRICTION-CLUTCH. STEPHEN S. COOK, Philadelphia, Pa. Filed Dec. 12, 1881. (No model.)

Claim.—1. The combination of a shaft, A, the pulley B, having two friction-surfaces, *s s*, the longitudinally-sliding friction ring or rings E, a frame, G, secured to and turning with the shaft A, and mechanism, substantially as described, carried by said frame G and adapted to operate the ring or rings E, as set forth.

2. The combination of the shaft A, the pulley B, having two friction-surfaces, *s s*, the longitudinally-sliding ring or rings E, a frame, G, secured to the shaft A, wedge-bolts *g*, carried by the frame, and arms or levers, also carried by the frame and serving to actuate said wedge-bolts, as set forth.



252,193. ELECTRICAL RAILWAY. EUGENE H. COWLES, Cleveland, Ohio. Filed June 27, 1881. (No model.)

Claim.—In an electric railway, the combination, with the track and car, the latter provided with an electromotor, of an electric generator, an insulated wire connected with the generator, means, substantially as described, for suspending the insulated wire over the track and above the car, and a sheave arranged to travel on said suspended wire, and a wire connecting said sheave and the electromotor on the car, the wire serving to transmit the current to the car, and one of the track-rails forming the return-conductor, substantially as set forth.

252,194. CORN-PLANTER. CYPRIAN U. CHAPDALL, Sterling, Ill. Filed May 18, 1881. (Model.)

Claim.—1. The combination of the rear frame, A, having the first seed-dropping devices located on the front part thereof and provided with the seed-tubes I, and the front frame, A', carrying the runners C, provided with the second dropping devices arranged to receive the seed from said seed-tubes and deposit the same in the furrows, substantially as described.

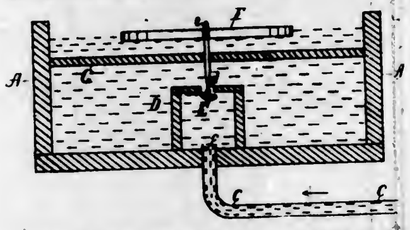
2. The combination, with a seed-box, of a horizontal rotary seed-dropping plate provided with seed-apertures, and devices for giving said plate an irregular lateral to-and-fro motion simultaneous with its movement about its center, substantially as described, and for the purpose set forth.

3. The combination, with the seed-box having the bottom plate, E, provided with the seed-passage and a central opening, of the chambered seed-dropping wheel or plate I, having lateral projections, the plate J, arranged above said seed-dropping plate, and provided with the lugs *f*, arranged to strike said lateral projections, and devices for giving to said seed-dropping plate an irregular rotary movement, substantially as described.

4. The combination, with the seed-plate I, loosely supported, of the shaft H, loosely connected with said plate at one end to communicate rotary motion to said plate, the gear-wheel *d*, loosely connected with the lower end of said shaft, and means for giving to said seed-plate an irregular lateral to-and-fro movement simultaneous with its rotation, substantially as described, and for the purpose set forth.

5. The combination, with the transverse shaft G, provided with bevel-gears *c*, the bevel-gears *d*, the vibratory and rotary shafts H, connected with said gears at their lower ends, the suitably-supported seed-plates I, and the plates J, provided with the lugs *f*, arranged to strike the rounded corners of the said seed-plates and communicate an irregular to-and-fro motion to the same, substantially as and for the purpose set forth.

6. The combination, in a seed-box, with the rotary loosely-supported seed-plate having the rounded corners, of the lugs *f*, arranged to strike said corners as the plate rotates and communicate an irregular to-and-fro motion to said plate, substantially as described.

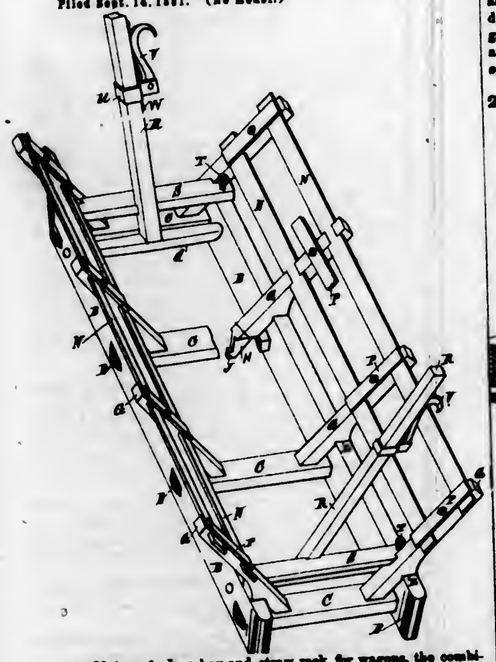


7. In a seeding-machine, the combination, with the seed-dropping plate provided with seed-apertures, of the elastic preliminary cut-off *l l*, substantially as described.

8. The combination, with the rotary seed-plate provided with seed-apertures, substantially as described, and the final or permanent cut-off bars *i*, of the elastic cut-offs *l*, arranged to bear upon the upper side of said seed-plate, over the apertures thereon, essentially as and for the purpose set forth.

9. The combination, in a seeding-machine, with the first seed-dropping devices mounted upon the rear frame, A, and means for operating the same, of the second dropping-wheel, S, arranged upon the front frame, A', and having the compartments *g*, to receive seed from said first dropping devices, and operated by intermittent moving devices, substantially as described.

10. The combination, with the second dropping-wheel, provided with compartments substantially as described, of the elastic screen arranged to cover one of said compartments, for the purpose set forth.



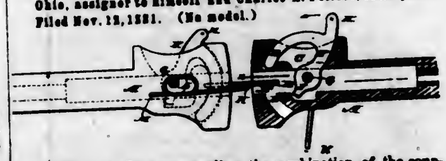
252,195. VALVE. WILLIAM DECKER, Colfax, assignor of three-fourths to John H. Hudgin, Edward Annable, and David Trovio, all of Fairbury, Ill. Filed Oct. 11, 1880. (No model.)

Claim.—1. The combination, with the chamber D, having an induction-port and a valve hinged to close upwardly and cover said port, of a float and a stem secured at one end to the float and at the other end hinged to said valve, substantially as set forth.

2. A supply-pipe, C, receptacle A, chamber D, with ports *c* and *d*, and floating weight F, in combination with a hinged valve attached to the inner surface of chamber D near the egress-port *d*, and suitable connections between the valve and floating weight, as set forth.

252,196. HAY-RACK. JAMES M. DIFFENBAUGH, Green Centre, Ind., assignor to himself and Daniel A. Leitch, same place. Filed Sept. 14, 1881. (No model.)

Claim.—1. In a hay and straw rack for wagons, the combination, with the longitudinal bars B and the cross-bars C, of the posts G, the longitudinal rails M, and the latch-strips P, pivoted to the posts G, substantially as herein shown and described, and for the purpose set forth.



2. In a hay and straw rack for wagons, the combination, with the longitudinal bars B and the cross-bars C, provided with slots F, of the posts G, provided with tenons H, having projection J and offsets L at the ends, and of the longitudinal rails M, substantially as shown and described, and for the purpose set forth.

3. In a hay and straw rack for wagons, the combination, with the longitudinal bars B and the cross-bars C, provided with slots F, of the posts G, each provided with a tenon, H, an offset, L, and an aperture, M, of the pins E and the longitudinal rails M, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with a boom-pole, B, of the collar or sleeve U, the hinged hook V, and the spring W, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the boom-pole B, provided with apertures or recesses Y, of the collar or sleeve U, and the hook V, provided with a stud, X, substantially as herein shown and described, and for the purpose set forth.

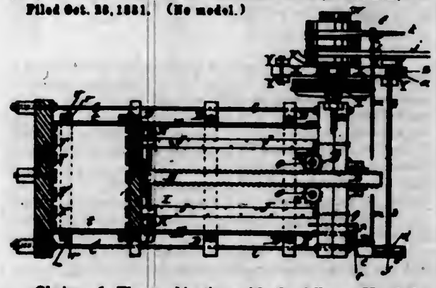
252,197. CAR-COUPLING. ROBERT H. DOWLING, Newark, Ohio, assignor to himself and Charles H. Pollett, same place. Filed Nov. 12, 1881. (No model.)

Claim.—1. In a car-coupling, the combination, of the coupling-link B and the draw-head A, provided with the central end recess, B, the slot C, and the segmental aperture D, extending entirely through the draw-head, the arm F, pivoted in the said draw-head and provided with the segmental coupling-pin E, the projection H above the coupling-pin, and the projection J below its pivot-pin, substantially as shown and described, whereby the coupling-pin is adapted to be tripped by the end of the link striking the projection J of the said arm, as set forth.

2. In a car-coupling, the combination, with the draw-head A and the plate G, having its ends extended on each side of the said draw-head, of the swinging guide-frame K, provided with elongated side loops, L, and crank-handles M, substantially as shown and described, whereby the guide is adapted to be moved forward or backward, as may be necessary, as set forth.

252,198. APPARATUS FOR RAISING AND LOWERING BOATS. REGINALD H. BARLE, St. Johns, Newfoundland. Filed Oct. 12, 1881. (No model.)

Claim.—1. The combination of the swinging frame D, connected by cross-bars *e* and attached by knuckle-joints *d* to the side of boat, the cradle E, having hooks *f f*, hung to the outer ends of arms *e* by joint-pins *g* and connected at the outer ends by the cross-bar A, and the davits C C, having blocks *m*, connected by ropes *l* and block *i* with eyes *h* on the hooks *f*, as and for the purpose specified.



2. The combination of the outwardly-movable levers *n*, having pins *n'* and hooks *r*, the inwardly-movable slides *o*, having pins, and the ropes *g*, with the apertured stands B, the frame D, having apertured arms *e e*, and the cradle E, having apertured lugs *p* on hooks *f*, as and for the purpose specified.

252,199. RAZOR-STROP. HOWARD B. EMERSON, Charlestown, Mass. Filed Oct. 3, 1881. (No model.)

Claim.—In a razor-strop, the combination of the body A, having mortise F and recess I, the block B, inserted in said mortise, the right-angled plate G, adapted to slide in the recess I, and provided with opening *i*, slot *g*, and screw H, the flexible band F, secured to the block E and sliding plate G, and the handle K, having screw I, adapted to engage with the threaded opening *i* and tighten the band F by moving the sliding plate, all substantially as shown and described.

252,200. BALING-PRESS. LOUIS ERCKMANN, Little Elm, Tex. Filed Oct. 28, 1881. (No model.)

Claim.—1. The combination, with the follower H, of the double rack-bar I, the two pinions N N on shafts O, the worm-wheels P, and the reversely-threaded screws Q Q on the rotary shaft R, whereby the follower is reciprocated, as described.

2. The combination, with the shaft R and gear-wheels S T U, of the shaft V, the hinged bar X, the hinged bar Z, the rod *b*, having arm *a*, the lever *d*, and the ratchet and pawl *e f*, whereby the gear-wheel U can be thrown into gear with either of the wheels S T, as described.

3. The combination, with the fingers *l m*, of the rod *o*, having arms *n p*, placed at right angles to each other the rod *q*, pivoted to the end of arm *p* and passing through a bearing in frame B, and the follower H, arranged to strike said rod *q*, as and for the purpose specified.

4. The combination, with the top and bottom doors, *t*, of the tie-rods C and bars X, the latter pivoted to said doors and adapted to swing out under the tie-rods, as and for the purpose specified.

5. The four short posts *y*, connected in pairs by inclined cross-boards *z*, in combination with the two doors 1, hinged to the boards *z*, the bars 2, pivoted to said doors, and the boards 3, arranged as shown and described.

252,201. UNDER-GARMENT. THOMAS B. FARRINGTON, Minneapolis, Minn. Filed Jan. 31, 1881. (No model.)

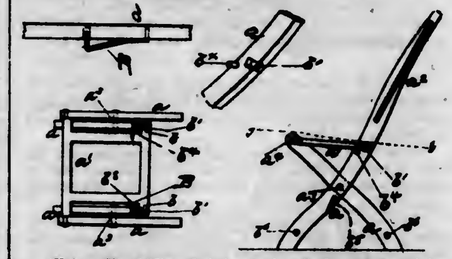
Claim.—1. A pair of drawers composed of an upper cloth part, A, and close-fitting lower knit part, B, joined above the calf, substantially as described, and for the purposes set forth.

2. In a pair of drawers having knit extremities extending from the ankle to a point above the calf, said extremities having two more contractile parts, one about the ankle and the other about the leg at a point above the calf and below the knee, substantially as described, and for the purposes set forth.

3. In a garment composed of the cloth part A and the knit extremities B, the upper margin of said knit portions enlarged by increase of stitches to practically equal the cloth part in size, substantially as described, and for the purposes specified.

4. In a garment composed of a cloth body and knit end, as described, said knit ends produced in a flat web and widened at the top by additional stitches upon the selvage edges to equal the width of the cloth part at the point of juncture and vertically seamed in line with the inclined seam of the cloth part, substantially as and for the purposes set forth.

252,202. ROSANILINE-RED COLORING-MATTER. OTTO FISCHER, Munich, Germany. Filed May 23, 1881. (Specimens.)



Claim.—As a new article of manufacture, the herein-described red coloring-matter, consisting of rosaniline prepared from para-nitrobenzaldehyde and a salt of commercial aniline-oil, and having the qualities as hereinbefore set forth.

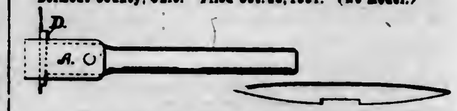
252,203. PREPARATION OF ROSANILINE-BLUE COLORING-MATTER. OTTO FISCHER, Munich, Germany. Filed Jan. 26, 1881. (Specimens.)

Brief.—This form of rosaniline blue is made by the reaction of paranitrobenzaldehyde upon diphenylamine and oxidating the resulting mixture.

Claim.—As a new article of manufacture, the herein-described blue coloring-matter, consisting of rosaniline prepared from para-nitrobenzaldehyde and diphenylamine, as hereinbefore set forth.

252,204. FOLDING CHAIR. NEHE C. FRINK, Saginaw, Mich. Filed Sept. 19, 1881. (No model.)

Claim.—The folding chair herein described, consisting of the front and rear legs, *a a*, pivoted together at *a'*, and the seat *a''*, the seat having projections *b* and notch *b'*, and pivoted to the upper ends of the rear legs, the front legs being provided with notches *b'* and spring-fastening B, all combined and arranged as set forth.

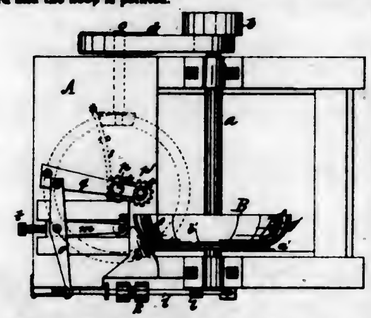


252,205. PACKING SNUFF. SAMUEL T. FORSYTH, Sr., Baltimore, Md. Filed Dec. 8, 1881. (No model.)

Claim.—1. A new article which consists of a piece of ox-gullet containing snuff, with its ends contracted to a small aperture, and the said aperture closed by paper seals pasted over the ends of the package, substantially as specified.

2. An improved process of packing snuff, which consists in placing a piece of moist ox-gullet having its outer end closed over the discharge-nozzle of a snuff-packing machine, then filling the said piece of gullet, then dividing the filled package into a number of sections by constriction, then drying the connected packages, then separating them, and then closing the end apertures by means of seals, substantially as specified.

252,206. MINING IMPLEMENT. THOMAS H. GALLAHER, Belmont County, Ohio. Filed Oct. 28, 1881. (No model.)

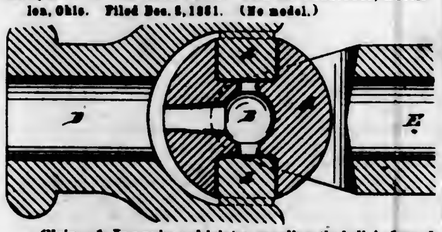


Claim.—The combination, with the head A, having a handle-socket, *a'* a pick-blade having a recess, *a*, the ends of which bear on the ends of the head and prevent displacement in the direction of the length of the blade, and a wedge-key, D.

252,207. MACHINE FOR DRESSING HOOPS. SAMUEL E. SARGENT, Janesville, Wis., assignor to himself, Joseph Beck, Augustus Huntemer, and Otto Reinke, same place. Filed Oct. 4, 1881. (Model.)

Brief.—The hoop is fed to a cutter-head with a weight-pressed rubber roller opposite and with a curved guide-plate near its edge. The weight is attached to a pivoted arm, which bears against a lever attached to the slide carrying the roller. This pivoted arm carries a grooved roller, which bears upon the edge of the hoop,

and thus limits the movement of the rubber roll. When the end of the hoop passes the grooved roller the rubber roller moves forward and the hoop is pointed.



Claim.—1. In a hoop-dressing machine, the combination, with the grooved frame A and the cutter-head B, of the slide *m*, the gage-roller *n*, the lever *o*, and the weighted lever *i*, substantially as and for the purpose set forth.

2. In a hoop-dressing machine, the combination, with the frame A and the cutter-head B, of the slide *m*, the gage-roller *n*, the lever *o*, the weighted lever *i*, and the set-screw *k*, substantially as and for the purpose set forth.

3. In a hoop-dressing machine, the combination, with the frame A and the cutter-head B, of the slide *m*, the roller *n*, the lever *o*, the weighted lever *i*, and the grooved pressure-roller *h*, mounted loosely on said weighted lever, substantially as and for the purpose set forth.

4. In a hoop-dressing machine, the combination, with the frame A, provided with the guide-plate *h*, and the cutter-head B, of the grooved pressure-roller *h*, the adjustable gage-roller *n*, and the adjustable fluted feed-rollers *p p'*, substantially as and for the purpose set forth.

262,208. UNIVERSAL JOINT. EDMUND GARRIGUES, Hacoillen, Ohio. Filed Dec. 8, 1881. (No model.)

Claim.—1. In a universal joint or coupling, the ball A, formed with the oil-chamber B, communicating with the bearings of the joint, substantially as shown and described.

2. The universal joint or coupling formed by casting the yokes D and E upon the ball A, substantially as described.

3. The method herein described of forming the universal coupling, consisting in first casting the ball, using chills for the journals, and then casting the yokes upon the ball in such manner that the journals act as chills for forming the bearings of the yokes, substantially as set forth.

4. The chilled ball A, in combination with the yokes D and E, having the chilled bearings *d* and *e*, substantially as described.

262,209. HERNIAL TRUSS. WILLIAM H. GARSON, Philadelphia, Pa., assignor to Hastings & Garson, same place. Filed Oct. 20, 1881. (No model.)

Claim.—In a hernial truss, the combination of a stem fitting freely in a bearing, a bevel-gear secured upon said stem, an adjusting-screw engaging a nut connected rigidly with the bearing of the stem, and a bevel-gear mounted loosely on said adjusting-screw and meshing with the gear of the stem, these members being combined for joint operation, so that the stem may be either held fast in or allowed axial movement within its bearing, substantially as set forth.

262,210. HORSESHOE. ROLLIN A. GOODNOUGH, New York N. Y., assignor of one-half to Charles W. Russell, same place. Filed Sept. 24, 1881. (Model.)

Claim.—1. A horseshoe having its hoof-face constructed with two distinct bevels, E and F, both inclined upwardly, essentially as shown and described, the outer bevel, E, extending in a downward direction from the outer edge of the hoof-face for about half the width of the shoe to form a seat corresponding in breadth to the shell or crust of the animal's hoof, and the inner bevel, F, being formed at a greater inclination than the outer one and extending in a downward direction toward the inner edge of the shoe to clear the sole of the hoof, substantially as and for the purpose set forth.

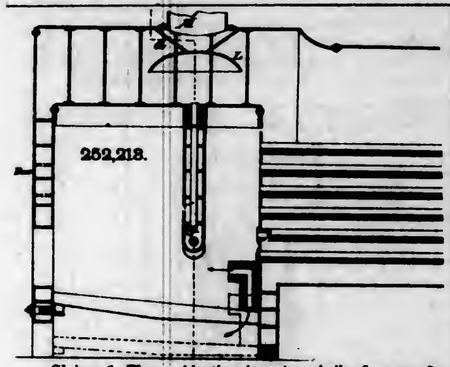
2. A horseshoe having its heels chamfered upon both their top and bottom faces, as shown, to prevent the concussion of the hoof upon the ground being transmitted to the heel or quarter of the hoof, and thereby preventing the tender part being bruised or becoming sore.

262,211. FEED-REGULATOR FOR GRINDING-MILLS. OLIVER S. GRAVES, Buffalo, N. Y., and JACOB HEBEL, Peoria, Ill. Filed Nov. 4, 1881. (No model.)

Claim.—1. The combination, with the running-stone F, provided with a revolving distributing-spout, H, having one or more discharge-nozzles, H', arranged in the eye of the runner, of the bed-stone B, provided with a guard-ring, I, substantially as set forth.

2. The combination, with the running-stone F, provided with a revolving distributing-spout, H, having one or more discharge-nozzles, H', arranged in the eye of the runner, of the bed-stone B, provided with a guard-ring, I, having perforations *m*, substantially as set forth.

262,212. DRAFT-EQUALISER. DAVID M. HARKRADER, Pittsfield, Ill. Filed Nov. 12, 1881. (Model.)



Claim.—1. An equalizing-bar, B, having the twist *b* and the inclined end E beyond the twist, provided with the hook *l*, substantially as specified.

2. An equalizing-bar, B, having at its outer portion the inclined end E, perforated for the hook-connection, and at its inner end the raised eye *c* above the plane of the bar, substantially as specified.

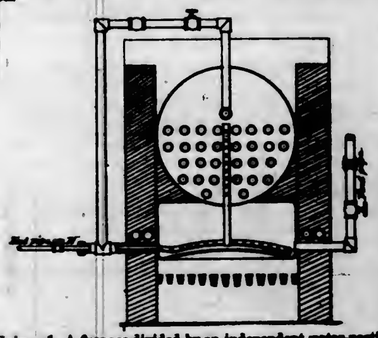
3. The combination, with the double-tree having the bolt-holes *a a* in each end, of the equalizing-bars B B, having raised eyes *c* at their inner ends, outer inclined ends, E, hooks *l*, and pivot-holes *b b*, corresponding in position to said bolt-holes, and the adjustable pivot-bolts C, substantially as specified.

262,213. STEAM-BOILER FOR LOCOMOTIVES. WILLIAM H. HARRIS, Brooklyn, and GEORGE FARR, New York, N. Y. Filed Dec. 7, 1881. (No model.

Brief.—A pendent water-heater is located near the rear tube-sheet. Against the tube-sheet is placed a hooded bridge-wall forming a narrow throat, through which pass the products of combustion, and which is met with blasts of heated air. Circulation is maintained through the heater and boiler. The bottom of the heater is arched, and the sediment is blown off through a perforated pipe which conforms to the arch of the heater.

Claim.—1. The combination, in a steam-boiler furnace, of a hollow independent water-partition arched at its bottom, as described, and perforated air heating and supply apparatus located at and against the rear water-leg, by means of which a narrow throat is formed, whereby the combustible gases and air are forced to mingle and unite for their more complete combustion, as described.

2. In a steam-boiler furnace, the independent hollow water-partition arched at its bottom, as described, the feed-pipes, the circulating-pipe which connects the partition with the water-leg of the boiler, and the sediment blow-off pipe, the whole combined and arranged to feed, heat, circulate, and purify the water before its introduction into the boiler, in the manner shown and set forth.



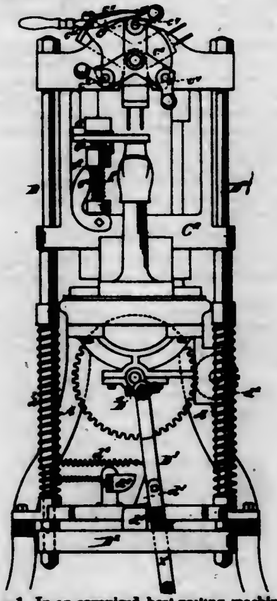
3. The combination, in a steam-boiler consisting of the pendent independent partition having an arched bottom, as described, the feed-water and circulating pipes, the blow-off pipe, and the central communicating pipe, with the steam and water separating devices, all arranged to operate in the manner shown.

4. The combination, in a steam-boiler furnace, of the pendent partition having a flat top for the reception of brick lining and arched bottom for the collection of sediment, and its blow-off, with an air heating and supplying device, the said partition dividing the furnace-chamber into a front and rear combustion-chamber, whereby smoke and gases are consumed in the manner set forth.

5. The combination, in a boiler, of the hollow pendent partition, connecting-pipe *c*, inverted-dish-shaped vessel L, separating-plates in steam-dome M, and dry-steam pipe O, all arranged as set forth.

262,214. FURNACE FOR STATIONARY BOILERS. WILLIAM H. HARRIS, Brooklyn, and GEORGE FARR, New York, N. Y. Filed Dec. 7, 1881. (No model.)

Brief.—Heated air passes through the sides of the furnace and a hooded-bridge wall and meets the flame and gases evolved from the fuel. Under the hood and against the wall a mass of incandescent fuel is placed. Through this mass, and between the heater and hood, the smoke and gases from the front combustion-chamber are forced and consumed. An arched pipe conforms to the arched bottom of the heater, through which the sediment is blown off.



Claim.—1. A furnace divided by an independent water-partition into front and rear combustion-chambers, said combustion-chambers being surrounded by air-heating flues arranged to twice encircle said furnace, said flues terminating in side apertures in the front chamber and in a series of perforations in the bridge-wall in an upper forward projection, whereby the gases are made to mix with the heated air and become ignited and thereby consumed in the manner described.

2. The combination, in a heating-furnace consisting in a divided furnace-chamber, of a hollow arched pendent partition, a hollow bridge-wall having a forward-projecting head or cap forming a hooded chamber beneath it, as described, and a series of air-heating flues encircling the furnace and within the walls, adapted to supply heated air to the side apertures in the front combustion-chambers and to the perforations in the head or projections in the bridge-wall in the manner set forth and described.

3. The combination, in a steam-boiler furnace, of the arched pendent partition arranged and located as described, the feed-water pipe, the central perforated pipe, the outside circulating-pipe, terminating in a perforated pipe at right angles thereto, and the blow-off pipe, all arranged for joint operation in the manner set forth and shown.

262,215. HEEL-NAILING MACHINE. HENRY A. HENDERSON, Lynn, assignor to F. F. Raymond, Sd, Trustee, Newton, Mass. Filed Oct. 15, 1881. (No model.)

Claim.—1. In an organized heel-nailing machine, the combination of a jack for holding the boot or shoe, adapted to be moved horizontally, a group or gang of awls and a group or gang of drivers carried by a crown-head adapted to be vertically reciprocated, and means, substantially as specified, for interchanging the position of the groups on the head, all substantially as and for the purposes described.

2. In an organized heel-nailing machine, the combination of a jack for holding the work, adapted to have a horizontal movement imparted to it, a templet adapted to be moved horizontally into a position over the heel, and a gang or group of awls adapted to be reciprocated by the same mechanism that reciprocates the drivers, all substantially as and for the purposes described.

3. In an organized heel-nailing machine, the combination of a jack for the boot or shoe, means for imparting to it a horizontal movement, a templet adapted to be moved horizontally into position, a nail-holder adapted to be moved horizontally into position independently of the templet, a gang or group of awls and a gang or group of drivers interchangeably secured to a crown-head, and means for reciprocating said crown-head, all substantially as and for the purposes described.

4. In an organized heel-nailing machine, the combination of a jack for the boot or shoe, the means for imparting to it a horizontal movement, a templet and nail-holder adapted to be brought into position by a horizontal movement, and also adapted to have a vertical movement imparted to them, a gang or group of awls and a gang or group of drivers fastened to the head and adapted

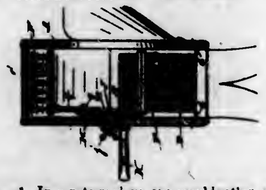
to be moved in relation to the templet and nail-holder as specified, and means for imparting to them and the head vertical reciprocating movements, all substantially as specified.

5. In an organized heel-nailing machine, the combination of a jack for the work, means for moving it horizontally, a templet and nail-holder adapted to have horizontal movements, as specified, a group of awls, a group of drivers, and a lift-holder adapted to be successively brought into position over the heel of the boot or shoe and to be reciprocated by the same operative mechanism, all substantially as described, and for the purposes specified.

6. In an organized heel-nailing machine, a templet-plate adapted to have a horizontal movement imparted to it and a nail-holder having a horizontal movement independent of the templet-plate, all substantially as and for the purposes described.

7. In a heel-nailing machine, the head C, provided with the awl-supporting arm c' and driver-supporting arm c^2, the awls and the drivers, and means for revolving the same upon a horizontal axis, whereby the awls and drivers may be successively brought into position, all substantially as described.

8. The combination of the cross-head C', supporting the revolving awl and driver-head C, and means for reciprocating them, consisting of the rods D D', the crank D^1, the connecting-rod D^2, the cross-bar D^3, and the springs d' d^3, all substantially as and for the purposes described.

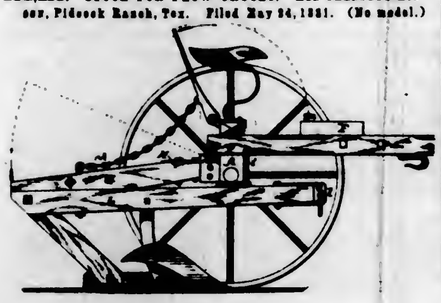


9. The combination, in an organized heel-nailing machine, of the head C', the head C, supporting the awls and drivers and top-lift holder, means for revolving the head to successively bring in position the awls, drivers, and holder, and for reciprocating the same, and an automatic stop-motion adapted to automatically stop the machine at the end of each revolution, substantially as and for the purposes described.

10. The form or support b^3, consisting of the fixed part b^4, and the toe part b^5, adapted to be revolved in relation to the fixed part, whereby the support may be used both for right and left shoes, all substantially as set forth.

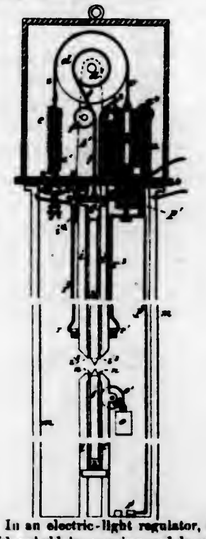
252,216. ELASTIC COMPOUND FOR TRUSS-PADS. HIRAM W. HENDRICKS, Portland, Oreg. Filed Feb. 28, 1881. (Specimens.)

Claim.—The herein-described plastic material, composed of glue, honey, sugar, gutta-percha, glycerine, borax, alum, black lead, sulphur, and saltpeter, substantially as described, and for the purpose set forth.



252,217. ROTARY SIEVE. WILLIAM L. HENDRIX, Indianapolis, Ind. Filed Nov. 14, 1881. (No model.)

Claim.—1. In a rotary sieve, the combination of the brushes F, shanks G, disk H, short shaft I, adjusting-bolt J, and crank K, substantially as specified.



2. The combination, in a rotary sieve, of the shanks G, carrying the brushes, said shanks having slots therein, screws g, pins h, and the disk H, all substantially as shown and described, and for the purposes specified.

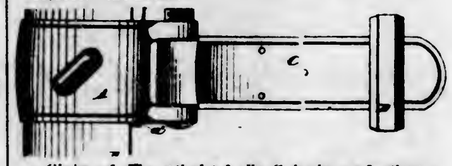
252,218. STOCK FOR PLOW-TRUCKS. ASA CHANDLER HINSON, Pidcock Ranch, Tex. Filed May 24, 1881. (No model.)

Claim.—The combination, with the stock G G', plow-beam L, and axle A, of the plates having eyes k, the ear-plates I, having a series of perforations, the clips I', connected at their ends by bolts i, and the bolt k, as and for the purpose specified.

252,219. ELECTRIC LAMP. ALFRED S. HOLCOMBE, Granby, Conn. Filed Apr. 2, 1880. (Model.)

Claim.—1. In an electric-light regulator, in combination, a movable solenoid upheld by a spring and located within a fixed solenoid, and a drum from which the upper carbon is suspended, provided with a pulley and a flexible brake-band passing over the pulley, one end of which is connected to the upper end of the movable solenoid and the other end to an adjustable spring, substantially as and for the purpose hereinbefore set forth.

2. In an electric-light apparatus, the combination of the resistance p', the insulated blocks r and r', and the insulated bar s, carried by the carbon-holder g, substantially as and for the purpose hereinbefore set forth.



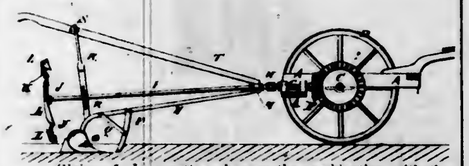
3. In an electric-light apparatus, the lower carbon counterweight, o, or its equivalent, in combination with the stud on the frame-bar l^3, insulated block p, and resistance p', substantially as and for the purpose set forth.

4. The refractory-metal carbon-retention fingers n n for electric-light apparatus, having the continuous bearing-surfaces n^2 n^2, corresponding to the form of the carbon rod at its straight sides and over a portion of its taper end, substantially as and for the purpose hereinbefore set forth.

5. The carbon-holder g, in combination with the fixed guide i', provided with the contact-pieces i^2, and the pivoted guide-bar i, also provided with a contact-piece, i^2, and operated by the adjustable spring i^3 to press the carbon in the holder g between the two contact-pieces i^2 i^2, substantially as and for the purpose hereinbefore set forth.

6. In combination, the coils or solenoids a a', the resistance p', insulated blocks r r', and bar s, counter-weight o, or its equivalent, insulated block p, frame-bar l^3, and their connecting-wires, substantially as and for the purpose hereinbefore set forth.

252,220. HAME. JNO. W. HUDSON, Wellington, Ill. Filed Nov. 16, 1881. (No model.)



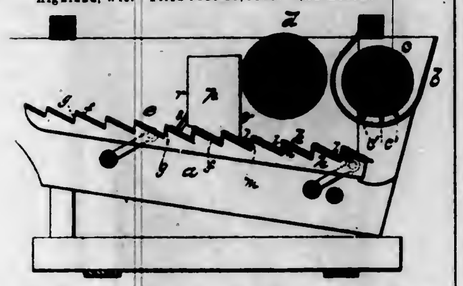
Claim.—1. The articulated clip C, having perforations e, adapting it to be riveted to a tug, and loop D, arranged at right angles to the clip C, all cast in one piece, in combination with a hame-bracket, as and for the purpose set forth.

2. The combination of the hame B with the bracket A, cast in one unbroken piece and having a V-shaped tapering groove, a', V-shaped key a, and perforated clip C, cast in one piece with loop D, substantially as and for the purpose set forth.

252,221. COTTON CHOPPER. JOSIAH L. HUGHES, Cleveland, Tenn. Filed Sept. 3, 1881. (No model.)

Brief.—A hollow bearing on the chopper-shaft attaches the front ends of the plow-beams and handles and permits the shaft to revolve therein. The whole is attached by a universal joint to the gear-shaft.

Claim.—1. In a cotton-chopper, the combination, with the shaft I, the knives L, and the operating mechanism, of the bearing M, the beams N, secured to the lower side of the bearing, the uprights R, the round S, and the handles T, secured to the upper side of the said bearing, substantially as and for the purpose set forth.

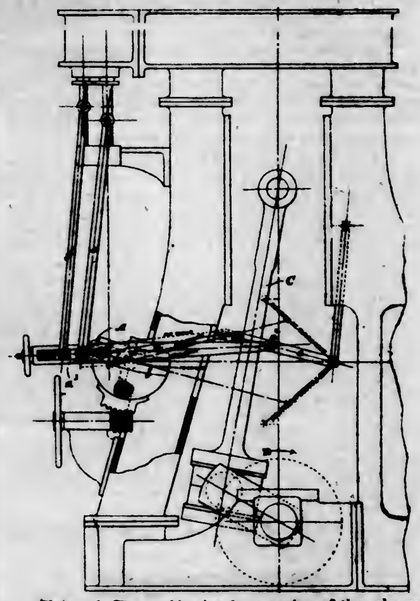


2. In a cotton-chopper, the combination, with the frame and the gear-shaft G, of the chopper-shaft I, the swivel H, the bearing M, the beam N, the handles T, and the upright frame R S, substantially as and for the purpose set forth.

252,222. WATCH-MAKER'S TOOL. GEORGE W. JOHNSON, Newton, Ill. Filed Dec. 3, 1881. (No model.)

Claim.—The tool herein shown and described, consisting of the jaws a and b, the jaw a being flattened and divided to form the fingers or tines c c, the jaw b being formed with the recess i, substantially as and for the purposes set forth.

252,223. CLOVER-HULLER. THOMAS JOYCE and JACOB KIEFER, Highland, Wis. Filed June 11, 1881. (No model.)



Claim.—1. In a clover-huller, the combination, with the hulling-cylinder c and concave b, the shaking-carrier, and the deflector or guide-board p, of the intermediate pressure-roller, d, substantially as and for the purposes specified.

2. In a clover-huller, the combination of the hulling-cylinder c and concave b, adapted to discharge at one side of the shaker e, of the shaker e, the guide-board or deflector p, and the pressure-roller d, substantially as and for the purposes specified.

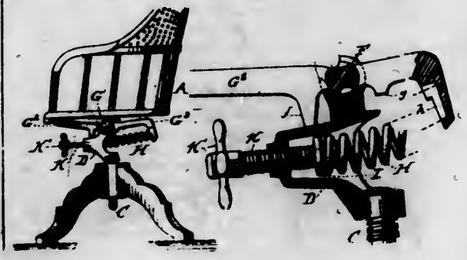
3. In a clover-huller, the combination, with the shaker e, having the open slotted surface, of the corrugated riddle or screen adapted to fit upon said shaker and formed with perforations in the bottoms of the corrugations, substantially as and for the purposes specified.

4. In a clover-huller, the combination, with the slotted shaker and the corrugated screen applied to the upper surface thereof, of the guide-board p, secured to the said shaker at one side thereof and extending toward the middle of the screen, substantially as and for the purposes specified.

252,224. STEAM-ENGINE VALVE-GEAR. DAVID JOY, Barrow-in-Furness, County of Lancaster, England. Filed June 10, 1880. (No model.) Patented in England Mar. 8, 1879.

Claim.—1. The combination, in an engine, of the valve-rod, the vibrating operating-lever pivotally connected to the connecting-rod and to the valve-rod, the pivoted link in which said lever is fulcrumed, and mechanism for controlling the position of the link, substantially as and for the purpose set forth.

2. The combination, in an engine, of the connecting-rod, the valve-rod, a lever-connection between said rods, and a pivoted slot-link which carries the fulcrum of the lever-connection, substantially as and for the purpose set forth.



3. The combination, in an engine, of the connecting-rod, the valve-rod, the lever-connection *a* between said rods, the sliding fulcrum of the lever-connection, and the pivoted slot-link in which it moves, substantially as set forth.

4. The combination of the valve-rod, the connecting-rod, the lever *c*, pivoted thereto, the lever-connection *a*, its sliding fulcrum, and the pivoted slot-link in which the fulcrum slides, substantially as set forth.

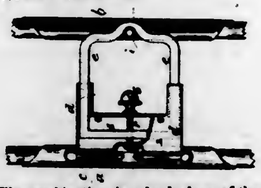
5. The combination of the connecting-rod C, the valve-rod *e*, the cut-off valve-rod *f*, the lever-connection *a*, its sliding fulcrum, and the pivoted slot-link, substantially as and for the purpose set forth.

6. The improved valve-gear consisting of the vibrating operating-lever pivotally connected to the reciprocating cross-head or connecting-rod of the engine at one end, and also to the valve-rod, and having a moving fulcrum, substantially as set forth, whereby the requisite movement of the valves is obtained by the combined motions of the parts, as described.

252,225. TILTING CHAIR. JOSEPH W. KNUPP, Chicago, Ill. Filed Feb. 28, 1881. (No model.)

Claim.—1. In a tilting chair, the combination, with the base B, the elevating-screw C, and the upright support connected with such screw and having standards E E', provided with bearings F F', open on their front sides, of the spider-arms G G', provided with round journals having bottom and top grooves or depressions *d e*, substantially as described and shown.

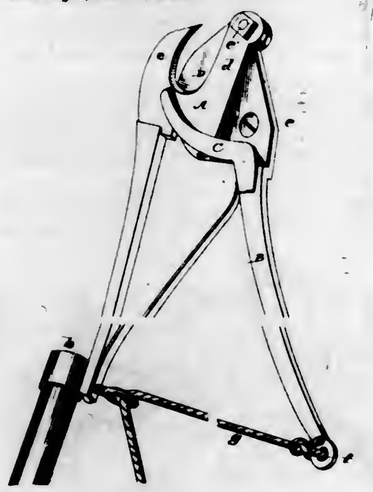
2. In a tilting chair, the combination, with the elevating-screw, the upright support connected with such screw, and the spider pivoted on the upright support, of the adjusting-screw K, turning through such upright support, and the spiral spring H, held between the rear arm, G^2, of the spider and the point of the said adjusting-screw, substantially as described and shown.



3. In a tilting chair, the combination, with the elevating-screw, of the socket D, connected with such screw, and having standards in which the spider is pivoted, the adjusting-screw K, turning through such socket, and the spiral spring H, held between the rear arm, G^2, of the spider and the point of said adjusting-screw, one end of such spring entering said socket, substantially as described and shown.

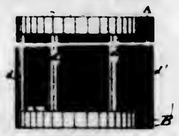
4. In a tilting chair, the combination, with the upright support, of the spider pivoted on the same, the adjusting-screw K, turning through such upright support, the guide-washer I, carried by the end of the adjusting-screw, and the spiral spring H, held between such guide-washer and a downward projection on the spider, substantially as described and shown.

5. In a tilting chair, the combination, with the socket D, having standards E E', provided with open bearings F F', of the spider removably pivoted in such bearings, the removable spring H, and adjusting-screw K, substantially as described and shown.



6. In a tilting chair, the combination, with the socket D, of the spider removably pivoted thereto and having front and rear stops, *f g*, the spring H, and adjusting-screw K, substantially as described and shown.

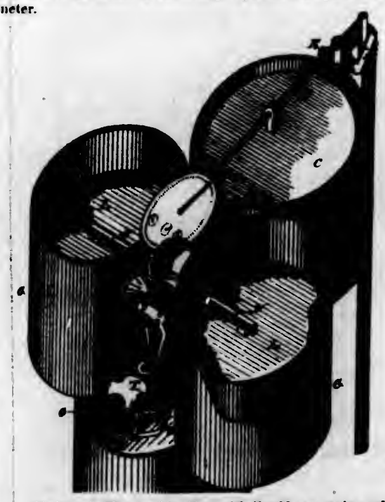
252,226. ALBUM-CLASP. JOHN C. KOCH, Berlin, Prussia. Filed July 5, 1881. (No model.)



Claim.—The combination, in a book-clasp, of the clips a and *b*, the box *d*, hinge *c*, connecting the same to the clip *a*, the frame *e*, having a cross-bar within the box, the screw *r*, also within the box and passing through the cross-bar, and having a head, *s*, outside the box, by which it can be revolved, substantially as set forth.

252,227. PRUNING-SHEARS. PAUL KOHRUS, Harlem, La. Filed Aug. 3, 1881. (Model.)

Claim.—The combination, with the stationary blade A, having the cutting-arm e and the long arm *d*, of a movable arm, B, carrying a removable cutter, D, and guide C, and pivoted to the extreme end of the arm *d*, and provided with a spring and an operating-cord, substantially as set forth.



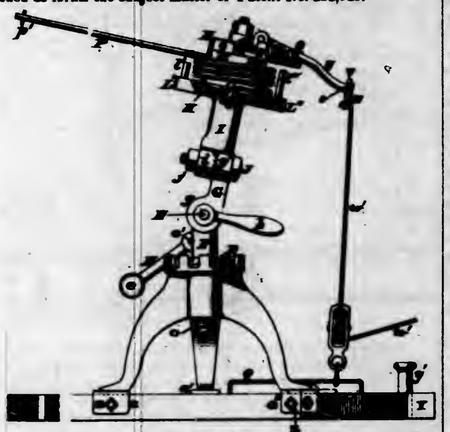
252,228. COIN-HOLDER. PETER O. KOHRBECK, New Orleans, La. Filed July 25, 1881. (No model.)

Claim.—As a new article of manufacture, the coin-holder consisting of the two removable heads A B, recessed on their inner faces, the central tube, C, rods *d*, and the central bolt, E, substantially as described.

252,229. WATER-METER WITH AUTOMATIC GOVERNOR. JULIUS LUDDE, Washington, D. C. Filed June 21, 1881. (No model.)

Brief.—A cylinder connected with the supply-pipe contains a float so connected with the cock that by the rise of water in the cylinder the supply is cut off. This cylinder discharges alternately into two measuring-cylinders, floats in which are joined together by an oscillating arm, by the movement of which the registering mechanism is actuated and the cock which determines the flow into one or the other is shifted. These cylinders discharge into a fourth cylinder, which is connected with the discharge-pipes, and contains a float attached to cocks, so that when no water is drawn the float rises and cuts off the flow between the supply-cylinder and the measuring-cylinder and also between the latter and the discharge-cylinder; hence the opening and closing of the several faucets in the house automatically regulates the operation of the meter.

Claim.—1. The combination, with liquid-measuring cylinders and registering mechanism connected therewith, of a governor which automatically regulates the discharge from said cylinders—that is to say, a governor which operates automatically to allow discharge from the measuring-cylinder when liquid is drawn off from the distributing-pipe and cuts off said discharge when the flow from the distributing-pipe is arrested, substantially as hereinbefore set forth.



2. The combination, with meter-cylinders and pipes leading to and from the same, and registering mechanism, of a governor which operates automatically to simultaneously shut off or allow the supply and discharge of the meter, substantially as specified.

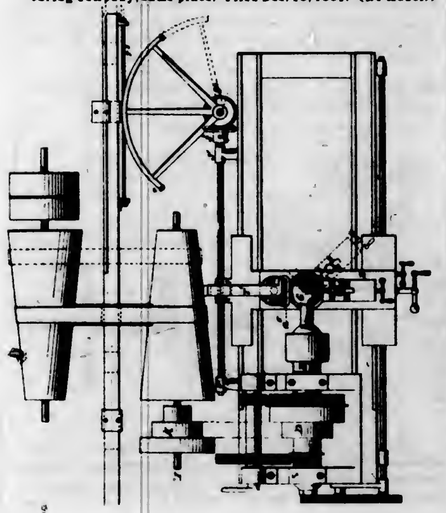
3. The combination of the eduction-governor consisting of a water-receptacle and contained float, the lever, and cocks T and T', the meter-cylinders, and pipe for discharging their contents into said governor-receptacle, substantially as shown and described.

4. The combination, with the induction-governor C D E, the meter-cylinders G G, and pipes F F' F', connecting them, and arranged as specified, of the eduction-governor P E S and cocks T T', connected therewith and arranged to regulate supply and discharge of said meter-cylinders, as shown and described.

252,230. TARGET-TRAP. GEORGE LIGOWSKY, Cincinnati, Ohio, assignor to the Ligowsky Clay Pigeon Company, same place. Filed May 16, 1881. (No model.)

Brief.—The trap is designed to throw a dish-shaped target such as forms the subject-matter of Patent No. 231,919.

Claim.—1. The combination, in a target-trap, of a spring-lever, a rack, and an adjustable tension-arm carrying the trigger, with which latter is engaged said lever, as herein described.



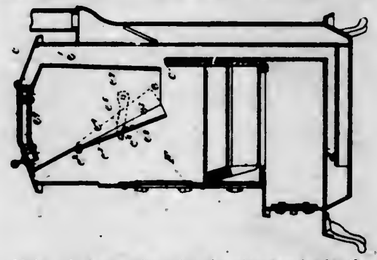
2. The combination of spring-lever P *p*, head M, segmental rack O, adjustable tension-arm U, and trigger V W, as herein described.

3. In combination with the target-trap, head M, having the spring portion *p* of lever P coiled around it, for the purpose described, the jointed standards F G I, notched knuckles *f g i f'*, bolts H J, and nuts *h j*, as herein set forth, and for the object stated.

4. The combination, in a target-trap, of a clamp consisting of the bar R *r'*, pivoted lever S *s'*, spring T, screw-threaded rod *t*, and adjustable nut *t'*, as described.

5. The trigger consisting of the slotted plate V *v*, pivoted catch *v'* W, and spring *w*, as described.

252,231. MECHANICAL MOVEMENT. HORACE LUND, Hartford, Conn., assignor to the Colts Patent Fire-Arms Manufacturing Company, same place. Filed Dec. 15, 1881. (No model.)

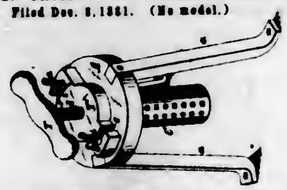


Claim.—1. The combination of the following elements: mechanism to support and impart revolution to the thing to be operated upon, a tool-holder carrying the tool to work upon the surface of the thing so held and revolving, mechanism, substantially such as described, to vary the velocity with which said thing is revolved, and mechanism, substantially such as described, communicating from said tool-holder to said velocity-varying mechanism, whereby the surface velocity of the thing being worked upon is automatically varied according to the position of the tool upon said surface, from its smaller to its larger diameter, or vice versa, substantially as described.

2. The combination of the following elements: mechanism to support and impart revolution to the thing to be operated upon, a tool-holder carrying the tool to work upon the surface of the thing so held and revolving, mechanism, substantially such as described, to vary the velocity with which said thing is revolved, said tool-holder arranged upon a carriage for transverse movement at substantially right angles to the axis of revolution of the thing to be operated upon, a rack attached to and movable with said carriage, a longitudinal shaft provided with a pinion, with which the said rack engages to impart a rotation to said shaft corresponding to the transverse movement of the tool-carrying carriage, and mechanism, substantially such as described, between said shaft and the said velocity-varying mechanism, whereby the surface velocity of the thing being worked upon is automatically varied according to the position which the tool occupies upon the surface to be worked upon from its smaller to its larger diameter, or vice versa, substantially as described.

3. The combination of the following elements: mechanism to support and impart revolution to the thing to be operated upon, a tool-holder carrying the tool to work upon the surface of the thing so held and revolving, mechanism, substantially such as described, to vary the velocity with which the said thing is revolved, said tool-holder hung upon a pivot to swing in a plane parallel with the axis of revolution of the thing being worked upon, a rack in connection with said tool-holder by mechanism substantially such as described, whereby the rotation of the tool-holder imparts a movement to said rack in a plane at right angles to the axis of revolution of the thing being worked upon, a longitudinal shaft provided with a pinion, with which said rack engages to impart to said shaft a rotation corresponding to the movement of said rack, and mechanism, substantially such as described, between said shaft and the velocity-varying mechanism, whereby the surface velocity of the thing being worked upon is automatically varied from its smaller to its larger diameter, according to the position which the tool occupies upon the surface to be worked upon, from its smaller to its larger diameter, or vice versa, substantially as described.

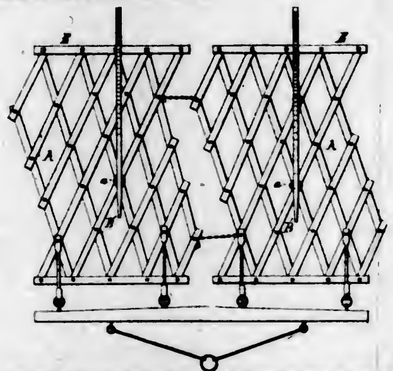
252,232. MAGAZINE-STOVE. JOHN MAGEE and FRANK A. MAGEE, Chelsea, assignors to the Magee Furnace Company, Boston, Mass. Filed July 25, 1881. (No model.)



Claim.—1. A magazine or base-burning stove having the plate or section supporting the doors of the combustion-chamber removable, whereby the stove is adapted to be converted from a close to an open grate, all substantially as described.

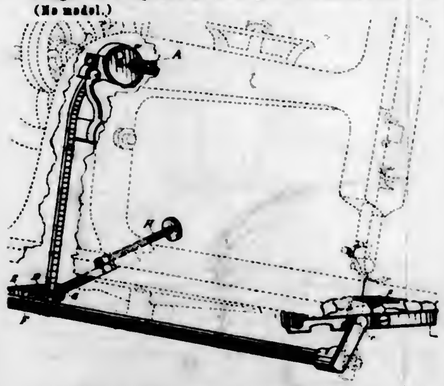
2. In a magazine or base-burning stove, a removable door-supporting front plate, F, all substantially as and for the purposes described.

3. The combination of the plate *d'*, forming a portion of one of the walls of the magazine, hinged at *d'* to the magazine, substantially as shown and specified, and means for moving the same to and from the remaining walls of the magazine to diminish or increase the size of its opening, all substantially as described.



4. A magazine or base-burning stove having interchangeable front plates or sections, each of which contains the opening to the combustion-chamber, one of which is provided with doors, and the other is adapted to receive a blower, whereby the stove may be used as a close or open grate, all substantially as described.

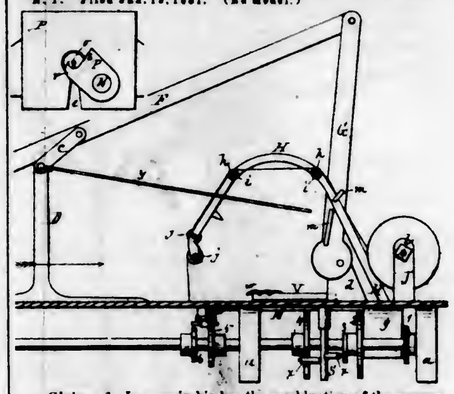
252,233. FRUIT-PRESS. FÉLICIEN F. H. HARAIS, New York, N. Y. Filed Dec. 8, 1881. (No model.)



Claim.—As an improvement on my aforesaid patented press, the combination, in a fruit-press, of the stationary platform A, supported by legs *a* and supporting the suspended perforated cylinder C, in combination with the plunger B, its T-shaped screw-handle, and the cross-bar T, adapted to be connected detachably to the platform, substantially as set forth

252,234. HARROW. THOMAS MATTHEWS, Almaden, Cal. Filed Nov. 15, 1881. (No model.)

Claim.—The combination, with the harrow A, of the sustaining-lever B, with its forward end capable of resting on the ground and its other end extended to or beyond the rear end of the harrow, and having the depending cord *b* or equivalent medium, substantially as and for the purpose described.



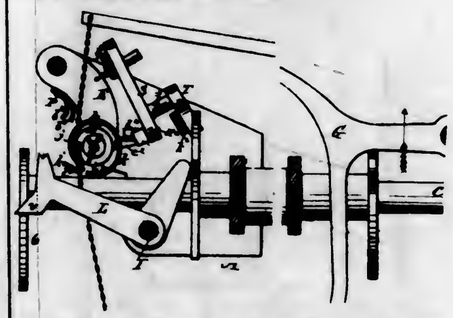
252,235. SEWING-MACHINE. GEORGE A. MAYO, Erie, Pa., assignor to George H. Noble, same place. Filed Apr. 21, 1881. (No model.)

Claim.—1. In a sewing-machine, the combination, with the oscillating shaft provided with a crank-arm, E, secured to said shaft and having an elongated slot formed therein, and a pitman, C, provided at its lower end with a pin that engages in the elongated slot of the arm E, of the inclined link G, attached at one end to the lower end of the pitman and at its opposite end to an adjusting-screw, H, substantially as described.

2. The combination, with the oscillating feed-shaft, the slotted arm connected therewith, a pitman having a roller-bearing in the slot of said arm and adapted to actuate the feed-shaft, of a link pivoted to the lower end of the pitman and an adjusting-screw pivoted to one end of the link and arranged to extend above the table of the machine, substantially as set forth.

252,236. GRAIN-BINDER. JOSEPH H. MCMASTER, Rochester, N. Y. Filed Jan. 19, 1881. (No model.)

Claim.—1. In a grain-binder, the combination of the reverse cams 5 and 6, set on the main shaft, the short upright shaft N, provided with pins *n n*, upon which the cams act and the plates P R, attached to the shaft and provided with hooks for carrying the wires into the slot of the twisting-pinion, as herein shown and described.



2. In a grain-binder, the combination of the reverse cams 1 2, the roller *f*, armed with pins *a a*, upon which the cams act, the curved binder-arm H, attached to the roller, and the compressor consisting of the standards D D, running in ways and connected by the crank *e* and arms F G with the binder-arm, so as to be operated by the latter, as herein shown and described.

3. In a grain-binder, the combination of the short vertical shaft S, provided with pins *s s*, the cams 3 and 4, set on the main shaft, and the arm V, attached to the shaft S on top the body-plate and provided with the prongs *w w*, as shown and described, and for the purpose specified.

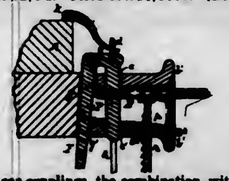
4. In a grain-binder, the combination of the curved binder-arm H, the rock-arm G, provided with stops *m m*, located at some distance apart, between which the binder-arm plays, the connecting-arm F, the crank-arm *e*, rock-shaft E, and standards D D, as shown and described, and for the purpose specified.

5. In a grain-binder, the combination, with the short vertical shaft N, provided with a plate, P, at its top, having a hook, *r*, for drawing the wire into the slot of the twisting-pinion, of an auxiliary plate, R, at its bottom, provided with a hook, *r'*, which strikes a stop *z*, and pinches the wire, thereby limiting the downward twist of the wires, as herein shown and described.

252,237. GRAIN-BINDER. JOSEPH H. MCMASTER, Rochester, N. Y. Filed Mar. 23, 1881. (Model.)

Claim.—1. In a grain-binder, the combination of the fixed screw-shaft D, the hollow collar D', engaging with the screw-shaft and provided at its top with the spring-wire *h* and prong *j*, and the spindle F, passing through the shaft D, provided at its top

with the hook *d* and on its side with the pivoted latch *f*, as shown and described, and for the purpose specified.



2. The combination, with the rock-shaft I, of the two arms K K, attached fast to the bottom of the shaft, and the single arm L, turning on the upper end, said arms having at their outer ends notches for catching the binding-cord and carrying it foward in position to be acted upon by the cutter-head and looping device, as herein shown and described.

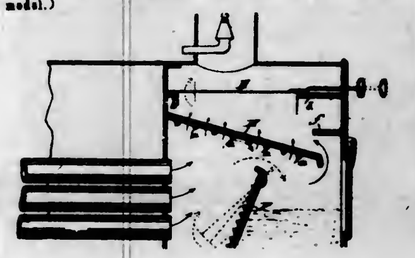
3. The combination, with the arm L, having a hub which turns freely on the upper end of shaft I, of an arm, *u*, engaging with the cam 5, and the projecting head *v*, engaging with the cam 6, as shown and described, and for the purpose specified.

4. In combination with the arms K K, the cutter M, having a shank, *x*, which rests between pins *w w*, attached to the lower arm, and plates N N, between which the cutter is pivoted, said cutter having a sharp cutting-edge at its top which engages with a corresponding sharp edge of the upper plate and a rounded edge at its bottom which engages with a rounded edge of the lower plate, as and for the purpose specified.

5. The combination, with the swinging arms K K L and looping apparatus D D', of the spring-clamps b^2 b^2, arranged in the same concentric line with the notches or fingers at the outer ends of the swinging arms, for the purpose of catching and clamping the cord as it is carried forward by the arms, and holding it with sufficient tension while the cord is being looped, as herein shown and described.

252,238. CAR-COUPLING. HENRY B. MCMURRAY and LEVI SCOTT, Hargettstown, Pa. Filed Oct. 24, 1881. (No model.)

Claim.—1. In car-couplings, the combination, with a buffer-head, of a coupling-pin and a rod pivoted to the head of the coupling-pin and extending through the buffer-head, said pivoted rod being so connected that when raised it will automatically catch upon the base of the buffer-head cavity in position to be caused to drop by the incoming link of the opposite buffer-head, substantially as and for the purposes set forth.



2. In car-couplings, the combination, with the buffer-head B, of the coupling-pin D and rod F, pivoted to the head of the coupling-pin and extending at an incline through slots *g g'* in the buffer-head back of the coupling-pin, and adapted, when raised, to swing forward and automatically catch upon the base of the buffer-head cavity, substantially as and for the purposes set forth.

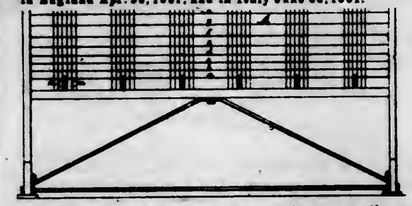
3. The combination, with the buffer-head B, of the coupling-pin D, vertically-moving guide A, secured to the coupling-pin, and rod F, pivoted to the coupling-pin and extending at an incline through slots *g g'* in the buffer-head back of the pin, and adapted, when raised, to swing forward and automatically catch upon the base of the buffer-head cavity, substantially as and for the purposes set forth.

4. In combination with a buffer-head, B, the lifting-bar *p* for supporting the link, and ratchet-and-pawl apparatus for holding the bar at the desired height, substantially as and for the purposes set forth.

5. In combination with a buffer-head, B, the lifting-bar *p*, having the ratchet-arm *r*, pawl-rod *s*, and disconnecting apparatus *t*, substantially as and for the purposes set forth.

252,239. SPARK-ARRESTER. GEORGE W. HOOBS and ABRAHAM O. FRICK, Waynesborough, Pa. Filed Nov. 7, 1881. (No model.)

Claim.—1. The combination, with the smoke-box in a steam-boiler, of a deflecting-plate extending from the tube-sheet to nearly the back end of the smoke-box and slightly dipping downward, and one or more deflecting-plates rising from the bottom of the smoke-box, and adapted to form both a deflecting-plate and a receptacle for sparks in the back end of the smoke-box, as described.



2. The combination, with the smoke-box, of the deflecting-plate E, perforated and provided with ribs *a*, and the subjacent plate or plates F, rising from the bottom of the smoke-box, substantially as described.

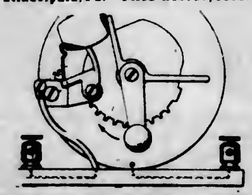
3. The combination, with the smoke-box, of a deflecting-plate extending from the tube-sheet to nearly the back of the smoke-box, and subjacent deflecting plate or plates F, made adjustable, substantially as and for the purpose described.

4. The combination, with the smoke-box of a steam-boiler having guides for rectilinear movement, of a rectilinearly-sliding and open-meshed screen or damper, H, arranged between the fire-tubes and the smoke-stack, substantially as and for the purpose described.

5. The combination, with the smoke-box, of the plate E, plate F, and the lip *f*, substantially as shown and described.

252,240. TARGET. RICHARD MORRIS, Lowtcham, County of Kent, England. Filed Oct. 5, 1881. (No model.) Patented in England Apr. 26, 1881, and in Italy June 30, 1881.

Claim.—1. The herein-described target for rifle practice, provided upon its front face with a bull's-eye, and having upon its rear side a graduated scale formed by a series of horizontal lines, substantially as described.

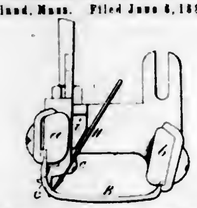


2. The herein-described target for rifle practice, having a bull's-eye upon its front face, and upon its rear side the series of horizontal and vertical lines, substantially as and for the purpose described.

252,241. AUXILIARY RIFLE-BARREL. RICHARD MORRIS, Lowtcham, County of Kent, England. Filed Oct. 5, 1881. (No model.) Patented in England Apr. 26, 1881, and in Italy June 30, 1881.

Claim.—An inner barrel for rifles or small-arms, consisting of a removable tube, E, inserted from the muzzle end and screwed into a breech-block, B, inserted from the breech end and secured by a screw-nut, G, substantially as and for the purposes described.

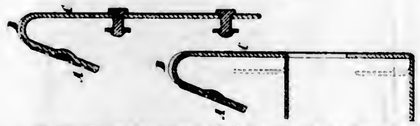
252,242. ELECTRICAL-SIGNAL TRANSMITTER. GARRET S. HOYT, Philadelphia, Pa. Filed Nov. 17, 1881. (No model.)



Claim.—1. The combination of a movable shaft carrying a break-plate and arms with a pivoted contact-lever adapted to be tilted by the said arms into and out of the path of the teeth of the break-plate.

2. The combination of the frame, rotary shaft carrying a break-plate, arms, and crank-handle, and a spring with a pivoted contact-lever adapted to be thrown by said arms into and out of the path of the break-plate teeth, substantially as set forth.

3. The combination of a movable shaft carrying a break-plate and arms with a pivoted lever adapted to be operated by said arms, and carrying a weight and a contact-finger, as and for the purpose described.

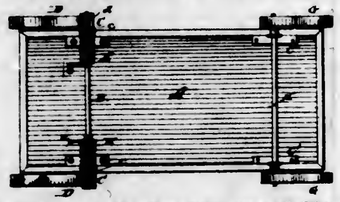


252,243. HEEL-TRIMMER. FRANKLIN MOULTON and CHARLES M. ADAMS, Ashland, Mass. Filed June 6, 1881. (Model.)

Claim.—1. In a heel-trimming machine, the combination, with the knife B, of the guard C, having the concave face *c*, said guard being adjustably connected to its support and carrying the adjustable knife D, substantially as and for the purpose set forth.

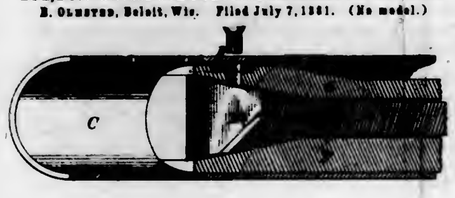
2. The guard C, having concave face *c* and wedge-shaped shank *f*, with elongated slot *g*, for attaching it to the arm *a*, the dovetail recess *d*, for connecting thereto the guard-knife D, substantially as and for the purpose specified.

252,244. BUTTON ATTACHMENT. CHARLES NEWBURGH, Beloit, Wis. Filed Aug. 10, 1881. (No model.)



Claim.—In combination with the button A and bent shank B, forming a hook, the strap C, provided with means for fastening it to the fabric at several points in its length, substantially as and for the purpose described.

252,245. ORNAMENTAL COMPOSITE VENEER. NELSON C. NEWELL, Springfield, Mass. Filed Dec. 3, 1881. (No model.)



Claim.—The within-described composite veneer, consisting of the metallic plate *a* and the mat or coating of pearl particles *d*, united together by a suitable interposed adhesive substance, substantially as described.

252,246. VEHICLE-SPRING. NILS NILSON, Maple Plain, Minn. Filed Sept. 12, 1881. (No model.)

Claim.—The compound vehicle-spring composed of the curved leaf-spring D D′ and coiled spring E, in combination with the spring-bearings C and bar B, provided with the washer *c*, bushing *d*, and tubular elastic packing *f*, as set forth.

252,247. DEVICE FOR PUNCHING METALLIC TUBES. OSCAR B. OLMSTED, Beloit, Wis. Filed July 7, 1881. (No model.)

Claim.—The combination, in pipe-punching machines, of the die D with the expanding mandrel G B F, substantially as described, for the purposes specified.

252,248. ADJUSTABLE TOOL. ALBERT A. PEASE, Springfield, Mass. Filed Aug. 10, 1881. (Model.)

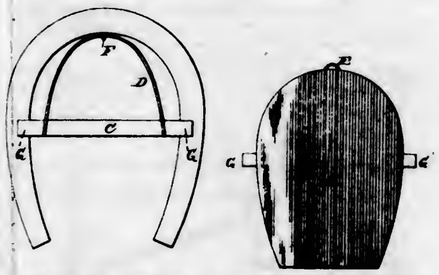
Claim.—1. The combination of the jaw C, having a handle and hole or aperture, *r*, the jaw B, having a handle and recesses, *r′* and *r″*, with slot *e*, and the recessed pivot D, with inclined bearing *a*, bolt *t*, spring, and nut, substantially as described, and for the purpose set forth.

2. In a tool, the pivot D, consisting of the pivotal part having the portions *h f*, inclined bearing *a*, and recess, the headed bolt having the nut *b*, and a spiral spring to draw the pivotal part and bolt together, substantially as described.

252,249. ELECTRIC CABLE. WILLIAM J. PHILIPS, Philadelphia, Pa. Filed Apr. 21, 1879. Patented in England, No. 1,475 of 1880.

Claim.—1. A telegraphic cable composed of two or more conducting-wires proper, and an independent wire arranged between or centrally with respect to the said conducting-wires and out of contact therewith, said independent wire being provided with means for connection with ground at points intermediate of the length of the cable, as described.

2. The method substantially as described of forming a lead joint for pipe-sections and intermediate mass of insulating material, the same consisting in wrapping the ends of the pipe-sections and intermediate insulating material in foil and then casting molten lead around said foil, substantially as described

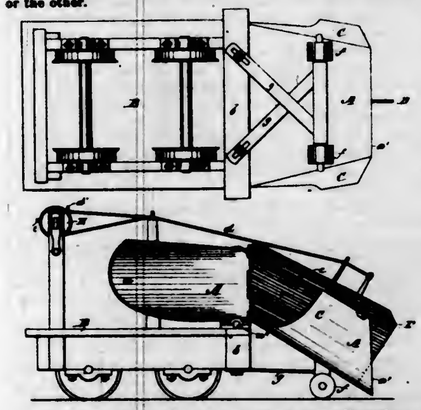


252,250. BLASTING-POWDER. WILLIAM R. QUINAN, San Francisco, Cal. Filed Apr. 8, 1881. (No specimens.)

Brief.—Uses the three ingredients in substantially the following proportions: fifteen parts of nitro-cellulose, seven to twelve parts of the nitrate or chlorate of potash, and from two to fifty-five parts of nitro-glycerine.

Claim.—1. A high explosive powder composed of nitro-glycerine, nitro-cellulose, and chlorate (or nitrate) of potash.

2. A high explosive powder composed of nitro-glycerine, nitro-cellulose, and chlorate (or nitrate) of potash, in the proportions substantially as set forth.

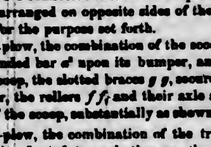


252,251. PAD FOR HORSES' HOOFS. WILLIAM F. RAYMOND, Sandusky, Ohio. Filed Oct. 3, 1881. (No model.)

Claim.—The elastic pad A, having transverse flat spring C, from which a wire ball, D, projects forward to form a loop, E, said flat spring having projecting ends G, in combination with the shoe B, having hook F, substantially as set forth.

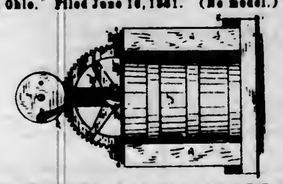
252,252. SNOW-PLOW. HORACE RESLEY, Cumberland, Md. Filed Sept. 8, 1881. (No model.)

Brief.—The scoop is mounted on a truck, and is adapted to rock and rest on a bar upon the end of said truck. Its sides are connected to the forward part of its wings by braces. The rear portions are deflected downward from the plane of the forward portion, and a deflector is provided to throw the snow to one side or the other.



Claim.—1. The combination, with the deflector D, of the scoop A, having its sides C C connected to the forward part of its wings *a a* by the braces *c c*, arranged on opposite sides of the deflector, substantially as and for the purpose set forth.

2. In a snow-plow, the combination of the scoop A, the truck B, having the rounded bar *a*′ upon its bumper, and which serves as a rest for the scoop, the slotted braces *g g*, secured to the under side of the bumper, the rollers *f f*, and their axle arranged under the forward end of the scoop, substantially as shown and described.



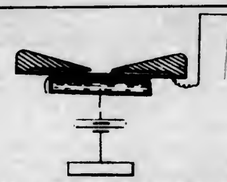
3. In a snow-plow, the combination of the truck B, having bar *a*′, the scoop A, adapted to rock thereon, the cords *d d*, the windlass E, having pin *e*, and the loop *d*′, placed upon one of the cords and adapted to be engaged with the said pin, substantially as shown and described, and for the purpose set forth.

252,253. GATE-ROLLER. CHARLES B. RICE, Evanston, Ill. Filed Apr. 4, 1881. (No model.)

Claim.—A farm-gate roller consisting of the disks *g g*, provided with rims *l*, and central openings adapted to fit on a hub and united together by pins, in combination with the hub *b*, provided with a horizontally-longitudinal slot, *e*, and shoulders *i*, mounted and pivoted upon a bolt, *a*, by a pin, *d*, passing vertically through the center of said slot, all constructed and arranged to operate substantially as herein shown and described.

252,254. ICE-CREAM FREEZER. MICHAEL RICHIMER, Macedon, Ohio. Filed June 16, 1881. (No model.)

Claim.—The combination of the uprights L L, the cross-bar M, supported independently of the ice-tub and of the gearing-frame, the mechanism for rotating the freezer and reciprocating the dasher, the ice-tub *J*, and the frame B *b*, which supports the gearing entirely independently of the ice-tub, substantially as set forth.



252,255. TELEPHONE. JAMES H. REGNER, Washington, D. C., assignor of one-half to Frank Hume and L. G. Hine, both of same place. Filed Dec. 9, 1881. (No model.)

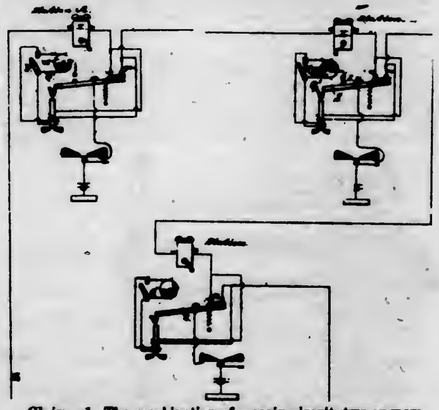
Claim.—1. The combination of the diaphragm, the mercury-cup in close proximity to the diaphragm, the mercury, and the free floating carbon in contact with the diaphragm, substantially as set forth.

2. The combination of the diaphragm, the mercury-cup in close proximity thereto, mercury, and the carbon balls or fragments floating on the mercury and in contact with the diaphragm, substantially as set forth.

3. The combination of the carbon diaphragm, the mercury-cup in close proximity thereto, the mercury, and the free floating carbon balls or fragments, substantially as set forth.

252,256.

252,256. TELEPHONE. JAMES H. REGNER, Washington, D. C., assignor of one-half to Frank Hume and L. G. Hine, both of same place. Filed Nov. 9, 1881. (No model.)



Claim.—1. The telephone herein described, consisting of a sheet of metal sufficiently thin to be more or less resonant and susceptible of magnetic induction, bent as set forth, and having a helix wound parallel with its adjacent edges, said telephone being adapted for the transmission and reception of articulate speech without the use of a diaphragm or armature.

2. A telephonic transmitter and receiver consisting of a comparatively thin sheet of metal susceptible of magnetic induction, bent so as to bring two of its edges in close proximity to each other, and having two or more helices wound parallel with its adjacent edges, substantially as set forth.

3. A telephone consisting of a comparatively thin resonant sheet of metal bent into a conical or funnel shape, with two of its edges in close proximity, and having a helix wound parallel with its adjacent edges, said telephone being adapted for the transmission and reception of articulate speech without the use of a diaphragm or armature.

252,257. TELEPHONIC APPARATUS AND CIRCUIT. JAMES HARRIS REGNER, Washington, D. C., assignor of one-half to Frank Hume and L. G. Hine, both of same place. Filed Dec. 5, 1881. (No model.)

Claim.—1. The combination of a main circuit, two or more stations thereon, the main lines extending from each station to the adjoining station, on each side thereof, receiving and transmitting apparatus at each station, and a continuously-revolving circuit-breaker at each station, which divides or breaks up the message be-

ing transmitted into fragments and throws portions upon the main line in one direction and other portions in the opposite direction, substantially as set forth.

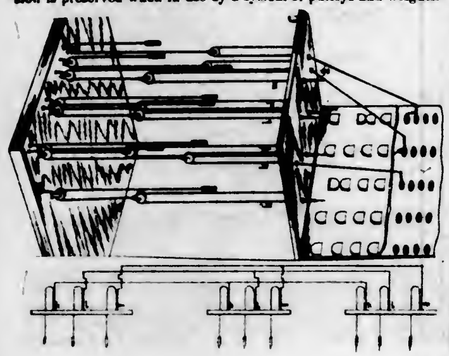
2. The combination of a normally-continuous main circuit, two or more stations thereon, transmitting and receiving instruments at each station, and at each station a continuously-revolving circuit-breaker and two branch circuits, both of which encircle the core of the receiver, and which extend respectively from the continuously-revolving circuit-breaker to the sections of the main line, which leave the station in opposite directions, substantially as set forth.

3. The combination of a continuous main line, two or more stations thereon, and at each station transmitting and receiving apparatus, a continuously-revolving circuit-breaker, branch circuits, both of which surround the core of the receiver and connect with their respective sections of the main line, a call-box, and a switch which may connect the branch circuits and cut the continuously-revolving circuit-breaker, substantially as set forth.

4. The combination of a continuous main line, two or more stations thereon, and at each station transmitting and receiving apparatus, a continuously-revolving circuit-breaker, branch circuits, both of which surround the core of the receiver and connect with their respective sections of the main line, a call-box, a switch which may be operated to connect the branch circuits and cut out the continuously-revolving circuit-breaker, and a switch-lever, which throws the receiver into circuit and grounds the sections of the main line, forming two electric circuits when it is lifted from the switch, substantially as set forth.

5. The combination of the continuous main line which leaves the stations in opposite directions, as set forth, a transmitter and battery, a continuously-revolving circuit-breaker, and induction-coils, the secondaries of which go to line, and in the primaries of which the continuously-revolving circuit-breaker is placed, substantially as described.

252,258. GAS-TRAP. JAMES W. ROGERS, Washington, D. C. Filed June 24, 1881. (No model.)



Claim.—1. A sack of flexible material provided with an annular chamber containing a suitable liquid surrounding a central passage, so as to act as a gas-check, substantially as set forth.

2. The combination of the sack C, containing an annular chamber, and the guard G, as and for the purpose set forth.

3. The combination of the sack containing an annular chamber and elastic bands or springs F, substantially as and for the purpose set forth.

252,259. TELEPHONE-EXCHANGE CIRCUIT. CHARLES W. ROSS, Columbus, Ohio, assignor to the Western Electric Manufacturing Company, Chicago, Ill. Filed Sept. 24, 1881. (No model.)

Brief.—The lines connecting the different boards of a duplicate system terminate in flexible conducting-cords provided with plugs for insertion into the subscriber's spring-jacks. The cords are automatically retracted when not in use, and a uniform tension is preserved when in use by a system of pulleys and weights.

Claim.—1. The combination of one or more sets of conducting-cords and plugs with the different switch-boards and connecting-wires permanently connecting each set to all the boards, whereby any given switch of one board may be connected directly with any given switch of any other board.

2. The combination of a fixed pulley, a movable pulley, and a supporting-cord and weight with a flexible conducting-cord and a switching device, as described, whereby telephone-lines may be connected and disconnected, while the slack of the conducting-cord is taken up from above and a uniform tension maintained, as and for the purpose specified.

3. The combination of sets of cords and plugs with three or more switch-boards, a cord with a terminal plug of each set being at each board, and connecting-wires, one for each set, permanently connecting the different sets, respectively, to all the switch-boards, whereby the circuit of any line of one board may be united directly with the circuit of any given line of any other board through a portion of the connecting-wire of any given set, substantially as and for the purpose specified.

4. Two or more telephone switch-boards provided with automatic cut-outs or switches, in combination with a conducting-wire passing to the several boards, and flexible conducting-cords, with pegs, connected to the conducting-wire, one at each board, whereby, by making one connection at each of the two boards, any two lines, one connected at one board and the other at the other board, may be disconnected from the ground and connected together.

5. Two or more telephone switch-boards provided with line terminals or switches, in combination with a conducting-wire passing to the several boards, and flexible conducting-cords, with pegs, connected to the conducting-wire, one at each board, whereby, by making one connection at each of two boards, any line of one board may be connected to any line of the other boards.

252,260. CUT-OUT FOR BURGLAR-ALARMS. WILLIAM H. SAWYER, Providence, R. I. Filed Sept. 24, 1881. (No model.)

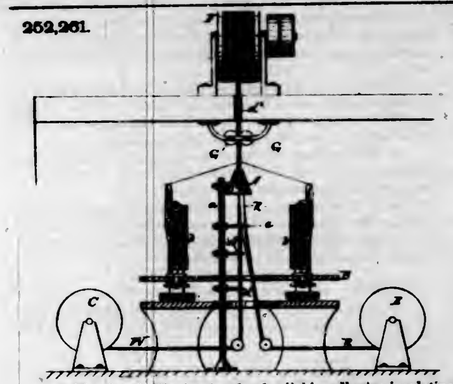
Brief.—A person provided with a suitable key and cognizant of the number of ratchet-teeth required to be passed over in order to break the circuit may from the outside cut out the alarm before opening the door, and after entering may by the same device restore the circuit to the alarm.

Claim.—1. In a cut-out for burglar-alarm circuits, the combination of the rod K, forced in one direction by a spring, and provided with finger N, the plate M, and the insulated plate Q, substantially as described.

2. In a cut-out for burglar-alarm circuits, the combination of the casing H, the rod K, arranged to rotate and move longitudinally in said casing, the finger projecting from said rod, the centrally-perforated and suitably-supported plate M, having slot *m*, and the insulated plate Q, carried by said plate M, substantially as described.

3. The combination of the casing H, the rod K, provided with the ratchet-wheel, and means for operation by a key, a pawl to engage said ratchet-wheel, a spring to move said rod in one direction, the finger projecting from said rod, the suitably-supported plate M, having a central aperture, and a radial slot opening into said aperture, and the insulated plate Q, all arranged to operate substantially as described.

4. A burglar-alarm circuit provided with a circuit-breaker and a cut-out arranged to short-circuit said circuit-breaker, and provided with means of operation from both sides of a wall or door, substantially as described.



5. The combination, with the rod K, constructed and arranged in a cut-out, as described, of the rod K', connected therewith by a universal joint, substantially as and for the purpose set forth.

252,261. INSULATED ELECTRICAL CONDUCTOR. WILLIAM H. SAWYER, Providence, R. I., assignor to Eugene F. Phillips, same place. Filed Aug. 17, 1881. (No model.)

Brief.—The insulation is perfected by a continuous operation.

Claim.—1. The herein-described continuous method of providing wire with an insulating-covering and an outer protecting-covering of fibrous material, the same consisting in covering the wire with a longitudinal strip of soft, pliable, adhesive insulating material, with its edges in contact with each other, superimposing a fibrous covering upon said insulating material and subjecting the wire thus covered to pressure, whereby the edges of the insulating material are caused to become firmly united and the fibrous outer covering is partially embedded in said soft adhesive insulating material.

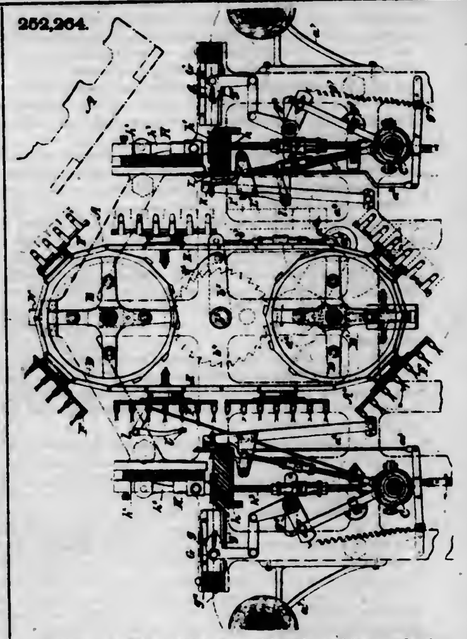
252,261.

2. The herein-described continuous method of preparing rubber-covered wire and providing the same with an outer protecting-covering of fibrous material, the same consisting in passing a suitable wire and an unvulcanized strip of rubber through a funnel-shaped guide, whereby the rubber is caused to surround the wire, applying, by means of a braiding-machine, a braided fibrous covering upon the rubber as the wire emerges from the said funnel-shaped guide, and passing the wire thus covered from said guide to compression-rollers, between which it is pressed to cause the adherence together of the edges of the rubber and the partial embedding of the braided covering in the rubber surface, essentially as set forth.

252,262. INSULATED ELECTRICAL CONDUCTOR. WILLIAM H. SAWYER, Providence, R. I., assignor to Eugene F. Phillips, same place. Filed Aug. 17, 1881. (No model.)

Claim.—The method of covering wires with rubber and an outer metallic covering, as herein described, the same consisting in arranging between two strips of unvulcanized sheet-rubber a series of suitably-spaced wires, placing upon the outer surfaces of said rubber strips, respectively, strips of metal foil, and simultaneously pressing the strips together and severing them between the wires, essentially as set forth.

252,263. MANUFACTURE OF BUILDING-BLOCKS. JOHN J. SCHILLINGS, New York, N. Y. Filed Oct. 11, 1881. (No model.)



Claim.—1. A building-block two opposite faces of which are provided with cavities, the cavities in each of said faces extending to within a short distance from the opposite face, while the remaining faces present solid or unbroken surfaces, substantially as shown and described.

2. The within-described process for producing building-blocks by placing clay or other suitable plastic material into a mold the top and bottom of which are provided with perforations, and then forcing from opposite sides, through these perforations, suitable pins for pressing the clay and producing cavities in two opposite sides of the block, as set forth.

252,264. SOD-TRAY MACHINE. NICHOLAS SCHNORR, Brooklyn, and JULIUS DUBEAUVAIS, New York, N. Y.; said DuBeauvais assignor to said Schnorr; said Schnorr assignor to Gustav L. Jaeger, New York, N. Y. Filed Feb. 16, 1881. (No model.)

252,264.

Claim.—1. The combination, with strip-making mechanism and a carrier and forms, of one or more placers, comprising clamps or holding-fingers for seizing the strips made by aforesaid mechanism and inserting them in said forms, substantially as described.

2. The combination of the carrier with a series of forms movable with and upon said carrier, and quarter-turns for acting successively on said forms, substantially as described.

3. The combination, with a form having clamps or spring-fingers, of a placer having clamps or holding-fingers and operating in connection with said form, substantially as described.

4. The combination, with a carrier and form supported thereby on a swivel or by a pivoted connection, of a quarter-turn for revolving said form, substantially as described.

5. The combination of a placer, form, and bottomer, substantially as described.

6. The carrier consisting of an endless belt or chain, supporting a series of swiveled forms, substantially as described.

7. The combination, with the endless belt and swiveled forms supported thereby, of the upper and lower quarter-turns, substantially as described.

8. The combination, in a form, with the boss supporting the clamps, of devices, substantially as described, for revolving said forms by engagement with other devices, as set forth.

9. The combination, with a carrier, one or more forms, and mechanism for advancing said carrier and forms, of one or more dischargers supported upon the machine-frame and a revolving cam for operating said dischargers, substantially as described.

10. The combination, with an endless belt or chain and one or more forms carried by said belt or chain and projecting beyond it at the sides, of one or more dischargers arranged to act upon the projecting portion, substantially as described.

11. The combination, with one or more forms comprising clamps or spring-fingers and releasing devices, as indicated, of one or more dischargers for acting upon said devices to relieve the pressure of the clamps or spring-fingers, substantially as described.

12. A form comprising, in combination with the base-plate and a number of clamps or spring-fingers, releasing devices, as explained, carried by the base-plate, for simultaneously releasing the pressure of said clamps or fingers, substantially as described.

13. The combination, with one or more pairs of holding-fingers hinged together and carried by pivoted uprights, of a cam and connections for closing and advancing and opening and returning said holding-fingers, substantially as described.

14. The combination, with one or more pairs of jaws or clamps hinged together and carried by a reciprocating support or supports to which one jaw or set of jaws is attached, of one or more operat-

ing rods or links connected with the other jaw or set of jaws, and a brake or friction devices for delaying the advance of said jaws, and thus securing the forcible biting or clamping of the same upon the material between them, substantially as described.

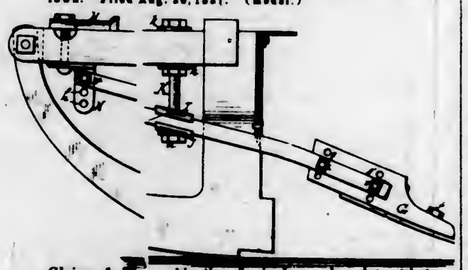
15. The combination, with a strip-making mechanism, of a placer comprising two clamping devices or sets of holding-fingers for receiving the strips when made, and operating means, substantially as described.

16. The combination, with an intermittently-operated carrier and forms, of a placer having clamping-plates or holding-fingers and also operated intermittently, and strip-making mechanism, substantially as described.

17. The combination of the strip mechanism for making the longitudinal cross-strips, the forms with spring-fingers, and carriers for receiving and conveying the strips, the placers with holding-fingers for receiving the strips as made and placing them in position, and the upper quarter-turn for revolving the forms after the longitudinal strips have been placed in the forms so as to bring them into position for receiving the cross-strips, substantially as described.

18. A machine for making egg-trays, comprising, in combination, duplicate feeders, punchers, clippers, and placers, a chain or endless belt, swiveled forms carried thereby, upper and lower quarter-turns or stationary prongs, and discharging apparatus, substantially as described.

19. In a machine of the character described, the combination, with an intermittently-rotating carrier, of an independent form pivotally connected with the carrier and intermittently carried around by the same, and having on its face a series of projecting receivers or clamps, substantially as described.



20. The combination, with an intermittently-rotating carrier, of a series of independent forms pivotally connected with and intermittently carried around by the carrier, and provided on their faces with projecting receivers or clamps, substantially as described.

21. The combination, with the series of independent forms pivotally connected with the intermittently-rotating carrier, and provided on their faces with projecting receivers or clamps, of the discharger arranged beneath the carrier, and mechanism, substantially such as described, connected with said discharger, for intermittently reciprocating the same as the forms are brought around in the part of the discharger, substantially as described.

22. The combination of an intermittently-rotating carrier and a series of independent forms pivotally connected with and intermittently carried around by the carrier, and having on their front faces the projecting receivers or clamps, with the placer and the cutting and slotting dies, substantially as described.

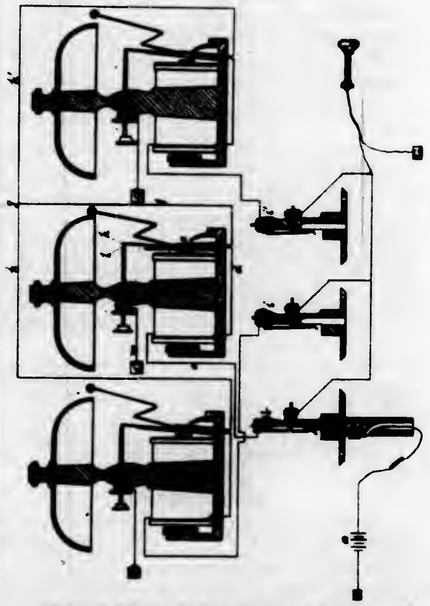
23. The combination, with the form and its clamps or receivers, and with the placer, of the clamps or placer, substantially as described.

252,265. CORN-PLANTER. LEVI SCOFIELD, Cedar Rapids, Iowa. Filed Aug. 30, 1881. (Model.)

Claim.—1. The combination of a single covering-plate with the runner and with a divided drag-bar pivoted to the frame near the upper front end of the runner, and supported between said pivot and the standard, whereby the inclination of said drag-bar can be adjusted and fixed in adjusted positions, and whereby the drag-bar is laterally supported by the standard from deflection in either direction, substantially as described.

2. The combination of a single covering-plate with the runner, with a long divided drag-bar pivoted to the frame near the upper front end of the runner, with a support between the pivot and the standard, and with an intermediate adjustable connection, G, arranged between the divided portion of the drag-bar and the covering-plate, substantially as described.

3. The combination of the drag-bar arranged above and independently of the runner with the covering-plate and with the intermediate block, G, adjustable on the drag-bar by means of a series of holes and a bolt, substantially as described.



4. The combination of the covering-plate with a divided drag-bar pivoted in front of the standard, and with the adjusting-bolt K, operating between the pivot and the standard, substantially as described.

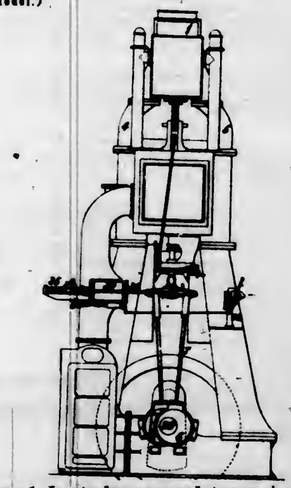
5. The combination of the covering-plate with the divided adjustable drag-bar suspended about midway of its length immediately in front of the standard, and with an adjustable pivot at the front end of the drag-bar, substantially as described.

6. The combination of the covering-plate, the pivoted divided drag-bar, the plates I J, or their equivalent, the screw-nuts *m n*, and the bolt K, substantially as described.

7. The combination of the covering-plate, the pivoted divided drag-bar, the adjustable connection between the plate and the drag-bar, and the adjustable suspending device immediately in front of the standard, substantially as described.

252,266. SELF-SWITCHING SIGNAL-BELL. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Filed Apr. 12, 1881. (No model.)

Claim.—1. The circuit of a battery through three or more electric bells, in combination with said bells and a ground-contact near the armature of the first bell, the succeeding two or more bells being placed one in each of the branches of the derived circuit, which extends from the armature of the first bell through the said two or more bells to a common line, whereby the current is directed automatically to ground, and thus momentarily cut off from the branches of the derived circuit, substantially as and for the purpose specified.



2. The combination of a battery, with three or more electric bells placed in the circuit of said battery, said circuit being connected with the armature of the first bell by line *d*, and extending thence in derived circuit through the two or more succeeding bells, one bell being in each branch of the derived circuit, the branches uniting in a common ground-line in which is placed the operator's telephone, and contact-points *h i*, whereby the current from the battery is momentarily diverted from the said branches and directed to ground at the first bell, substantially as and for the purpose specified.

3. The circuit of battery *a* through switches *b* and *i* to ground, in combination with two electric bells in circuit between said switches, a branch circuit from the armature of the first bell to ground, and means, as described, whereby the current is directed automatically to ground through said branch at each stroke of the first bell, thus preventing the second bell from ringing, as and for the purpose set forth.

4. The combination of three or more electric bells, with their armatures severally placed in distinct branch lines, an outer common line, a common ground-line at the central office, the coils of the electro-magnets of the bells respectively in the circuit of the branch lines which connect with said armatures, switching apparatus in each line or branch, and a ground-contact, and an automatic shunting device near the armature of each bell, whereby any given line may be separated from said common ground-line and closed to battery, and the current shunted to ground through the ground-contact of the armature of the bell in the line thus closed to battery, substantially as and for the purpose specified.

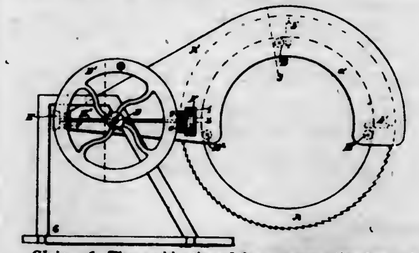
5. The combination of three or more electric bells, each placed in a different branch of a group of telephone-lines, with switching apparatus in each branch, between the ground and bells, and automatic switching devices, one device for each bell, whereby any line may be connected to battery, and the current thus directed through said given line may be shunted from the bells of the other lines of said group, substantially as and for the purpose specified.

252,267. STEAM-ENGINE. HOSACK SIM, Philadelphia, Pa., assignor of one-half to the William Cramp & Sons Ship and Engine Building Company, same place. Filed Oct. 29, 1881. (No model.)

Claim.—1. In a tandem compound steam-engine, the combination, substantially as set forth, of a high-pressure piston-rod having a conical or tapered end and a collar adjacent thereto, a low-pressure piston-rod having a conical central recess to receive the end of the high-pressure piston-rod, and an external thread, a nut fitting the thread of the low-pressure piston-rod and serving to clamp the piston thereof in position, and a threaded sleeve engaging said nut and securing the high and low pressure piston-rods together through the nut of the latter.

2. In a direct acting steam-engine, the combination, substantially as set forth, of a valve-link, a steam-reversing cylinder located substantially in line with said link when in the position corresponding to the termination of the strokes of the engine-piston, and a pair of connecting links or bars by which the valve-link and the cross-head of the reversing-cylinder are coupled directly together.

3. In a direct-acting steam-engine, the combination, substantially as set forth, of a valve-link, a steam reversing-cylinder located substantially in line with said link when in the position corresponding to the termination of the stroke of the engine-piston, and an exhaust-pipe which forms the standard or support of said reversing-cylinder.



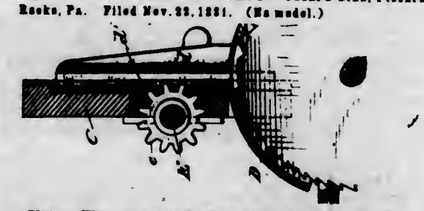
4. In a direct-acting steam-engine, the combination, substantially as set forth, of a steam reversing-cylinder and an exhaust-pipe which is recessed transversely adjacent to said cylinder and increased in width throughout said recessed portion, said cylinder and exhaust-pipe being connected by flanges on each side of said recessed portion.

5. The combination, substantially as set forth, of a crank-shaft, a balance-wheel secured thereto and having series of ratchet-teeth formed in reversed directions upon its periphery, a direct-acting steam-cylinder having a piston-rod and cross-head traversing tangentially to said balance-wheel, pawls pivoted to said cross-head and adapted to engage either of the series of ratchet-teeth of the balance-wheel, and a hand-lever connected to a rock-shaft by which either of the pawls may be engaged with or both disengaged from the teeth of the balance-wheel.

6. The combination, substantially as set forth, of a crank-shaft, a balance-wheel secured thereto and having series of ratchet-teeth formed in reverse directions upon its periphery, a steam-cylinder adapted to operate pawls engaging one or the other of the series of ratchet-teeth of the balance-wheel, and a pair of hand-levers mounted adjacent one to the other in a stand or bearing upon the working-platform of the engine, said hand-levers operating respectively, the one to engage and disengage the pawls and ratchet-teeth and the other to move the valve of the steam-cylinder.

7. The combination, with the cross-head of a turning-engine, of pivoted pawls, a rock-shaft having arms projecting in opposite directions and connected by links with said pawls, a shaft moving with said cross-head and connected by a link with one of the arms of the rock-shaft, and a hand-lever coupled to an arm on said longitudinally-moving shaft, the shaft and arm being connected through a feather and spline, so that the shaft shall partake of the vibrations of the arm and be allowed free longitudinal movement within it, substantially as set forth.

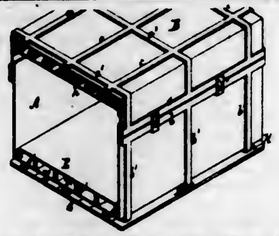
252,268. RIM-SAW MACHINE. OSCAR F. SILCOTT, Pellatty, Ohio. Filed Apr. 18, 1881. (No model.)



Claim.—1. The combination of the saw-supporting frame A', consisting of the segments *a a'*, suitably connected and containing rollers, as B B' B² and *b b'*, and the saw arranged to rotate between said segments, and the shaft D, connecting the supporting-frame A' to the main supporting-frame and permitting said frame A' to turn on said shaft D, substantially as and for the purposes specified.

2. The combination of saw-supporting frame A', consisting of the segments *a a'*, suitably connected, and containing rollers, as B B' B², and as *b b'*, and the saw arranged to rotate between said segments and carrying the boxes *e e'*, and the shaft E', journaled in said boxes, and provided with friction-wheel F, and the geared wheel and its shaft D, whereby the saw-supporting frame A' is hinged to the main supporting-frame, substantially as and for the purposes specified.

3. In a sawing-machine, the combination of the saw-frame A', hinged to the supporting-frame C by shaft D, carrying the operating hand or power wheel D', shaft E', supported in bearings *e e'*, carrying friction-wheel F, and pinion E, engaging a gear on wheel D', and saw A and anti-friction rollers, as *b b'*, preventing its lateral displacement, and anti-friction rollers, as B B' B², preventing displacement in the direction of its operating plane, substantially as and for the purposes specified.



252,269. CIRCULAR-SAW GUARD. JOSEPH SILL, Picture Rocks, Pa. Filed Nov. 22, 1881. (No model.)

Claim.—The saw guard or shield D, having the rack *d'* on its stem *d*, combined with beam C, shaft E, cog-wheels *e* and *e'*, and pawl F, substantially in the manner and for the purposes set forth.

252,270. APPARATUS FOR SWEATING TOBACCO. FREDERICK W. SMALLEY and ROBERT G. J. KERBAUGH, Jr., Brooklyn, N. Y. Filed Aug. 1, 1881. (No model.)

252,270.

Claim.—1. An apparatus for sweating tobacco, in which is combined a body for containing the tobacco, a movable cover provided with a stationary horizontal foraminous partition, and a filling of charcoal or other absorbent material interposed between the partition and the cover, for absorbing and retaining the gases arising from the tobacco during the sweating operation, substantially as described.

2. The combination, substantially as hereinbefore described, of the body A, the cover B, the compartment D in the cover, the false bottom E, and the space F beneath said false bottom and communicating with the interior of the body A.

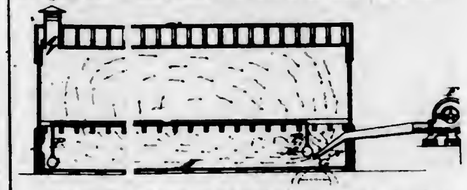
3. The combination, substantially as hereinbefore described, of the body A, the cover B, the guard-rails *b' c d'*, the shield G, and cleats H.

252,271. BREECH-LOADING FIRE-ARM. WILLIAM SOPER, Reading, England. Filed Sept. 27, 1880. (No model.) Patented in England Aug. 30, 1879.

Brief.—The side lever operates the breech-block by means of tumblers on its shaft and cocks the hammer by a link-connection. A stop operated by a supplemental trigger locks the breech-block in its closed position.

Claim.—1. The combination, in a fire-arm having the vertically-slidable breech-block *d*, of the lever *l*, arranged at the side of the gun, the tumbler *h*, fitted upon the spindle of the said lever and engaging the slidable breech-block, the movable rod connecting the tumbler with the cock, and the extractor *j*, acted upon by the said tumbler, whereby the opening of the breech, the cocking of the gun, and the extraction of the cartridge-shell will all be effected simultaneously by one downward movement of the lever, substantially as described.

2. The combination of the lever *l*, located at one side of the gun and provided with the transverse spindle *l'*, the tumbler *h*, secured to said spindle, the cock *f*, having the front projection, f^a, a link-connection between the tumbler and cock, and a vertically-sliding breech-block, *d*, constructed with the recess d^3, said members being constructed and arranged for operation substantially as described.



3. The combination of the tumbler *h*, mounted on the axis or spindle *l'*, and having the horns or projections h^2, the vertically-sliding breech-block *d*, having the grooves d^3 in its sides, which engage the horns or projections of the tumbler for depressing the breech-block by the direct downward pressure of said horns or projections, and a cock or hammer connected by a rod with the said tumbler, said members being arranged to operate substantially as described.

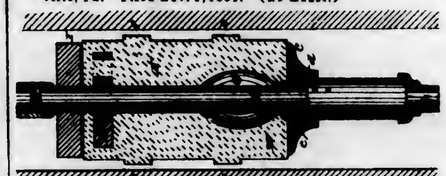
4. The combination, with the cock, the extractor, and the vertically-slidable breech-block, of the breech-tumbler *h*, fitted upon the spindle of the operating-lever, and formed with the studs *h' h'* or projections upon the arms h^2 h^2, the tubular transverse part h^3, the arm h^4, and a rod connecting the cock with the said breech-tumbler, for the purpose described.

5. The combination, with the vertically-sliding breech-block, of the upright lever or latch *p*, pivoted at its lower end, and provided with a rearward-projecting toe, q^2, and the pivoted breech-trigger *q*, having a toe, q^3, and acted on by a spring, substantially as and for the purpose described.

252,272. DRYING-KILN. GARRETT P. SPEER, Philadelphia, Pa. Filed Nov. 5, 1881. (No model.)

Brief.—The warm and moist air from the drying-chamber is brought in contact with the cold-air inlet to condense the moisture.

Claim.—The combination, in a drying apparatus, of a close chamber controlled by a relief-valve, steam-heating pipes, a condensing-fan or air-pump, and an air-cooled condenser formed by the flattened nozzle or tuyere of the fan, all constructed and arranged for conjoint operation substantially in the manner described.

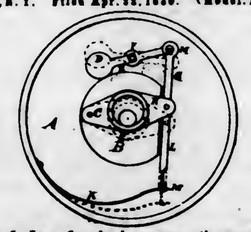


252,273. PURPLE DYE-STUFF OR COLORING-MATTER. JAS. H. STEBBINS, Jr., New York, N. Y. Filed Nov. 26, 1881. (No specimens.)

Claim.—A dark-violet coloring-matter produced by the action of an acid solution of the soda salt of betanaphtholmonosulpho-acid upon nitrosodimethylaniline hydrochlorate, substantially as described.

252,274. MANUFACTURE OF BLUE COLORING-MATTER. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Nov. 28, 1881. (Specimens.)

Claim.—A coloring-matter or dye-stuff produced by the action of the soda salt of monosulpho-acid of alpha naphthol on paramido dimethylaniline hydrochlorate, substantially as set forth.

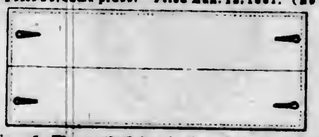


252,275. DEEP-WELL PACKING. LYMAN STEWART, Titusville, Pa. Filed Nov. 1, 1881. (No model.)

Claim.—1. In a deep-well packing, the combination, with the anchor and the upper sliding tubing-section, of the rubber annulus, concaved, as at G, near its lower end, substantially as set forth.

2. In a deep-well packing, a rubber annulus having an external rib, *e*, and an internal recess, G, opposite thereto, substantially as set forth.

252,276. GOVERNOR FOR STEAM-ENGINES. JOHN E. SWEET, Syracuse, N. Y. Filed Apr. 22, 1880. (Model.)



Claim.—1. In a fly-wheel governor, the combination of the eccentric with a single-acting governing weight or ball by suitable intermediate devices, whereby the gravitating action of the said governing weight is counterbalanced by the eccentric, as and for the purposes set forth.

2. The combination of the eccentric B, actuating and counterbalancing weight or ball D, centrally-pivoted lever E, and link G with the fly-wheel A, as and for the purposes set forth.

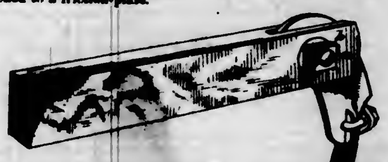
3. The combination of the fly-wheel A, eccentric B, counterbalancing weight or ball D, centrally-pivoted lever E, link G, and spring K, as and for the purpose set forth.

4. In a governor of the form described and moving pivotal joints formed of a circular pin or bearing resting on a plain surface, combined with the arms F and G of the governor and the arms C and H of the eccentric, so related that a parallel motion is produced and a rolling action is given to the pins on their bearing-surfaces, as hereinbefore set forth.

252,277. CUFF. ISAAC P. TURNER, Troy, N. Y., assignor to A. Clark Fellows, same place. Filed Aug. 12, 1881. (No model.)

Claim.—1. The method herein described of taking up the slack or fullness in a false or detachable cuff, the same consisting in forming a crease and a seam in the facing between its side edges after the thicknesses composing the cuff have been run together and before turning the same, substantially as described.

2. The method of taking up the slack or fullness in the back facing of a detachable cuff, the same consisting in cutting the parts of equal widths, running or stitching them together at the edges of the said parts after they are laid together wrong side out, then forming a crease along the facing-piece between its edges and running a seam along the said crease, and finally turning the cuff right side out through an opening at either of its ends, substantially as described.



3. As a new article of manufacture, a detachable cuff formed with a crease or creases and a seam or seams along its facing between the side edges of the latter, whereby the fullness or slack of the facing is taken up, and when turned the seam alone will be visible, substantially as described.

252,278. FIRE-BRICK AND FIRE-PROOF LINING FOR FURNACES. BERNARD ULLMANN, Königshütte, Prussia, Germany, assignor to Edward Cooper, New York, N. Y. Filed Nov. 15, 1881. (No specimens.) Patented in Germany July 25, 4288, Sept. 29, 1880, and Oct. 6, 1880, and in Belgium Oct. 15, 1880.

Claim.—As a new article of manufacture, basic fire-brick or fire-proof lining free from carbonic acid and water, produced by mixing limestone, dolomite, or magnesia with a binding material—such as chlorides or alkalies—then burning the mixture, then comminuting the same, then mixing it with tar, and finally reburning the mixture, substantially as herein described, or by any other means adapted to produce a like result.

252,279. CULTIVATOR-TOOTH. WILLARD A. VAN BERNT, Horicon, Wis. Filed Sept. 3, 1881. (Model.)

Brief.—A reversible spring-tooth with a longitudinal rib attached to a friction-plate.

Claim.—1. The combination, with the slotted bar, of a slipping plate pivoted thereto and having the perforated shank, spring-tooth secured to the latter, a clip-plate adapted to brace the tooth, and a clip for holding the tooth and clip-plate in position, substantially as set forth.

2. The combination, with the bar having an open slot [illegible] end, and a slipping plate consisting of a body and shank, [illegible] of the said plate adapted to be secured in the slot, while the [illegible] extends outward in a rearwardly-inclined direction, and a [illegible] hole for retaining the plate in any desired adjustment, of a [illegible] pointed reversible spring-tooth secured to the said shank, substantially as set forth.

3. The combination, with the bar, of the slipping plate pivoted thereto, a double-pointed reversible spring-tooth having a longitudinal rib, a clip-plate having a longitudinal groove corresponding to said rib, and devices for securing the slipping plate, clip-plate, and tooth together, substantially as set forth.

4. The combination, with the [illegible] ping plate having a perforated seat or bearing on its [illegible] of a spring-tooth provided with a strengthening-[illegible] ting through the perforated seat or bearing, and [illegible] vided with a longitudinal groove, substantially as [illegible]

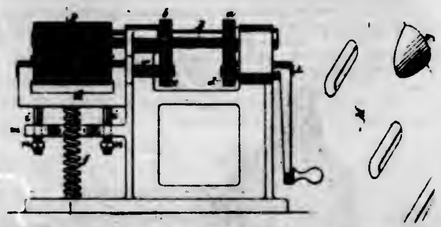
252,280. SEAT FOR BICYCLES. CURTIS H. VENDER, Plattsburg, N. Y. Filed Mar. 18, 1881. (No model.)

Claim.—1. A suspension-saddle constructed with a flexible portion, C, and having an under spring in two or more parts, B D, to which the flexible portion is attached at either end, and which metallic parts are extensible, substantially as and for the purposes set forth.

2. In a velocipede-seat, the combination of plates B and D, clamp F, stop b^3, and adjusting-bolt F', substantially as shown and described.

3. An adjustable supporting device for a velocipede-seat, consisting of a clamp, by which it is held to the perch or supporting-bar, depending links, and arms connected therewith and adapted to be connected with and to support the spring-plate of the saddle, substantially as set forth.

4. A supporting and adjusting device for a velocipede-saddle, consisting of slotted plates M' M', links M^3 M^3, and suitable connecting and clamping mechanism adapted to hold the same to a perch or supporting-bar and the spring-plate of a saddle, and constructed to operate substantially in the manner and for the purposes set forth.



5. In combination with the supporting-plate M and links M^3 M^3 and plates M' M', the spring m^2, constructed and attached substantially as and for the purposes set forth.

6. A spring-plate for a suspension-saddle, having its rear portion divided into two or more curved arms or branches, constructed and adapted to support the rear end of a flexible seat, substantially as shown and described.

7. In the supporting mechanism of a seat to a bicycle, the spring-plate D, with two or more curved arms, in combination with the plate B, substantially as and for the purposes set forth.

8. In combination, a supporting and adjusting device for a velocipede-saddle, consisting of the parts K K' K^3 K^3, suitably connected and attached by clamping mechanism to a perch or supporting-bar with the spring-plate of a saddle, all substantially as and for the purposes set forth.

252,281. MACHINE FOR CUTTING SHANK-STIFFENERS FOR BOOTS AND SHOES. CHAS. B. WEBB, Philadelphia, Pa. Filed Nov. 23, 1881. (No model.)

Claim.—1. The within-described knife for cutting shank-stiffeners, said knife having a beveled front edge, *a*, the continuity of which is interrupted by the gauge *y*, beveled in the opposite direction, as set forth.

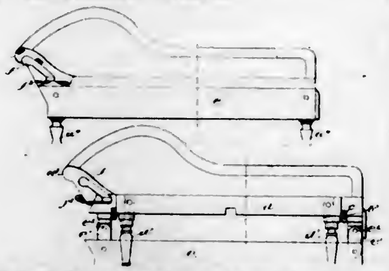
2. A knife for cutting shank-stiffeners, said knife having [illegible] edge, part of which is beveled on one side and the [illegible] made in the shape of a gauge and beveled on the [illegible] whole being made in one piece, as set forth.

3. The combination of the knife M, having the beveled [illegible] gauge *y*, with the feed-rolls D and J, as set forth.

4. The combination of the feed-rolls D and J, the [illegible] having a beveled edge, *a*, and gauge *y*, and the knife-carrier [illegible] adjustable on the frame of the machine, as set forth.

252,282. ROLLER FOR MOVING HOUSES. JONATHAN C. WILSON, Rogersville, [illegible]. Filed June 11, 1881. (No model.)

Claim.—1. A roller for use in moving large structures, having a central bearing, D, outer bearing-wheels, B, and inner wheels, C, of smaller diameter, whereon the outer walls are full or equal toward said central bearing, substantially as specified.



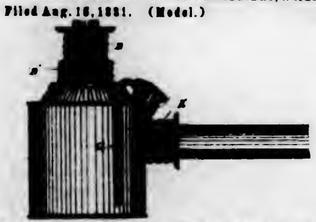
2. The combination, with a roller having circular bearings B

252,282.

and C, of different diameters, and a central bearing, D, of smaller diameter, having convex side walls, H, of the cap or bearing-block E, having the concavity F, and saddle-plate G, substantially as specified.

252,283. BED-LOUNGE. JOSEPH D. WESTGATE, Manchester, N. H. Filed Nov. 7, 1881. (No model.)

Claim.—1. In a bed-lounge, the main frame and the auxiliary frame, having journals c mounted upon slide-bars, as described, the auxiliary frame being adapted to be inverted, substantially as set forth, to bring it into a higher plane to coincide with the position occupied by the main frame.



2. The main framing and its slide-bars b^2, combined with the auxiliary sliding and reversible frame d, and with pivoted legs d', to operate substantially as described.

3. The main framing a, combined with the front board and its supporting-links c', to operate substantially as described.

4. The main framing and main head-piece, combined with the auxiliary head-piece and its carrying-arm f^3, shaped to permit the auxiliary head-piece to be placed under the main head-piece, or end to end with it as a continuation thereof, substantially as described.

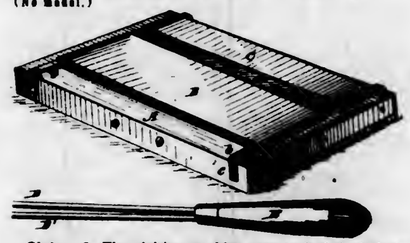
5. The main frame-work and its head-piece and sliding bars b^2, combined with the sliding reversible auxiliary frame d, having trunnions supported in bearings in the said slide-bars, and with the auxiliary head-piece and its pivoted carrying-arm f^3, to operate substantially as described.

252,284. MINER'S LAMP. DAVID D. WILLIAMS, Wilkes-Barré, Pa. Filed Aug. 16, 1881. (Model.)

Claim.—1. In combination with the lamp-body and its removable screw-threaded handle, the cap secured thereto, and provided with a screw-threaded extension surrounding the wick, into which the handle is adapted to be screwed to serve as a cap for the wick-tube, substantially as specified.

2. In combination with the body of the lamp, having the tube B and cap B' and its extension D, the detachable screw-threaded handle, adapted to be attached to the lamp-body or secured to the wick-tube, as desired, substantially as and for the purposes specified.

252,285. SPEED-INDICATOR FOR SHAFTING. LOUIS J. WOEHLER, Detroit, Mich. Filed June 8, 1881. (No model.)



Brief.—Two cog-wheels mesh into a worm-shaft carried by the revolving shaft or wheel. One wheel has one hundred teeth and the other a hundred and one. Each revolution will be indicated by the pointer moving one degree on the dial.

252,285.

Claim.—The combination of the plate D, having a spring, E, and pintle p, with the wheel b, having hub o, wheel B, index-finger c, and worm-shaft H, substantially as described.

252,286. PLAITING-MACHINE. JOHN I. D. WOODRUFF and LAURICY Y. WOODRUFF, St. Charles, Ky. Filed Aug. 8, 1881. (No model.)

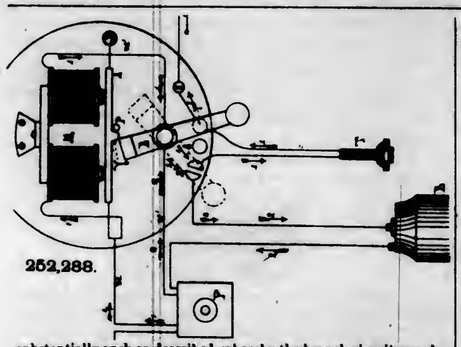
Claim.—1. The plaiting-machine composed of the bed-piece A, parallel guides b b, and flexible apron B, substantially as described, for the purpose set forth.

2. The plaiting-machine composed of the bed-piece A, parallel guides b b, flexible apron B, and sheet-metal clamping-apron C, substantially as described, for the purpose set forth.

3. The plaiting device or knife consisting of the parallel blades D D', of unequal length, with or without a handle.

252,287. PROCESS OF TREATING MINERAL PYRITES AND SULPHIDES FOR THE MANUFACTURE OF SULPHUROUS AND SULPHURIC ACIDS. HENRY WURTS, New York, N. Y. Filed Apr. 11, 1881. (Specimens.) Patented in Canada Oct. 1, 1881.

Claim.—1. The consolidation of granular sulphurets before burning in kilns to make sulphurous or sulphuric acids into cakes, lumps, or blocks by mixing therewith metallic iron in comminuted or divided form, and causing this iron to rust and form hydrated oxide or a basic salt in the interstices of the mass by mixture with a saline solution.



2. Accelerating and intensifying the rusting and cementing action of metallic iron when mingled with granular sulphurets to be burned in kilns for making sulphurous and sulphuric acids by the process of alternately moistening the mixture with water and drying, either spontaneously or by a gentle heat, as herein specified.

3. As a new product or composition of matter to be used in making sulphurous and sulphuric acids by burning the same in kilns, a consolidated product made by mingling together granulated metallic sulphurets with granulated metallic iron, asbestus, or mica, and in which composition oxidation or rusting has been produced by the action of a saline solution, as herein described.

252,288. ELECTRICAL SIGNALING APPARATUS. CHARLES E. BUELL, New Haven, Conn., and J. FREDERICK BUELL, Woburn, Mass.; said Charles E. Buell assignor, by mesne assignments, to the United States Telephone Manufacturing Company, New York, N. Y. Filed Jan. 31, 1880.

Brief.—The bell-magnet at a subscriber's station is included in the main line, and its armature is provided with a projection which locks the telephone-switch when the armature is not attracted. The main battery being kept on the line except during conversation, the switches are free to move in the normal condition of the line, but locked when conversation is being carried on. By this means interruption is prevented.

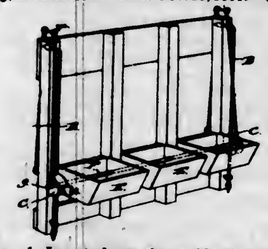
Claim.—1. In a telephone-station apparatus, the combination of the following elements, to wit: a main electric circuit, an independent branch circuit including a telephone, and switch devices,

252,288.

substantially such as described, whereby the branch circuit may be interposed in and withdrawn from the main circuit, essentially as herein set forth.

2. The combination, with a charged main telephone-line and a station telephone-circuit, of a switch and an attracted armature of the electro-magnet included in the said circuit, the switch and the armature being arranged to be interlocked with each other when the attraction of the armature has ceased by the removal of the charging-batteries from the main circuit, substantially as described, whereby the telephone-circuit is prevented from being interposed in the main circuit after the charging-batteries are removed from the main circuit, as set forth.

3. The combination, with a main electric circuit, of a telephone apparatus, substantially as described, provided with a switch and connections arranged to interpose a telephone and transmitter in the said main line, and to simultaneously close a local battery through said transmitter and produce a call or signal upon said main line, as set forth.

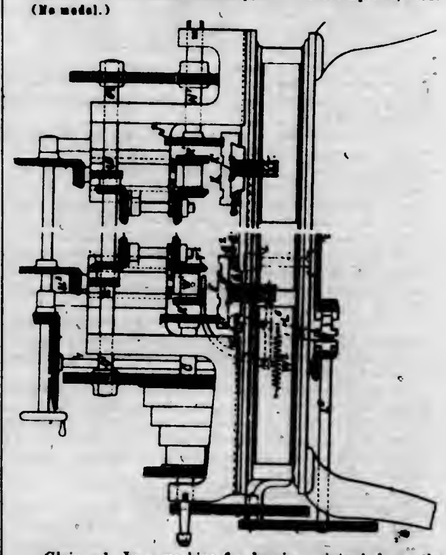


4. The combination, in a telephone-station apparatus, of a call-bell electro-magnet included in a main circuit, a telephone, and a transmitter in a branch circuit with a switch and connections, substantially such as described, whereby the telephone branch circuit may be interposed in the main circuit with the said call-bell electro-magnet, as set forth.

5. The combination, with a charged main electric circuit, including a telephone-station, of a telephone apparatus provided with a switch, an electro-magnet, and an attracted armature, said armature being arranged to lock the switch when the attraction ceases to prevent it being turned to interpose the telephone in the main electric circuit, as set forth, whereby the central office can look out stations not already interposed by removing the charging-batteries from the main line.

6. The combination, with a single-coil electro-magnet, of a bell attached to and supported by the rod or core which retains the helix of the magnet, substantially as described.

7. The combination, with a call-bell electro-magnet, of a stationary bell arranged to cover the electro-magnet and armature, and having a projecting piece rigidly attached to its inner surface to receive the blows of the armature or hammer, substantially as described.

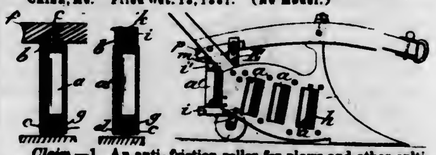


252,289. STOCK-CAR. GEORGE J. CLINE, Goshen, Ind., assignor of two-thirds to Stanley Harding, same place, and Hugo B. Busing, Rockford, Ill. Filed Nov. 19, 1881. (Model.)

Claim.—1. In a stock-car, the combination, with the vertical slide-rods B and the slide-heads C thereon, of the vertically-adjustable horizontal rod F, pivoted in the slide-heads, the set-screws s, and the troughs E, secured to said horizontal rod, substantially as specified.

2. In a stock-car, the revolvable horizontal rod carrying the troughs, and pivoted in vertically-adjustable bearings having set-screws for the rotary adjustment of said horizontal rod and ropes for raising and lowering the bearings, substantially as specified.

252,290. MACHINE FOR DRESSING PRINTERS' CHASES. CALVERT B. CORNELL, Westerly, R. I. Filed Apr. 14, 1881. (No model.)



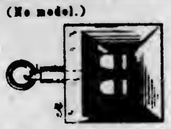
Claim.—1. In a machine for dressing printers' chases, the combination of a pair of cutters or milling-tools, one of which is arranged to move up and down, with a supporting and reciprocating bed and suitably-operating mechanism, whereby the outer and inner edges of a chase-frame and the adjacent inner corners may be completely finished, as hereinbefore set forth.

2. In a machine for dressing printers' chases, the combination of two pairs of cutters, one of each pair of which is arranged to move up and down, and their supporting mechanisms, whereby two opposite sides of a chase-frame and their adjacent inner corners may be completely dressed or finished, as hereinbefore set forth.

3. The combination of two supporting and moving beds, arranged transversely to the main frame and adapted to be adjusted relatively to each other for receiving the various sizes of work, as hereinbefore set forth.

4. The combination of the double clutch and its lever with the shifting devices on the supporting-bed and on the guide of the supplementary cutter, to trip said clutch to and fro for varying the movements of the bed and the supplementary cutter or cutters, as hereinbefore set forth.

252,291. PLOW. WILLIAM A. BOYNS, Vassalborough, assignor of three-eighths to Andrew Webber and Hartwell B. Haskell, China, Me. Filed Oct. 13, 1881. (No model.)



Claim.—1. An anti-friction roller for plows and other cultivators, having the ends of its journal, shaft, or pivot loosely inclosed in a movable nipple, which is adapted to revolve in its bearing for the purpose of diminishing wear, all the parts being constructed and arranged substantially as specified.

2. The combination, with the mold-board and landside of a plow having bearings e f and slots h, of the rollers a, arranged toward the rear sides of said slots, and provided with recesses or journal-boxes c, and the movable nipples g, placed loosely within said journal-boxes and surrounding the journals of the rollers, substantially as and for the purpose set forth.

3. The combination, with a plow-frame, of the adjustable roller a', having its journals inclined in nipples g, and provided with a rod or bar, k, substantially as described.

252,292. CAR-COUPLING. JOSEPH C. FOWLER, Houston, Tex., assignor of one-half to Sinclair Taliaferro, same place. Filed Nov. 25, 1881. (No model.)

Claim.—1. In a car-coupling, the vertically-movable coupling-pin provided with a horizontal cross-bar adapted to rest upon the link when the latter is engaged by the coupling-pin, substantially as described.

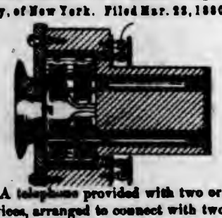
2. The combination, with the draw-head having grooves in its inner vertical walls, of the coupling-pin provided with a horizontal cross-bar having its ends received into the said grooves, substantially as and for the purpose described.

3. The combination, with the draw-head having grooves in its inner side walls, with notches at the lower ends of said grooves, of the coupling-pin provided with a horizontal cross-bar having its ends received in the said grooves, whereby lateral strain on the coupling-pin in a forward direction when the pin is down will draw the ends of the cross-bar into said notches and thereby lock down the coupling-pin, substantially as described.

4. The combination, with the draw-head having grooves in its inner side walls, of the coupling-pin provided with a cross-bar having its ends received into said grooves, and the spring arranged to depress the coupling-pin, substantially as described.

5. The combination, with the draw-head, of the coupling-pin provided with a cross-bar having its ends received in grooves in the draw-head, said coupling-pin being formed with the shoulder or offset E on its rear edge, whereby the shock and strain upon the cross-bar when the coupling-pin is raised will be partly relieved, substantially as described.

252,293. ELECTRO-MAGNETIC BRAKE. LEONARD W. GOSS and HUGO WALTER, Cincinnati, Ohio, assignors, by mesne assignments, to the Waldamar Electro Magnetic Brake Company, of Ohio. Filed Mar. 28, 1881. Renewed Dec. 3, 1881. (No model.)



Claim.—1. In an electro-magnetic brake, the pole-piece *a*, in combination with a friction-shoe insulated therefrom, as set forth.

2. In an electro-magnetic brake, the core A, pole-piece *a*, shoe *b*, and backing *b'*, in combination substantially as and for the purpose specified.

3. In a double electro-magnetic brake for railway-cars, a hollow brake-bar, A, constituting the core of an electro-magnet, connecting the brake-shoes, substantially as set forth.

252,294. TELEPHONE. ERWIN T. GREENFIELD, Brooklyn, N. Y., assignor of one-half to the Holmes Burglar Alarm Telegraph Company, of New York. Filed Mar. 28, 1880. (No model.)

Claim.—1. A telephone provided with two or more magnets or equivalent devices, arranged to connect with two or more independent line-wires, substantially as described.

2. The combination, in a telephone, of two or more independent helices, arranged upon the same magnet or bar and connecting with separate line-wires, substantially as and for the purpose set forth.

3. The combination of two or more independent line-wires with one receiving-telephone, for the purposes set forth.

4. The combination of two or more telephonic conductors with one telephone by means of a plurality of magnets or equivalent devices, substantially as described.

5. The combination of two or more magnets or equivalent devices, arranged in a single telephone, and provided with independent helices connecting with separate line-wires, and a yoke connecting the poles of the magnets, substantially as described.

6. The combination, in a telephone, of two or more independent helices connecting with independent line-wires, substantially as and for the purposes set forth.

252,295. NUT-LOCK. DANIEL P. PRESCOTT, Vernon, Vt., assignor of one-half to Marcus M. Beeman, Syracuse, N. Y. Filed Sept. 8, 1881. (No model.)

Claim.—The within-described improved nut-lock, consisting of the nut A and the pawl *e*, said nut being provided on its under face with a single vertical socket to receive the short arm of said pawl, and with a groove to receive the downwardly-inclined long arm thereof, reaching from said socket beyond the sides of said nut, the combination and arrangement of said nut and pawl being substantially as and for the purpose set forth.

252,296. CARBON OF TELEPHONE-TRANSMITTERS. CHAS. E. SCRIBNER and GEORGE D. CLARKE, Chicago, Ill., assignors to the Western Electric Manufacturing Company, same place. Filed Oct. 16, 1880. (No model.) Patented in England Nov. 20, 1879.

Claim.—1. In a carbon-telephone, the combination of a piece of hard carbon with the button of soft carbon, the hard carbon being provided with a true surface, which is in contact with the soft carbon, the hard-carbon and soft-carbon buttons thus combined forming the contact-electrodes or medium of variable resistance, as and for the purpose set forth.

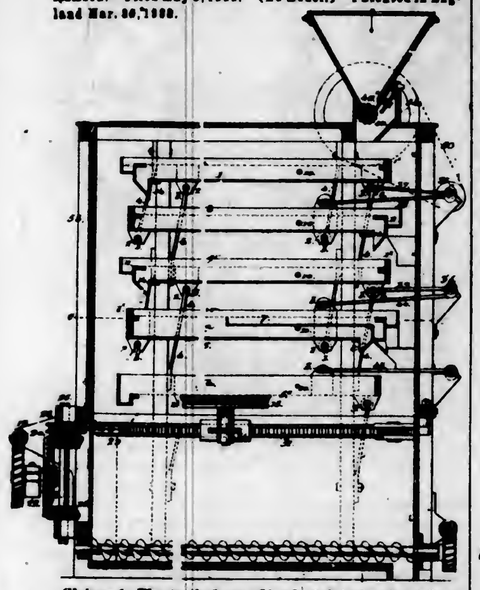
2. In a telephone-transmitter, the combination of a piece of hard carbon with its upper surface coated with metal, and the button of soft carbon, and the diaphragm, the piece of hard carbon and the button of soft carbon having surfaces in contact and forming the contact-electrodes, substantially as and for the purpose specified.

252,297. DEVICE FOR CONVERTING RECIPROCATING INTO ROTARY MOTION. ABSALOM G. SMYTH, Hamilton, Ontario, assignor of one-half to John Smith, Brantford, Canada. Filed Aug. 11, 1879.

Claim.—1. An opening or recess, B, placed in a shaft so constructed and arranged that a pawl may be used upon either side of said shaft and engage the central portion of rack-wheel E, substantially as and for the purposes set forth.

2. A lock or clutching device composed of a recess and pawl, contained in a shaft upon which a loose wheel may be placed, in combination with a rack-pitman, for the purpose of converting reciprocating into rotary motion, as set forth.

3. A rack-pitman having the side pieces, J I, made long, so that a piece, J, may be securely fastened between them, for the purpose set forth.

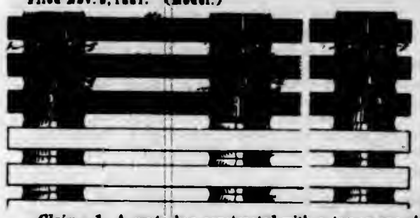


4. In a rack-pitman, one or more cogs, *d*, left wider than the others, for retaining the rack in gear, as and for the purposes set forth.

5. In combination with a locking device and gear-wheels E E, for converting reciprocating into rotary motion, an adjustable rack-pitman, as and for the purpose set forth.

6. A guard-frame provided with the opening L or its equivalent, constructed and arranged substantially as and for the purpose set forth.

7. A nib, N, or projection, formed on block K, in combination with pin *i* or its equivalent, for the purpose of retaining the guard-frame in position, as shown and described.

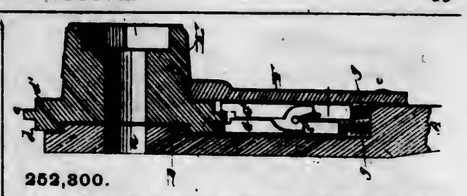


252,298. MACHINERY FOR DRESSING AND SIFTING FLOUR, &c. PENDR. THOMPSON and WM. H. WILLIAMSON, Wakefield, County of York, England; George Marsh and Samuel Bruce, Executors of said Frederick Thompson, assignors to said Williamson. Filed May 3, 1880. (No model.) Patented in England Mar. 30, 1880.

Claim.—1. The toothed way 31, adapted to be elevated or lowered, as set forth, in combination with a horizontally-revolving brush and operating mechanism, as shown and specified.

2. The combination of a brush, 18, with the pinion 24, carriage 32, toothed way 31, endless chain 29, pulleys upon which the chain is worked, and suitable operating mechanism to produce an alternate motion, as set forth.

252,299. GRATE-BAR. THOMAS P. VAN KLEECK, Sangerties, N. Y., assignor to himself and Howard Finger, same place. Filed Nov. 9, 1881. (Model.)

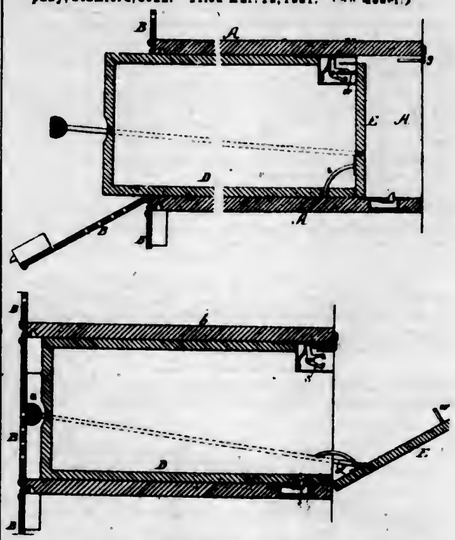


Claim.—1. A grate-bar constructed with a lug on one side having a ventilating-passage and with a socket on the opposite side adapted to receive a corresponding lug of another grate-bar, the sides of the socket having ventilating-grooves which communicate with the ventilating-passage of the lug, substantially as described.

2. A grate-bar provided with tubular ventilating-lugs and with sockets having ventilating-passages, the lugs and sockets being tapered and adapted to interlock respectively with the ventilating-lugs and sockets of a corresponding grate-bar, substantially as described.

3. A grate-bar constructed with lugs *a*, having shoulders *c* and ventilating-passages *e*, and with sockets *b*, pins *d*, and ventilating-grooves *f*, substantially as described.

252,300. RATCHET-WRENCH. JAMES W. WOOLDRIDGE, Guyandotte, W. Va., assignor to himself and A. H. Simms, same place, and Robert T. Guey, Huntington, W. Va. Filed Nov. 19, 1881. (No model.)



Claim.—1. The combination of the perforated circular bearing D on one side of the enlarged end of the handle A, the perforated right-and-left ratchet-hub E, fitted on said bearing, the division *e* thereof, the nut-socket in one end of the hub, the removable retaining-plate F, and the spring-actuated pawls inclosed in the handle, substantially as described.

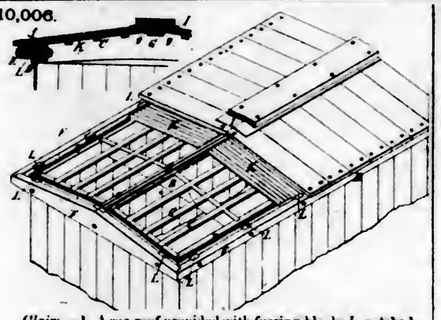
252,300.

2. The combination of the right-and-left ratchet-hub E, the bearing D, and retaining-plate for the hub, the spring-actuated pawls G G', for the right and left teeth of the said hub, the shoulders *i i* on these pawls, the key, and the channeled stock, substantially as described.

252,301. POST-OFFICE BOX. CHARLES S. THOMPSON, Philadelphia, Pa., assignor to the Yale Lock Manufacturing Company, Stamford, Conn. Filed Mar. 12, 1881. (No model.)

Claim.—1. The combination of the post-office compartment A and its hinged door B, having locking attachment, the box D, adapted to the said compartment, and the door E, hinged to the open end of the said box at the lower edge of the same, in combination with mechanism, substantially as described, whereby the door E of the box is retained in an open condition by the door B of the compartment, as set forth.

2. The post-office compartment A, its hinged door B, and spring-catch *a*, the box D, its hinged door E, and the handle *c*, connected to the said door and rendered inoperative by the door B of the compartment as long as the latter is closed, in combination with a self-locking device on the box and its door, and with a device on the same for operating the said spring-catch, all substantially as set forth.



3. The combination of the box D and its door E with the handle *c* at the closed end of the box and with rods *d d* outside the said box for connecting the door to the handle, as specified.

REISSUES.

10,006. CAR-ROOF. HIRAM ALDRIDGE, Chicago, Ill., assignor, by mesne assignments, to Chicago Car Roofing Company, same place. Filed Nov. 18, 1881. Original No. 221,142, dated Nov. 4, 1879.

Brief.—The metal sheets extend beyond the edge of the car-body and rest on notched furring-blocks in the drip-passages formed between the walls of the car and the eave-plates.

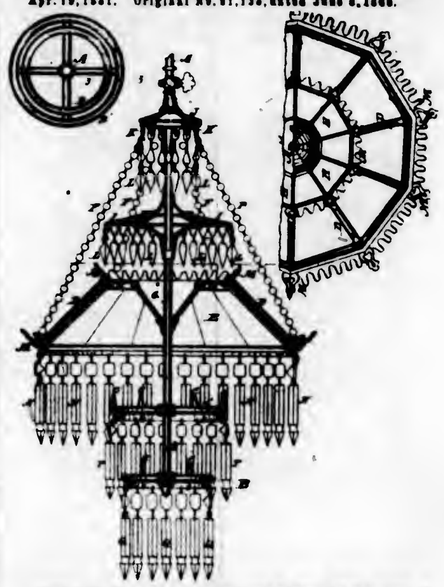
10,006.

Claim.—1. A car-roof provided with furring-blocks I, notched, as at *f*, and applied within drip-passages formed between the eave or outer plates, E, and the car-body, said passages being extended down to the bottom edges of said plates, whereby the metal sheets are allowed to extend beyond the outer surface of the car-body, and are prevented from slipping so as to entirely close the drip-passages, while the drip-water is allowed to directly descend to the ground without coming in contact with the car-body, substantially as described.

2. A car-roof having its metal sheets used for prevention of leakage extended beyond the range of the car-body, and having drip-passages F, which are formed between the walls of the car-body and the eave or outer plates, E, and extended down to the bottom edges of said plates E, partly over which said metal sheets extend, substantially as described.

3. The combination, in a car-roof, of the metal sheets or plates, furring-blocks, notched, as at *f*, purlins and carlings, and the ridge-pole rabbeted flush with the bases of the notches of the furring-blocks and with the bearing-surfaces of the purlins and carlings, substantially as and for the purpose described.

4. The combination of the running-board, faced on its under side with water-shedding material, the covering or deck boards, rabbeted ridge-pole, notched furring-blocks, metal sheets, and the frame-work of the car-roof having eave or outside plates, substantially as and for the purpose described.



10,007. PLOW. MARK COOPER, Spartanburg, S. C. Filed Dec. 23, 1881. Original No. 247,999, dated Oct. 4, 1881.

Claim.—1. The plow-standard constructed of the pieces *a a'*, the piece *a* being bent at right angles above the beam and passing through the perforation in the upper end of piece *a'*, in combination with and clasping the beam A and the bolt k, all constructed and operated as and for the purpose set forth.

2. The double rear brace, C, adapted to receive a movable grass-cutter or other attachment, N, secured by bolt and nut *p*, and its lower portion bent to form the land-slide, in combination with and pivoted to the lower end of the front double standard, B, at hole k, all constructed, arranged, and operated substantially as set forth.

10,008. CHANDELIER. CHARLES F. JACOBERG, New York, N. Y., assignor of one-half to Isaac P. Frisk, Newark, N. J. Filed Apr. 19, 1881. Original No. 91,135, dated June 8, 1869.

Claim.—1. The combination of two or more burner-rings B B', placed the one above the other, with the pipe or rod A and reflector D E G, substantially as herein shown and described, and for the purpose set forth.

2. The rings B B', provided with the flanges O O, to receive and support the glass pendants, as herein shown and described, for the purpose set forth.

3. In combination with the reflector D E, having struck-up edges or beading and flanges for holding the glass, the borders or bands M, said bands being designed for stiffening and ornamenting the reflector, substantially as and for the purpose described.

4. The panels in the outer part of the reflector D E, surrounded by beads or ribs, substantially as and for the purpose described.

5. A silver-coated glass reflector, made water, air, and heat proof by cement, substantially of the nature described.

6. As a means of protecting the silver-covered surface of glass for reflectors against air, heat, and moisture, the shellac or varnish coating covered with a cement composed of plaster-of-paris, oxide of zinc, and varnish, substantially as set forth.

7. A silver-coated glass reflector provided on its back with an air, moisture, and heat proof covering, consisting of a cement composed of dry pigments and varnish, substantially as and for the purpose specified.

8. The combination of the two canopies I and J, provided with borders or bands K and pendants L, with the rod or pipe A and polygonal and pyramidal reflectors D E G, substantially as herein shown and described, and for the purpose set forth.

9. The combination and arrangement of the rod or pipe A, rings B B', provided with burners, polygonal and pyramidal reflectors D E G, chains F, canopies I J, provided with raised borders K and pendants L, and pendants N P Q, with each other, substantially in the manner herein shown and described, and for the purpose set forth.

ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

MCKESSON *et al. v.* CARNDICK.

Decided April 8, 1881.

1. IMPROVEMENT IN PILL-MACHINES—CONSTRUCTION OF PATENT.

An improvement described as consisting in the employment, either in a combination with a molding device for shaping pills or other holder for them, of a comb-bar with pins or needles adapted for inserting a pin in each mold-cavity for taking the pills and dipping them in a coating solution, and a clamp and stripper for taking them from the needles and redipping them for filling and covering the cavities formed by the pins, claimed as "the combination of the molds A with the comb-bar B, substantially as and for the purpose specified," *Held* to cover any suitable holder of pills co-operating with a comb-bar, whether the pills are formed in it or in another mold.

2. SAME—COMBINATION—AGGREGATION.

There is a combination between two or more elements if there is a concert of action between them for a definite time to accomplish a result due to their conjoint action, even though the device may then be separated and perform other functions.

3. SAME—STATEMENT OF INVENTION DISTINGUISHED FROM CLAIMS.

Where in the specification an invention was stated to consist of four (4) elements in combination, and in the claims there are two combinations of less number of elements and no claim for the combination of all four elements, *Held* that the claims, if clear and distinct, must control.

Mr. Frederick H. Betts for the plaintiffs.

Mr. James A. Whitney for the defendant.

BLATCHFORD, *J.*:

This suit is brought on letters patent granted to Pierre Cauhapé January 3, 1871, for an improvement in pill-machines. The specification states the invention to be an "improvement in the manufacture of pills." It says:

This invention relates to improvements in the manufacture of pills; and it consists in the employment, either in a combination with a molding device for shaping pills or other holder for them, of a comb-bar with pins or needles adapted for inserting a pin in each mold-cavity for taking the pills and dipping them in the coating solution, and a clamp and stripper for taking them from the needles and redipping them for filling and covering the cavities formed by the pins, all as hereinafter described.

Figure 1 is a transverse section of the mold and the device for taking them therefrom. Fig. 2 is a side view of the device for taking the pills from the mold and dipping them; also, a sectional view of the bath, showing the manner of dipping them. Fig. 3 is a perspective view of the clamp, stripper, and the device for taking them from the mold, showing the manner of stripping them. Fig. 4 is a side elevation of the clamp, and Fig. 5 is a face view of the same.

Similar letters of reference indicate corresponding parts.

The pills are to be formed in a mold or flask, A, composed of two parts, either hinged together or not, each having a part of the cavities, of which there may be any convenient number, and from each cavity a groove extends to one side, so that where the two parts of the mold are closed together a pin may be thrust into the pill for removing and holding it; and in connection with this mold a comb-bar, B, is used having as many pins or needles, C, as there are cavities projecting from it the same distance apart as the cavities for inserting into said cavities and taking the pills therefrom. The mold is then opened, the pills removed on the pins and inserted in the bath of glycerine or other substance with which they are to be coated. Then, for holding and redipping the pills to fill and cover the cavities left by the withdrawal of the pins, I use a clamp composed of the two bars E, hinged together as shown in Fig. 3, and the elastic frictional strips F, of india-rubber or other like substance, the latter being placed on the faces of the said bars, which come together when closed over cavities G, made considerably longer than the pills and opening out through the front edges of said hinged bars, as clearly shown in Figs. 3 and 5, in which the pills are inserted by opening the clamp, presenting them thereto coincident with the cavities while on the pins, and drawing the latter back over the stripping-bar H, placed in front of the clamp, and having the small grooves I in the upper surface placed in front of the cavities for guiding the pins of the comb-bar in placing the pills in the clamp. The pills are held by the soft, flexible, and elastic strips F, so that the ends having the holes project, as shown in Fig. 4, and may be dipped to cover and fill the holes and then be discharged by opening the clamps.

In practice the molds, comb-bar, clamp, and stripper may be made in any convenient length and with any preferred number of holes best calculated to effect a rapid operation; and any number of sets of apparatuses may be used in case it may be required to retain the pills on the pins or in the clamp for drying the substance with which they are coated.

The pills may be taken on the comb-bar while in any suitable holder after having been formed in other molds; and I propose to use it in this way if found advisable.

There are two claims, as follows:

1. The combination of the comb-bar B, clamp E, and strippers H, substantially in the manner described, and for the purpose specified.

2. The combination of the molds A with the comb-bar B, substantially as and for the purpose specified.

The only claim in question in this suit is the second claim. That claim relates to the combination of the comb-bar carrying the needles with the pill-holder, substantially as and for the purpose described. The pill-holder is to have a number of cavities, so as to secure rapid work. There are to be as many needles as there are cavities. The manner of the combination is to have a groove extending from each cavity when the two parts forming the holder are closed, so that the needle may pass through the groove into the pill and the pill be retained on and removed with the needle when the two parts of the holder are separated, so that the pills on all the needles may be removed at once and be dipped on the needles all at once into the coating solution. That is the purpose specified. The result of this rapid work is a greater number of pills coated in a given time, and thus a reduction of cost.

It is objected that the specification states that the pills are to be formed in "a mold A," and that the needle is to be thrust into the pill while the pill is in the mold in which it is formed, and that the defendant does not form his pills in his pill-holder; also, that "the molds A," mentioned in the second claim, are limited to molds in which the pills are formed, and cannot include as holders receptacles in which the pills are not formed or made or molded from the raw material. But this view is contrary to the tenor of the text of the specification, which states that the invention consists in combining the comb-bar carrying the needles with "a holding device for shaping pills or other holder for them," and that "the pills may be taken on the comb-bar while in any suitable holder after having been formed in other molds." That being so, the expression "the molds A," in the second claim, must be held to mean

any suitable holder of the pills, whether the pills are formed in it or in another mold.

It is also objected that a pill cannot be molded with practical success in the mold shown in the drawings of the patent, and that the specification is misleading in saying so. But no such defense is set up in the answer, nor does the answer allege any fraudulent or deceptive intention, nor is any such proved, nor is it shown that Cauhapé did not believe that he could mold pills in the mold, nor that he had not done so. Moreover, the second claim is good, even if the mold will not form the pill, provided it will act as a holder for the pill.

It is also objected that there is no combination between the comb-bar and needles and the pill-holders, but only an aggregation of parts. This is an erroneous view. The pill-holder holds the pill while the needle carried by the comb-bar is being thrust into the pill. The concert of action takes place when the needle enters the pill, and although such concert of action continues only from the time the needle enters the pill until the pill is removed by the needle from the holder, yet the combination made by such concert of action continues as long as it needs to continue, and the concert of action could not exist at all so as to impale the pill on the needle if the pill were not carried by the holder and the needle were not carried by the comb-bar. So, when the needle enters the pill, there is a combination or concert of action between the comb-bar and needle and the holder carrying the pill.

It is also objected that the specification names glycerine as a substance to be used for coating, and that glycerine is not used as a coating, and will not act as such. This is immaterial and aside from the invention. No such defense is set up in the answer. The specification refers to any coating solution which will coat. The word "glycerine" may be rejected as surplusage. Neither one of the claims has any reference to any particular coating solution, nor has any specific coating solution any connection with the subject-matter of either of the claims.

It is also objected that the specification sets out with stating the invention to be a combination of the holder, the comb-bar, the clamp, and the stripper, and that in the claims there are two combinations, (1) the comb-bar, the clamp, and the stripper, and (2) the molds and the comb-bar, and that there is no claim for a combination of all four elements. A combination of all four is an impossible combination. The holder never acts when the other three are acting. The clamps take the place of "the molds A" when the stripper and the comb-bar are brought into action. The claims must control, they being clear and distinct. Moreover, it is not a fair construction of the language of the statement of the invention in the description that it requires there should be a combination of the four elements. It speaks of the employment of a comb-bar and needles in combination with a molding device or other holder, and then it speaks of the employment of a clamp and stripper with the needles. The language might admit of a combination of the four, if such a combination could exist, but it equally admits of the two separate combinations which are claimed.

The mold shown in the drawings of the plaintiffs' patent does, as a receptacle for or a holder of the pill, act perfectly with its groove and the needle and the comb-bar to produce the result specified in the patent, if the pill be suitable for the holder in size and shape, although the pill be made in another mold. The holder has certain characteristic features. It is made of two parts fitted together, which inclose a series of cavities for pills, in which the pills are so held as to receive all at the same time the needles carried by the comb-bar, and to be removed altogether by the needles. A groove extends from each cavity through the body of the holder and acts as a channel-way and a guide for the needle while it is being thrust into the pill. One part of the holder is removable from the other part in such way that the removal of it lays bare all the pills in the cavities and frees all the needles at once, so as to enable all the needles and all the pills to be carried away at the same time by the comb-bar. The comb-bar has as many needles as there are grooves or cavities or pills, and the needles are the same distance from each other as are the grooves. Thus the needle is accurately guided through and by the groove into the pill. The needle is sharp pointed, and can enter and remove the pill without injuring it, and is so small that nearly all the surface of the pill can be coated while the pill is on the needle, and the needle can afterward be removed from the pill without injuring it.

The apparatus is shown to be a very valuable one in the business of supplying the market with gelatine-coated pills.

The structure used by the defendant, Exhibit No. 3, has a holder provided with a large number of holes in its surface to hold pills, the holes being shaped to conform to the shape of the pills and to support the pills properly for the action of the needles. There is also a frame carrying needles which pass through and are guided by holes or grooves in and through another frame, the points of the needles projecting beyond the latter frame. There is one hole for each needle.

In use the receptacles in the pill-holder are filled with pills. The points of the needles are at distances apart from each other corresponding with the distances between the pills, and are thrust into the pills until the face of the grooved frame comes against the face of the holder. The needle-frame and the grooved frame are removed together, with the pills impaled on the needle-points, and the pills are then dipped in this condition into the coating solution. There is the same combination as in the second claim of the plaintiffs' patent of comb-bar, needles, guiding-groove, and pill-receptacle. There is a merely formal change. The guiding-groove, instead of being in the frame which contains the pill-receptacles, is in a frame which is attached to the needle-frame; but the grooves in the defendant's apparatus act to support the needles laterally against diverting forces, and thus to guide them and insure their penetrating the pills properly.

It must be held that the defendant's apparatus infringes the second claim of the plaintiffs' patent. The guiding-grooves in it, by allowing the frame in which they are made to be drawn toward the pills while impaled, and after they are dipped, permit such frame to be used as a stripper to free the pills from the needles; but this is an additional function added to the use of the Cauhapé invention.

The defendant's apparatus has all the essential features of the combination covered by the second claim of the plaintiffs' patent, as before defined.

There is nothing in the provisional specification of

Newton which shows the Cauhapé invention or the apparatus of the defendant. There are no drawings with it. The description is ambiguous, and it is far from clear how the apparatus was made. It is not a machine for making pills, but one for making capsules. There is no idea in it of a plurality of pills all impaled and freed together. There are no guiding-grooves and no sharp-pointed needles or pins.

As to the Goward patent, Cauhapé's application was filed before Goward's specification was sworn to.

As to the Murdoch and Haynes patent, the defendant has introduced no evidence to show its bearing. On the contrary, the plaintiffs' expert shows that what is described in it has no relevancy to either the plaintiffs' apparatus or the defendant's.

The Cardey apparatus amounts to no anticipation of the plaintiffs' or the defendant's. No original apparatus is produced. The matter is one of recollection after the lapse of many years. The witnesses do not agree, and there is great doubt and obscurity. Whatever there was, there were no guiding-grooves and no sharp needles, nothing adapted to pick up pills which were to be coated and then stripped so as to leave no material trace of the puncture. Even if Cauhapé knew of all that was there at the time there was invention in what he patented.

The assignment from Cauhapé to the plaintiffs is satisfactorily proved as a valid assignment. The testimony of Wickham fully explains the interlineations.

All the views urged on the part of the defendant have been carefully considered, although only the material ones have been commented on.

There must be a decree for the plaintiffs as to the second claim of the patents in this suit, and also in the suit against Neynaber.

U. S. Circuit Court—District of Rhode Island.

CROSS v. LIVERMORE.

Decided December 13, 1881.

1. MOTION FOR PRELIMINARY INJUNCTION—REASONABLE DOUBT.

Whenever upon a motion for preliminary injunction a fair and reasonable doubt exists upon the facts presented as to whether defendant has actually been guilty of an infringement, or when it does not satisfactorily appear that the complainant is the first and sole inventor of the improvements claimed, a preliminary injunction will be refused.

2. SAME—CHANGES IN THE COMBINATION.

Motion for preliminary injunction will also be refused if it appears that the alleged infringer uses less than all the elements of the combination and substitutes something for the part which he omits, unless the substitute is a mere mechanical equivalent.

3. SAME—PATENT—LONG POSSESSION—INFRINGEMENT.

While it is unquestionably true that, three things being proved—namely, a patent, long possession, and infringement—the party is entitled *prima facie* to an injunction, yet even where this is shown the question will be, in cases of opposing evidence, whether this right has been displaced by the respondent.

Mr. Samuel J. Elder for the complainant.
Mr. Oscar Lapham and *Mr. Benjamin F. Thurston* for the respondent.

MOTION for a preliminary injunction.

COLT, *D. J.*:

This is a motion for a preliminary injunction. It is claimed by the complainant that the defendant has been guilty of an infringement of certain patents issued to him for improvements in stylographic or fountain pens. The inventions of the complainant as set out in his several letters patent are for certain improved combinations of several parts or elements, whereby a more perfect pen is secured.

In entering upon the consideration of a proceeding of this character we are to bear in mind: First, that whenever, upon the facts presented, a fair and reasonable doubt exists as to whether the defendant has actually been guilty of an infringement, or when it does not satisfactorily appear that the complainant is the first and sole inventor of the improvements claimed, a preliminary injunction will be refused. (High on Inj., sec. 606; *Dodge* v. *Card*, 2 Fish., 116; *Parker* v. *Sears*, 1 Fish., 93; *Thomas* v. *Weeks*, 2 Paine, 99.) Second, that if an alleged infringer uses less than all of the elements of a combination and substitutes something for the part which he omits, there is no infringement unless the substitute is a mere mechanical equivalent. (*Dismore* v. *Schofield*, 4 Fish., 148; *Prouty* v. *Ruggles*, 16 Peters, 341; *Eames* v. *Godfrey*, 1 Wall., 78.)

The complainant maintains, in the first place, that the defendant's pen is an infringement of claims 1, 2, and 4 of Reissued Letters Patent No. 9,716, which are as follows:

1. In a fountain-pen, the combination of a tubular point, a spindle adapted thereto and connected to an independently-moving spindle-carrier, said spindle-carrier being adjustable in relation to a fixed part of the pen, whereby the movement of the spindle may be changed and the wear thereof compensated, as set forth.
2. The combination of the spindle-carrier C, loosely-attached spindle B, and ink-delivery tube A, substantially as described.
4. The combination of the spindle-carrier C, spindle B, and adjusting-screw E, substantially as described.

It is not contended that Cross was the inventor of the principal elements of the fountain-pen—such as the air-tube, gravitating valve, spindle or needle, &c.—but the improvements worked out by Cross in this patent are, in brief, putting a screw in the upper end of the valve or carrier to regulate the rise of the valve from its seat, putting a screw in the lower end of the valve or carrier to regulate the length of the needle, and attaching the needle to the valve by a swivel-joint to give a free play to the needle. A glance at the defendant's pen shows that it is different in form and construction. The valve, which regulates the supply of ink in the complainant's pen, being raised by pressing the point of the spindle or writing-pin upon the paper, thus letting in the ink, and which falls by the action of gravity upon its seat when no such pressure is exerted, thus cutting off the flow, and which was deemed indispensable in all the earlier fountain-pens, is done away with in the pen of the defendant. A spiral spring, to which the needle is attached, is substituted, and this spring is inserted in a small tube, which is securely held by a supporting-post. No screw is attached to the lower end of the spring to regulate the length of the needle, and it is questionable, to say the least, whether the screw at the upper end of the spring, which serves to plug up at that end the small tube which holds the spring, performs the same function as in the complainant's.

A combination which includes as one of its principal elements a valve or spindle-carrier of the kind described in the above claims in the complainant's invention can hardly be said to be the same as a combination which dispenses with this and substitutes another element of nearly different character, not to mention other less important changes in the construction of defendant's pen. Grave doubt therefore exists whether the defendant has been guilty of an infringement of this patent.

The complainant further contends that the defendant's pen is an infringement of the first claim in another patent granted to him, No. 199,621, dated January 29, 1878, which is in the following language:

I claim as my invention—
1. The vibrating pin D and spring F, combined with an air-tube, B, case A, and tube H, substantially as described.

Just before this the specification states:

The attachment of the pin D to the lower end of the air-tube B, so as to be operated by means of a spring, substantially as shown and described, being the gist of my improvement.

The improvements here made are the substitution of the spring for the valve and the attachment of the pin to the air-tube in the manner described in the patent. It cannot be denied that the defendant's pen much more nearly approaches this construction than that of the complainant's first patent, and the question of infringement is therefore a closer one. The defendant's pen has a vibrating pin or needle, which is operated by means of a spiral spring; but the pin, instead of being attached to the air-tube in the manner set out in complainant's patent, is entirely separated from it, a supporting-post below the air-tube holding firmly a small tube containing the spring and the upper end of the pin or needle. Can a combination which dispenses with the attach-

ment of the pin to the air-tube and the device by which such attachment is made, and which substitutes for this a supporting-post, whereby the pin and spring are cut off entirely from the air-tube and the upper section of the pen, be considered an infringement of the complainant's claim? The defendant Livermore derived this supporting-post by assignment to him of the patent of G. F. Hawkes, for improvements in fountain-pens, No. 236,222, dated January 4, 1881. It is claimed that this construction is superior to the complainant's because, by being able to entirely disconnect the upper from the lower section of the pen, and by this means to confine the delicate machinery of the spring and pin within the lower section, there is much less liability to injury from exposure when filling, and that it is also more easily cleaned. If the attachment of the pin to the air-tube is a substantive part of the complainant's invention, and if for this part the defendant substitutes something else which is not a mere mechanical equivalent—viz., the supporting-post—there has been no infringement. To say that this attachment is not a material part of the patented combination, considering its importance in the arrangement and the language of the specification, would, we think, be going most too far. At least, the point is sufficiently doubtful to dispose of this motion, whatever may be the final conclusion after a full hearing.

Again, it is charged that the defendant has infringed another patent granted to the complainant, dated May 11, 1880, and numbered 227,416, wherein the claim is—

In a stylographic fountain-pen, a spindle having a tip of iridium or like hard substance, in combination with a tubular point of comparatively soft metal, the spindle being arranged in the point to project slightly and bear upon the paper, substantially as set forth.

The defendant, in answer to this charge, introduces affidavits seeking to show a prior use or knowledge by others before the invention of the complainant. Cross states in his affidavit that he is "unable to give the exact date of this invention, but it was probably in the spring or summer of 1878." On the other hand, the defendant produces the affidavits of James M. Clark, a manufacturer of fountain-pens, and Charles H. Court, an employé, who swear to a similar use of iridium upon other fountain-pens prior to the middle of 1877.

James M. Clark says:

The pens in which the iridium-tipped needle was used all had a tubular point, from which the needle projected, composed of metal much softer than the iridium, and the needle had an endwise movement, and was arranged in the point to project slightly from or beyond the end of the tubular point and bear upon the paper.

In the affidavit of Charles H. Court we have also a similar description of the use of iridium, both statements detailing the same use in substance as that specified in complainant's patent.

Judging from the evidence before the court, we cannot but say that some doubt is thrown upon the validity of this patent. A fuller investigation may, of course, dispel this. While it is unquestionably true that, three things being proved—namely, a patent, long possession, and infringement—the party is entitled *prima facie* to an injunction, yet even where this shown the question will be, in cases of opposing evidence, whether this right has been displaced by the respondent. (Curtis' Law of Patents, sec. 414.) Long possession, however, can hardly be set up here, nor are former recoveries claimed.

Upon the whole, we are of the opinion that the complainant has not made out a case under the evidence submitted that would warrant the granting of a preliminary injunction, and the motion is therefore denied.

U. S. Circuit Court—Southern District of New York.

BERNARD *et al. v.* HEIMANN *et al.*

Decided October 7, 1881.

IMPROVEMENT IN HAT-COVERINGS—PATENTABILITY—ANTICIPATION.

This patent for improvement in hat-coverings held to cover (1) a layer of flock on a support of buckram or the like; (2) a support of buckram or the like next the flock, with a coating of adhesive substance on the buckram, on which the flock is strewn; (3) a canton-flannel or other similar lining on the face of the buckram, to which the flock is not applied, with the napped face of the canton-flannel exposed and not next to the buckram; and held not to be anticipated by prior hats lacking any one of these elements.

Mr. S. J. Gordon for the plaintiffs.

Mr. J. H. Goodman for the defendants.

BLATCHFORD, *J.*:

This suit is brought on letters patent granted to Robert Gray, September 9, 1879, for an improvement in head-coverings. The specification, which is accompanied by and refers to a drawing which represents a sectional side view of a hat embodying the invention, says:

This invention relates to the manufacture of hats, bonnets, or other head-coverings with a top layer of flock. Hats of this description have been made by applying the flock to a buckram support, but have invariably been stiff, owing to the fact that, in order to give the article the required body or strength, it was necessary to use a heavy or thick piece of buckram. One objection to this hat is the stiffness referred to, it being desirable in some cases to furnish a soft hat, and another the visibility of the buckram tending to defeat the object of the flock layer, which is to produce a felt-like article.

My invention is a head-covering consisting of a support of buckram or the like, a top layer of flock, and a canton-flannel or other similar lining, whereby the article is rendered capable of taking a soft finish, while both surfaces thereof have the appearance or semblance of felt—one of plain felt and the other of napped felt.

In the drawing, the letter A designates the support; B, the flock layer, and C the canton-flannel or other similar lining.

In carrying out my invention I first cement the lining C to a piece of buckram or other like fabric by a suitable adhesive substance, with the nap of the lining exposed, and then press the two together in any usual or suitable manner to the desired shape. In lieu of canton-flannel, the fabric known as "glove-lining" may be used. I now apply to the buckram a layer of cotton, woolen, or other flock, this process consisting in coating the buckram with an adhesive substance and strewing the flock thereon in finely-powdered form. The article is then in a state for trimming.

The buckram A supports both the flock layer B and the lining C, and, being re-enforced by the lining, a light or thin piece of such material may be used, rendering the article pliable or soft, substantially like soft felt. The appearance of the article, moreover, is felt-like, inasmuch as the lining has the semblance of napped felt and the flock layer that of plain felt.

The claim is as follows:

A head-covering consisting of a support of buckram or the like, a top layer of flock, and a canton-flannel or other similar lining, substantially as and for the purpose described.

The only defense is want of novelty. It is plain that the hat of the patent must be a hat made by pressing the materials into the shape of a hat, and not made the top in one piece, the side crown in another, and the brim in another, and then these joined. There must also be (1) a layer of flock on a support of buckram or the like; (2) a support of buckram or the like next the flock, with a coating of adhesive substance on the buckram, on which the flock is strewn; (3) a canton-flannel or other similar lining on the face of the buckram, to which the flock is not applied, with the napped face of the canton-flannel exposed and not next to the buckram.

The Kendall turban, defendants' Exhibit No. 3, has no side crown or brim. Irrespective of this, it is not satisfactorily established that that article had in it any stockinet support, or anything but canton-flannel with flock applied directly to the unnapped face of the canton-flannel.

Bracher's frame, No. 6, if made with the unnapped face of the canton-flannel exposed, had only flock enough put on the buckram to take an impression of straw braid, and was made not for use in that condition as a hat, but solely to be stamped as an imitation of a straw hat. The flock was put on only as a pulp on which to emboss, and the flock, by the embossing, lost its identity and parted with all resemblance to felt.

The Morse hat, No. 13, is a flocked buckram hat, with a strip of canton-flannel put on separately as a brim.

Hats such as the Novelty Company hats of 1876, made of canton-flannel, muslin, and flock, with the napped face of the canton-flannel not exposed, were not the Gray hat. It is plain that cementing the nap to the buckram tended to destroy the pliability or softness aimed at by Gray, by reason of the absorption of the nap by the cement, and that there could be no appearance of napped felt.

The case is one where there was sufficient invention to support the patent, and there must be a decree for the plaintiffs, with costs.

Amendment of Rule 46.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., December 8, 1881.

Rule 46 (Rules of Practice, revised September 1, 1880) is hereby amended by the addition of the following provision, viz:

When the person before whom the oath or affirmation is made is not provided with a seal his official character shall be established by competent evidence, as by a certificate from a clerk of a court of record or other proper officer having a seal.

This amendment will take effect January 15, 1882.

V. D. STOCKBRIDGE,
Acting Commissioner.

Approved:
S. J. KIRKWOOD,
Secretary.

A certificate of the official character of a magistrate, stating date of appointment and term of office, may be filed in the Patent Office, which will obviate the necessity of separate certificates in individual cases.

Issue of January 17, 1882.

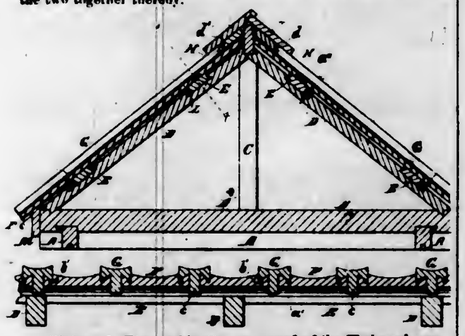
2,595.—Title: "A SYRUP OF TAR, WILD CHERRY, &c FOR THE SPEEDY CURE OF THROAT AND LUNG DISEASES AND ALL PULMONARY COMPLAINTS."—*Henry M. Guild*, Woodbury, N. J. Application filed December 22, 1881.

2,596.—Title: "BEEBE'S COUGH AND LUNG HEALER."—*James A. Beebe*, Woodbury, N. J. Application filed December 17, 1881.

2,597.—Title: "HOLDSTEIN'S GREAT DYSPEPSIA CURE."—*Gustav Holdstein*, Woodbury, N. J. Application filed December 22, 1881.

2,598.—Title: "MELLIN'S FOOD FOR INFANTS AND INVALIDS."—*Theodore Metcalf & Co.*, Boston, Mass. Application filed December 27, 1881.

2,599.—Title: "MELLIN'S FOOD FOR INFANTS AND INVALIDS."—*Theodore Metcalf & Co.*, Boston, Mass. Application filed December 27, 1881.



2,600.—Title: "PALMER'S PLANT AND VINE PROTECTOR."—*Palmer Plant & Vine Protector Company*, Rockford, Ill. Application filed December 27, 1881.

PATENTS

GRANTED JAN. 17, 1882.

252,302. FRAME HOUSE. JOHN BOYD, Galveston, Tex. Filed June 16, 1881. (No model.)

Brief.—The rafters and battens have dovetailed grooves in them, which receive the purlins, the grooves in the rafters receiving one half the thickness of the purlins and the grooves in the battens receiving the other half. The battens are T-shaped, and depend between and below the roof-boards, which are dished in the center and kept from slipping down by a groove therein fitting upon a rib in the upper purlin. The tie-beams are grooved and the ceiling-boards slipped into the grooves. A beveled groove in the tie-beams receives a beveled key on the wall-plates, fastening the two together thereby.

Claim.—1. The combination, in a roof, of the T-shaped caps or battens G G, having in their depending tongues the transverse dovetail grooves *c' c'*, the roof-boards F F, arranged above the grooves *c' c'* and below the horizontal or lateral arms of the said battens, and the purlins E E, adapted to enter the grooves *c' c'* and grooved longitudinally to engage the said tongues, substantially as and for the purposes specified.

2. The combination, in a roof, of the purlins E E, having thereon the ribs *a'' a''*, and having on one longitudinal edge thereof the V-shaped groove *a'*, the rafters D D, having therein the dovetail gains *a a*, and the roof-boards, having therein the gains or grooves *b b*, substantially as and for the purposes specified.

3. The combination, in a roof, of the T-shaped caps or battens G G, the roof-boards F F, the purlins E E, and the rafters D D, when the said battens overlap and depend between and below the said boards, and when the said battens and rafters have therein dovetailed grooves, and the purlins have V-shaped grooves to admit of their being connected to each other, substantially as and for the purposes specified.

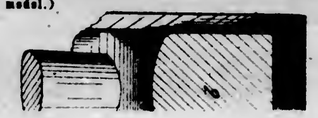
4. The combination, in a roof, of the roof-boards F F, having therein the grooves or channels *b' b'*, and the T-shaped caps or battens G G, covering the said grooves or channels and depending between and below the said boards, and having in their lower edges transverse grooves *c' c'*, for adapting them to be locked to the frame by means of correspondingly-formed purlins, substantially as and for the purposes specified.

5. The combination, in a roof, of the dishing roof-boards F F, having therein the grooves or channels *b' b'*, and the T-shaped and dishing caps or battens G G, extending between the said boards and covering the said grooves or channels, substantially as and for the purposes specified.

6. The combination of the T-shaped caps or battens G G, having therein the dovetail gains *c' c'*, the roof-boards F F, and the purlins E E, having therein the grooves *a' a'*, substantially as and for the purposes specified.

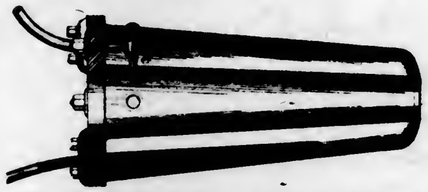
7. The combination, in a frame house, of the wall-plates A A, the tie-beams B B, arranged upon the wall-plates, and having therein the beveled gains *f f*, and the beveled keys *f' f'*, applied to the said plates, substantially as and for the purposes specified.

252,308. HAY ELEVATOR AND STACKER. JOSEPH DAIL, Jr., Meadville, Mo. Filed Oct. 27, 1881. (No model.)



Claim.—1. The combination, in a hay-stacking device, of the diagonal upper track-beams, F F, the lower track-beams, H H, diverging from beams F, and the guide-beams I I, parallel to the lower track-beams, with the carrier having two sets of rollers traveling the one upon the upper and the other upon the lower track-beams, as described, for the purpose set forth.

2. In a hay-stacker, the combination of the tracks, as described, with the herein-described carrier, having teeth O, provided with rearward-projecting arms P, having slots Q, forming bearings for the ends of a shaft mounted in pivoted arms and having rollers or casters, as described, for the purpose shown and specified.

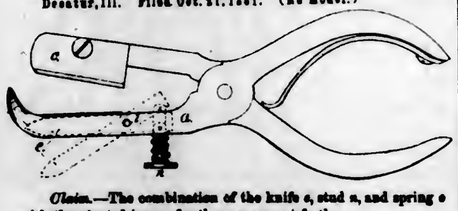


3. The combination of the track having studs A' B' with the herein-described carrier having pivoted latches V and suitable operating mechanism, as described, for the purpose set forth.

252,304. TIRE FOR VEHICLE-WHEELS. ABRAM DICKINSON and JOSEPH WARNER, Pittsburg, Pa. Filed Sept. 15, 1881. (No model.)

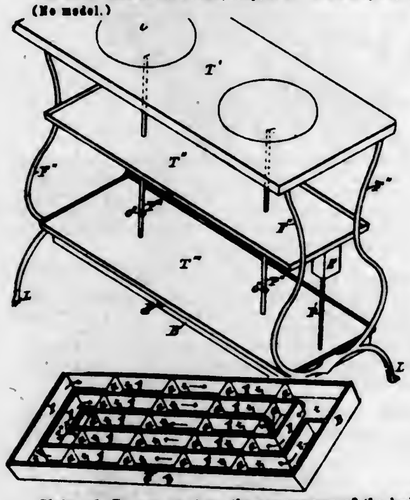
Claim.—The combination of the plain ungrooved felly *b* and the flanged tire A, having its inner faces meeting at a right angle and the outer face of its flange beveled, substantially as and for the purposes described.

252,305. TUYERE. NICOLAS DIDIER, Pittsburg, Pa. Filed Aug. 10, 1881. (No model.)



Claim.—1. The tuyere formed of two conical concentric thin sheet-copper shells with an annular water-space between them, in combination with a removable ring-shaped cap, E, held thereto by means of two or more eyebolts that enter each water-space and connect each with an appropriate radially-arranged short bar or rivet, substantially in the manner shown and set forth.

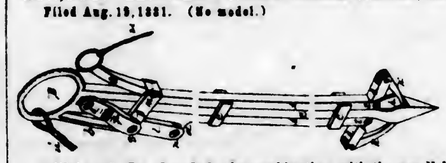
2. A tuyere formed of two conical concentric thin sheet-copper shells, the outer one of which is curved inwardly at its smaller end and made to join the inner shell at that point, by which a convex nose is given the tuyere, as set forth.



3. A tuyere formed of two conical concentric thin sheet-copper shells provided with a convex nose integral with the outer shell and made thicker at the convex portion.

252,306. TENDON-CUTTING IMPLEMENT. ORVILLE EWING, Decatur, Ill. Filed Oct. 21, 1881. (No model.)

Claim.—The combination of the knife *c*, stud *a*, and spring *e* with the pivoted jaw *a*, for the purpose set forth.



252,307. DEVICE FOR BURNING AIR AND HYDROCARBON VAPORS. MICHAEL C. FAGAN, Troy, N. Y. Filed May 13, 1881. (No model.)

Claim.—1. In a vapor-stove, the combination of the hydrocarbon-receptacle B, formed with the flues *f* by means of the vertical strips F, and provided with the pendent wicks *a*, the pipes P', and supporting-platform T, with openings O, substantially as and for the purpose set forth.

2. In a device for cooking by the combustion of a mixture of air and hydrocarbon vapor, the combination of tables T' T'' T''', supported on the standards F' F'' and on the legs L L L L, the hydrocarbon-receptacle B, having the flues *f*, wicks *a*, the air-inlet pipe P', and the outlet-pipes P'' P''', as shown and as described.

252,308. HAY-FORK. CHARLES FRIEBE, Rockford, Ill. Filed Aug. 19, 1881. (No model.)

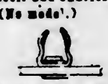
Claim.—1. In a hay-fork, the combination, with the parallel bars and central sliding bar, of a two-armed lever arranged to span the bars and pivoted to a projection on the side thereof, and links *p p*, pivoted to the central bar and said two-armed lever, substantially as set forth.

2. The combination, with the parallel bars, one of which is provided with a flange, *b*, and the sliding bar, of the two-armed lever spanning said bars and pivoted to a projection of one of the parallel bars, and links *p p*, pivoted to the sliding bar and two-armed lever, as and for the purpose set forth.

252,309. CHAIN-BOLT. CHRISTIAN H. GOEBEL, Philadelphia, Pa. Filed Apr. 22, 1881. (No model.)

Brief.—A combination of old devices with a spring-actuated pusher.

Claim.—The locking chain-bolt consisting of a slotted plate with serrations on its inner face, and a button having a cross-head with a connected spring-actuated pusher, substantially as and for the purpose set forth.

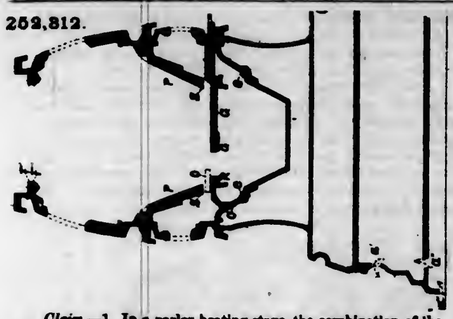


252,310. BOLT. CHRISTIAN H. GOEBEL, Philadelphia, Pa. Filed Apr. 22, 1881. (No model.)

Brief.—The bolt is operated by a rotary knob having a projection that works in a transverse groove in the bolt, and it is locked in its retracted or thrown position by the engagement of a spring-actuated dog with notches in the casing.

Claim.—A bolt and its casing, in combination with a rotary knob which shoots and withdraws said bolt and a fastening device attached to said knob for locking said knob and bolt in either position.

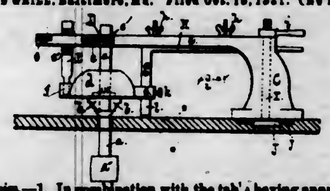
252,311. SPRING-BUTTON. LEWIS GOULDING, South Abington, Mass., assignor to himself and Charles E. Phillips, same place. Filed Oct. 20, 1881. (No model.)



Claim.—1. A button consisting of a perforated base and two spring-metal ears, in combination with an eyelet which is adapted to pass through a fabric and through said perforated base, for the purpose of fastening the button to the fabric, substantially as set forth.

2. A button consisting of a perforated base and two spring-metal ears, in combination with an eyelet which is adapted to pass through said perforated base, an eyelet, *i*, adapted to engage with said button, and a washer, *k*, having one or more corrugations, and inserted between one of the flanges of said eyelet and the fabric to which it is attached.

252,312. PARLOR HEATING-STOVE. GEORGE W. CHAVES, Troy, N. Y., assignor of one-half to Charles E. Potter, same place. Filed Feb. 1, 1881. (No model.)

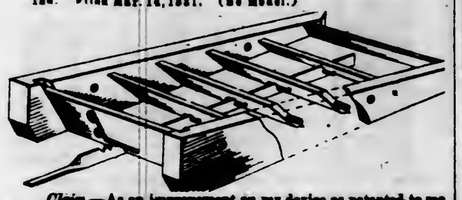


252,312.

Claim.—1. In a parlor heating-stove, the combination of the fire-pot P, the grate G, the ring R, surrounding the latter, and the projections O O, constructed on the top and at the outer edge of the grate, so as to divide up the clinker-cleaning space between the top of the grate and the bottom of the fire-pot, substantially as set forth.

2. In combination with the draw-center of a grate, the upwardly-projected teeth S'' S'' S'', arranged at the front, as and for the purposes described and set forth.

252,313. GUARD FOR VARIETY MOLDING-MACHINES. GOTTFRIED GRILL, Baltimore, Md. Filed Oct. 10, 1881. (No model.)



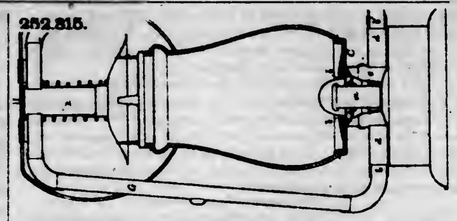
Claim.—1. In combination with the table having annular undercut groove, the bracket pivoted upon the center-shaft and provided with a clamp for securing it at any point in the groove, and with an adjustable bell wholly or partially inclosing the knives, as set forth.

2. In combination with the table having annular undercut groove, and the bracket having adjustable bushing for the center shaft, and the clamp *i J*, the bell-shaped guard *d*, as set forth.

3. In combination with the guard *d* and bar F, secured to the guard and vertically adjustable upon the bar *e*, the bracket C, mounted upon the shaft, and the guide *l*, as set forth.

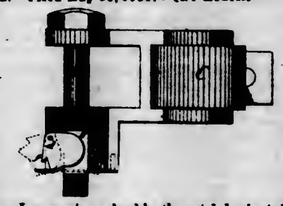
4. In combination with the bracket C *e*, adjustable about the shaft and pivoted thereon, the guard *d*, arms H, *h'*, G, and E, having clamping-screws for securing and admitting of the adjustment of the parts, as set forth.

252,314. GRAIN-SEPARATOR. JEFFERSON GRUEN, Auburn, Ind. Filed Mar. 14, 1881. (No model.)



Claim.—As an improvement on my device as patented to me December 7, 1880, No. 235,232, the graduated partitions, in combination with means for adjusting the same, substantially as and for the purposes hereinbefore set forth.

252,315. TUBULAR LANTERN. ELIAS J. HALE, Foxcroft, Me. Filed Nov. 25, 1881. (No model.)

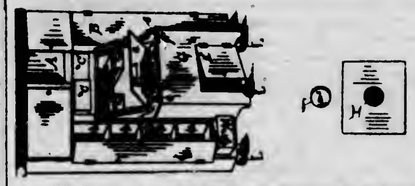


Brief.—The lower portion of the air-tubes are swiveled, so as to allow the upper portion of the lantern to be tilted or swung back and to permit access to the burner.

Claim.—In the tubular lantern, the air-duct G, having its lower tubular portions, *b' b'*, supported by and adapted to revolve or turn in bearings in or projecting from the air-chamber of the lamp and opening into such chamber, all being substantially as set forth.

252,315.

252,316. THILL-COUPLING. WILBUR A. HERBERT, Big Rapids, Mich. Filed May 31, 1881. (No model.)



Claim.—In a carriage-shackle, the catch *b*, pivoted in a slot in one ear, combined with the bolt, constructed with a corresponding slot, into which the said catch will enter when the bolt is in place, or from which the catch may be turned to permit the removal of the bolt, and a spring-latch to engage the said catch when in the closed or locking position, substantially as described.

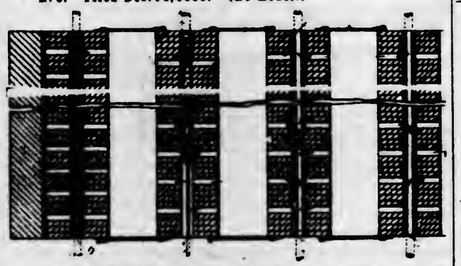
252,317. PRODUCING AND COLORS UPON VEGETABLE FIBER. THOS. HOLLIDAY, Huddersfield, County of York, England. Filed Apr. 21, 1881. (No specimens.) Patented in England Apr. 14, 1881.

Claim.—The process of producing a fast azo color upon vegetable fiber, which consists in subjecting the fiber to the action of oil followed by an alkali, so as to oxidize the oil on the fiber, subsequently subjecting the oiled fiber to the action of a naphthol or phenolic body, and then of producing the azo color upon the fiber by treating the same with a diazo compound, thereby fastening the color upon the fiber in conjunction with the oil, as distinguished from the process of presenting the fiber to a color already formed, substantially as described.

252,318. COMBINED PORTABLE PANTRY-DRESSER, AND SIDEBOARD. LYMAN O. HUDSON, Stockton, Cal. Filed May 11, 1881. (No model.)

Claim.—1. In a portable pantry-dresser and sideboard, the center portion composed of a cabinet having a sliding leaf, *d*, held to its place by segments F F, and having a kneading-board, *c*, hinged thereto at its rear edge, sliding beneath the dresser D and over the flour-bin G, drawers C C and *a a*, and closet K, the flour-bin G, having openings in its bottom communicating with closet K, for the purpose of cleansing the former of refuse contents, substantially as and for the purposes herein set forth.

2. The detachable segments F F, provided with bumpers *e e*, in combination with the dresser D, and arranged with relation to sliding leaf *d*, having hinged thereto at its rear edge the kneading-board *c*, substantially as and for the purposes set forth.



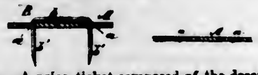
3. In combination with the board E, bin G, and the segments F F, provided with the bumpers *e e*, so that the latter may afford a rest for the kneading-board *c* when in use, while the segments F F prevent the sliding leaf *d* from slipping from its place except when desired by their removal, all operating substantially as and in the manner herein described and set forth.

4. The combination of the sliding leaf *d* and kneading-board *c*, hinged to the rear of the leaf to form the sideboard E, with the bin G, having segments F F, attached to each corner of front edge

and dresser D, whereby, when in service, said sideboard forms a cover for flour-bin G and when the said board *e* is in a perpendicular position as a tight cover for said bin and for dresser D, substantially as herein shown and described.

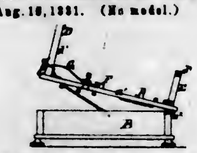
5. A kitchen-safe having the pantry-sections A B B, drawers C C, dresser D, with spice-drawers *a a*, kneading-board *c*, attached to sliding leaf *d*, forming sideboard E, segments F F with bumpers *e e*, flour-bin G, with circular hole H in its bottom opening into closet K, and drawer M, for table-linen, in combination with supports L L L L, all constructed, arranged, and operated substantially as herein described and shown.

252,819. BRICK-KILN. EBENEZER NYE HUTCHISON, Charlotte, N. C. Filed Dec. 14, 1881. (No model.)



Claim.—1. In a kiln for burning brick, the perforated pipes herein described, located within the side walls or in the bottoms of the fire-arches, for supplying air to the fuel, as set forth.

2. In a kiln for burning brick and other analogous purposes, the perforated air-supply pipes herein described, arranged one within the other, for directing and supplying air to any desired portion of the kiln, substantially in the manner and for the purpose set forth.

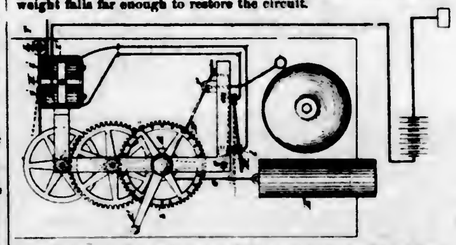


3. The method herein described of burning brick uniformly, the same consisting in the application of air to the fuel to promote combustion at any desired point by means of perforated pipes of varying lengths, arranged one within the other, as set forth.

252,820. PRICE-TICKET. JOHN KELLER, New York, N. Y. Filed Aug. 6, 1881. (No model.)

Claim.—A price-ticket composed of the described ticket A, having upon its index-face the deep depressions *a*, and adapted to be secured to fabrics by means of the fastener B, having the body *b*, and the parallel long sharp arms *b'* at substantially right angles to said body, and made to register with the depression on the ticket, all substantially as and for the purpose specified.

252,821. FOLDING-GRAPHOSCOPE. JAS. LEE, New Brighton, N. Y. Filed Aug. 16, 1881. (No model.)

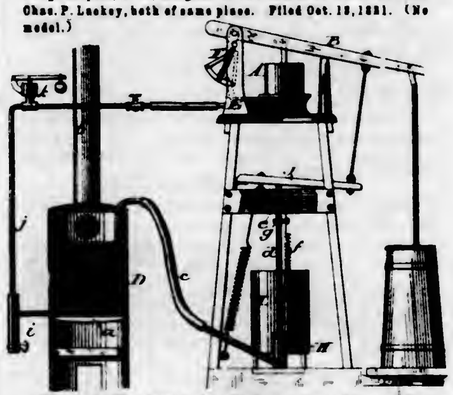


Claim.—1. In a graphoscope apparatus, the base A, composed of the central portion, *a*, and the side pieces, *a'*, the central portion being hinged to the standard B, and having fixed thereto the picture-holder, and the said side pieces being arranged to slide longitudinally on said central portion and carrying the lens-holder, and the entire base-plate thus constructed being adapted, when closed, to act as a cover for a box-like standard, as and for the purpose specified.

2. In a graphoscope apparatus, the combination, with the slides *a'*, working on the central portion, *a*, of the base-plate, of the supporting-bar C, extending from one to the other of and hinged to the said slides and carrying the lens-holder D, together with the leaf-springs G, acting upon the extended ends of said bar, all substantially as and for the purpose specified.

3. In a graphoscope apparatus having the hinged supporting-bar C, carried by the slides *a*, the lens-holder D, detachably seated on said supporting-bar by means of the pins *d'* and sockets *c'*, as and for the purpose specified.

252,822. ELECTRIC CALL FOR TELEPHONES AND OTHER PURPOSES. WILLIAM C. LOCKWOOD, Brooklyn, N. Y., assignor, by mesne assignments, to the Long Distance Electric Call Company, same place. Filed Mar. 10, 1881. (No model.)



Brief.—The object is to utilize the movement made in giving a signal for winding up a clock mechanism. The bell is mechanically operated, the operating mechanism being controlled by a magnet in the circuit and operated by a weight. To give a signal the clock-work is wound up a short distance, and as the weight rises it makes or breaks the circuit through the controlling-magnet, and allows the bell to be wrung by the clock-work till the weight falls far enough to restore the circuit.

Claim.—1. In an electric call, the combination, with an electro-magnet and suitable electrical connections, the spring or controlling lever M and stop *l*, arranged, as shown, relatively to the weight or motor E, operated by winding means A, so that the winding of the apparatus, by changing the circuit from one condition to another, makes the call, and the running down of the apparatus, by changing the circuit, again to its previous condition, discontinues the call, as herein specified.

2. The combination of an electro-magnet, an armature also serving as a brake, a train of mechanism controlled by said brake, a weight or equivalent motor changing its position as the machine runs down, and a spring or contact piece, M, stop *l*, and suitable electrical connections arranged to be separated by the adjustment of the machine for work and to come in contact and close the circuit by the working of the machine, as herein specified.

252,823. STEAM CHURN-POWER. THEOPHILUS MAYBEW, Poughkeepsie, N. Y., assignor of two-thirds to Robt. Rice and Chas. P. Luckey, both of same place. Filed Oct. 18, 1881. (No model.)

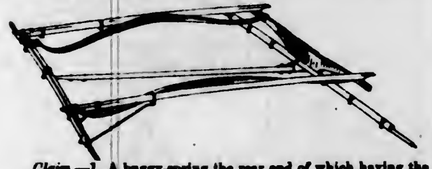
Claim.—1. The herein-described apparatus for operating churns, &c., consisting of generator D, motor A, lever B, operated by the motor and having one end free, pump H, having its rod *d* provided with nut or collar *g*, and spring *f*, all combined and operating as set forth.

2. In combination with a motor provided with a vibratory lever, B, the pump H, provided with rod *d*, and the lever J, adapted and arranged to depress the pump-rod as the lever descends, substantially as set forth.

252,824. LIFE-PRESERVER. ALEXANDER MCDONALD, Boston, Mass. Filed Oct. 11, 1880. (No model.)

Claim.—In a life-saving propeller, the combination of the breast-frame A and the inner fastening-band, K, with the external band, H, and its floats I I I I and lacing-straps *f f f*, all operating together substantially as described, and for the purpose set forth.

252,824.



252,825. BREAD-CUTTER. ABEL HOOPER, Lawrence, Mass. Filed Nov. 10, 1881. (No model.)

Claim.—1. An implement for slicing bread or other analogous articles of food, consisting of a flat tablet to receive the loaf and a bearing-plate erected adjustably upon the rear part of such tablet, and against which the loaf is held, such bearing-plate being slotted vertically to receive and guide the motions of the knife and provide a bearing for the loaf upon each side of such knife, substantially as and for purposes stated.

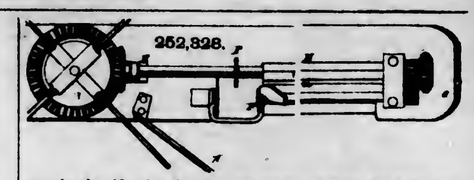
2. An implement for slicing bread, &c., consisting of a flat tablet to receive the loaf, a bearing-plate or rest erected adjustably upon the rear side of such tablet and slotted vertically to receive and guide the motions of the knife and provide a bearing upon each side of such knife, and a vertical gage applied adjustably to the front of the bearing-plate to one side of the said slot, and serving as a stop against which the end of the loaf being cut from is placed, substantially as set forth.

252,826. CARRIAGE-SPRING. GEORGE PENNOYER, Chicago, Ill. Filed Oct. 31, 1881. (No model.)

Claim.—1. A buggy-spring the rear end of which having the sweep below the line of suspension and the sweep at the center above the line of suspension substantially equal, and the sweep at the front end of spring substantially one-half the sweep at rear end and center, substantially as shown and described.

2. The combination of the above-described spring with a side-bar buggy.

252,827. APPARATUS FOR DARKENING TOBACCO. ALEXANDER P. POLADURA, New Orleans, La. Filed Oct. 13, 1880. (No model.)

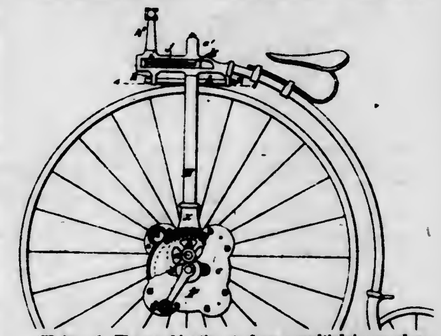


Claim.—1. The vessel A, made in two sections, as described, and provided with a wire basket, E, tube G, and cap *x*, as described, and for the purpose set forth.

2. An apparatus for removing nicotine from tobacco-leaves and giving the same a uniform color by darkening the veins thereof, composed of a lower section for containing water and an upper section with an interior suspended wire basket and a vent-tube, whereby the generated steam in the lower vessel has access to all parts of the suspended wire basket to penetrate the leaves and escape through the vent-tube, substantially as described.

252,828. CORN-HARVESTER. EDWARD W QUINCY, Peoria, Ill. Filed July 23, 1881. (No model.)

Claim.—1. In a corn-harvester, the picking-rollers G H, arranged parallel, or nearly parallel, with the rows of corn and to



pass by the side of such rows, and means whereby the stalks are brought first to the rear end of the picking-rollers, substantially as described.

2. In a corn-harvester, the combination of the picking-rollers, arranged as described, the saw P, or other suitable mechanism, for severing the stalks, located at the rear of said picking-rollers, and means by which the stalks are presented to the rear ends of such rollers, substantially as specified.

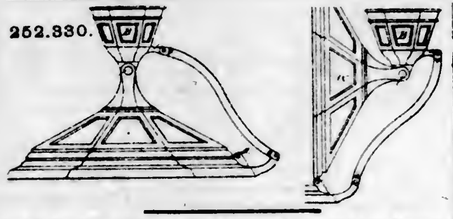
3. The combination, in a corn-harvester, of the picking-rollers, arranged as described, and the gathering-arm N, for the purpose of bending the stalks inward and downward and bringing them to the rear ends of the picking-rollers, substantially as specified.

4. In a corn-harvester, the combination of the picking-rollers G H with a gathering device and suitable cutting mechanism, arranged substantially as set forth, for the purpose of bringing the stalks to the rear ends of the rollers and severing the stalks below the ears, substantially as specified.

252,829. VELOCIPEDE. EDMUND C. RICHARD and JUAN E. RICHARD, New York, N. Y. Filed Oct. 22, 1880. (No model.)

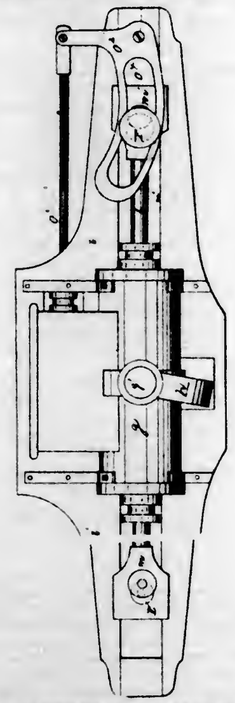
Claim.—1. The combination, to form a multiplying mechanism for a bicycle or velocipede, of a casing for the gearing secured to the lower extremity of the fork, the axle of the driving-wheel, provided with a bearing in said casing, a pinion mounted on the end of said axle within said casing, an internal-gear wheel mounted in said casing and arranged to mesh with the pinion on the driving-wheel axle, said gear-wheel having an external bearing only, whereby the cavity occupied by the pinion is left unobstructed, and a crank on the projecting axle of the said internal-gear wheel, all arranged substantially as and for the purposes set forth.

2. The combination, to form a multiplying mechanism for a bicycle or velocipede, of the fork E, casing F, driving-axle *a*, pinion *b* on the said axle, the gear-wheel *c*, having an external side bearing in the case *e* of the casing, the bearing-rolls *f*, shaft or axis *d*, and crank G, all arranged to operate substantially as and for the purposes set forth.



3. In a bicycle or velocipede, the combination, with the frame, the steering or driving wheel, and the fork swiveled in said frame, of the leaf-spring *h*, confined in a slot in the fork and its end or ends engaged by lugs *g*, projecting from the frame, substantially as set forth.

4. The combination, in a bicycle or similar vehicle, of the driving-wheel and fork, the cross-handle provided with a vertical spindle, the lug or lugs *i* on said spindle, a link or links, *j*, and a lug or lugs *k*, on the fork-spindle or fork, all arranged to operate substantially as set forth.



252,830. URN FOR STOVES. HENRY H. RYDER, Taunton, Mass., assignor of one-half to John F. Montgomery, same place. Filed Nov. 14, 1881. (No model.)

Claim.—The combination, with the urn, the hinged cover, and the stove, of a link hinged to the urn and the stove, substantially as described.

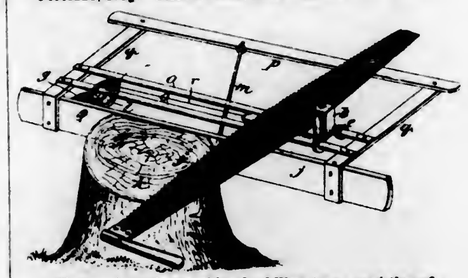
252,330.

252,331. LOCOMOTIVE-ENGINE. HENRY F. SHAW, Boston, Mass. Filed Sept. 15, 1881. (No model.)

Claim.—1. In combination, the balanced vibratory trunnes *i i* and oscillating steam-cylinders *g g*, with their pistons, piston-rods, and cross-heads, connected respectively to the driver-wheels *e e* and *f f* on the outside of the latter, as described, the axles *d* and *f'*, connected together by means of the bevel-gears *c''*, *i*, *i'*, and *f''*, as and for the purpose set forth.

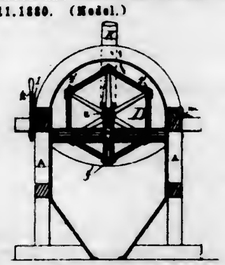
2. The eccentric F upon the crank-pin F, in combination with the slotted lever O'', hinged to the end of the balanced vibratory beam *i*, and having valve-rod O', attached to the valve O, to give proper motion to the latter, in a manner as described.

252,332. NECK-YOKE. CHARLES SHUMAN, Rockford, Ill. Filed Aug. 10, 1881. (No model.)



Claim.—1. The ring C, formed wider at the top than at its under side, and provided with a leather or other equivalent lining, *b*, fitting the upper side of said ring, but projecting below the under side thereof to form the flange *c*, substantially as set forth.

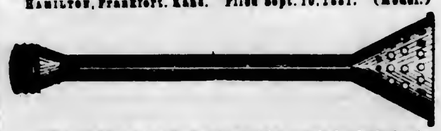
2. The combination, with the socket B and the flange *c*, of the ring C, having its rear side beveled and provided with a leather or other equivalent lining, the latter having a flange, *c*, which bears against the flange *c*, substantially as set forth.



3. The combination, with the ring C, having studs *d* and *e*, of a leather or other equivalent lining, *b*, having the flange *c*, the clasp-ring D, adapted to fit over the ring C, and provided with an opening, *h*, to receive the stud *d*, a semi-bearing, *k*, for the stud *e*, and a clasp-arm, E, passing under the neck-yoke and arranged to bear on the pole, and a clasp-arm, F, secured to the front of the neck-yoke and provided with a stud, *l*, to complete the bearing for the stud *e*, substantially as set forth.

252,333. CROSSCUT-SAWING MACHINE. WILLIAM H. SMITH, Portland, Oreg. Filed Nov. 11, 1880. (Model.)

Claim.—A sawing-machine for felling trees, consisting of a cross cut-saw, a frame, *j q q p*, having guide-rods *e e* and feed-carrier *c*, operated by a spring, *g*, and cord *r*, said feed-carrier having rollers *b* and *c*, and a hinged bearing-board, *d*, when made substantially as described, and for the purpose set forth.



252,334. MACHINE FOR REMOVING SEED FROM GRAIN. DAVID TALMAGE and MARTIN L. FLOWERS, New Orleans, La. Filed Oct. 11, 1880. (Model.)

Claim.—1. A revolving screen having its shell constructed of tubing, arranged at right angles to the supporting-shaft and forming a continuous fluted surface throughout the screen, and having their points of intersection strengthened by exterior angle-strips running the whole length of the screen, as described, and for the purpose set forth.

2. The combination, with a revolving screen, of the oscillating journal-box *f*, supporting one end of the screen-shaft, and the grooved cam *i*, mounted on a transverse shaft, with the lever *h* and segment I, for supporting and adjusting the other end of the screen-shaft, substantially as described.

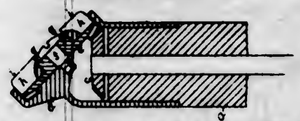
252,335. CHURN-DASHER. ANDREW J. TAYLOR and MILO A. HAMILTON, Frankfort, Kans. Filed Sept. 10, 1881. (Model.)

Claim.—The churn-dasher comprising a tubular body having a perforated conical lower end, and an enlarged upper end provided with a perforated screw-cap, in combination with the valve and the wire-gauze disk inclosed within the cap at the said upper enlarged end, substantially as described.

252,336. REMOVABLE PERMUTATION-LOCK. ROBERT W. TRUEMAN, Lynchburg, Va. Filed Nov. 17, 1881. (Model.)

Claim.—1. The combination, with the lock O, having a slotted case, spindle B, and dial D, of the toothed cylinder E, spindle *b*, notched tumbler A, and dial C, substantially as shown and described.

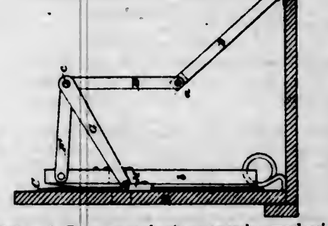
252,336.



2. A removable lock having an independent set of tumblers adapted to register with teeth secured to the door, whereby the whole may be removed without operating the combination of the main lock, substantially as shown and described.

3. In combination with the lock O, the cylinder E, provided with teeth *g*, adapted to register with the tumblers of an independent lock, whereby the locks are detachably secured in the door, substantially as shown and described.

4. In combination with the lock N, having a cylindrical slotted case, spindle *b*, and dial C, the toothed cylinder E, substantially as shown and described.



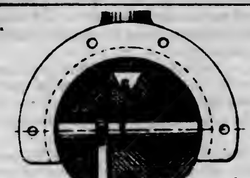
252,337. ROTARY PEG-CUTTER. HERMON C. TOWER and JOHN H. TOWER, Hudson, Mass. Filed July 6, 1881. (No model.)

Claim.—1. The combination of gear *e*, having the externally threaded wall or rim *g*, and the cutter A, having a corresponding interior-threaded passage, and to be seated upon said gear, substantially as specified.

2. The combination of gear *e*, having the externally-threaded wall or rim *g*, the cutter A, having a corresponding interior-threaded passage, and the self-locking screw *f*, to serve as the journal of said gear, substantially as specified.

252,338. ORGAN-BELLOWS. JOHN W. TRAIBER, Fort Wayne, Ind. Filed Oct. 25, 1881. (No model.)

Claim.—1. In an organ having a pumping mechanism of the character described, the vertical link E, the part F, pivoted to the link E and to the pumper, and a supporting arm or lever, G, pivoted between the pumpers to the vertical board which supports the pumpers, substantially as set forth.

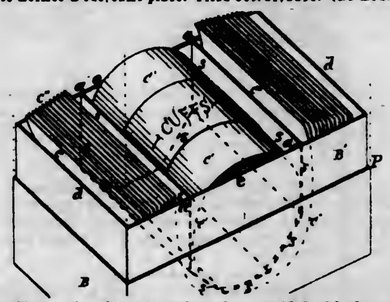


2. The combination, with the treadle, the pumper, and the vertical board which supports the pumpers, of the link E, pivoted to the treadle, the link F, pivoted to the pumper, and the lever G, pivotally connected to the link F and to the board B at a point below the inner end of the link F, substantially as set forth.

3. The combination, with the treadle, the pumper, the vertical board B, which supports the pumper, and the series of levers pivotally connected to the treadle, to the pumper, and to the board B, of devices, substantially such as described, for supporting the levers upon the board B between the pumpers, substantially as set forth.

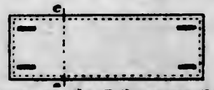
252,339. MECHANICAL MOVEMENT. CHARLES H. TRACK, Lynn, Mass. Filed June 30, 1881. (No model.)

Claim.—1. A ball-and-socket joint having a belt-pulley journaled within the ball, at or near the axial line thereof, substantially as described, as and for the purposes set forth.



252,339.

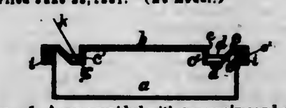
2. A ball-and-socket joint having a belt-pulley and eccentric journaled at or near the axial line thereof, substantially as described, as and for the purposes set forth.



3. A ball-and-socket joint having a belt-pulley journaled at or near the axial line thereof, and provided with a driving-belt adapted to pass through opening in said socket, substantially as described, and for the purposes set forth.

252,340. CUFF-BOX. ISAAC P. TURNER, Troy, N. Y., assignor to Holmes & Ide, same place. Filed Oct. 31, 1881. (No model.)

Claim.—A cuff-box body formed or provided with the semicircular, or nearly so, partition S, for dividing the box into two compartments for displaying inclosed cuffs both curled and loose, substantially as shown and described.



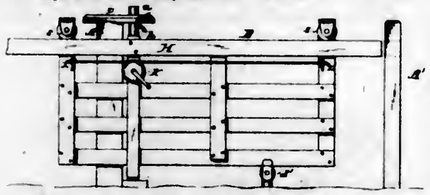
252,341. CUFF. ISAAC P. TURNER, Troy, N. Y., assignor to Marshall & Briggs, same place. Filed Nov. 8, 1881. (No model.)

Claim.—1. In an apparel-cuff, the connection of the double blank B, made of a continuous piece of fabric adapted to be folded longitudinally so as to produce the unequal folds A' and A², and the linen blank C, placed between the folds of the double blank when folded down for stitching their side edges, to form with the blank C and the wider fold A' the exterior of the cuff, and with the narrower fold A² the intermediate ply, or a thickness of the ply, when the parts are placed with reference to each other, stitched at their side edges and turned through either of their unsewed ends, in the manner herein shown and described.

2. An apparel-cuff made with the double blank B folded longitudinally to produce the unequal folds A' and A², the linen blank C, placed between the said folds of the double blank when laid, the blank D, placed next to the fold A', with the parts sewed together near the edges of their sides, their side edges coinciding, and then turned through either of their unsewed ends, so that the blank C will form the linen exterior of the cuff, the fold A' its facing, the blank D and the fold A² its intermediate ply, with the ends of the cuff turned in and the whole border stitched, as herein shown and described.

252,342. SHEET-METAL CAN. FRANCIS A. WALSH, Chicago, Ill. Filed June 28, 1881. (No model.)

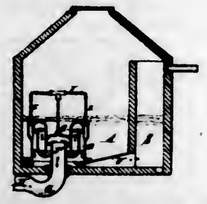
Claim.—1. A can provided with an opening and collar, *c'*, over which is fitted a cover, *b*, having a rim, *c*, and flange *d*, of thin and soft metal, overlying an annular channel, *g*, said flange being



soldered beyond said channel and cut to open the can by passing a knife through the flange into the channel, substantially as and for the purpose specified.

2. A can, *a*, provided with a collar, *c'*, and flanged slip-cover *b*, adapted to be cut away with a knife and united beyond the flange *d* to the annular ring supporting said collar, and so formed as to leave an annular chamber, *g*, substantially as and for the purpose specified.

3. The channeled rim *i*, provided with flat part A and collar *c'*, and provided with a flanged slip-cover united to the top of the can and adapted to be opened by cutting the flange above the chamber *g*, so as to leave an uncut portion, *h*, of the flat part, substantially as and for the purpose specified.



4. A can, *a*, provided with a collar and slip-cover, *b*, having a flange, *d*, soldered at its outer edge and adapted to be cut inside of the soldered part through said flange for opening the can, substantially as and for the purpose specified.

252,343. SLIDING AND SWINGING GATE. WM. R. WHITE, Meoga, Ill. Filed May 11, 1881. (Model.)

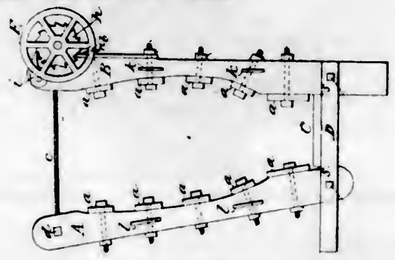
Claim.—The combination of the divided turn-post A, supported adjacent to a post, A, with a gate, B, sliding between the sides of the post A, and provided with rollers *s s*, resting on a rail, H, secured to the turn-post, and a roller, K, on a crank-shaft, and cord *p*, all as set forth.

252,344. FLUSHING-BASIN. BURRIDGE WILLIAMS, Chicago, Ill. Filed Mar. 30, 1881. (No model.)

Claim.—1. The partial trap G, in combination with the reservoir A and drain H, and with two siphons, B C and E F, and with a complete trap, D, arranged to operate as herein specified.

2. The lip or projection J, arranged as shown, in combination with the first siphon, B C, the second siphon, E F, and with a complete trap, D, partial trap G, reservoir A, and drain H, as herein specified.

3. The air pipe or passage I, connecting the top of one siphon, E F, with the ascending leg B of the other siphon, and carried higher than either, so as to serve for arresting the flow of the water, but admitting air past the trap D into the leg B, and thereby stopping the discharge of the siphon, substantially as herein specified.



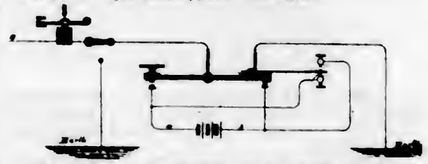
4. The chamber M, float N, valve O, ports *g*, and air-passage P, in combination with the siphon B C and the reservoir A, arranged to serve as herein specified.

5. The pipe K, reservoir A, compound siphons formed of B C and E F, trap D, partial trap G, drain H, air-passage I, chamber M, float N, valve O, ports *g*, and the air-passage P, combined and arranged as herein specified.

6. In a house-drainage system, the channel U, having the inclined upper surface, as shown, in combination with the grease-chamber S, the house-basin A, and low connecting-opening, T, arranged to serve as herein specified.

7. In a house-drainage system, the pipe K, the reservoir A, the chamber S, the opening T, the chamber U, the compound siphons formed of B C and E F, the trap D, the partial trap G, the sewer H, the lip J, and the air-passage I, combined to form a house-basin and sewer-flushing apparatus, in which the grease of the sewage is held until it is cold, and is carried off with a strong flow of the sewage, as herein specified.

252,345. BRANDING-CHUTE. RILEY YORK, North Platte, Nebr. Filed Mar. 1, 1881. (Model.)

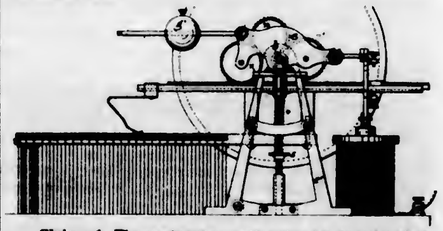


Claim.—1. In a branding-chute, the bars *a*, fixed posts B, and adjustable posts A, in combination with means for adjusting the sides of the chute toward each other.

2. In a branding-chute, the combination of fixed posts B with the adjustable posts A, floor C, sills D, having mortise *s*, gate I, shaft E, cable *c*, wheel F, pawl *i*, and ratchet h, substantially as shown and described.

3. In a branding-chute, the combination of the gate I, having projecting bars *m*, of different lengths, with fixed posts B, adjustable posts A, and bars *a*, substantially as shown.

252,346. POLE-CHANGING KEY. WILLIAM E. ATHEARN, New York, N. Y. Filed Oct. 26, 1881. (No model.)

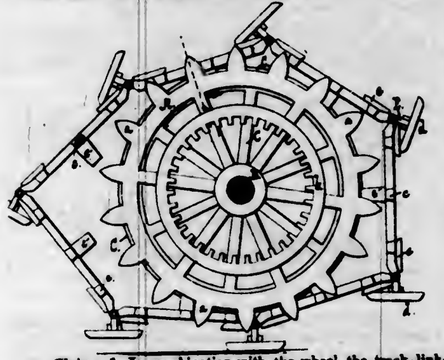


Claim.—1. In a pole-changing key or transmitter, the combination, substantially as hereinbefore set forth, of a pivoted lever vibrating between and alternately making contact with two independent stationary contact-points, and a flexible arm secured to but insulated from said lever, vibrating between two stationary adjustable contact-points.

2. The combination, substantially as hereinbefore set forth, of the key-lever and its metallic base, the insulated flexible arm, and the spring A', insulated from the lever and base, but in electrical connection with the flexible arm.

252,347. CIRCUIT-REGULATING DEVICE FOR ELECTRIC LIGHTS. CLINTON H. BALL, Troy, N. Y., assignor to himself and JOHN B. TIBBITS, same place. Filed Mar. 16, 1881. (No model.)

Brief.—A rheostat governing the current passing through the field of a dynamo-electric machine has its contact-point moved in one direction or the other, according to the strength of current passing through its controlling-magnet, which is located in the light-circuit. A continually-running clock-work driven by spring or a suitable motor is caused to engage with a sliding rack-bar, which carries the contact-point of the rheostat, the direction of motion being governed by the position of the armature of the controlling magnet.



Claim.—1. The combination, with a rheostat or series of resistance-coils and a movable contact, of an electro-magnet, a shaft revolved continuously by power, and mechanism between the movable contact and the revolving shaft, brought into action by the electro-magnet, to vary automatically the resistance of the rheostat

in proportion to the variation of the electric current in the magnet, substantially as set forth.

2. The combination, with the rheostat-coils and the movable contact, of a rack, a swinging frame, an electro-magnet acting upon such swinging frame, and revolving gearing moved by that swinging frame, and acting to give motion to the rack either in one direction or the other to vary the resistance in the circuit automatically, substantially as set forth.

252,348. TRACTION-WHEEL. BENJAMIN S. BENSON, Baltimore, Md. Filed July 7, 1881. (No model.)

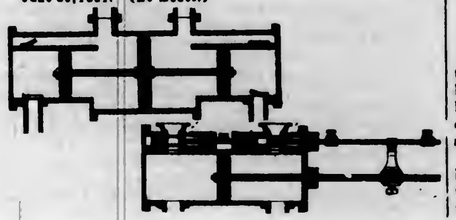
Claim.—1. In combination with the wheel, the track-link provided with lateral downwardly-projecting ears, the foot *d*, having ears *l*, and the pivot-pins passing through the ears of the track-links and foot and below the links, as set forth.

2. In combination with the wheel, the track-links having overlapping ends *i*, and the foot having ears *l*, of a thickness above the pins equal to that of the parts *i*, whereby an even tread for the wheel is afforded, as set forth.

3. In combination with the track-links and foot, the pivot-pins connecting the same and the central supports, A, sustaining the pins, as set forth.

4. In combination with the wheel, the track-links having side guides, *c'*, therefor, and the feet pivoted to the links, as set forth.

5. In combination with the track-links having cogged edge and the feet pivoted thereto, as set forth, the wheels A and C.

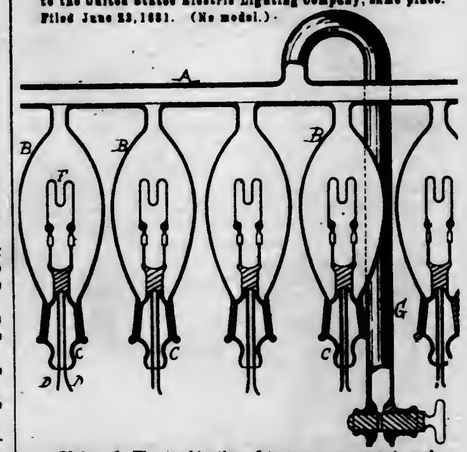


6. In combination with the track-links and feet pivoted together, as set forth, the wheels A and C and the gear-wheel *b*.

252,349. ICE-CREEPER, &c. HENRY BLAND, Luton, County of Bedford, assignor to William Brown Lascelles, London, England. Filed Nov. 23, 1881. (No model.) Patented in England Aug. 26, 1881.

Claim.—A device to be applied to a boot or shoe to prevent slipping, comprising two long spiked links jointed at their front ends to a toe-clamp and at their rear ends to side clamps, two shorter strips jointed to said side clamps and to a metal loop, and a fastening strap or device connected with said metal loop, all combined and operating substantially as described.

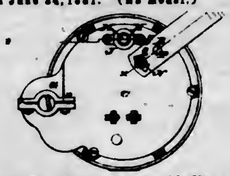
252,350. PUMP. CARL BLANKENBURG, Berlin, Germany. Filed June 16, 1881. (No model.)



Claim.—1. The combination of a double-acting main pump, an auxiliary differential twin pump having two suction and force valves and three pistons, and two pipes connecting the main and auxiliary pumps, substantially as described.

2. The combination of a double-acting main pump having double sliding cut-off valves, an auxiliary twin pump having two suction and force valves and three pistons, and two pipes connecting the main and auxiliary pumps, so arranged that the water in each pipe is caused to serve alternately as a regulating-weight to the pistons, substantially as described.

3. The combination of a double-acting main pump having double sliding cut-off valves, a reciprocating rod for operating the valves connected to the main piston-rod, and provided with adjustable gages for regulating the valves, an auxiliary twin pump having two suction and force valves and three pistons, and two pipes connecting the main and auxiliary pumps, so arranged that the water in each pipe is caused to serve alternately as a regulating-weight to the pistons, substantially as described.

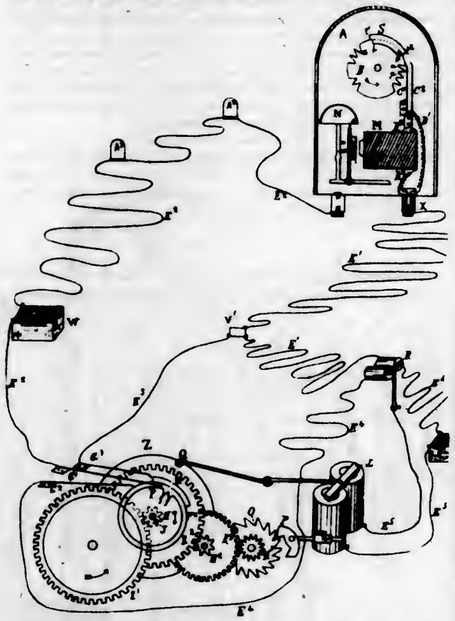


252,351. APPARATUS FOR THE PREPARATION OF CARBON CONDUCTORS. LUDWIG K. BOHM, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed June 23, 1881. (No model.)

Claim.—1. The combination of two or more separate carbon depositing or testing receivers, each closed by a plug or stopper containing the metallic conductors to which the carbons are attached, the several receivers being connected by a pipe or tube common to them all, and adapted to be combined with devices for exhausting the air and for introducing a gas into the said receivers, as and for the purpose set forth.

2. In an apparatus for electrically heating and testing carbon conductors for incandescent lamps, the combination, with main tube G and horizontal tube A, of the several bulbs, B B, closed by plugs or stoppers containing the conducting-wires D D, carrying clamps for retaining the ends of carbon conductors, as and for the purposes described.

252,352. LAWN-MOWER. MATHIAS BRAUN, Philadelphia, Pa. Filed June 24, 1881. (No model.)

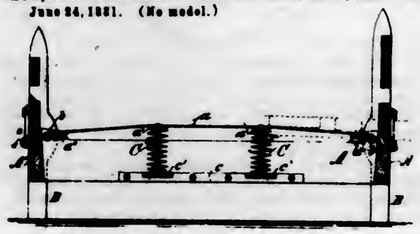


Claim.—1. In a lawn-mower, a binding rod or shaft with tubular externally right and left hand screw-threaded ends, in combination with annular internally right and left hand screw-threaded hollow brackets which receive said ends and lugs which enter said ends, said lugs and brackets being fast to the frame of the mower, substantially as set forth.

2. The side plates, C, each having cast with it the cylindrical lug R and segmental lug Q, the handle-braces each provided with the circular opening P and segmental slot N, the screw S, and the washer T, all combined and operating substantially as set forth.

252,353. AUTOMATIC ELECTRIC SIGNALING APPARATUS. HENRY J. BROWER, Brooklyn, and FRANK B. WOOD, New York, N. Y., assignors of one-fourth to Benjamin E. Valentine, Brooklyn, N. Y. Filed Apr. 27, 1881. (No model.)

Brief.—The first break at the signal-box sets register mechanism at central station in motion, one of the wheels of which revolves in unison with the signal-wheel at the signaling-station. Contact-plates and circuit-breakers are provided for automatically repeating or announcing that the register has performed its functions after the signal has been transmitted.

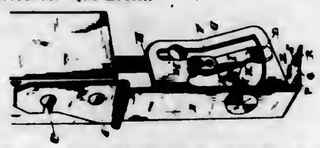


Claim.—1. The combination of the revolving wheel and contact-surfaces F and F', a register for recording electric signals, an electric circuit, of which the signal-box A, for automatically breaking the circuit, forms a part, and with the simultaneously-revolving wheel and contact-surfaces B and S, located in said signal-box, and mechanism for switching the circuit through the magnet M, and with the contact-springs and circuit-breakers, forming part of the above-named electric circuit, substantially as described, for the purpose of automatically announcing a return signal.

2. The combination, with a revolving contact-surface, F, for sending a return signal, of the electric circuit of which the signal-box A forms a part, the relay-magnet R, revolving contact-segment S^2, and intervening connections for automatically cutting the magnet R out of circuit temporarily and restoring it to circuit, substantially as and for the purpose specified.

3. The within-described means for automatically cutting out and restoring the relay-magnet R from and to an electric circuit, consisting of the combination of the revolving contact-surfaces F' and S^2 with the contact-spring G^2, and circuit-breaker G^3, battery W, lines E^2 and E' of the circuit, and line E^3 for short-circuiting, substantially as set forth.

252,354. BEDSTEAD. ALVA P. BROWN, Texas, Ohio. Filed June 24, 1881. (No model.)

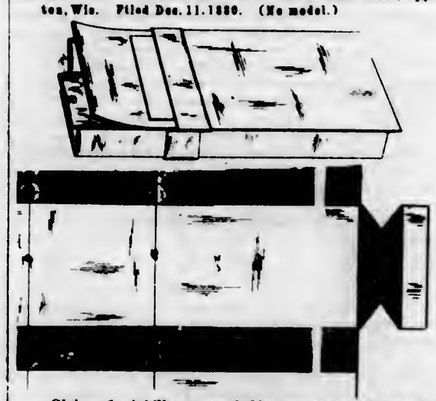


Claim.—1. The bed-bottom formed of the strips *a a*, cross-strips *a' a'*, and the coiled springs C C, the strips *a a* being attached to the tie-rods *b b*, which are adapted to pass through the side boards of the bedstead, substantially as and for the purposes specified.

2. In combination with the bed-bottom formed of the strips *a a* and cross-strips *a' a'* and the coiled springs C C, and the tie-rods *b b*, the legs B B, hinged to the tie-rods outside the bedstead, substantially as and for the purposes specified.

3. The side boards, A A, of the bedstead, in combination with the legs B B, hinged to the bedstead by the rods *b b*, substantially as and for the purposes specified.

4. The end cross-strips, *a'' a''*, formed with the extended ends, as shown, whereby the bottom is kept in place, in combination with the rods *b b* and strips *a a* and cross-strips *a' a'*, substantially as specified.



252,355. RUFFLER FOR SEWING-MACHINES. FREDERICK P. CHENEY, Clover, Vt., assignor to the Dauntless Manufacturing Company, Norwalk, Ohio, and Fred M. Cheney. Filed Aug. 30, 1881. (No model.)

Claim.—1. In a ruffler for sewing-machines, the combination, with an arm adapted to be secured to the face-plate of a sewing-machine, of a plate, E, having the depending arm J and guideway F, an arm, I, pivoted to the arm J, and adjustable by means of a thumb-screw, N, substantially as set forth.

2. In a ruffler for sewing-machines, the combination, with the needle-bar and screw or stud attached thereto, of an arm adapted to be secured to the face-plate of a sewing-machine, said arm being provided with a plate located at right angles to the arm, the plate being formed with a bar, G, depending arm J, pivoted arm I, having a lateral extension, M, and a set-screw, N, substantially as set forth.

252,356. FILE FOR BILLS, &c. JOHN T. CHYDENWYTH, Appleton, Wis. Filed Dec. 11, 1880. (No model.)

Claim.—1. A bill or paper holder provided with an outside pocket formed of an integral portion of the holder by folding and adapted to receive a card or slip, whereby the contents may be made known without opening said holder.

2. A bill or paper holder having the material of which it is formed folded downward to produce a folded edge at the top of the holder, and thence folded upward to form a pocket or receptacle for a card or slip, substantially as shown.

3. A bill or paper holder provided with a lip or leaf adapted to be turned down to expose the contents of the holder, and with a pocket adapted to receive a card, both formed of an integral portion of the holder by folding, substantially as shown and described.

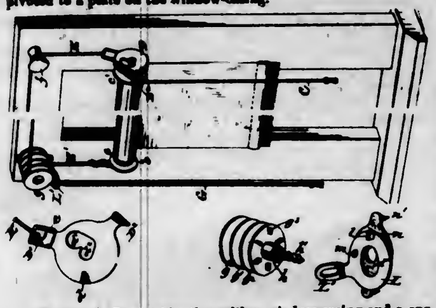
4. The herein-described bill or paper holder, consisting of the body having collapsible sides and bottom, and provided with a lip which may be turned down to expose the contents, and with a pocket to receive a card or slip.

252,357. CAR-AXLE BOX. JESSIE R. COOPER, Union City, Pa. Filed Sept. 12, 1881. (No model.)

Claim.—1. In a car-axle-lubricating device, the oil-conveying roller provided on its surface with fibrous and absorbent material, and a traction-surface, E', in direct contact with the axles, substantially as and for the purposes set forth.

2. In a car-axle-lubricating device, the combination, with the journal of the oil-conveying roller, of the vertical guides *g g*, supporting-spring *f*, having its feet resting upon the reservoir floor or bottom, and the guides *d*, located, as shown, to prevent the feet of spring *f* from slipping laterally, all combined and arranged substantially as described.

3. An oil-reservoir for car-axle-lubricating devices, having a hopper-shaped top for catching the drippings, vertical guides for the journals of a roller, and lateral guides upon the floor, for the purpose set forth, in combination with a roller having springs attached to the journal and resting upon the floor between the side walls and lateral guides, substantially as set forth.



252,358. CIGARETTE. HENRY A. CUPPIA, New York, N. Y., assignor to the Kinney Tobacco Company, same place. Filed Oct. 21, 1881. (No model.)

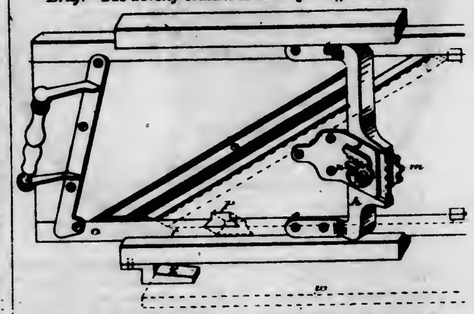
Claim.—A cigarette having a mouth-piece attachment abutting against its end and secured in place by a binding-strip that envelopes both the cigarette end and the end of the mouth-piece, all substantially as described.

252,359. CURTAIN-FIXTURE. JOSEPH DARLING, Peachville, and ANDREW J. NICHOLSON, Fairview, Pa. Filed May 19, 1881. (No model.)

Brief.—The spool on one end of the roller is provided with projections which come in contact with a pawl on the hanger to hold the curtain. One arm of this hanger is inclosed in a rubber sleeve. A series of pulleys joined together and upon the same axis receive and hold the cords by which the curtain-roller is suspended by means of projections thereon in connection with a slotted pawl pivoted to a plate on the window-casing.

Claim.—1. In combination with a window-casing and a curtain-roller suspended from the ends of a single cord, the three pulleys *g g' g''*, united and adapted to turn together upon a single shaft or sleeve, with the cords B, B', and G, substantially as and for the purpose described.

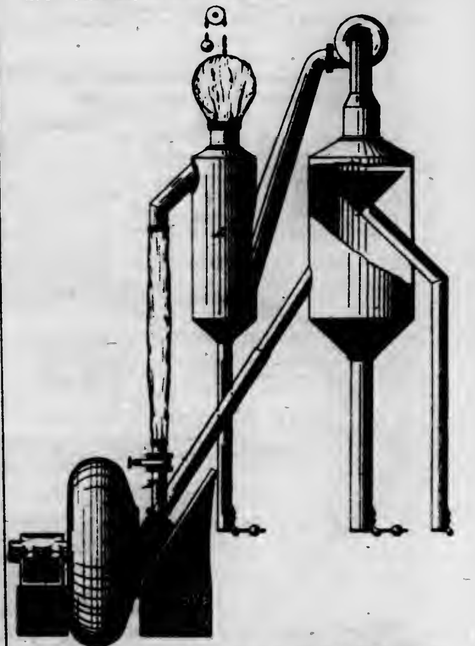
2. The combination of perforated plate a and pawl L, slotted at *l'*, and pivoted on a pin, *m*, having its axis at right angle with the axis of the curtain-roller, and provided with a tooth, *l*, at the upper edge thereof, and a slotted arm, L', with pulleys *g g' g''*, carrying pallets *g'*, substantially as and for the purpose described.



3. The combination of a curtain-roller, a spool at the end thereof having projecting pallets *c'* and spindle *c''*, with movable bracket D, having pawl *d* projecting therefrom, arm D' above, and arm D^2 in front thereof, substantially as and for the purpose described.

4. In combination with the movable bracket D, having a pawl projecting therefrom, a beat arm, D^2, and an arm, D', from which it is suspended by a cord, the yielding sleeve *e*, inclosing the upper arm, D', substantially as and for the purpose described.

5. The combination of a curtain-roller, a cord connected at both ends to said roller and between said ends to the septum of a pulley, a series of pulleys upon the same axle, the inner pulley having pallets projecting from its septum, and a slotted pawl pivoted to a plate clamped to the side of a window-casing, substantially as and for the purpose described.

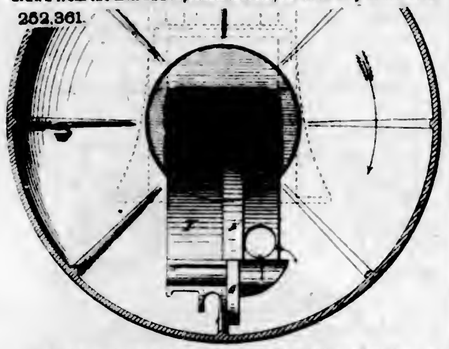


252,360. BREAD AND MEAT SLICER. SAMUEL L. DENNEY, Cap, assignor to Israel L. Landis, Lancaster, Pa. Filed May 11, 1880. Renewed Jan. 26, 1881. Again renewed Dec. 7, 1881. (No model.)

Brief.—The novelty consists in the adjusting mechanism.

Claim.—The combination, in a slicing-machine, of the bridge A, angular plate *s*, thumb-piece *n*, with its pinion, and tightening-nut *m*, all substantially as set forth.

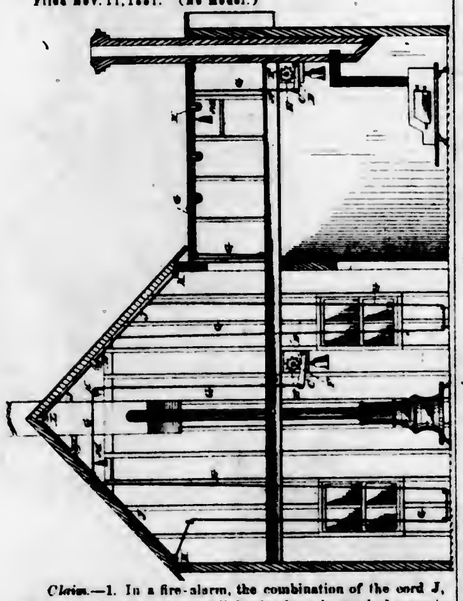
252,361. ATTRITION-MILL. HENRY A. DUC, Jr., Charleston, S. C., assignor of one-half to Thomas F. Rowland, Brooklyn, N. Y. Filed May 31, 1881. (No model.)



Claim.—1. The combination, in an attrition-mill, of a transverse plow or bar extending to the outside of the mill, a support for said plow outside of said mill, and appliances whereby the plow may be moved upon said support to the interior of the mill to compensate for wear at the end of the plow-bar, for the purpose specified.

2. The combination of a rotating shell open at one side and guides, and a curved plow-bar secured in said guides, in which it may be moved in a curved line to carry its end to and from the inner face of the shell, substantially as set forth.

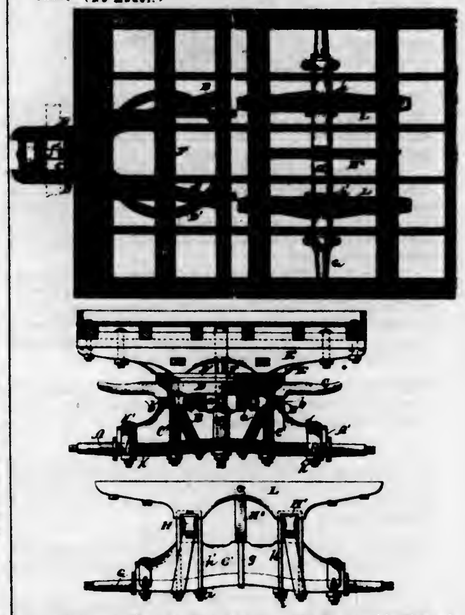
3. The combination, in an attrition-mill, of a rotating shell, a slide, a plow-bar, a feed-tube for delivering the material within the mill, and a frame adapted to permit the slide to be readily withdrawn from the mill and replaced therein, substantially as set forth.



252,861.

4. An attrition-mill provided with three independent passages delivering into the mill from the outside of the chamber, one for the exhaust of the air from the mill, one for the return of the air so exhausted to the mill, and the other for feeding the material to be reduced to the mill, substantially as set forth.

5. The combination, in an attrition-mill, of a shoe constructed to direct the body of material beneath it, and adapted to compress the said material against the periphery of the mill, and a plow-bar arranged radially across the shell at the rear of and close to the shoe, and adapted to act against said material, substantially as set forth.



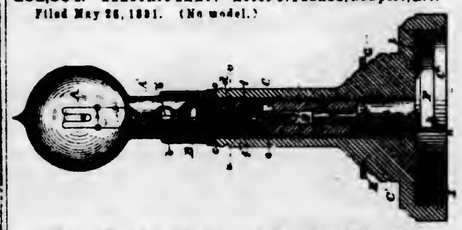
252,862. FIRE-ALARM. EDWARD EARLEY, Newton, Iowa. Filed Nov. 11, 1881. (No model.)

Claim.—1. In a fire-alarm, the combination of the cord J, arranged as described, the cord G, having its ends attached respectively to said cord J and to the free end of a weighted lever, C, having tooth D, and a suitable alarm mechanism having toothed wheel E, held inactive by said lever C when cord G is taut, substantially as set forth.

2. In a fire-alarm, the combination of the cord J, arranged as described, the cord G, having its ends attached respectively to said cord J and to the free end of a weighted lever, C, having tooth D, a suitable alarm mechanism having toothed wheel E, capable of being held inactive by the said cord G, and a weight, M, suspended upon the latter, substantially as set forth.

252,863. TRUCK. JOS. ESCH, Milwaukee, Wis. Filed Nov. 3, 1881. (No model.)

Claim.—1. In a truck or heavy wagon, the combination of the hounds, sand-bar, bolster, and axle with straps C C and F, and the lower circle grooved to fit over the hounds and sand-bar, as set forth.



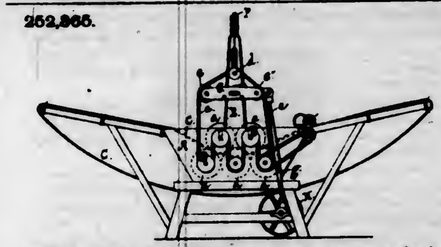
2. The bolster A' and sand-bar C, in combination with supporting-pillars *b*, as set forth.

3. The combination of the axle, bolster, hounds, and circles of trusses E E, and king-bolt F, as set forth.

4. The combination, with rear axle and bolster, of trusses H H', securing-straps *h h'*, bracing-straps K, and the trusses L, upon which the body rests, as set forth.

5. The combination of trusses L, strap H', and the bolster, as set forth.

252,864. ELECTRIC LAMP. MOSES G. FARMER, Newport, R. I. Filed May 26, 1881. (No model.)

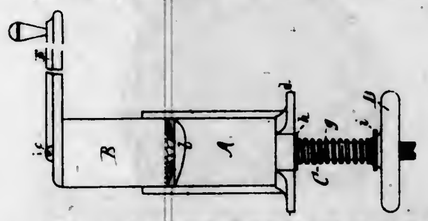


Claim.—The globe A, mounted in the socket B, in combination with the carbon *a*, contained in said globe, the wires *b* and *b'*, connected at one end to said carbon, the metallic ring *d*, connected to the other end of the wire *b*, the pin *e*, connected to the wire *b'*, the stand C, provided with one or more springs, *f f'*, and one or more springs, *g g'*, and the wires *i i'* and *j j'*, all arranged and adapted to operate substantially as and for the purposes described.

252,865. HEMP-WASHER. THOMAS J. PEGGSON, Pikesville, Md. Filed Nov. 23, 1881. (No model.)

Claim.—1. In a hemp-washer, a tank having a series of washing-rollers and mechanism, substantially as described, for imparting to the same a reciprocating rotary movement, the motion being greater in one direction than the other, as and for the purpose set forth.

252,865.

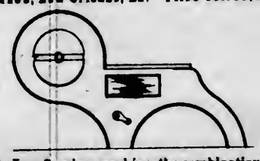


2. In combination with the tank having rollers *a* and mechanism for imparting to the same a reciprocating rotary movement, the endless apron C, as and for the purpose set forth.

3. In combination with the tank having rollers and apron, the driving chain or belt *e* and rocking shaft or lever G, provided with ratchets *e e'* and their pawls, as set forth.

4. In combination with the tank having rollers and apron, the driving-chain *e*, rocking lever G, having unequal arms and ratchets *e e'* and pawls, and the tension-rollers *d*, as set forth.

5. In combination with the tank and rollers, the driving-chain *e* and lever G, laterally adjustable with reference to the pivot, whereby the feed may be regulated, as set forth.



252,866. BAND AND WELT CRIMPING MACHINE. MOSES G. FLINT, Haverhill, Mass., assignor to Lucius E. Goldsmith, same place. Filed Sept. 11, 1879. Renewed Sept. 12, 1881. (Model.)

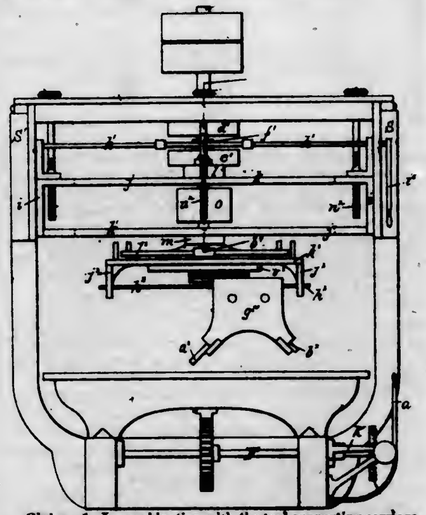
Claim.—1. In a crimping-machine, the combination of the fixed smooth-faced bottom cylinder, A, having the throat or depression *l* formed in its face, the hollow cylinder B, having the radial teeth *m* formed in its face, and with crank E or other means of rotation, axial rod C, with compressing-nut D and spring *g*, and the stationary guide F, all substantially as specified.

2. In a crimping-machine, the hollow non-rotative smooth-faced cylinder A, the hollow rotative tooth-faced cylinder B, the coiled spring *g*, and the compressing-nut D, all arranged axially coincident and upon the central rod, C, substantially as specified.

252,867. FANNING-MACHINE. MARTIN L. FLOWERS and DAVID TALMAGE, New Orleans, La. Filed Oct. 11, 1880. (No model.)

Claim.—1. In a fanning-machine, the combination of the tail-board and the adjusting means, consisting of the leg *h*, ball-joint *h*, and adjusting-screw, for the purpose stated.

2. In a fanning-machine, the combination of the tail-board F, cam *g*, leg *h*, ball-joint *h*, rod *l*, and handle M, substantially as described, and for the purposes set forth.



252,868. SAFETY DEVICE FOR RAILWAYS. JOHN GODBOUT, Decatur, Ill., assignor of one-half to George B. Peake, same place. Filed Apr. 23, 1881. (No model.)

Brief.—A guard consisting of springs having their upper ends loosely attached to a plate, and the whole resting upon the ties.

Claim.—The improved guard or safety device herein described, adapted for use between the guard and track rails of a railroad, or at the point of a frog, and capable of application before or after the laying of the rails, the same consisting of a plate, A, of spring or sheet metal, formed to fit in the desired positions, and springs *a*, having their upper ends suitably attached to the plate in such wise as to hold the plate in place and not prevent so much of the sliding of one part upon another as to allow the plate freely to yield, said springs being sloped back from this point of attachment and fastened directly to the ties at their lower ends, forming the sole support of the guard, the whole lying above and finding a rest upon the ties or road-bed, substantially as set forth.

252,869. LEATHER-DRESSING MACHINE. WILLIAM GOODMAN, Boston, Mass. Filed July 18, 1881. (No model.)

Claim.—1. In combination with the tool-supporting carriage, the screws a^3, journaled with the machine, and engaging the carriage, and adapted to be rotated by gears fixed to their upper ends, and the shafts q^2 r^2, with their gears p^2, said devices operating as mechanism for raising and lowering the tool-supporting carriage, substantially as set forth.

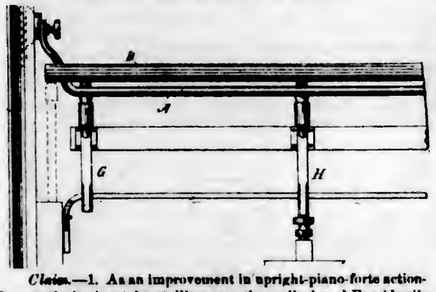
2. The combination of toothed racks j^2 k^2, pinions l^2 m^2, and shaft c' with the traversing tool-carriage and the table, substantially as set forth.

3. The means described for effecting traverses of the tool-carriage and tools bodily in opposite directions, consisting of the toothed racks j^2 k^2, pinions l^2 m^2, carried by the shaft c', pulleys d' e', rotating in opposite directions and mounted loosely upon such shaft h', and the clutch f', sliding upon such shaft and adapted to engage either of the pulleys.

4. The combination of a table, a supporting-frame, and a carriage adapted to travel horizontally on said frame with a vertical shaft, c', journaled in said carriage, a pair of loose pulleys on said shaft, an intermediate sliding clutch splined to said shaft, a forked plate, g', which engages with the clutch to ship and unship the same, and a rock-shaft which operates said shipping-plate, whereby the rocking motion of said rock-shaft causes one or the other of said pulleys to turn with shaft c', substantially as set forth.

5. In combination, the head g', supported upon the rods h^2 i^2, sliding plate or stock f^2, with its notched ears j^2, and the dressing-tools sliding within the head and changed in position therein by the ears, substantially as stated.

6. In combination with the head g', sliding stock or plate f^2, and tools a^3 b^3, the rock-shaft w^2 x^2, with their wings y^2 z^2, substantially as herein set forth and described.



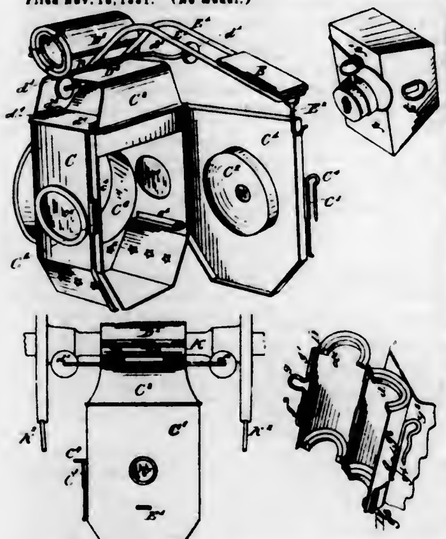
7. In combination with the head g' and stock f^2, the disk n^3 and its link o^3, connected with the stock and operating to effect the movement of both head and stock, substantially as stated.

8. In combination with the head g', sliding stock or plate f^2, the rock-shafts w^2 x^2, with their wings y^2 z^2, and the tools a^3 b^3, each

consisting of two portions, a^4 b^4, with an intervening spring, c^4, all as and for the purposes described.

9. The combination, with the head g^4, supported upon the rods h^3 i^3, sliding plate i^3, with its notched ears j^3, of the dressing-tools formed in two parts with the slotted strap f^3, bolt k^4, and the intervening spring, c^4, whereby an elastic or yielding movement is imparted to said tools, substantially as herein described.

252,870. UPRIGHT-PIANO ACTION-FRAME. PAUL GMEHLIN, New York, N. Y. Filed Aug. 16, 1881. (No model.)



Claim.—1. As an improvement in upright-piano-forte action-frames, the horizontal metallic supporting-rails A and E, said rails being independent of the wooden rails to which the small parts of the action are directly attached, and not screwed or bolted to them, but to serve as a part of the frame to which said wooden rails are secured by the standards, said metallic rails having their ends extended, bent, and curved into a position to fasten to the case or string-frame, thereby securing the action into the piano by the aforesaid metallic rails directly, in combination with the standards G and H, screwed or riveted thereon, as shown and described.

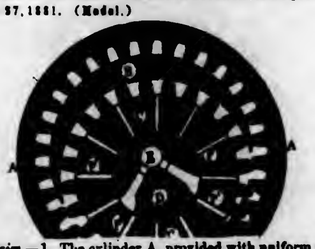
2. The horizontal metallic supporting-rail A under the hammer-rest rail D, constructed as shown, with its widest part in a horizontal or flat position, in combination with the said standards G and H, and being screwed or riveted on the top ends of said standards, substantially as shown and set forth.

3. In upright-piano-forte action-frames, the hook I on the lower end of the standard H, the block J, provided with a notch or recess, the screw K, having a groove in the under side of the head, thereby forming an outer rim or flange, all in combination, arranged to operate substantially as shown and described.

252,871. LANTERN FOR BICYCLES. PETER GRAY, Cambridge, assignor to the Pope Manufacturing Company, Boston, Mass. Filed Nov. 16, 1881. (No model.)

Claim.—1. The described bicycle-lantern, consisting of a case, C, with lights c^4 c^5 c^6 and opening at the back, reflectors C^3 and C^4, glass front c^7, removable lamp A, open top parts C^7 and C^8, and a hinged clamp, D D', for suspending the whole upon the axle of a bicycle, said clamp having a safety-fastening, and being connected by rivets to the top C^8 at its forward part, all constructed and adapted essentially as set forth.

2. In a bicycle-lantern having a hinged clamp, a fastening device consisting in fixed loops g' g^2 g^3 g^4 and sliding loops g g^5, the latter having a curved tongue to form a spring-fid, constructed and adapted to operate substantially as set forth.



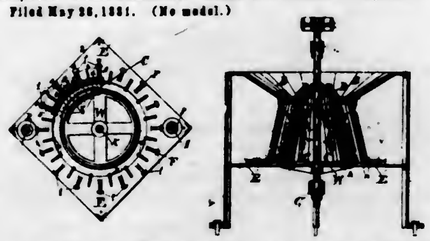
3. Combined in a bicycle-lantern having a case, C, and a lamp, A, the open top part C^7, a hinged clamp, D D', and a hinged holder having a loop, E, said parts being constructed and adapted to operate substantially as set forth.

4. A velocipede constructed with a case, C, containing a lamp, a door, C', a top, C^4, a front glass, c^7, and a hinged brace, E' E', bearing a loop, E, and connected with the top and rear of the case, substantially as and for the purposes herein set forth.

5. A removable holder for a velocipede-lantern, consisting in a loop adapted to fit a clip on the frame of the velocipede, a spring-brace, E', for hinged attachment to the case of the lantern, and a catch, E^5, for attachment to the rear and lower part of the lantern, when constructed and adapted to operate substantially as herein set forth.

6. The removable detent shown in Fig. 8, constructed with a buffer, d^7, and short parallel fingers d^8 d^9, for insertion in loops d^5 d^6 in the top of the lantern, substantially as and for the purposes set forth.

252,872. ROTARY ENGINE. DEXTER D. HARDY, Havana, Ill., assignor of one-half to Charles G. Krehbiel, same place. Filed June 27, 1881. (Model.)



Claim.—1. The cylinder A, provided with uniform and regular inside teeth, and the crescent B, in combination with the spur cog-wheel C, with holes or ports P, the eccentric D, with two ports, P P, and the tubular axle E, with bridge L, substantially as and for the purpose set forth.

2. The cylinder A, provided with regular and uniform inside teeth, and the spur-gear wheel C, with holes or ports P', in combination with the eccentric D, with ports P P, the crescent B, disk R, attached to said crescent and eccentric D, and the tubular axle E E, fastened to supports G G, substantially as and for the purpose specified.

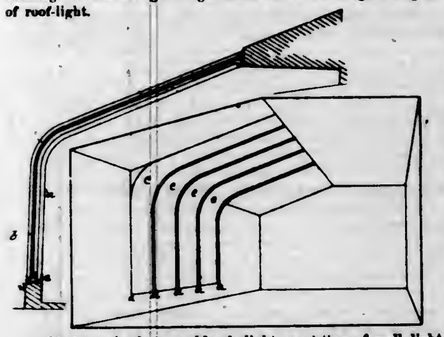
3. The cylinder A, provided with regular and uniform inside teeth, and with cylinder-heads F F', and the wheel C, with holes or ports P', and with regular and uniform teeth to gear in with the inside teeth of said cylinder A, for the purpose set forth.

252,873. CORN-SHELLER. HIRAM A. HAWKINS, Chicago, Ill. Filed May 26, 1881. (No model.)

Claim.—1. The combination, in a corn-sheller, of the plate E, having projections F and s, with the case A and rods N, substantially as described and shown.

2. The combination, in a corn-sheller, of the hopper B, cylinder C, case A, grooved spider W, and plate E, having projections F and s, the said case and cylinder being formed in sections and provided with devices for rendering them automatically adjustable, substantially as shown and described.

252,874. OSTRICH-FEATHER TRIMMING. JOHN HAWLOWETZ, New York, N. Y. Filed Nov. 8, 1881. (Model.)



Claim.—1. An ostrich-feather trimming composed of a textile base or backing and a series of ostrich-feathers interwoven therewith, the base or backing being shrunk upon the quills of the feathers, firmly holding the same, and the vanes of the feathers being trimmed to an even length, substantially as described.

2. The process of making ostrich-feather trimmings, consisting in first cutting the ostrich-feathers into suitable lengths, then interweaving them with a textile backing, then subjecting the fabric so formed to the action of a dye-liquor, whereby the feathers are colored and the webbing shrunk upon the quills of the feathers, and finally trimming the ends of the vanes, substantially as set forth.

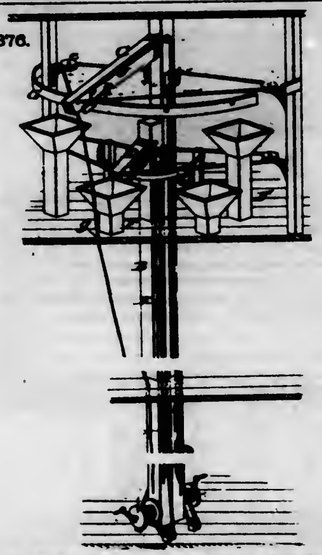
252,875. PHOTOGRAPHIC SKYLIGHT. GEORGE HAYNS, New York, N. Y. Filed Apr. 6, 1881. (No model.)

Brief.—The wall-light and roof-light are connected at the point usually occupied by the transom by a curved portion or light forming a continuous glass light from base of wall-light to apex of roof-light.

Claim.—A photographic skylight consisting of wall-light with plane-surface glass, roof-light, also with plane-surface glass, and angle-light of curved or bent glass, all sustained by lengthwise bars or rafters, and combined so as to constitute a continuous glass surface, without transom or cross-bar, from base of wall-light to highest point or apex of roof-light, substantially as shown and described.

252,876. GRAIN-ELEVATOR. EDWARD C. HINCKLEY, Delmar, Iowa, assignor of one-half to Le Roy Webster Parker, same place. Filed Oct. 24, 1881. (No model.)

Claim.—1. In combination with an elevator having a movable spout arranged to deliver into a series of concentric hoppers or bins, one or more additional elevators located beside the first, and provided with spouts extending beyond the end of the spout of the first elevator to other series of hoppers or bins, whereby each spout is permitted to deliver into any one of its series of hoppers without interfering with the delivery of the other.

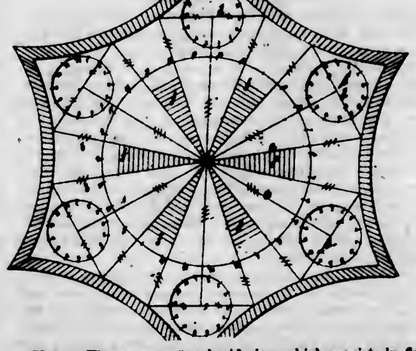


2. In combination with a movable grain-delivery spout, operating ropes or bands attached to the same, extending outward from opposite sides thereof and around pulleys or guides, and a rigid section or drum connected with the ends of said bands and arranged to simultaneously pay out one cord and take up the other, substantially as explained.

3. In combination with a movable spout and operating ropes or bands extending from opposite sides of the same, a starting-cord attached to the spout and passing through a guide at a point between the extremes of movement of said spout, as and for the purpose explained.

4. In combination with a movable spout, a latch or bolt applied directly thereto and arranged to engage with a fixed catch, whereby the spout is held firmly and accurately in position.

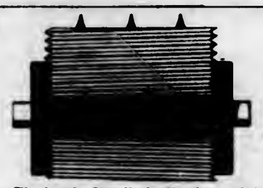
5. In combination with a movable delivery-spout and operating cords or bands arranged substantially as described, a rigid section provided with an indicator and arranged to move with the operating cord or band past the graduations of a fixed scale, substantially as shown.



252,876.

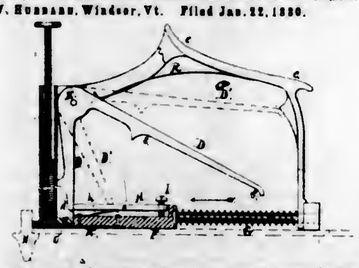
6. In combination with the notched track G, the movable spout traveling over or under the same and provided with a latch to engage with the said track.

7. The herein-described apparatus for elevating grain and delivering it to different spouts, consisting of an elevator provided with a movable spout, a track provided with a series of notches or openings, a latch or bolt attached to the spout and arranged to engage in said openings, operating-bands attached to the spout and connected with a rigid section or a winding-drum in the manner explained, a scale, and an indicator to show the position of the spout.



252,877. PROCESS OF EMBROIDERING. MAX HOFFMANN, St. Gallo, Switzerland, assignor to Ulr. De Gaep. Vonwiller, same place. Filed Sept. 17, 1881. (Model.)

Claim.—The process of embroidering, which consists in first boring holes in the fabric to be embroidered, then stitching threads across the same, then twining re-enforcing threads through the said holes around the threads stitched as aforesaid and drawing the re-enforcing threads along over the fabric, then connecting the threads as stitched and re-enforced in any suitable manner to form a desired piece of open-work, then stitching the portions of solid embroidery desired, and subsequently cutting away the portions of the fabric remaining between the portions of solid embroidery and behind portions of the open-work, substantially as set forth.



252,878. BILLIARD-TABLE ADJUSTER AND LEVELER. OLIVER P. HOOVER, Dayton, Ohio, assignor of one-half to John D. Arras, same place. Filed May 19, 1881. (No model.)

252,378.

Claim.—The herein-described adjusting and leveling device for billiard and other tables, consisting of the exterior rotating adjusting-nut and contained upper and lower bearing-plugs, which do not rotate, and the one of which is attached to the floor and the other to the table-leg, substantially as described.

252,379. MACHINE FOR SETTING GLAZIERS' POINTS. GEO. W. HUBBARD, Windsor, Vt. Filed Jan. 22, 1880.

Claim.—1. In a glazier's-point setter, the combination of the spring G, the striker F, and driving-plate K, substantially as and for the purposes set forth.

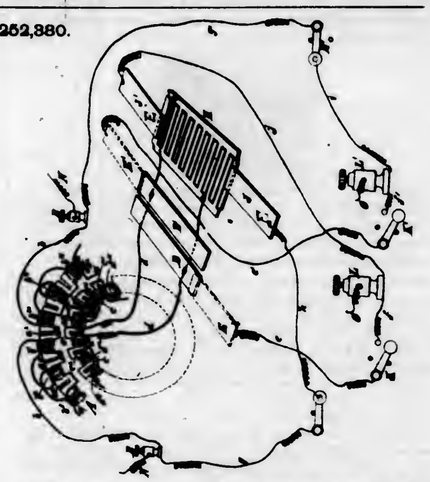
2. In a glazier's-point setter, the combination of the lever D, striker F, and driving-plate K, substantially as and for the purposes set forth.

3. The combination, with a receptacle for glaziers' points, of a driving-plate, which also forms an opening and closing bottom for the said receptacle, substantially as set forth.

4. The vibrating latch or key H, in combination with the striker F and lever D, substantially as and for the purposes set forth.

5. The adjusting-screw I, in combination with the latch or key H, striker F, and lever D, substantially as and for the purposes set forth.

252,380. DYNAMO-ELECTRIC MACHINE. CHAS. A. HUSSEY, New York, N. Y., assignor to the Hussey Electric Company, same place. Filed Sept. 7, 1881. (No model.)



Brief.—The field and armature magnets are formed of arc-shaped portions alternately of greater and lesser radius. The field-magnet is made of a single piece and the armature of many thin pieces. The winding of the field-magnet is upon the portions of greater radius and that of the armature upon those of lesser radius, and is sufficient to fill the spaces nearly flush, thus forming two concentric multipolar magnets with poles facing each other. By means of a double commutator and shifting brushes the machine can be employed for direct or alternating currents. Switches are provided whereby it may be used either as a generator or motor. In the latter case the field-magnets are charged by a current from an external source of electricity.

Claim.—1. The combination, in a dynamo-electric machine, of a field-magnet and an armature severally having cores composed of arc-shaped portions wound with wire, intervening arc-shaped portions, and radial portions connecting the said arc-shaped portions which are wound with wire to the intervening portions, the radial portions of both the field-magnet and armature forming poles, polar extensions, or consequent points, and extending toward each other, substantially as specified.

2. A field-magnet for a dynamo-electric machine, having a core composed of arc-shaped portions wound with coils of wire, intervening arc-shaped portions of shorter radii, and radial portions which connect the two series of arc-shaped portions, substantially as specified.

3. The combination, in a dynamo-electric machine, of a field-magnet having a core made of one integral piece of metal, and an armature having a core composed of a number of pieces or plates of metal, both cores having a corresponding number of arc-shaped portions wound with wire, from which extend radial portions forming poles, polar extensions, or consequent points, substantially as specified.

252,380.

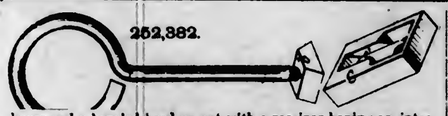
4. The combination, with a field-magnet and armature in a dynamo-electric machine, of means, substantially such as described, whereby a current of electricity may be made to traverse the coils of the field-magnet from a source outside the machine, and the circuit between the coils of wire of the field-magnet and the coils of the armature may be severed to cause the machine to produce an alternate current or currents, or the supply of electricity to the coils of the field-magnet from an outside source may be cut off and the circuit established between the coils of wire of the field-magnet and the coils of the armature to cause the machine to produce a direct current of electricity, substantially as specified.

5. The combination, with a field-magnet and armature in a dynamo-electric machine, of switches and suitable connecting-wires, whereby a current of electricity from a source outside of the machine may be made to traverse the coils of the field-magnet and the circuit between the coils of wire of the field-magnet and the coils of the armature may be severed, or the supply of electricity to the coils of the field-magnet from an outside source may be cut off and the circuit established between the coils of the field-magnet and the coils of the armature, substantially as and for the purposes set forth.

6. The combination, with a dynamo-electric machine and an outside circuit, of wires N, communicating with the wires *b* of the field-magnet, the wires *d* of the armature, the rings D D', the brushes E E', the wires *e e'*, the switches K K', controlling communication between the wires *e e'* and the outside circuit, the commutator H, to which the wires *d* of the armature also lead, the wires *g h*, the switch M, the wire *j*, the wire *g'*, the switch M', and the wire *i*, substantially as and for the purpose specified.

252,381. CORN-HUSKING PLATFORM FOR WAGONS. WESLEY HYDE, Thorn Creek Township, Whitley County, Ind. Filed Aug. 8, 1881. (No model.)

Claim.—1. The hanger B, provided with the hook I, in combination with the pivoted support O, substantially as described.



2. In a corn-husking attachment for wagons, the combination of the detachable hooked supports B B with the pivoted supports O O, substantially as described.

252,382. PATTERN-LIFTER. WILLIAM J. INNIS and PATRICK H. KANE, Oil City, Pa. Filed July 14, 1881. (No model.)

Claim.—1. A pattern-lifter composed of a handle formed of a screw-threaded single stem, in combination with a beveled nut having its lower face wider than its top, substantially as and for the purpose described.

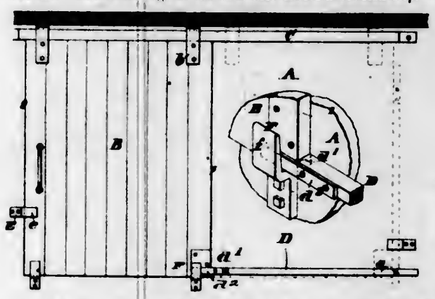
2. The combination of a pattern-lifter handle having at its

252,382.

lower end a beveled head or nut with a receiver having an internal recess formed with rectangular sides a portion of its length and beveled sides or a dovetailed opening the balance of its length, substantially as and for the purposes set forth.

3. Ribs upon a pattern with an interior dovetail, in combination with a beveled nut upon a screw-threaded stem or handle, for the purpose of lifting the pattern from the sand, substantially as described.

252,383. TREATING TEXTILE FABRICS. PETER A. G. JUEL, Wurzen, Saxony, Germany, assignor to Schatz & Juel, same place. Filed Aug. 16, 1881. (Specimens.)

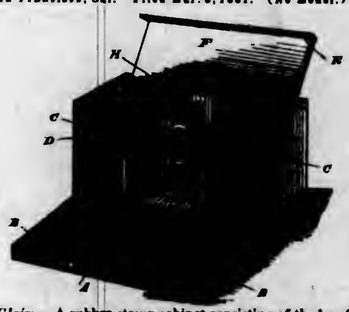


Claim.—1. A burnished metallic textile fabric consisting of a textile base and a burnished coating composed of a prepared mixture of ground metal and caoutchouc, substantially as described.

2. A burnished metallic textile fabric consisting of a textile base and a burnished coating composed of a prepared mixture of ground metal and caoutchouc, said fabric being printed in ornamental figures, substantially as described.

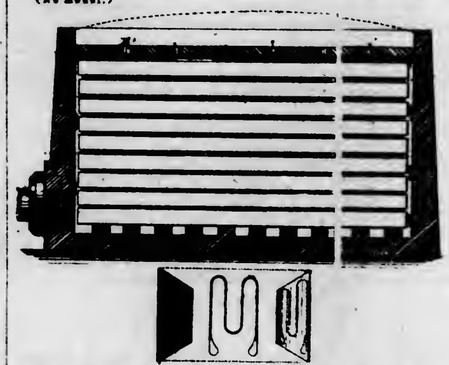
3. The process of producing a burnished metallic textile fabric, consisting in first coating the textile base with a prepared composition of ground metal and liquid caoutchouc, then drying the same, and subsequently burnishing the composition-coating, substantially as described.

252,384. CAR-DOOR FASTENING. CHRISTOPHER C. KILTS, Hannibal, Mo. Filed Oct. 28, 1881. (No model.)



Brief.—The end of a bar pivoted to the side of the car abuts against the rear of the door when closed. A lateral projection on the end of the bar wedges between the door and a beveled clip on the car. The front edge of the door also enters a beveled clip.

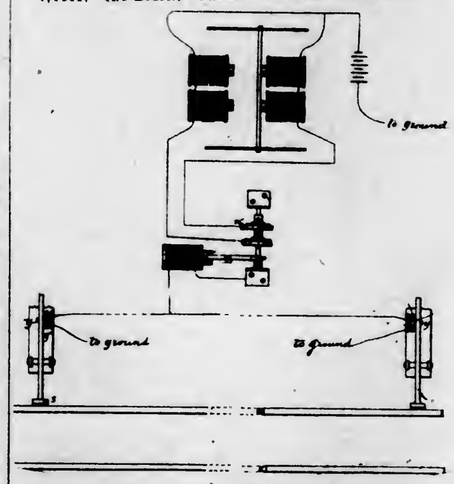
Claim.—1. The combination of the side A, the door B, the bar D, having the projection d^2, and the clip F, substantially as described.



2. The combination of the side A, the door B, the bar D, having the projection d^2, and the clips E and F, substantially as described.

252,385. RUBBER-STAMP CABINET. CHARLES A. KLIENER, San Francisco, Cal. Filed Mar. 8, 1881. (No model.)

Claim.—A rubber-stamp cabinet consisting of the box C, having partitions G H, hinged side A, provided with pads B B, flanged lid F, adapted to engage with said hinged side, and springs or buffers D D, arranged between the side A and partition G, substantially as and for the purpose shown and described.



252,386. PROCESS OF MANUFACTURING CARBONS. LEWIS M. LATIMER, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Feb. 19, 1881. (No model.)

Claim.—1. The process of carbonizing shapes or blanks of carbonizable material, substantially as described, which consists in subjecting the same to a high temperature while inclosed in envelopes or between sheets of card-board or equivalent material whose rate of expansion and contraction is the same, or approximately the same, as their own.

2. The process of carbonizing shapes or blanks of fibrous or textile material under pressure and between sheets or envelopes of card-board or equivalent material whose rate of expansion and contraction when exposed to heat is the same, or approximately the same, as their own.

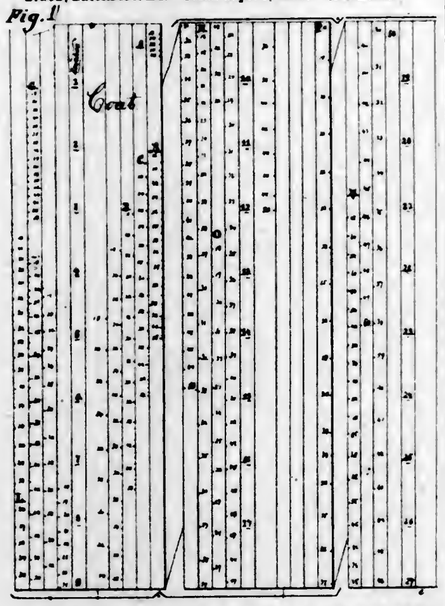
252,387. ELECTRIC SIGNAL FOR RAILWAYS. HIPPOLYTE LEBLANC and EUGENE V. A. LOISEAU, Paris, France. Filed July 7, 1881. (No model.) Patented in France Jan. 10, 1881.

Claim.—1. The combination, with the magnets of the signal apparatus, of a commutator and pedal apparatus, the commutator being connected in circuit with the pedal apparatus and arranged to connect said magnets alternately in circuit, substantially as described.

2. The combination, with a signal apparatus comprising two electro-magnets, an armature moving between said magnets and a signal-disk connected with said armature, of a commutator comprising an electro-magnet and armature, and circuit-changing de-

vices, operated by said magnet to bring into circuit one or the other of the signal-magnets, substantially as described.

3. The commutator described, comprising the shaft, with the contact-disks and insulating ratchet-disks mounted on said shaft, the two contact-springs, the electro-magnet, armature, and retractile spring, and the pawl and ratchet-wheel, arranged to turn said shaft when the armature is retracted, substantially as described.



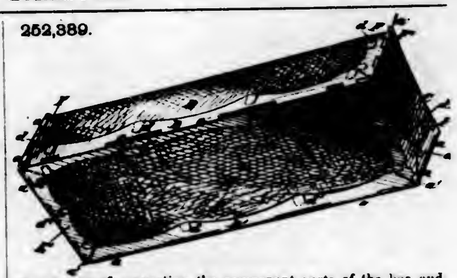
4. The pedal apparatus comprising the bellows, weight, and spring, in combination with the pedal and contact devices for making and breaking an electric circuit, said pedal and weight being disconnected from said bellows, so as to be moved by the train independently thereof, and said spring being adapted to expand the bellows when the pressure of the weight is removed, substantially as described.

5. The combination of a pedal, its weighted lever, a bellows, a fixed and a movable electrical contact, one of said contacts being carried by a spring, substantially as described.

6. The combination of a signal apparatus comprising two electro-magnets, with armatures moving between them, pedal apparatus comprising a pedal, bellows, and electrical contacts, and a commutator comprising circuit-changing devices, pawl, ratchet, retractile spring, electro-magnet, and armature arranged so that circuit-changing devices are moved step by step and are shifted when the armature is retracted, substantially as described.

252,888. CHART FOR DRAFTING GARMENTS. EMIL J. LINCK, Baltimore, Md. Filed Sept. 6, 1881. (No model.)

Fig. 1.



Claim.—The chart herein described for drafting coats, pantaloons, and vests, consisting of a strip of suitable material having imprinted thereon the marks and scales as shown in Fig. 1 of the drawings, adapted for use in laying off the appropriate measures for cutting, substantially as and for the purpose set forth.

252,889. BOX. WILLIAM LIVINGSTON, New York, N. Y., assignor to himself and Lewis W. Haines, same place. Filed Sept. 1, 1881. (No model.)

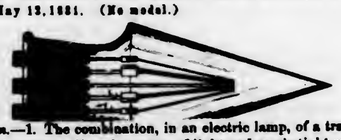
Claim.—1. A box comprising a bottom, sides, and ends, made of card-board, binder's board, paper, or like material, metal corner-pieces affixed thereto and provided with eyes or bearers, which are adapted to intermatch with the eyes or bearers of adjacent corner-pieces, pins extending parallel with the bottom and passing through the intermatched eyes or bearers which are located at the junction of the bottom and the ends or sides, and other pins extending at an angle to the bottom and passing through the eyes or bearers of the corner-pieces which are located at the junction of the ends and sides, the whole being so combined and organized that the said pins exact to secure the box in form, and the corner-pieces serve

252,889.

as a means of connecting the component parts of the box and strengthen and protect them at the corners, substantially as specified.

2. The combination, with the bottom, sides, and ends A B C of the box, made of card-board, binder's board, paper, or like material, of corner-pieces D D' E E' F F', secured thereto by means of claws or prongs *d d'*, and provided with intermatched eyes or bearers *a* and pins *a'*, arranged parallel with and at an angle to the bottom, and adapted to be inserted through the intermatched eyes or bearers, substantially as specified.

252,890. CAR-VENTILATOR AND DUST-ARRESTER. CHAS. C. MACCONNELL, U. S. Army. Filed Oct. 15, 1881. (No model.)

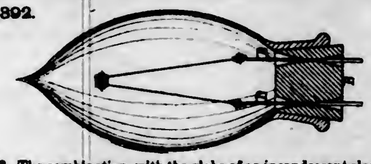


Claim.—1. A ventilator for use in car-windows, consisting of a box, A, having in combination a screen-protected air-inlet, B, in its side face, an air-outlet, a^2, in its inner edge, a partition, *a*, extending from the top of the box downward below the outlet a^2, and a dust-outlet, *c*, in the bottom of the box, substantially as and for the purposes described.

2. In an inclosed ventilator adapted for use in a car-window, the combination of a screen-protected air-inlet, an air-passage leading therefrom downward within the ventilator, a dust-escape opening in the line of downward flow of air, and an air-passage leading from the inflow-passage upward to the air outlet or discharge, substantially as and for the purposes set forth.

3. In a ventilating-box, A, the combination of screen-covered inlet B, dust-outlet *c*, an inflow air-passage leading downward from inlet B to outlet *c*, an air-passage, *e*, leading upward from the inflow-passage to a main air-outlet, and means for opening and closing the air-passage between the inlet and outlet, substantially as set forth.

252,891. ELECTRIC LAMP. HIRAM S. MAXIM, Brooklyn, N. Y. Filed May 13, 1881. (No model.)



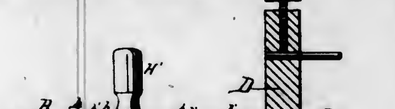
Claim.—1. The combination, in an electric lamp, of a transparent globe surrounding the source of light and an air-tight non-conducting plug or stopper closing the same and containing two or more conical steel wires or plugs ground into perforations through the material of which said stopper is composed, and in electrical connection with the carbon conductors, as described.

2. The combination, with the transparent globe of an incandescent electric lamp, of a glass stopper fitting the same by a ground joint and containing two or more conical steel wires or plugs ground into and passing through correspondingly-shaped perforations in the said stopper and suitably connected to the supporting-conductors of the carbon strip, as described.

252,892. ELECTRIC LAMP. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Mar. 25, 1881. (No model.)

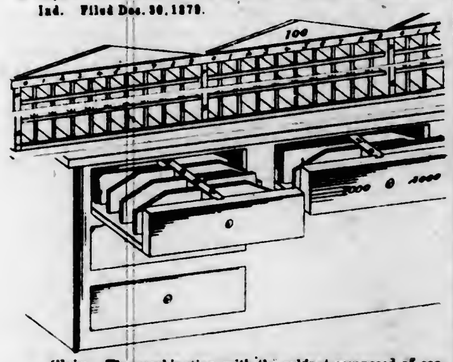
Claim.—1. A carbon conductor for electric incandescent lamps, composed of independent straight strips or filaments of carbon, the ends of which are connected respectively to a small mass of conducting material and to the supporting-conductors, as set forth.

252,892.



2. The combination, with the globe of an incandescent electric lamp, of an air-tight stopper of glass having partly conical perforations and conducting-wires of ductile metal contained therein, as set forth.

3. The method herein described of sealing the metallic conductors of an incandescent lamp, which consists in drawing under a high temperature the tapering ends of the same through perforations in a glass stopper, either with or without the addition of a fusible gum, as set forth.



4. The ground-glass stopper B, having metallic wires D D embedded therein, and the conical indentations C C, for retaining a suitable cement or gum.

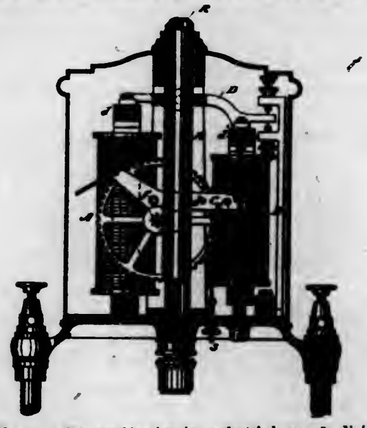
252,893. HORSESHOE. PATRICK MCCABE, Ithaca, N. Y., assignor of one-half to Howell H. Girard, Philadelphia, Pa. Filed July 18, 1881. (No model.)

Claim.—A horseshoe having the ordinary smooth upper surface and an under surface without calks, but covered with ridges, except at the heel portions, with a nail-crease extending entirely around the shoe, and with heel portions presenting flat plain surfaces sunken below the tops of the ridges, substantially as shown and described.

252,894. INDEX FILE-CASE. HIRAM E. HESS, Richmond, Ind. Filed Dec. 30, 1879.

Claim.—The combination, with the cabinet composed of sections, each subdivided into one hundred pigeon-holes, compartments, or boxes, under horizontal and vertical digital numbering, of the drawer or drawers subdivided into indexed compartments and containing sub-indexed books, cards, or other devices to facilitate search or use of the cabinet, as set forth.

252,895. ELECTRICAL SWITCH-BOARD. JOHN B. ODELL, Chicago, Ill. Filed July 29, 1881. (No model.)

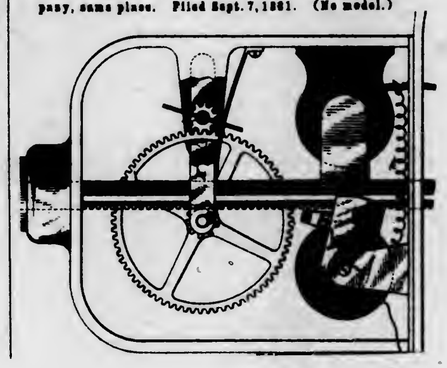


Brief.—The plugs are screw-threaded to fit both the vertical and horizontal strips of a cross-bar switch-board, whereby the plugs are prevented from being loosened by jarring the board.

Claim.—In a switch-board, the combination of strips B, provided with threaded holes *b*, and cross-strips C, provided with smaller threaded holes *c*, and plug H, provided with screw-threads b^1 and b^2, adapted to fit in the corresponding holes in said strips and cross-strips, substantially as specified.

252,896. ELECTRIC LAMP. JOSEPH OLMSTED, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed July 26, 1881. (No model.)

Brief.—Combines a clamp and a rack-and-pinion lamp. The pinion, which is on a frame vertically movable by the main actuating-magnet, is provided with flanges, which clamp the carbon-carrier and prevent both the rotation of the wheel-work and the descent of the carrier whenever the frame is raised by the magnet

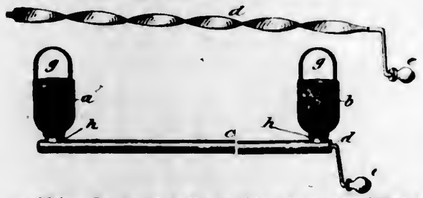


Claim.—1. The combination, in an electric lamp, of a divided or branched plate or frame controlled by one or more electro-magnets, a pinion, and one or more gear-wheels carried thereby, and a rack-bar in gear with said pinion and passing between it and the frame, so as to be locked or released by the tilting of the said frame, substantially as hereinbefore set forth.

2. The combination, in an electric lamp, of frame C, pinion E, having teeth *e* and projections or flanges *f*, rack-bar R, engaging with the pinion, a train of gears for limiting the rotation of the pinion, and one or more electro-magnets operating to move the frame for the purpose of locking or releasing the said rack-bar, substantially as hereinbefore set forth.

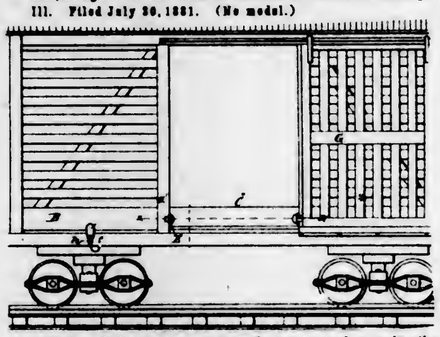
3. The pinion E, having teeth *e* and flanges *f f*, in combination with a rack-bar and electro-magnetic detent mechanism, as and for the purpose set forth.

4. The combination of one or more electro-magnets, A B, lever D, and armatures attached thereto with frame C, adjustably connected thereto, pinion E, having flanges *f*, rack-bar R, and a train of gears carried by frame C and operating to limit the rotation of the pinion, as and for the purpose set forth.



252,897. ELECTRIC LAMP. JOSEPH OLMSTED, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Sept. 7, 1881. (No model.)

Claim.—1. The combination, in an electric lamp, with the gravitating carbon-carrier, of a swinging frame, one or more gear-wheels carried thereby and meshing with the said carrier, a stationary detent for intercepting the tilting of the frame at a predetermined point, and an electro-magnet and movable armature in conjunction with one of said wheels, by the action of which the feed and adjustment of the carbons are effected, substantially in the manner hereinbefore set forth.

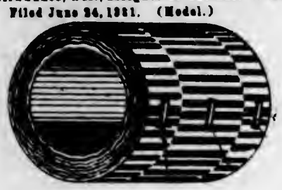


2. The combination, in an electric lamp, with the gravitating carbon-carrier, of a swinging frame, one or more gear-wheels carried thereby and meshing with the said carrier, a stationary detent for intercepting the tilting of the frame at a predetermined point, a magnet in the main circuit, and a pivoted or swinging armature therefor, wound with fine wire, forming a part of a shunt or derived circuit in conjunction with one of said wheels, and by the movement of which, caused by the varying attraction of the magnet, the feed and adjustment of the carbons are effected, substantially in the manner hereinbefore set forth.

252,398. SEED-SOWER. THEODORE PARKS, Freedom, Pa. Filed May 11, 1881. (Model.)

Claim.—In a hand seeding-machine, the combination of the long perforated tube *c*, the spiral shaft *d*, the crank *e*, and the two sacks *a b*, attached to the ends of the tube, and supporting-straps *g g*, substantially as described.

252,399. STOCK-CAR. GEORGE F. PATTERSON, Baltimore, Md., assignor of one-half to Charles C. Fairlamb, Chicago, Ill. Filed July 30, 1881. (No model.)

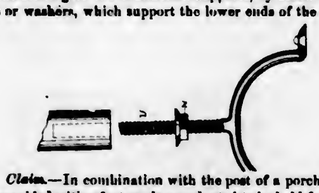


Claim.—1. In a stock-car, a shallow water-tank covering the floor of the car, whereby a body of water may be permanently retained at the bottom of the car, substantially as and for the purpose set forth.

2. In a stock-car, the car-body provided with a substantially water-tight flooring, in combination with base-boards B and doorway-strips C, both water-tight at their joints with the flooring and each other, substantially as and for the purposes set forth.

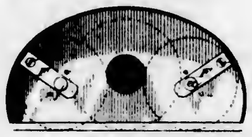
3. In a stock-car, the car-body, in combination with the base-boards B, the removable doorway-strips C, and the clamping-bolts or hooks E, substantially as described.

252,400. COVERING FOR STEAM-PIPES, &c. JAMES D. PINCH, Milwaukee, Wis., assignor of one-half to Henry Clay Bradley. Filed June 24, 1881. (Model.)



Claim.—1. A covering for pipes, boilers, &c., consisting of layers of paper so secured together at intervals as to form air-spaces, substantially as set forth.

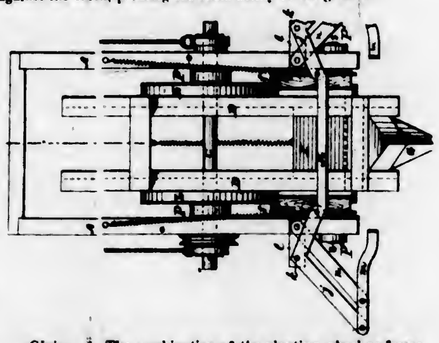
2. The method of preparing paper coverings herein described—that is, placing layers of paper one upon the other and securing them together at intervals, as by pasting, so as to form intermediate air-spaces, and cutting through the pasted portions to divide the covering into blocks or sheets of the size required.



252,401. PORCH-IRON. HENRY S. STAUFFER, Mount Joy, Pa. Filed Nov. 3, 1881. (No model.)

Brief.—Porch-posts are rendered adjustable, to compensate for the settling of the foundation-supports, by screw-rods having nuts or washers, which support the lower ends of the posts.

Claim.—In combination with the post of a porch, the upright U, provided with a foot or sleeve adapted to be held fast, the screw-thread cut therein, and a nut, N, with or without a washer, substantially as and for the purpose specified.

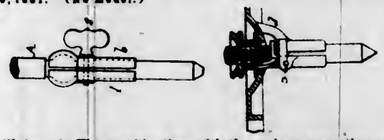


252,402. CARPET-SWEEPER. MYRON G. STOLP, Aurora, Ill., assignor to the Aurora Manufacturing Company, same place. Filed Dec. 1, 1881. (No model.)

Claim.—In a carpet-sweeper, in combination with the brush-shaft, a friction-wheel, E, pivoted on a swinging arm, F, with the center of the wheel below the horizontal plane in which the brush-shaft is pivoted, and having the outer end of such arm E pivoted to the case in such a position that this arm will form an obtuse angle with a line drawn from the center of the wheel E to the center of the brush-shaft, substantially as and for the purpose specified.

252,403. TRANSPLANTER. JOHN C. THERRY, Glyndon, Md. Filed Sept. 14, 1881. (Model.)

Brief.—The interior revolving frame carries a hollow triangular point at one or both ends. While horizontal the plant is placed in the receptacle. As it descends a pointed cover actuated by cams slides over it till, on reaching a vertical position in the trench, the cover is released and thrown back by a spring. At the same time tamping-bars are released and by springs thrown from each side against the earth, pressing the roots firmly in the ground.



Claim.—1. The combination of the planting wheel or frame D, provided with the rigid hollow point or points G and movable face or faces I, with the cross-bar J and cam-plates K, whereby the planting-point is closed to retain the plant therein during the downward movement of said point.

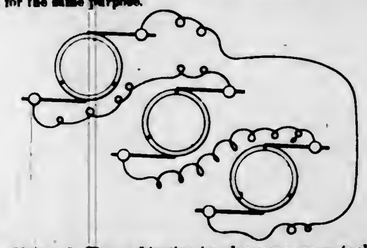
2. The combination of the planting wheel or frame D, provided with the rigid hollow point or points G and movable face or faces I, with the cross-bar J and spring *b*, whereby, when the ends of the cross-bar J have passed at the lower ends of the cam-plates, the movable face will be raised to allow the plant to be deposited in the soil.

3. The combination of the disks L, secured to the shaft C, and frame or wheel D, with the pins *f*, pivoted levers *d*, links A, bell-crank levers *g* and *j*, parallel bars *n*, and presser-bars *m*, whereby the presser-bars are held back from contact with the earth during a part of a revolution of the planting wheel or frame, as set forth.

4. The combination of the disks L, provided with the notch *e*, with the pins *f*, pivoted levers *d*, links A, bell-crank levers *g* and *j*, parallel bars *n*, pressers *m*, and springs *o*, whereby the presser-arms are thrust forward in a line parallel with the surface of the ground and the soil is pressed around the root of the plant, as set forth.

252,404. CARBON-HOLDER FOR ELECTRIC LAMPS. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Apr. 30, 1881. (No model.)

Claim.—1. The combination, with the carbon-supporting rod A, of a carbon holder or socket consisting of the two clamping-sections *d* and *b* and screw S, the said sections being formed with a socket at one end adapted to fit the spherical end of the rod A and grooves at the other for clamping the end of the carbon, as described.



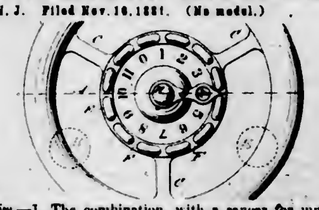
2. The combination, in a carbon-holder, of the semi-cylindrical socket *e* and clamping-section *f*, hinged together by the arms *g* and pins *c*, and clamped to the cross-bar B by means of nut *a* and screw A, passing through the bar, as described.

3. The combination, in an electric lamp, of a carbon-holder, with a cross-bar having a convex or concave seat on which the holder is clamped by means of a nut and screw, whereby the holder is capable of both lateral and angular adjustment, as described.

4. The combination of the semi-cylindrical socket *f*, having legs *l l'*, with clamping-piece *e*, having a leg, *l'*, and notched projecting arms *g*, for engaging with pins on the socket *e*, these parts being clamped together and secured to the cross-bar of an electric lamp by means of a nut, *n*, and screw *h*, attached to or forming a part of the socket *f*, substantially as shown and described

252,405. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Apr. 3, 1881. (No model.)

Brief.—The rings are formed of two sections or plates, to which the ends of the armature-coils are connected, one of the plates extending more than half-way around the commutator, whereby the armature-coil connected with each ring, is short-circuited while passing the neutral point. As a modification, the plates are made of equal length and the brushes so arranged as to be in contact with a single plate during a portion of the revolution for the same purpose.



Claim.—1. The combination, in a dynamo or magneto electric machine, with the revolving armature and two or more coils wound thereon, of brushes adapted to connect the same in series, and plates forming the rings of a commutator, constructed or placed, as described, to form through any given ring a metallic connection between the brushes of the coil belonging thereto at times when the said coil is passing the neutral points, as described.

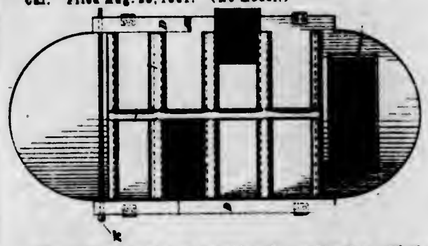
2. A commutator-ring composed of two segments to which the two ends of an armature-coil are connected, one or both of said segments being so formed as to extend more than one-half way around the said ring, substantially as and for the purpose set forth.

3. A commutator composed of a ring or a series of rings, each of which is divided into two segments, to which segments or pair of segments the opposite ends of armature-coils are connected, in combination with commutator-brushes, the relative arrangement of the said segments and brushes being such that both brushes belonging to each ring will be in contact with a single segment while the armature-coil belonging to such ring is passing the neutral points of its revolution, substantially as and for the purpose set forth.

4. In a dynamo-electric machine, two or more pairs of collecting-brushes, in combination with commutator-rings, each composed of two insulated metallic segments connecting with separate coils on the armature, and one or both of the segments of each pair being formed to extend to more than one-half way around the circumference of the ring, substantially as and for the purpose set forth.

252,406. SAUCER FOR MUGS. FREDERICK L. WEBER, Hoboken, N. J. Filed Nov. 10, 1881. (No model.)

Claim.—1. The combination, with a saucer for mugs, &c., having three projections, B B B, on its bottom for legs, and three ribs, C C C, on its upper part, for the purpose specified.

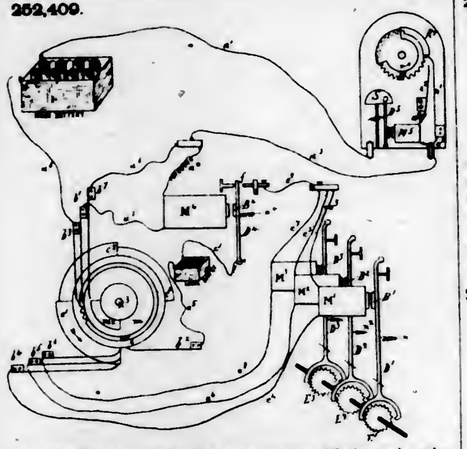


2. In a saucer for mugs, &c., the arrangement of a dead face, in combination with a movable hand, G, its center pin, H, and notches F F in circular projection E, for the purpose set forth.

252,407. BEVEL-JAW FOR VISES. HORATIO D. WEST, Stafford Springs, Conn. Filed Apr. 26, 1881. (No model.)

Claim.—The extra bevel-jaw *f*, rotarily hung on the base-block A, provided with springs *i* and bedded upon the screw-case *e*, all substantially as described.

252,408. SIGN-BOARD. GEORGE B. WILBUR, San Francisco, Cal. Filed Aug. 25, 1881. (No model.)



Claim.—In a sign board or holder, the combination, with the hinged stops D D, of a binding-rod, E, passed through the ends of said stops and adapted to be securely locked, substantially as and for the purpose set forth.

252,409. AUTOMATIC ELECTRIC-SIGNAL-PRINTING REGISTER. FRANK B. WOOD, New York, and HENRY J. BREWER, Brooklyn, assignors of one-fourth to Benjamin E. Valentine, Brooklyn, N. Y. Filed June 13, 1881. (Model.)

Claim.—1. In a register constructed substantially as described

252,409.

for recording electric signals, the combination of the intermittently-moving type-wheel Q′, the spring Y′, the escapement-lever D′, and its intervening mechanism for permitting an intermittent movement of Q′, the electro-magnet M′, with its armature for governing the intermittent movements of the escapement-lever, and the engaging-wheels L′ and K′, with their trains, substantially as described, for winding up the spring Y′ and returning the type-wheels to unison.

2. In a register for recording electric signals, the combination of two or more intermittently-moving type-wheels, Q′ Q², &c., with their governing and actuating attachments Y′, &c., E′, &c., D′, &c., substantially as described, with the cam-wheels c′ c², &c., and contact-springs or circuit-breakers b² b³ b⁴, &c., and electro-magnets M′ M², &c., for changing the local circuits successively through said magnets, substantially as and for the purposes specified.

3. The combination of a signal-printing register substantially as described whose intermittently-moving type-wheels are controlled by the electro-magnets M′, &c., of a local electric circuit, and a time printing-register, substantially as described, whose type-wheels are controlled by a chronometer or time-piece, with the printing-lever N, automatically operating, substantially as described, to imprint by the same impress both the electric signal and the time when it is received, substantially as specified.

4. The combination of one or more signal-boxes, A, the main line of an electric circuit, a relay, and an automatic printing-register, (forming part of a local circuit,) constructed with a series of spring register-wheels having escapements operated by the electric current for moving them, and with a counter-moving mechanism which is impelled by a force superior to that of the register-wheels, and which engages with them during a part of its revolution to throw them back to unison after the printing is done, so that the electric signal and number of the station from which it is sent will be automatically recorded and printed, and then a return signal automatically sent to the signal-box, and the parts restored automatically to their original position by the mechanism herein described or its equivalent.

5. In a signal-register having a type-wheel or series thereof, mechanism to operate the same, as described, to present the desired number or mark at a given point, and provided with a spring or springs which impel the wheel or wheels in one direction, in combination with means for reversing said register wheel or wheels and bringing them back to unison, consisting of a trip mechanism and unison-wheels impelled by a greater force than the register-wheels, having engagement with the register-wheels during only a part of their revolution, substantially as set forth.

252,410. CALIPERS. LUDLIN B. WOODRUFF, Chicago, assignor to himself and James Shaw and Albert J. Hopkins, Aurora, Ill. Filed May 18, 1881. (No model.)

Brief.—The shorter arms being set to the diameter of a circle, the circumference is shown by the distance between the longer arms.

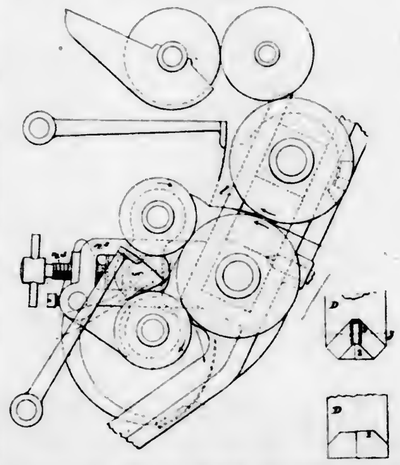
Claim.—1. Compasses, calipers, or other similar instruments freely adjustable on a fixed pivot, on each leg of which instrument are indicated, in any suitable manner, (including offsets,) distances from the point B, the ratio between which distances on a given leg is equal to the ratio between a diameter and its circumference, substantially as and for the purpose described.

252,410.

2. Compasses, calipers, or other similar instruments freely adjustable on a fixed pivot, and provided with two sets of points, a a′ and a² a³, arranged and operating substantially as and for the purposes set forth.

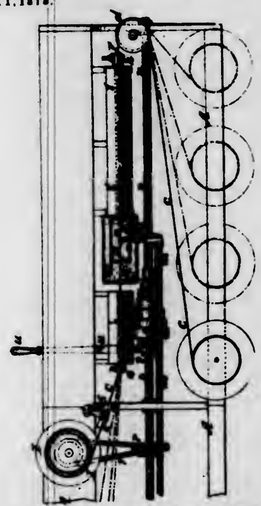
3. Compasses, calipers, or other similar instruments freely adjustable on a fixed pivot, and provided with two sets of points, c c′ and c² c³, located on the same side of the pivot and arranged and operating substantially as and for the purposes set forth.

252,411. ADJUSTABLE BUGGY. WILLIAM T. ARGUS, Sydney, New South Wales, Australia. Filed Dec. 5, 1881. (No model.) Patented in Australia Sept. 29, 1879.



Claim.—1. In a buggy, the combination, with the seat E and its hinged back F, of the curved rods G and the brackets H, substantially as herein shown and described, whereby the said back will be supported when turned down into a horizontal position, as set forth.

2. In a buggy, the combination, with the seat E, having a hinged back, F, and the brackets H, having arms N, of the second hinged back, K, having spring-latches O, substantially as herein shown and described, whereby the said second back will be supported when raised into a vertical position, as set forth.

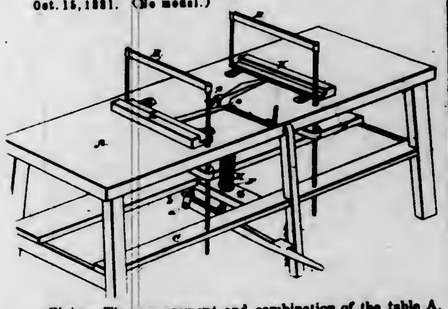


3. In a buggy, the combination, with the body D and the hinged end-board P, of the hinged extension-board Q, the curved bars R, and the standards S, substantially as herein shown and described, whereby the said hinged boards will be supported when turned down to serve as a foot-board, as set forth.

252,412. FOLDING MECHANISM FOR PAPER-BAG MACHINES. DANIEL APPEL, Cleveland, Ohio, assignor to Newton W. Taylor, same place. Filed May 11, 1881. (No model.)

Claim.—In a paper-bag machine, three rollers arranged in contact, or nearly so, and two folding or tucking blades co-operating therewith to fold or tuck the paper-bag blank twice in succession between parts of the periphery of that one of the said rollers which forms a support for the main part of the bag, and the two rollers arranged about it, which support the free or leading end of the blank in advance of the portion engaged by the blade, substantially as described.

252,413. APPARATUS FOR HARDENING AND TEMPERING WIRE FOR CARDS. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Dec. 22, 1879. Patented in England Sept. 5, 1878, and in Germany Dec. 1, 1878.

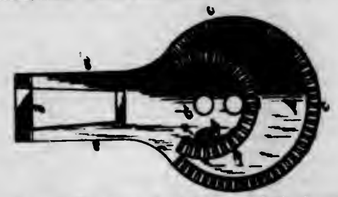


Claim.—1. A wire hardening and tempering apparatus having the following elements: a gas-burner, F, for heating the wire, a gas-burner, G, for annealing the wire, an intermediate tank containing hardening liquid, and drums for drawing the wire through the two gas-flames and the intermediate tank, all substantially as described.

2. The combination of the burner F and guides *h* with shield *i*, as set forth.

3. The within-described wire hardening and tempering apparatus, consisting of the burners F and G, cistern H, perforated at both ends, guides *h*, plate *i*, and drums I, all substantially as set forth.

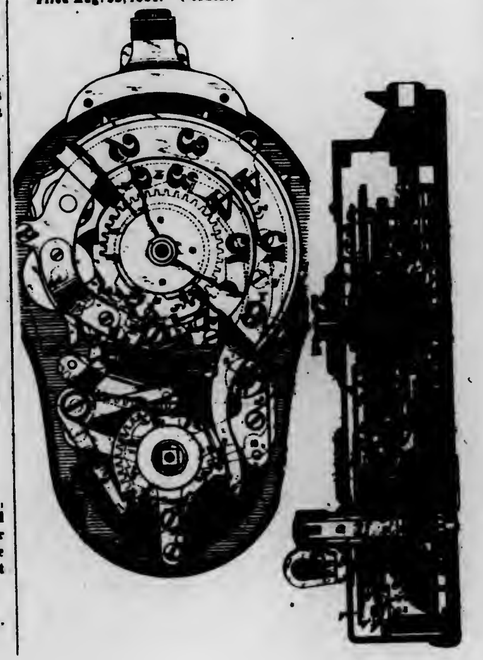
252,414. BOX-COVER PRESS. EDWIN AUSTIN, Winters, assignor of one-half to William Cantelow, Vacaville, Cal. Filed Oct. 15, 1881. (No model.)



Claim.—The arrangement and combination of the table A, vertically-moving clamps or straps B B, and bed-pieces K K, said bed-pieces having different levels and adapted to slide together or apart by means of the rocking shaft L, with its cranks O and the connecting-rods m, substantially as and for the purpose herein set forth.

252,415. END-GATE FOR WAGONS. DAVID B. BAUDER, Mosomisco, Mich. Filed July 2, 1881. (No model.)

Claim.—The end-gate B, having cleats *b*, provided with the steps E, or their equivalent, and pivoted lock-levers C C D, constructed as described, in combination with the wagon-box A, having cleats *a a′*, slotted or recessed at *c*, and provided with the staples *d*, substantially as and for the purpose herein shown and set forth.



252,416. WASHING-MACHINE GEAR. OREN W. HARBAUGH, Harlan, Iowa. Filed Oct. 31, 1881. (No model.)

Claim.—1. The drive-wheel A, cast with the inwardly-projecting cogs c and handle *a a b*, and having a central bearing, B, and auxiliary bearing C, and auxiliary set of cogs D, cast with ears E E for their attachment to the face of disk A, concentric with the upper or auxiliary bearing, C, substantially as and for the purpose herein shown and described.

2. The combination, with the pinion F of a washing-machine agitator, of the vertically and horizontally adjustable drive-wheel A, provided with double bearings B and C, and with a set of detachable auxiliary cogs, D, adapted to be fastened upon the face of the disk or wheel A, concentric with its bearing C, substantially in the manner and for the purpose herein shown and specified.

252,417. FARE-REGISTER. JOHN B. BENTON, New York, N. Y. Filed Aug. 23, 1881. (Model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the arbor or shaft, the hub provided with a connection to rotate the general register-wheels, mounted so as to turn around said arbor, the hub to rotate the trip-register wheels or disks, also mounted so as to turn around said arbor, and the ratchet-and-pawl connection between said hubs, whereby the turning movements of the hub of the trip-register in the counting direction may be communicated to the hub of the general register, while its turning movements in the opposite direction are independent and free of said general register.

2. The combination, substantially as hereinbefore set forth, of the arbor or shaft, the hub to drive the general register, mounted so as to turn upon said arbor, the actuating or sector arm fitted to turn or vibrate upon the front end of said hub, and a ratchet-wheel connected with said hub in front of said arm to drive the hub when said arm is vibrated.

3. The combination, substantially as hereinbefore set forth, of the arbor or shaft, the hub provided with a connection to rotate the general register-wheels, mounted so as to turn around said arbor, the hub to rotate the trip register wheels or disks, also mounted so as to turn around said arbor, the ratchet-and-pawl connection between said general-register and trip-register hubs, the actuating ratchet-wheel of said trip-register hub, and the actuating or sector arm having a single driving or actuating pawl to engage the teeth of said actuating ratchet-wheel, whereby the vibration or movement of said actuating-arm suffices by its single driving-pawl to actuate the trip and general registers simultaneously, or nearly so, while said trip-register may be set independently of said general register.

4. The combination, substantially as hereinbefore set forth, of the arbor or shaft, the trip-register hub, mounted so as to turn around said arbor, the actuating ratchet teeth or wheel of said hub, the sector-arm, carrying a pawl to engage said teeth or wheel to turn said hub, the units-disk, connected with the front end of said hub by a cap-plate so as to turn with it, the tens-disk, mounted so as to turn upon said hub below or in rear of the units-disk, the gearing by which said tens-disk is turned one point for each complete revolution of the units-disk, and the set-back knob upon the outside of the casing, connected with said cap-plate by a pawl-and-ratchet connection.

5. The combination, substantially as hereinbefore set forth, of the arbor or shaft, the actuating-wheel of the trip-register, turning about said arbor, the actuating or sector arm also turning about said arbor as a center, and the double-armed actuating or driving pawl of said sector-arm, one end of which engages said actuating-wheel of the register on the forward stroke of the arm to move the register in the counting process, while the opposite end of said pawl engages or strikes a stationary pin or abutment on the back stroke of the sector-arm to throw the pawl out of engagement with the ratchet-wheel, so as to afford no obstruction to the backward movement of the trip-register when reset.

6. The combination, substantially as hereinbefore set forth, of the arbor or shaft, the trip-register hub turning upon said arbor, the actuating ratchet-wheel of said hub, the driving-pawl engaging said ratchet-wheel to turn it in the process of counting, the units-disk connected with the front end of said hub, the tens-disk fitted to turn around said hub, the gear-wheel forming part of said tens-disk, the toothed wheel with which said gear-wheel meshes, the notched wheel connected with said toothed wheel to turn it, and overlapping the front face of the actuating ratchet-wheel of the hub, so as to engage a curved surface of said hub to lock the notched wheel, and the lug or pin on the front face of said actuating ratchet-wheel to engage said notched wheel to positively turn it the distance between two of its notches once for each complete rotation of said actuating ratchet-wheel.

7. The combination, substantially as hereinbefore set forth, of the trip-register disks, the actuating or sector arm to actuate said disks, and the signal-plate Q, fitted at one end to turn about a support in front of said disks and jointed at the other end to said actuating-arm, so as to move therewith.

8. The combination, substantially as hereinbefore set forth, with a trip-register and its actuator, of a pivoted lever which in one position prevents a backward resetting movement of the trip-register while freeing the actuator of the machine, while in another position it permits the register to be reset in a backward direction while locking the actuator against its counting movement or actuation.

9. The combination, substantially as hereinbefore set forth, of the trip-register, the actuating ratchet-wheel of said register, the pivoted detent-lever, the upper end of which normally engages said ratchet-wheel through the influence of a spring, and a cam controlled by a knob upon the outside of the register-casing to rock said lever to disengage it from said actuating ratchet-wheel.

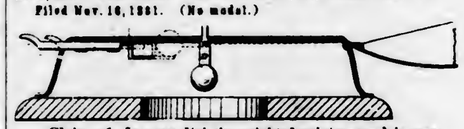
10. The combination, substantially as hereinbefore set forth, of the trip-register, the actuating ratchet wheel or teeth of said register, the actuator of said register, and the pivoted lever, one end of which in one position of the lever engages said ratchet wheel or teeth to prevent back movement of the register, while the opposite end in another position of the lever engages the actuator to lock it while permitting of a resetting movement of said trip-register.

11. The combination, substantially as hereinbefore set forth, of the trip-register, the actuating or sector-arm carrying a driving-pawl to actuate said register in the counting process, the turning shaft-actuator vibrating said sector-arm by means of a gear-wheel meshing with the teeth of said sector-arm, a tongue or projection on said gear-wheel, and a locking device to engage said projection to lock the actuator from turning when the trip-register is free to be turned to zero or the starting-point.

12. The combination, substantially as hereinbefore set forth, of a register, the actuator of said register, a direction-indicator, the shifting or setting mechanism of said indicator, and a locking mechanism which permits said shifting or setting mechanism to be operated to shift or set said indicator when the actuator is in its normal position in readiness to actuate the register, while it automatically locks said shifting mechanism when the actuator is moved forward in its counting direction.

13. The combination, substantially as hereinbefore set forth, of the trip-register, the actuator of said register, the detent-lever to prevent back movement of said register, the knob or device to rock said detent-lever to permit the register to be moved backward or reset, and a locking device which in one position permits said knob or device to be moved to rock the detent-lever, while in another position it engages said knob or device and positively locks it from movement.

14. The combination, substantially as hereinbefore set forth, of the direction-indicator plate with the wheel or portion connected therewith provided with projections or surfaces to positively limit the shifting or turning movement of said indicator.

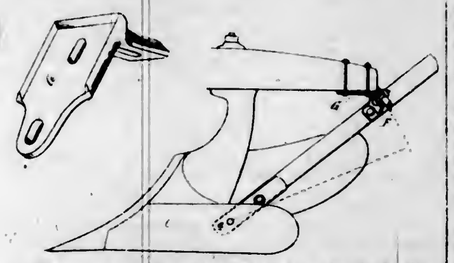


15. The combination, substantially as hereinbefore set forth, of the direction-indicator plate, the gear-wheel of said plate, the pinion-wheel meshing with said gear-wheel and turned by a knob outside the case to shift the indicator, the ratchet-wheel of said indicator, and the detent-pawl engaging said ratchet-wheel to prevent back movement of said indicator.

16. The combination, substantially as hereinbefore set forth, of the direction-indicator plate, the gear-wheel to shift said indicator, the wheel or portion provided with projections or stops to limit the shifting movement of said indicator, and the ratchet-wheel or teeth to prevent back movement of said indicator.

17. The combination, substantially as hereinbefore set forth, of the trip-register, the direction-indicator, the three-armed lever, two arms of which engage said trip-register and one of which engages the direction-indicator, the notches in said trip-register, into which the two arms which engage the trip-register are automatically forced when said register stands at zero, and the projection or stop on said direction-indicator, with which the arm which engages the said indicator connects to stop the indicator at the proper point when being reset or shifted.

18. The combination, substantially as hereinbefore set forth, of the trip-register, its actuator, the detent-lever to prevent backward movement of said register, the direction-indicator plate locked from back movement, the knob to shift said indicator and rock said detent-lever to permit the register to be reset, the wheel or portion of said indicator provided with projections or stops to limit its shifting movement, and the three-armed lever, two arms of which engage the trip-register and are forced into notches therein when the trip-register is at zero, while the third arm engages the one of the projections of the indicator to limit its movement, whereby a movement of the knob to shift the indicator releases the detent-lever from the trip-register, carries a stop of the direction-indicator against one of the arms of said three-armed lever, and necessitates resetting the trip-register to zero before the shifting of the indicator can be completed.



252,418. SUN-DIAL. HENRY A. BURR, Jr., Washawken, N. J. Filed Nov. 16, 1881. (No model.)

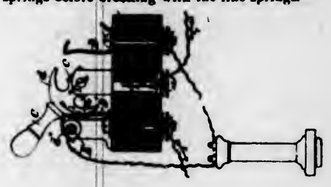
Claim.—1. In a sun-dial, the weighted pointer or rod, in combination with a slide which supports the rod in a horizontal position, substantially as shown.

2. In a sun-dial, the combination of a pivoted weighted rod or pointer, a slide for supporting the pointer in a horizontal position, a slotted dial-plate, and the compass, the parts being arranged to operate substantially as described.

252,419. PLOW. DENNIS P. BIGELOW, Albion, Mich., assignor to the Gale Manufacturing Company, same place. Filed July 8, 1881. (No model.)

Claim.—In a plow, and in combination with the handles thereof, pivoted at their lower ends, as described, the tail-iron G, adjustably secured to the rear end of the beam, and provided with a vertical slot, and curved on its outer surface on the arc of a circle drawn from the handle-pivots, and the index F, fastened between the handles and provided with a lateral slot, and having its outer surface curved to correspond with the adjoining surface of the tail-iron, substantially as and for the purpose specified.

252,420. FIRE-KINDLER. JOSEPH W. BLAISDELL, Brooklyn, N. Y. Filed Dec. 9, 1881. (No model.)



Claim.—1. As an improved article of manufacture, a fire-kindler made substantially as herein shown and described, and consisting of a bag containing combustible material, one end of the bag being twisted, sealed, and covered with an inflammable coating to form a wick, as set forth.

2. The combination, with the bag A, of the lighting-wick C, made in one with the bag material, and coated and sealed with resin or other suitable inflammable material, substantially as set forth.

3. The method herein described of sealing fire-kindler bags and providing the same with lighting-wicks, which consists in twisting the mouth part of the bag and then sealing the twisted portion by dipping the same in molten resin or other suitable material, as set forth.

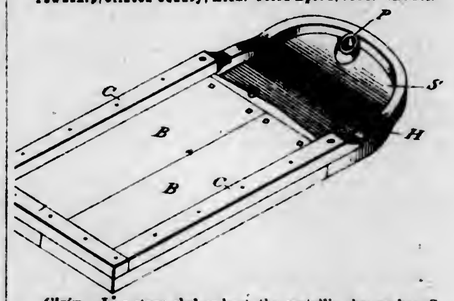
252,421. SWITCH FOR TELEPHONE-EXCHANGES. HENRY W. BUCKINGHAM, Providence, R. I. Filed July 23, 1881. (No model.)

Brief.—The object of this device is to enable the operator to put his telephone in circuit with subscribers without breaking the line. It consists of a series of swinging jacks, one for each line, and connected therewith, a series of contact-springs through which the lines are continued, a bar forming one terminal of the telephone-circuit and forming a common anvil for the line-springs, and a series of springs connected with the other terminal of the telephone-circuit. The jacks are normally in contact with the line-springs, forcing them from their anvil. Upon swinging the jacks to connect in the telephone contact is made with the telephone-springs before breaking with the line-springs.

Claim.—1. As an improved article of manufacture, a fire-kindler made substantially as herein shown and described, and consisting of a bag containing combustible material, one end of the bag being twisted, sealed, and covered with an inflammable coating to form a wick, as set forth.

2. The combination, with the bag A, of the lighting-wick C, made in one with the bag material, and coated and sealed with resin or other suitable inflammable material, substantially as set forth.

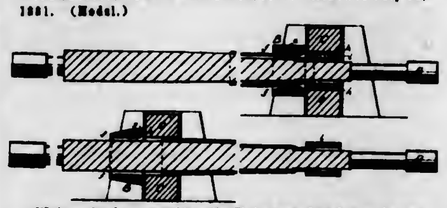
3. The method herein described of sealing fire-kindler bags and providing the same with lighting-wicks, which consists in twisting the mouth part of the bag and then sealing the twisted portion by dipping the same in molten resin or other suitable material, as set forth.



Claim.—1. A supplementary telephone-switch comprising a series of swinging jacks or levers of conducting material adapted for connection with separate subscribers' circuits, a metallic spring-contact on each of two opposite sides of each of said jacks, a common conductor with which all the spring-contacts on one side of the series of jacks make electrical connection when their respective jacks are in connection with the opposite contacts, but from which conductor they are separated when they are themselves in electrical connection with the jacks, the construction of the jacks being such that they make connection with the contacts toward which they are moved before breaking connection with those from which they are moved, substantially as described.

2. The telephone-switch herein described, consisting of the swinging jack C, arranged for connection to the subscriber's line, and provided with the arms *d* and *d'*, the springs D and D', arranged for connection respectively with a telephone and a switch-board, and the rod E, arranged to be put in or out of connection with spring D' by the action of the jack, and to be connected also with the telephone, substantially as described.

3. The combination of the jack C, provided with the arms *d* and *d'*, the springs D and D', and rod E, the said spring D' being arranged to be driven out of and brought into connection with the rod by the action of the jack, but to be in connection with said rod and jack during a portion of the movement of the jack in contact with the other spring, substantially as and for the purpose set forth.

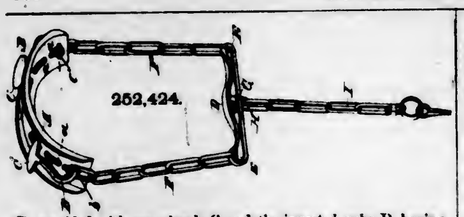


4. The supplementary telephone switch-board provided with a series of jacks, the two series of springs arranged for alternate connection with said jacks, and the rod E, substantially as described, one series of springs being electrically connected with each other and the others arranged for individual or separate connection with and disconnection from the rod by the action of the jacks, substantially as and for the purpose set forth.

252,422. STONE-SLED. VAN RENSSELAER T. BRIGGS, De Witt Township, Clinton County, Mich. Filed Apr. 4, 1881. (Model.)

Claim.—In a stone sled or boat, the metallic shoe or bow S, having outer rim, H, hitching-hole P, and cross-bar O, to form the bow part of a stone-sled, in combination, with straight planks B B and side rails, C C, substantially as specified.

252,423. DEVICE FOR DRAWING METAL TUBES. EDWIN B. BUCKINGHAM, Brookline, assignor to the American Tube Works, Boston, Mass. Filed Jan. 26, 1877. Renewed July 14, 1881. (Model.)

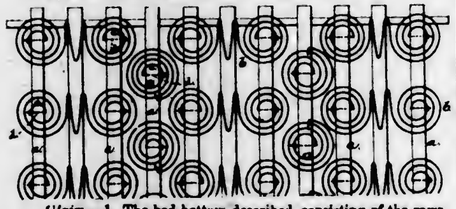


Claim.—1. An expanding die, B, in parts *b* and *c*, each made of metal capable of expanding and to abut or interlock, as at *d*, substantially as and for the purpose described.

2. The combination, with a mandrel, a die, and a head-block for drawing tubes, of a loose collar, *l*, which is on the mandrel and outwardly is adapted to fit the head-block, substantially as and for the purposes described.

252,424. CATTLE-TIE. AUGUST BUSSLL, Grantsburg, Wis. Filed June 28, 1881. (No model.)

Claim.—1. A cattle-tie comprising the yoke A, having hooks



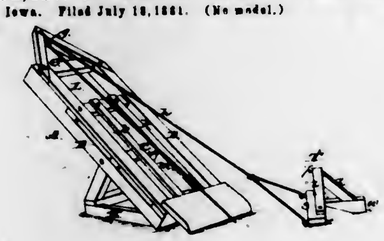
B, provided with cross-heads C, and the inverted yoke D, having eyes E E, chains F F, and swiveled bolt G, provided with the chain I, constructed and combined substantially as and for the purpose herein shown and described.

2. A cattle-tie composed of the yoke A, U-shaped in cross-section, and having a series of slots, *a a*, detachable and adjustable hooks B, having cross-heads C C', and inverted yoke or cross-bar D, provided with the end chains, F F, and swiveled middle chain, I, substantially as and for the purpose herein shown and set forth.

3. The combination, in a cattle-tie, of a yoke, U-shaped in cross-section, and having T-shaped end hooks, with a bottom yoke or cross-bar, having end chains adapted to be adjusted upon said hooks, substantially as and for the purpose herein shown and specified.

252,425. SPRING BED-BOTTOM. DUDLEY L. CAMPBELL, Denver, Colo. Filed Dec. 10, 1881. (No model.)

Claim.—1. The bed-bottom described, consisting of the rows of single springs *a* and of twin springs *b*, arranged lengthwise of the frame, and alternately with said single springs, thereby massing the supporting-spirals under the heaviest portions of the body, substantially as specified.



2. The combination, with the slat *a* and the base-coil *c* of the spiral spring thereon, of the clamping-arm *d*, extending under the slat and having a downwardly-projecting end, *g*, and the looped-wire fastening *e*, connecting said end to the base-coil, substantially as specified.

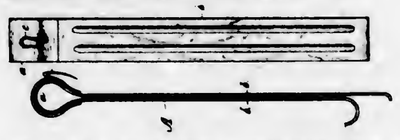
252,426. THRASHING-MACHINE TOOTH. LUCIUS CARRIER, Providence, R. I. Filed June 13, 1881. (No model.)

Claim.—The thrashing-machine tooth A, made of tough iron and having its forward upper portion provided with the re-enforce B, consisting of a plate of steel folded to fit over the upper portion of the front edge and along both sides of the upper front portion of the tooth, said re-enforce being secured in place by a rivet passing through both its side portions and the portion of the tooth between them, substantially as described.

252,427. HAY-STACKER. LEONIDAS W. CARSON, Madison, Iowa. Filed July 18, 1881. (No model.)

Claim.—The inclined frame A, having the guide-tracks *k k*, forming the way *m*, and having its upper portion extending beyond the base, with the opening L in such overhanging portion, in combination with pulley *g*, rope A, and drag T, having body *s* and guide or rudder *w*, all arranged to operate as and for the purpose set forth.

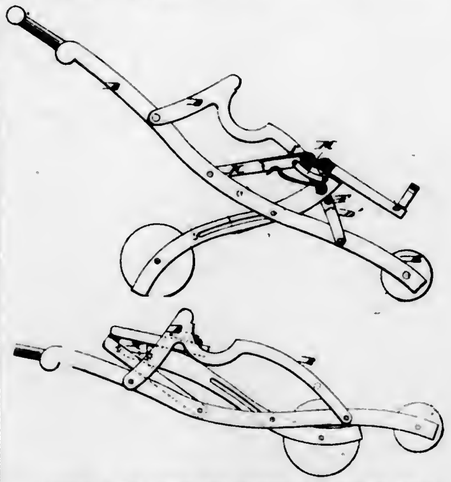
252,428. CAKE-PAN FRAME. WILLIAM J. CASSIDY, Portland, Conn. Filed Oct. 14, 1881. (No model.)



Claim.—1. The pan B, formed with the indentations *c*, in combination with the frame A, formed with the lips *b*, substantially as described.

2. The pan B, formed with the rim *d* and indentations *c*, in combination with the frame A, formed with the lips *b*, and the annular depression *e*, substantially as described.

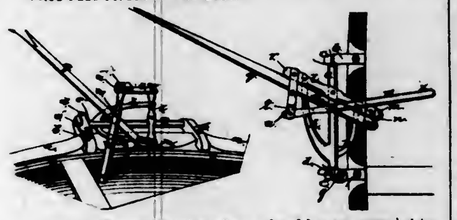
252,429. SUBSTITUTE FOR COFFEE. LUIGI CHIOSSA, Cervignano, Austria, assignor to Arno Behr, Jersey City, N. J. Filed Aug. 8, 1881. (No specimens.)



Claim.—As an improved article of diet, the germs and hulls of maize isolated from the grain and from each other, and respectively roasted to a full brown color for use, either separately or mixed together in any desired proportions, as the base of a decoction or infusion, substantially as herein set forth.

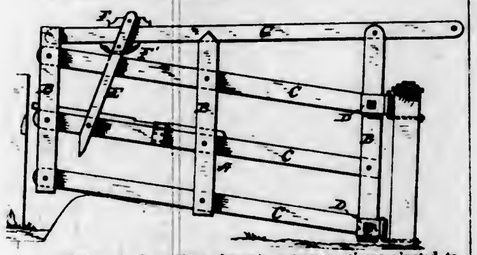
252,430. BARBER'S PAPER-CLIP. MOSES COHEN, Hallettsville, Tex. Filed Nov. 10, 1881. (No model.)

Claim.—The barber's paper-clip A, bent to form a spring at *a*, and having its straight portions *b b* corrugated longitudinally, whereby the corrugations of said portions shall fit into each other, and provided with a suitable hook, substantially as and for the purpose specified.



252,431. WHEEL OR NURSERY CHAIR. CLAUDIUS O. COLLIGNON, Harrington Township, Bergen County, N. J. Filed June 8, 1881. (No model.)

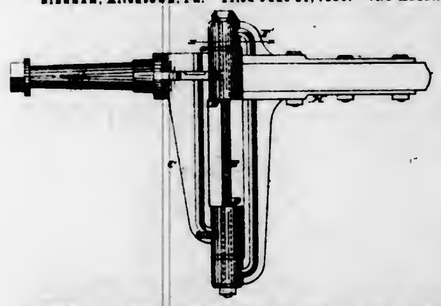
Claim.—1. The folding chair adapted to be converted into a child's carriage or rolling chair, and consisting essentially of two parts, one embracing the front legs, back, arms, hinged seat, and front and foot boards, and the other consisting of the hind legs, formed with grooves receiving pins on the front legs, and connected with the seat by pivoted braces, substantially as described.



2. The combination, in a folding chair convertible into a child's carriage or rolling chair, of the front legs extended to form the sides of the back, with the arms D, extended down to constitute braces D', secured to the front legs, the round F, connecting the said braces, the hind legs formed with grooves receiving pins on the front legs, and the metal braces M, pivoted to the hinged seat and to the hind legs, substantially as described.

252,432. ROWING-GEAR. LEWIS A. COOK, Hanover, Mich. Filed June 11, 1881. (No model.)

Claim.—The combination of oar *g*, hand-lever *e*, swiveled together, rock-shaft *c*, rest *h*, and brace connected to the shaft and extending forwardly, connecting-rod *e*, and coupling-strap *n*, as set forth.

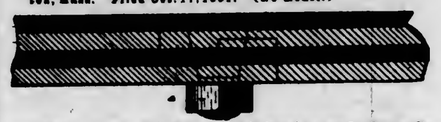


252,433. GATE. NEWTON O. COOLEY, Corning, Iowa. Filed Sept. 27, 1881. (No model.)

Claim.—1. In a pivot slat-gate, a loop or stirrup pivoted to one of the central slats, and provided with templets pivoted in its upper end capable of receiving between them and engaging with a lifting-bar pivoted in the hinge-post of the gate, substantially as described.

2. The improved pivot slat-gate consisting of the vertical bars B, the pivoted slats C, the loop E, with the templets F F', and the pivoted lifting-bar G, all arranged and operating in the manner as described.

252,434. TURNING-GEAR FOR VEHICLES. PETER B. CUNNINGHAM, Allentown, Pa. Filed June 21, 1881. (No model.)

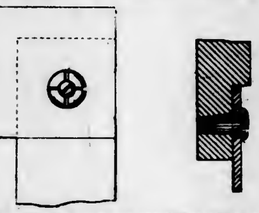


Claim.—1. The turning portion of the axle, consisting of the journal and bosses, and a perpendicular web, C, which connects the journal and bosses and projects outwardly from the bosses, substantially as and for the purpose set forth.

2. The stationary portion of the axle, consisting of two separate parts, each formed of a boss, an inwardly-projecting web, and an inwardly-projecting iron, one part being above and the other below the stationary axle, and both irons bolted or otherwise secured thereto, substantially as and for the purpose set forth.

3. The stationary portion of the axle, provided with gear which is reversibly connected to the gear of the turning portion, whereby the gear is adapted both for high and low-down springs and bodies of vehicles, as stated.

4. The turning portion consisting of the journal, perpendicular web, and bosses, in combination with the two-part stationary portion consisting of the bosses, perpendicular web, and horizontal irons or flanges, the two webs projecting from the respective bosses on opposite sides of the axial bolt C, substantially as and for the purpose set forth.



252,435. BURGLAR-PROOF SAFE. GEORGE L. DAMON, Boston, Mass. Filed Oct. 17, 1881. (No model.)

Claim.—1. As an improvement in burglar-proof safes, vaults, doors, and like work, the combination of rabbet or tongue-and-groove joints, with conical bolts or rivets passed through both members of said joints for fastening the same, substantially as described.

2. In burglar-proof safes, vaults, or like work, the combination of plates put together with an undercut scarf or double rabbet and conical bolts or rivets passing through both members of the respective joints, substantially as described.

252,436. METALLIC TRY-SQUARE. SAMUEL DARLING, Providence, R. I. Filed Sept. 14, 1881. (No model.)

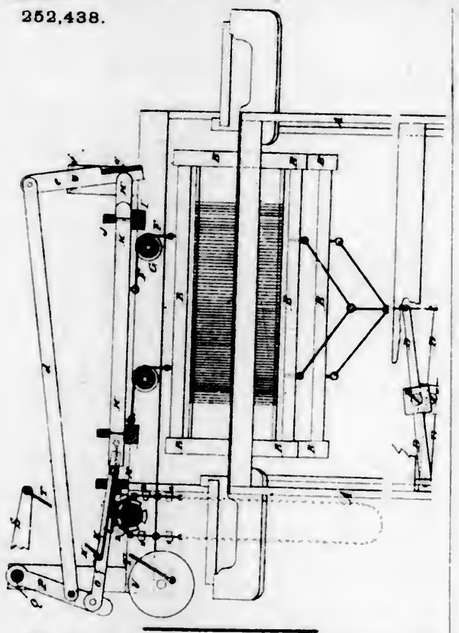
Claim.—1. A try-square consisting of the metal stock gained at one end to receive the metal blade, and having the blade secured thereto, substantially as described.

2. A try-square having its metal stock gained at one end, a steel blade, and the double bolt by which the two are secured together, substantially as described.

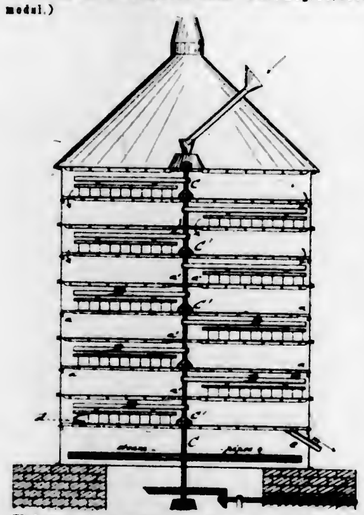
3. In combination with the steel stock of a try-square gained at one end and having a portion of its screw-hole enlarged on the side toward the shoulder, the blade adapted to fit the gain, and having the hole for the fastening-screw enlarged on the side away from the shoulder, and an expansive bolt, all substantially as described, and for the purpose set forth.

4. The double bolt consisting of a hollow bolt split at the head end and having an exterior and interior screw at the other end, and a center piece provided with a screw at one end, fitting the internal screw of the hollow bolt for the purpose of expanding it, substantially as described.

252,437. CIGARETTE-PAPER. AUGUSTUS V. D'COSTA, Matanzas, Cuba. Filed June 20, 1881. (No model.)



Claim.—As an improved article of manufacture, a cigarette-paper having applied to one of its edges a composition capable of igniting by friction, substantially as and for the purpose set forth.

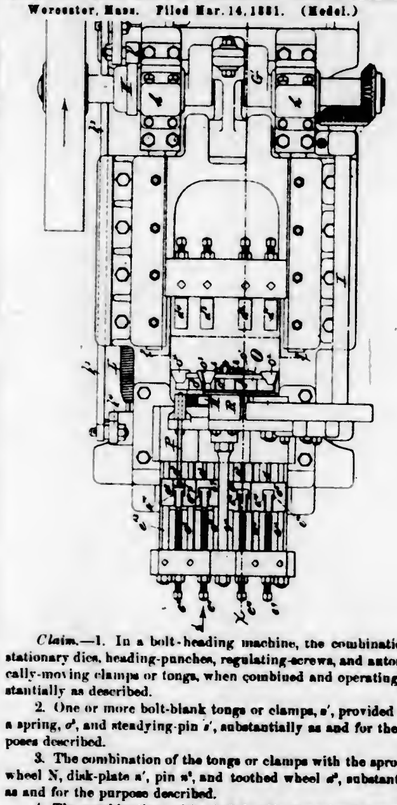


252,438. SHEDDING MECHANISM FOR LOOMS. JOSEPH DENTON, Paterson, N. J. Filed June 11, 1881. (No model.)

Claim.—In a loom, the combination, with the heddle-slides H and the crank-wheel U, the connecting-rod T, the rock-shaft Q, and the rigid arms S P, of the connecting-rods *d*, the levers *e*, and the step-board *g*, substantially as herein shown and described, whereby the inward movement of the heddle-slides is controlled, as set forth.

252,438.

252,439. APPARATUS FOR DRYING COFFEE-BEANS. WM. A. DIESELDORFF, Coban, Guatemala. Filed Aug. 16, 1881. (No model.)



Claim.—1. In a coffee-drying apparatus, a closed cylinder provided with a series of interior shelves having alternate central and circumferential passages, the stirring mechanism composed of a main radial arm, an auxiliary arm, connecting screw-bolts and spacings, flanged stirrer-blades, and main shaft, in combination with the rake and means for heating, substantially as described.

2. In a coffee-drying apparatus, a closed cylinder provided with a series of interior shelves having alternate central and circumferential passages, in combination with the stirring mechanism D D' D² *b b'* and shaft C, substantially as described.

3. In a coffee-drier, the combination, with the cylinder and shelves, of the stirring mechanism, the conical stop-disks, means for heating, rake-hook *d*, and discharge-pipe, substantially as described.

252,440. BOLT-HEADING MACHINE. JOHN S. DUCKWORTH, Worcester, Mass. Filed Mar. 14, 1881. (Model.)

Claim.—1. In a bolt-heading machine, the combination of stationary dies, heading-punches, regulating-screws, and automatically-moving clamps or tongs, when combined and operating substantially as described.

2. One or more bolt-blank tongs or clamps, *s'*, provided with a spring, s^3, and steadying-pin *s'*, substantially as and for the purposes described.

3. The combination of the tongs or clamps with the sprocket-wheel N, disk-plate n', pin n^3, and toothed wheel n^2, substantially as and for the purpose described.

4. The combination, with a bolt-heading punch, of the cup or conical shaped mouthed tongs or clamps *o'*, substantially as described.

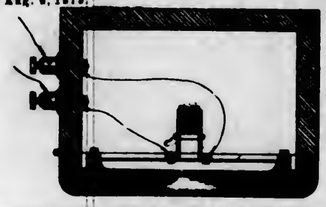
5. The combination, with plunger *e'*, plunger-slide e^2, plunger-lever k^{14}, and operating-connections, of regulating-screw e^3, substantially as and for the purposes set forth.

6. The combination, with rotating sprocket-wheel N, wheel O, and clamp *o'*, of discharger I', substantially as described.

7. The combination, with a series of plunger-levers, k^{14} k^{15} k^{16} k^{17}, provided with slots k^{18}, of a series of slides, e^1, e^2, e^3, and e^4, and a series of operating-arms, k^7, substantially as and for the purposes set forth.

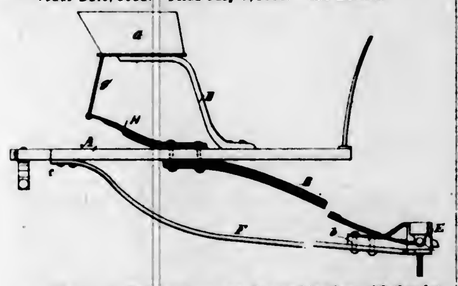
252,441. BRACELET AND CLASP. WILLIAM C. EDEN, Newark, N. J. Filed Nov. 19, 1881. (No model.)

Brief.—The parts of the bracelet are swiveled. A stop at the joint limits the movement. A spring holds the bracelet in a closed position.



Claim.—1. In a bracelet, the combination of its rigid portions A B with the spring *i*, and with the stops *e* and *h*, all arranged so that the parts A B are swiveled together and have an opening movement that is arrested by said stops, substantially as specified.

2. In a bracelet, the combination of the swiveled parts A B with the spring *i* and stops *e h* and *f g*, for operation substantially as herein shown and described.

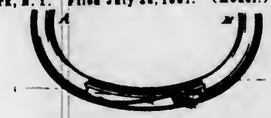


3. In a bracelet, the combination of the swiveled parts A B with the shoulder *b*, having stops *g* and *h*, with the tube C, carrying stops *f* and *e*, and with the spring *i*, substantially as specified.

252,442. TELEPHONE. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 6, 1879.

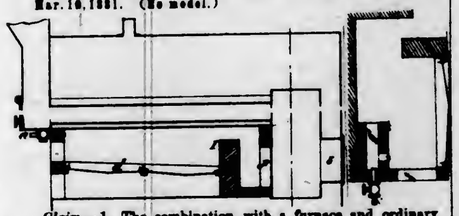
Claim.—The combination, in a telephone, of a diaphragm, two spring-arms attached to the same, one of which is insulated, a carbon button between the said arms, a contractile spring applied to the arms, and the circuit-connections, substantially as set forth.

252,443. SPRING-WAGON. GEORGE A. ELLIOTT, North Grosvenor Dale, Conn. Filed July 9, 1881. (No model.)



Claim.—1. In a spring-wagon, the combination, with the platform A and the middle spring, F, extending from the rear of platform to the bolster, of the side springs, B B, fastened to platform just behind the seat-risers D and at the other end shackled to the under side of the front bolster, as shown and described.

2. The combination, with the bolster E, of the short reach *b* and the spring F, fastened under it and to the platform, as described, to support said bolster in place without connecting it by a reach with the rear axle.

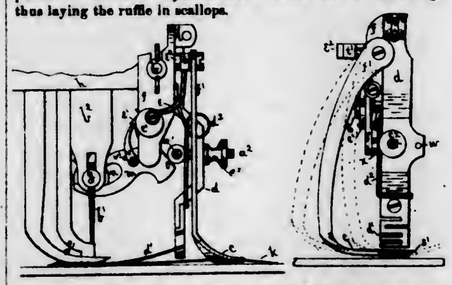


3. The combination of the seat G, supported in front by risers D, with the braces *g* and springs H, arranged as shown and described.

252,444. SPRING-HINGED BRACELET. ABRAHAM H. ENGEL, New York, N. Y. Filed July 28, 1881. (Model.)

Claim.—In a spring-hinged bracelet, the combination, with the parts A B and spring G, of the beveled lug F, substantially as herein shown and described, whereby the parts of the bracelet will be held in position both when opened and when closed by the tension of the said spring, as set forth.

252,445. BOILER-FURNACE. WILLIAM ENNIS, Glen Cove, N. Y.; Phebe L. Ennis, Administratrix of said William Ennis, deceased, assignor of one-third to Wright Duryea, same place, and one-third to William B. Taylor, Brooklyn, N. Y. Filed Mar. 10, 1881. (No model.)



Claim.—1. The combination, with a furnace and ordinary bridge-wall, of a hanging bridge projecting downward from the top of the furnace, behind the ordinary bridge-wall, a bridge extending across the upper front part of the furnace, forming communicating upward and rearward passages, said rearward passages being above the lower edge of said hanging bridge, and a pipe or pipes for injecting steam into said rearward passages, substantially as and for the purpose specified.

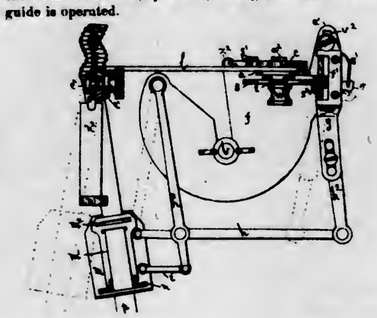
2. The combination, with a steam-boiler having one or more cylindric flues, in which are furnaces and the ordinary bridge-walls, of an annular bridge fitting in each flue in rear of the ordinary bridge-wall, and having an opening which is nearer the bottom than the top thereof, and a pipe for injecting steam entering the furnace and terminating above the top of the opening in said annular bridge, substantially as and for the purpose specified.

252,446. RUFFLING OR PLAITING ATTACHMENT FOR SEWING-MACHINES. EDGAR D. FELLOWS, Watertown, N. Y., assignor to the Davis Sewing Machine Company. Filed June 27, 1881. (Model.)

Brief.—The guide which carries the strip to be ruffled or plaited is vibrated slowly from side to side of the line of sewing, thus laying the ruffle in scallops.

Claim.—1. The combination of the ruffler with a reciprocating strip-guide, both in one frame or attachment to a sewing-machine, substantially as and for the purpose described.

2. A strip-guide having a pendulous motion across the line of sewing, in combination with the ruffler of a sewing-machine, substantially as and for the purpose described.



3. The guide *c* and arm *d*, in combination with cam-lever *m*, adapted to be connected with and operated by sewing-machine mechanism, substantially as and for the purpose described.

4. The guide *c*, rock-shaft *i*, having arms *f'* and e^2, connecting-rod *e*, wheel *e'*, ratchet-wheel *e'*, and pawl *e*, in combination with lever *m*, adapted to be connected with and operated by sewing-machine mechanism, substantially as and for the purpose described.

5. In combination with an attachment-frame, *f*, the guide *c*, rock-shaft *i*, having arms *f'* and e^2, rod *e*, ratchet-wheel *e'*, pawl *e*, lever *m*, and arm *d*, substantially as and for the purpose described.

252,447. RUFFLING OR PLAITING ATTACHMENT FOR SEWING-MACHINES. EDGAR D. FELLOWS, Watertown, N. Y., assignor to the Davis Sewing Machine Company. Filed July 2, 1881. (Model.)

Brief.—The guide which carries the strip to be plaited is moved slowly from side to side of the line of sewing in an arc of a circle whose center is at or near the needle, thus forming the plaited or ruffled strip into scallops, which may be varied by changing the form of the cam, by which, through suitable connections, the guide is operated.

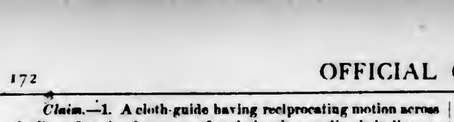
Claim.—1. A cloth-guide having reciprocating motion across the line of sewing in an arc of a circle whose radius is in line, or approximately in line, with the needle, in combination with the ruffler, said guide being adapted to be connected with and operated by sewing-machine mechanism, for the purpose of forming scalloped plaiting, substantially as described.

2. A cloth-guide having reciprocating motion across the line of sewing and adapted to be connected with and operated by sewing-machine mechanism, in combination with the ruffler and with a cam to determine the shape of the scallops, for the purpose of forming scalloped plaiting, substantially as described.

3. The ratchet-wheel *c* and its pawl and cam *s*, or their equivalent, in combination with guide *m* and levers and bars arranged intermediate the guide and ratchet, to transmit to the guide a reciprocating motion in an arc of a circle whose center is at the needle of the sewing-machine, substantially as described.

4. The spring s^3, having one end attached to pawl *c'* and the other and lower end to frame *f*, in combination with pawl *c'*, ratchet *c*, lever *l*, and hook *c'*, said hook being adapted to engage the needle-nut *b'*, substantially as described.

5. The parallel arms h' h^3, pivoted to frame *f* in line with needle e^3, in combination with guide *m* and the bar *h*, pivoted to said arms and parallel with said line, substantially as described.

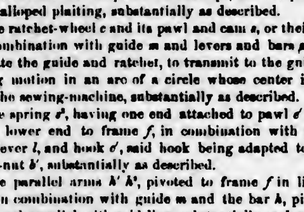


6. The parallel arms h' h^3, pivoted to frame *f* in line with needle e^3, in combination with guide *m* and bars *h* and *i*, the bars *h* and *i* being parallel with each other and with said line and pivoted to the guide and to arm h', and bar *h* being also pivoted to arm h^3, substantially as described.

7. The slotted adjustable lever *g* and frame *f*, slotted at v^3, in combination with cam *s* and the pivoted arm h^3, substantially as described.

8. The adjustable lever *g*, provided with sliding roller *s'* and its shaft s^3, in combination with cam *s* and pivoted arm h^3 and frame *f*, substantially as described.

9. The lever *l*, provided with hook *c'*, pawl *c'*, ratchet *c*, cam *s*, roller *s'*, lever *g*, spring s^3, arms h' h^3, bars *h* and *i*, and guide *m*, all attached to frame *f*, in combination with the ruffler, and adapted to be connected with and operated by sewing-machine mechanism, substantially as described.



252,448. PISTOL AND CARBINE-HOLDER. LOUIS S. PLATAG, Pittsburg, Tex. Filed Nov. 16, 1881. (Model.)

Claim.—1. The combination of the belt A, the plate B, secured thereto, the spring C, having prongs *c c*, made fast to plate B and adapted to hold the arm D, with its button *g*, as shown and described.

2. The combination of the prongs *c c*, upturned at the ends, and the plate B, cut away to allow the passage of the button, as shown and described.

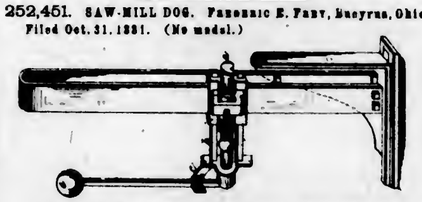
252,449. PISTON-VALVE. WILLIAM FOLEY, Keokuk, Iowa. Filed Oct. 15, 1880. (Model.)

Claim.—1. The combination of the round or cylindrical piston-head C, formed of two pistons *c c'*, with a connecting-neck, c^3, having steam-passage c^4, extending through the neck and pistons, and the steam-chest B, formed with induction-port and openings *a e* at bottom, extending up the sides of the steam-chest, as set forth.

2. The combination of the round or cylindrical piston-head C and the steam-chest B, formed with openings *i i a e* at bottom, and extending up the sides of the steam-chest, as set forth.

3. The combination of the valve-stem F, having T-head *f*, and piston *c*, having lugs *g g*, the said stem and head adapted to fit in a suitable recess formed between lugs or shoulders *g g*, to permit the free descent of the piston-head as the valve wears and to prevent its turning in the steam-chest.

252,450. PISTON-VALVE. WILLIAM FOLEY, Keokuk, Iowa. Filed May 31, 1881. (Model.)



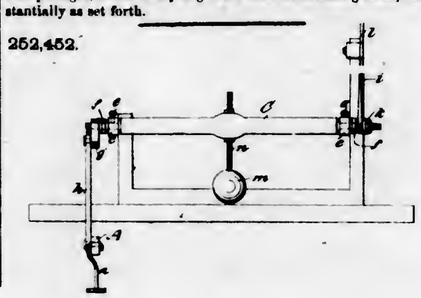
Claim.—1. Cylinder-valve working in a valve-chest provided with suitable induction and eduction ports, and composed of two heads, each containing a live-steam chamber and an exhaust-steam chamber separated from each other and closed upon the outer sides by packing-rings encircling the head.

2. The combination, in a cylinder slide-valve, of the duplicate steam-ports *f f'* and induction-ports *h h'* at each end of the cylinder, the two heads G G, each having three packing-rings, a live-steam chamber, *g*, and an exhaust-chamber, *g'*, connected by a duct, g^3, with the central exhaust-chamber, I, substantially as and for the purpose set forth.

3. The combination, in a valve-chest, of the induction-port L, passages M, extending over the steam-chest, and induction-ports *h h'* on both sides of the steam-chest, substantially as set forth.

252,451. SAW-MILL DOG. FREDERIC E. FARY, Smyrna, Ohio. Filed Oct. 31, 1881. (No model.)

Claim.—1. In a saw-mill dog, a rotary shaft constructed at one end with the engaging-dog eccentrically arranged to the shaft and at the other end with a weighted lever, a follower with extending bars, and a block formed with passages for the reception and passage of the bars of the follower, substantially as described.

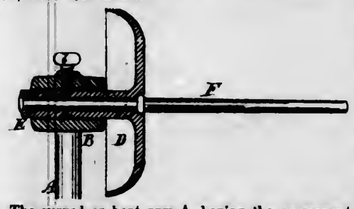


2. A shaft formed at one end with a dog-head and at the other provided with a weighted lever, in combination with a follower set in a shoulder of the shaft, said follower provided with extending bars and a sliding block, substantially as described, and for the purpose set forth.

3. In a saw-mill dog, a horizontal shaft with a dog-head at one end and a weighted lever at the other, and provided with a follower with extending bars fixed in the annular groove formed between the shoulder on the shaft and the end of the lever-cap, in combination with spring fixed to the follower and capable of receiving and retaining the handle of the weighted lever, substantially as described.

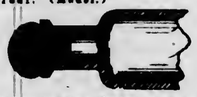
4. In a saw-mill dog, the combination, with a horizontal rotary dog-shaft provided with a lever for actuating the same, of a vertical sliding block with horizontal passages, a follower with extending arms passing through said block, and a double-ended eccentric-lever bearing on said arms, substantially as and for the purpose set forth.

5. The combination, with a saw-carriage knee, of an upright standard, a vertical adjustable block formed with horizontal passages, the eccentric-lever, the follower with arms extending through said passages, and a rotary dog-shaft with an actuating-lever, substantially as set forth.



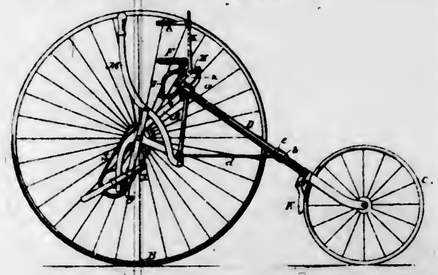
252,452.

252,452. INDICATOR FOR SCALES. VALENTINE M. PULCHER, Hughes Springs, Tex. Filed Aug. 24, 1881. (No model.)



Claim.—In scales, the combination, with the scale-beam A and the notated arc-arm *l*, of the rocker C, carrying the weight *m* on an adjustable arm, *n*, and having the threaded-end spindles *d*, passing through slots of the arms *e*, the set-screws *e*, the nuts *f*, the crank-arm *g*, connected by rod *h* with the scale-beam A, the pointer *i*, and the set-nut *k*, as shown and described.

252,453. BELT-LIFTER. ADOLF GAIRING, Cleveland, Ohio. Filed Dec. 7, 1881. (No model.)



Claim.—The curved or bent arm A, having the permanent sleeve or socket B and set-screw *b*, the disk D, having the permanent sleeve E, provided with the annular groove *c*, and the spindle F, all constructed and operating as shown and described.

252,454. DROP-BOTTLE. CHARLES GEBERT, Trenton, N. J. Filed Dec. 12, 1881. (Model.)

Claim.—The herein-described dropping-bottle, constructed with longitudinal grooves diametrically opposite each other on the interior of the neck, in combination with a stopper having shoulders, as described, adapted to cover and uncover the outer ends of the grooves, substantially as and for the purposes specified.

252,455. VELOCIPEDE. WILLIAM W. GILES, Washington, D. C. Filed Oct. 31, 1881. (No model.)

Claim.—1. In a tricycle, an arm projecting from the frame and capable of partial revolution around an oblique axis, and a steering-wheel mounted on said arm at its extremity, combined with means whereby movements of the rider's body in a vertical plane transverse to the line of progression will cause a rotation of said arm and control of the steering-wheel, as set forth.

2. In a tricycle, an arm projecting from the frame and capable of partial rotation around an oblique axis, and a steering-wheel mounted on said arm at its extremity, combined with a side lever independent of the seat and moving on a horizontal axis, against which the rider leans in a vertical plane transverse to the line of progression, whereby said arm may be rotated and the steering-wheel controlled, as set forth.

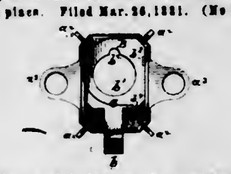
3. In a tricycle, a steering-wheel mounted at the outer end of an oblique arm which is capable of partial revolution on its axis, whereby the plane of said wheel can be parallel with the planes of the main bearing-wheels or be deflected in either direction therefrom, combined with a side lever against which the rider leans in a plane transverse to the line of progression, and a multiplying device interposed between said side lever and said oblique arm to increase the relative motion of the latter and control the steering-wheel, as set forth.

4. In a tricycle, a steering-wheel, C, mounted at the extremity of an oblique arm, D, which is capable of partial revolution upon its axis, and provided with the arm I, combined with the rock-shaft having one end turned downward and engaged with said arm I, and the side braces, G, mounted upon said rock-shaft, whereby the rider may control the steering-wheel by swaying his body in a plane transverse to the line of progression.

5. In a tricycle-frame, A, provided with a box, *a*, attached to said frame, an oblique arm, D, which turns in said box at its forward end and bears the steering-wheel C at its rear end, combined with a box, *b*, fitted to said arm nearer its wheel end, and side brace-rods, *d*, whereby said box *b* is restrained from motion toward the box *a*, as set forth.

6. In a tricycle, a brake-lever, E, and its actuating cord or rod, combined with a vibrating lever placed so that said brake will be pressed against the wheel by a backward motion of the rider's body in contact with said vibrating lever.

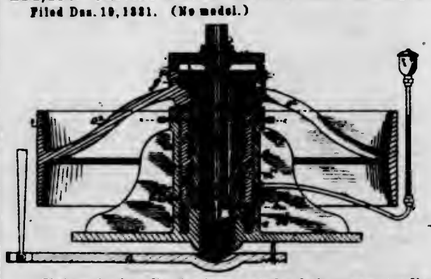
7. In a tricycle, a steering-wheel and a brake, combined with a rock-shaft, H, a lever, K, pivoted thereon and extending up near the rider, and provided with side arms or braces, G, and means for connecting said rock-shaft and lever with the steering-gear and brake, respectively, whereby the same lever, K, may be caused to actuate the steering-gear or the brake at will.



8. In a tricycle, a frame, A, having its ends bent forward to receive and hold the axles for the wheels and treadle-shaft in advance of the seat, combined with a rearward-projecting arm oblique to the horizon, and capable of partial rotation on its axis to control a steering-wheel mounted on the rear end of said arm.

9. In a tricycle, the wheel B, provided with ratchet-teeth *t*, combined with a ratchet-hub, R, in engagement therewith, and the driving-chain S on said hub R, and motor crank-shaft below the level of said hub, whereby the wheel B may be liberated from the driving power by withdrawing said hub R from engagement, as set forth.

10. In a tricycle, a steering-gear operated by movements of the rider's body in a plane transverse to the line of progression, combined with the side arms, G, adjustable vertically and horizontally, so as to be fitted to the rider, as set forth.



11. In a tricycle, the steering-gearing, with its controlling-shaft H, combined with the lever K, pivoted to said shaft and provided with the joint at *u*, for the purpose set forth.

252,456. NECKTIE-FASTENER. JACOB GOLDBERG, New York, N. Y., assignor of three-fourths to Louis Silverman and Isaac Noar, same place. Filed Mar. 26, 1881. (No model.)

Claim.—In a necktie-fastener, the combination of the apertured and flanged shell A, having opening *a'* in one end, the apertured plate B, having shank *b*, studs b^2 and b^4, and slot b^3, leading to its aperture, spring C, notched and apertured plate D, soldered strips a^2, and perforated shield E, substantially as shown and described.

252,457. DRIVING-WHEEL. JNO. A. HAPGOOD, Pittsburg, Pa. Filed Dec. 19, 1881. (No model.)

Claim.—1. A pulley having a tubular hub, arms extending laterally from one end of the hub, and a periphery the middle of which is on, or nearly on, a level with the middle of the hub, substantially as and for the purposes described.

2. The combination of a pulley having a tubular hub, arms extending laterally at the upper edge, and a hollow bearing in which the hub may turn, substantially as and for the purposes described.

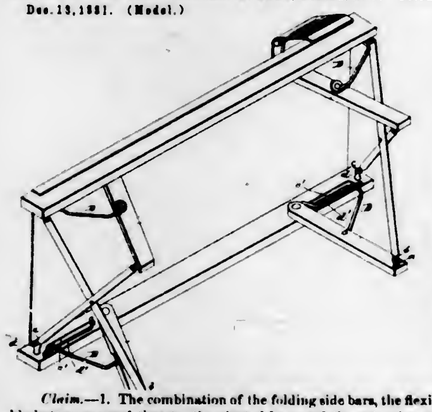
3. The combination of a pulley having a hollow hub, a spindle

of less diameter than and operating inside of the hub, and a clutch device connecting the hub and spindle, which permits a slight lateral movement of the pulley and a vertical movement of the spindle, substantially as and for the purposes described.

4. The combination of the hub, the tubular bearing, and adjustable followers placed in the sides of the tubular bearing, substantially as and for the purposes described.

5. The combination of the tubular hub, the deflecting-plate placed on the hub-step, and an oil or grit channel leading away from the step to a suitable receptacle, substantially as and for the purposes described.

6. The combination of a vertical toothed clutch and a loose sector-plate placed between the two parts of the clutch, having wings slightly less in width than the distance between the clutch-teeth, substantially as and for the purposes described.



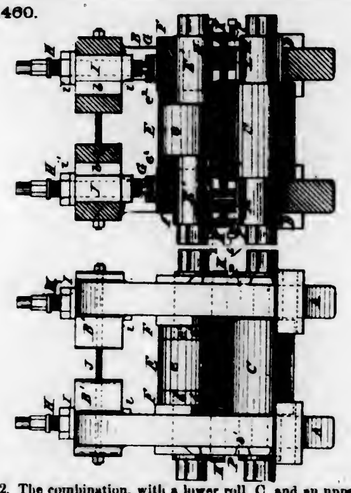
7. A gear-clutch having straight-sided teeth with friction-balls placed in axially-extending slots in the same, substantially as and for the purposes described.

252,458. END-GATE. JNO. W. HANDAYSYDE, Floral, assignor of five-eighths to John D. Pryor, Winfield, Kans. Filed Nov. 7, 1881. (No model.)

Claim.—In an end-gate, the combination, with the sides of the wagon-body having perforations *b*, of the separable sections B' and C, provided with hooks *c*, and the latter being provided with a beveled projection, upon which is eccentrically pivoted a correspondingly-beveled button, and an overlapping section, B², secured to the section B' and having an elongated beveled slot, through which said button is adapted to pass and be turned to securely hold the sections in place, substantially as set forth.

252,459. COT-BED. CHARLES H. HARD, Oneida, N. Y. Filed Dec. 13, 1881. (Model.)

Claim.—1. The combination of the folding side bars, the flexible bottom secured thereto, the pivoted legs, and the extension or crossed braces pivoted together and connected by linked eyes to said legs and side bars, substantially as described.



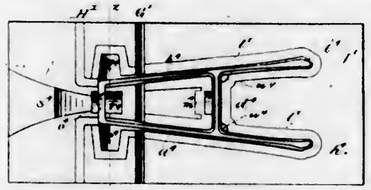
2. The combination of the side bars having a flexible bottom secured to them, the folding legs pivoted to the side bars, the extension-braces pivoted to the side bars and legs, the angular pivoted braces D, the grooves *c' c''*, and the guard-rails *d'*, substantially as described.

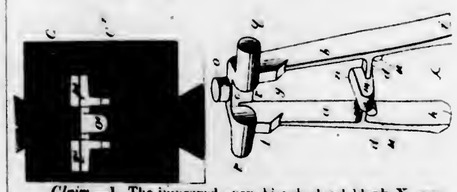
3. The combination of the flexible head-rest J, the folding and supporting bars G therefor, the angularly-bent arms A A', and the recesses *f* therefor, substantially as described.

252,460. ROLLING-MILL. WILLIAM E. HARRIS, St. Louis, Mo. Filed July 28, 1881. (No model.)

Claim.—1. The combination of extensible upper rolls, E, lower rolls, C, and vertical rollers K, the latter working over the lower roll and at the ends of upper roll, as set forth.

252,460.





2. The combination, with a lower roll, C, and an upper roll, E, of edging-rolls K, varying in diameter.

3. The combination, with a roller, E, of supplemental rings *e'*, for the purpose set forth.

4. The combination, with a roller, E, having an extensible working-face, of the adjustable bearing device F G H I, substantially as set forth.

252,461. DIE FOR FORGING BICYCLE-HEAD BLANKS. HORACE B. HICKS, Hartford, Conn., assignor to the Pope Manufacturing Company, Boston, Mass. Filed Mar. 11, 1881. (Model.)

Claim.—1. The improved open-bicycle-head blank X, constructed with sides *a* and *b*, bridges *c* and *d*, arms *h* and *i*, centerlugs *o r*, braces *f* and *g*, handle-bar lugs *p* and *q*, brake-lug *m*, and trouser-guard lugs *u u*, essentially as set forth.

2. The primary break-down dies A A', constructed and adapted to operate substantially as and for the purposes shown and described.

3. The secondary break-down dies B B', constructed and adapted to operate substantially as and for the purposes shown and described.

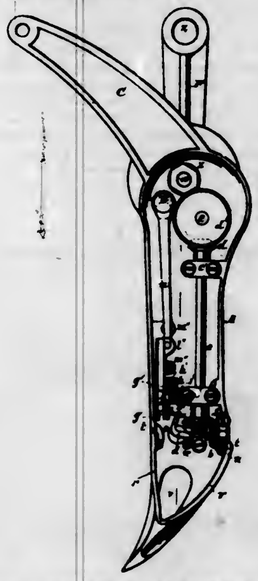
4. The primary forming-dies C C', having the described cameo and intaglio parts, and constructed and adapted to operate substantially as and for the purposes herein set forth.

5. The secondary forming-dies I I', having the described cameo and intaglio parts, and constructed and adapted to operate substantially as and for the purposes herein set forth.

6. Dies constructed in a corresponding pair and with recesses for approximately forming an open-bicycle-head blank, said recesses being substantially as herein set forth and designated by the reference-letters a^2 b^2 c^2 d^2 h^2 i^2 p^2 q^2 m^2 o^2 r^2, essentially as herein shown and described.

7. Dies constructed in a corresponding pair and with recesses adapted to form and substantially finish an open-bicycle-head blank, said recesses being substantially as herein set forth and designated by the reference-letters a^4 b^4 c^4 d^4 h^4 i^4 p^4 q^4 m^4 o^4 r^4 m^4, and the slight surrounding recesses *l*, to receive the flash, essentially as herein shown and described.

8. Constructed and adapted to operate substantially as herein set forth, the trimmer Q, having an opening bounded by cutting-edges *c' c' c'*, corresponding to the outer contour of an open-bicycle-head blank, and the punch K, having the cameos *w' w' w'*, substantially conformed to the plan of an open-bicycle-head blank.

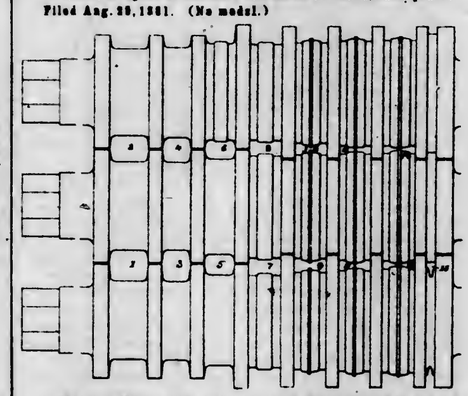


9. The trimmer S, constructed with the opening V, recesses *y' y'*, and lips *x' x'*, and the punch U, with cutting-edges *t t*, constructed and adapted to operate substantially as herein set forth.

252,462. NUT-LOCK. GEORGE B. HILL, Detroit, Mich. Filed Dec. 5, 1881. (No model.)

Claim.—The pressed nut herein described, having a punch-recess, *c*, in its face between its threaded interior and its wrench-seat, said recess being formed with an inner thin wall, *b'*, near the threaded interior, and an outer beveled or guide wall, *b*, substantially as specified.

252,463. AUTOMATIC GRAIN-BINDER. PLINY F. HODGES, Chicago, Ill., assignor to himself and William Deering, same place. Filed Nov. 10, 1880. (Model.)



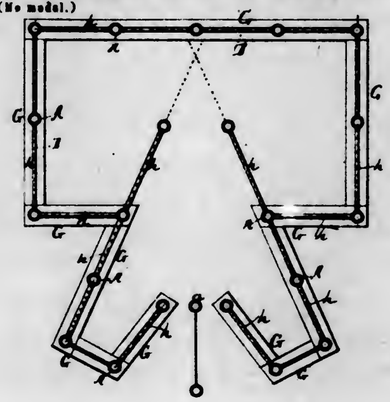
Claim.—1. In combination with the binding-arm of an automatic grain-binder, a twisting-hook, *a*, having a shank, *a'*, and operated by the gear-wheels *b b'*, shaft *c*, and gear-wheels *d d'* from a driving-pinion, *f*, and a cutting device consisting of shear-blades pivoted to a sliding head and operated by a pitman and eccentric from a driving-pinion, *p*, the pinions *f p* both being driven intermittently by the rotation of a single crank, substantially as and for the purposes specified.

2. A wire-cutting device for an automatic grain-binder, consisting of the blades *g h*, having the handles *g' h'*, links *j j'*, pivoted as described, slide or head *l*, carrying the shears and located in a support or frame, and a mechanism for reciprocating the head or slide and advancing and receding the shear-blades to open and close them, substantially as and for the purpose specified.

3. The twisting-hook *a*, having a shank, *a'*, beveled gear *b b'*, shaft *c*, beveled gear *d d'*, stop-pinion *f*, shear-blades *g h*, having handles *g' h'*, links *j j'*, slide or head *l*, frame *m*, pitman or rod *n*, eccentric *n'*, and stop-pinion *p*, located and arranged as described, in combination with the head E, located on the end of the crank F, and having a flange provided with a cogged segment, *q*, and stop-flange *q'*, for operating the twisting and cutting mechanisms, substantially as specified.

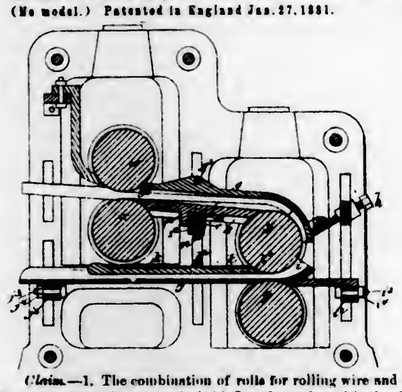
4. A binding-arm consisting of the body A, extension C, and cover B, the body and cover having side flanges to form an interior chamber to receive the twisting mechanism, consisting of the hook *a*, having the shank *a'*, beveled gear *b b'*, shaft *c*, and beveled gear *d d'*, and to receive the cutting mechanism consisting of the blades *g h*, having handles *g' h'*, links *j j'*, slide or head *l*, frame *m*, pitman or rod *n*, and eccentric *n'*, and locate the two mechanisms side by side, and have them operative entirely within the binding-arm, substantially as specified.

252,464. ROLLS FOR ROLLING METAL. FRANK HOLUB, Joliet, Ill., assignor of one-half to Charles S. Looke, same place. Filed Aug. 29, 1881. (No model.)



Claim.—The combination, in a set of three-high rolls, of the reducing, grooving, creasing, and finishing dies from 1 to 15, inclusive, substantially as and for the purpose specified.

252,465. CLOCK-MOVEMENT. ARTHUR E. HOTCHKISS, Cheshire, Conn. Filed Jan. 22, 1881. (Model.)

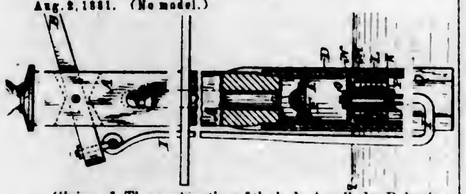


Claim.—In combination with a supporting-plate for a clock-movement, a stud projecting from said plate, a hollow arbor sleeved thereon, and a mainspring and main wheel mounted on said arbor and arranged on the same side of the said plate.

252,466. FISH-TRAP. ALBERT H. HOXIE, Foxborough, Mass., and EDWARD COLLINS, New York, N. Y. Filed Sept. 1, 1881. (No model.)

Claim.—In a fish-trap, the posts A A, made hollow and of metal, the said posts being arranged as shown, the rods A, the frame G, and the net B, all arranged and combined in the manner shown, and for the purpose set forth.

252,467. ROLLING-MILL FOR ROLLING WIRE AND RODS. ALFRED HUGHES, Glasgow, Scotland. Filed Mar. 17, 1881. (No model.) Patented in England Jan. 27, 1881.



Claim.—1. The combination of rolls for rolling wire and the like in double pairs, one pair behind and at a less altitude than the other pair, and suitable guides for guiding the material from the pass in the front or upper pair to and so as to return it through the pass in the rear or lowermost pair, substantially as described.

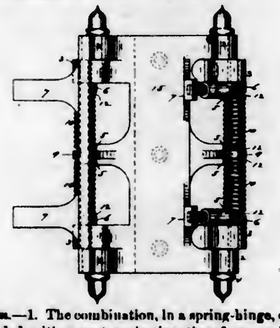
2. In combination with the rolls arranged as described, a fixed bed or table, *f*, and pivoted guide-piece *g*, the bed or table extending from the upper surface of the lower roll of the first and upper pair of rolls to the upper surface of the upper roll of the second or lower pair of rolls, the end *g'* bearing against the upper roll of the first pair of rolls and the other end, *g*², curved over and partly around the upper surface of the upper roll of the second pair of rolls, substantially as and for the purpose set forth.

3. In combination with the rolls arranged as described, a curved guide-piece, *i*, table *j*, and counterweighted pivoted lever *k*, the guide-piece being level with the upper surface of the lower roll of the second and lower pair of rolls, the table extending from the upper side of said lower roll to the front of the machine, and the lever *k*, having one end, *k'*, bearing against the under side of the upper roll of the second pair of rolls and the other end extending toward the front of the machine substantially parallel with the table, as set forth.

252,468. PUMP. GEO. R. HUNTER, Hawleyville, Iowa. Filed Aug. 2, 1881. (No model.)

Claim.—1. The combination of the body A, cylinder D, having the diaphragm E and valve G, with the handle B, bent rod I, piston K L M, and valve N, substantially as shown and described.

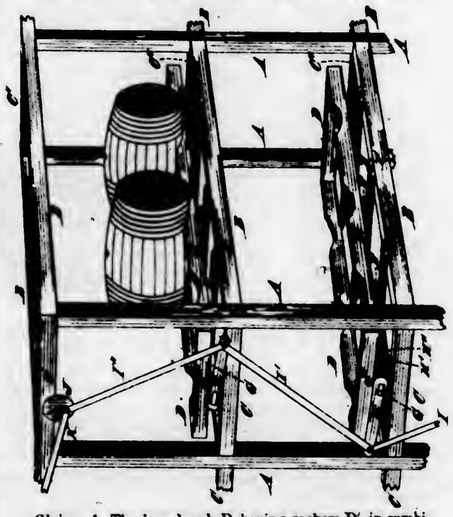
2. The combination, with the body A and cylinder D, provided with diaphragm E and valve G, of the supports Q, substantially as shown and described.



3. The bent rod I, adapted to operate on the outside of the pump-body and to enter the cylinder D, and provided with the base-nut J, perforated base-plate K, packing L, perforated cap-plate M, valve N, and cap-nut O, said base-plate, packing, and cap-plate having passages P therethrough, substantially as shown and described.

252,469. BED-BOTTOM SPRING. JOSHUA V. JARRETT, Valley Mills, Tex. Filed Dec. 8, 1881. (No model.)

Claim.—As a new article of manufacture, a twin bed-spring formed in one piece, of the spirals A A' and platform B, made of a series of parallels, *b*, constructed substantially as and for the purpose set forth.



252,470. SPRING-HINGE. GEORGE H. JEWETT, Unionville, Conn. Filed May 31, 1881. (Model.)

Claim.—1. The combination, in a spring-hinge, of two leaves, one provided with a post projecting therefrom, and both leaves provided at each end with a hinge-projection, which two projections are pivoted together, an actuating-spring located between and secured to the upper and lower projection of one of said leaves and outside the line of the hinge-pivots, a cam secured to said spring, and an operating or knuckle bar having a loose socket-connection with said cam at one end and connected with said post at the other end, substantially as described.

2. The combination, in an improved spring-hinge, of two leaves, one provided with a post, 7, and both leaves provided at each end with a projection, which two projections are pivoted together, a spring located between the upper and lower projections on said leaves, a cam connected with and secured to said spring, with a knuckle-bar having a loose socket-connection with said cam, and made in two parts, and adjustable as to its length, and connected with said post at the other end, substantially as described.

252,471. RACK FOR STORING AND AGING WHISKY. CLAUDE M. JOHNSON, Lexington, Ky. Filed Oct. 20, 1881. (No model.)

Claim.—1. The barrel-rack D, having rockers D', in combination with the rack-frame A B C C', provided with rocker-beds E, substantially as and for the purpose herein set forth.

2. The barrel-rack D, having rockers D', in combination with the rack-frame A B C C', provided with rocker-beds E and rocker-guides F, substantially as and for the purpose herein set forth.

3. In combination with the series of rockers D', the transverse rocker-shaft G, supported in bearings at each end of the rack-frame, substantially as herein set forth.

4. The combination, with two or more rocker-frames, D, of shafts G, cranks H, connected with the latter and extending in opposite directions, pitmans I, and crank-wheel J, substantially as described, whereby each alternate rocker-frame will rock in a direction opposite to the other, as set forth.

5. The combination, with a stationary supporting-frame, of two or more rocker-frames, D, constructed to hold two or more tiers of barrels and arranged one above the other, and crank and pitman connections, substantially as described, whereby each alternate frame will rock in a direction opposite to the other, substantially as set forth.

252,472. SASH HOLDER AND TIGHTENER. CHAS. A. JUDD, Milwaukee, Wis. Filed Nov. 11, 1881. (No model.)

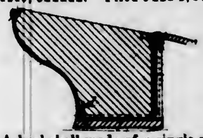
Claim.—1. A sash-frame broad at the bottom and provided with a cell, C, and seat *b*, and a sash, A, adapted to move therein, combined with an elastic device attached to said sash at or near its top, projecting from said sash on opposite sides at different points of elevation, and adapted to press the bottom of the sash outward toward its seat *b*, but out of contact with the frame except along the bottom edge, substantially as set forth.

2. The elastic rollers E F, having their pivots in different planes vertically and horizontally, attached to and combined with a sash, so as to project from opposite sides at different elevations, as and for the purpose set forth.

252,473. MANUFACTURE OF DINITRO-BENZOLE FROM GAS OBTAINED BY DISTILLATION OF COAL. JAMES ALFRED KENDALL, London, England. Filed July 6, 1881. (No specimens.) Patented in England Feb. 9, 1881.

Brief.—In the manufacture of illuminating-gas produced by distillation of coal and similar carbonaceous substances a certain amount of benzole is formed and passes over with the purified gas into the gasometer. From such gas nitro-benzole has been obtained; and in this improvement the nitro-benzole is further converted into dinitro-benzole by the ordinary method used for nitro substitution.

Claim.—A process whereby dinitro-benzole may be obtained from benzole or nitro-benzole existing in gas produced from carbonaceous substances, which consists in passing the latter through a mixture of nitric and sulphuric acids, the latter being in excess.

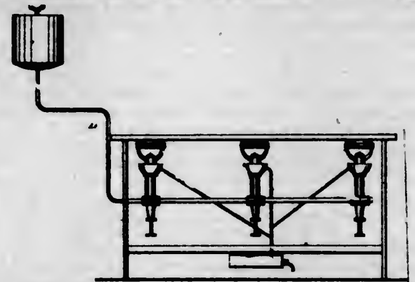


252,474. HEEL FOR BOOTS AND SHOES. JOSEPH KIRPPAN, Montreal, Quebec, Canada. Filed July 26, 1881. (No model.)

Claim.—1. A combined leather and metal lift in which the metal plate is adapted to be fastened to the top lift by means of circumferential edge projections, and is also provided with upward projections adapted to secure the plate to the heel proper, all as herein set forth.

2. The metal plate B, having edge projections or serrations *b*, adapted to be forced laterally into and thereby to hold itself to place to a heel-piece.

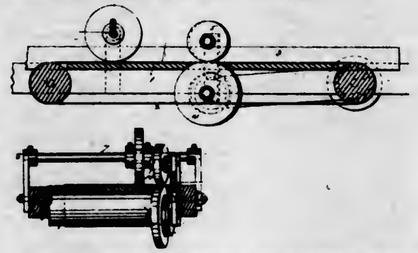
252,475. HEEL FOR BOOTS AND SHOES. JOSEPH KIRPPAN, Montreal, Quebec, Canada. Filed June 6, 1881. (No model.)



Claim.—1. A heel-shell made of a single piece of leather or like substance, and having its upper edges turned down so as to form a channel for the stitching securing it to the upper, substantially as herein set forth.

2. In combination with the shell of a boot-heel, the sole secured thereto by stitching on the turned-down edge of the front, substantially as described.

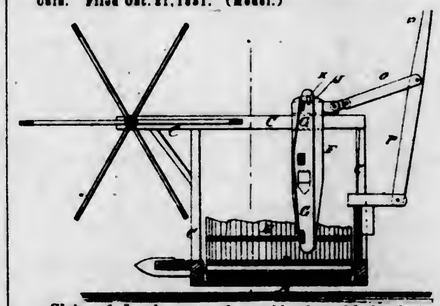
3. In combination with a boot-heel shell provided with a turned-up rim and the covering-piece, the metal plate provided with projections secured to the one and holding the other in place, substantially as described.



4. In combination with the turned-up rim of the outer shell of a boot-heel, a metal plate forming the bottom of the heel, secured to said rim by serrated projections, and provided with suitable projections underneath, as and for the purposes set forth.

252,476. VAPOR-STOVE. CHARLES F. KLIEN and WILLIAM H. WOODARD, Cleveland, Ohio. Filed Oct. 29, 1881. (No model.)

Claim.—In vapor-stoves, the combination of the supply-pipe, the drip-cups beneath the burners, and the overflow-pipes attached to the drip-cups near the top edge and leading to a lower reservoir, whereby the oil in the cup is prevented from overflowing when ignited for use, substantially as and for the purpose described.

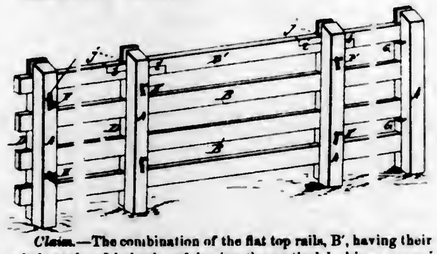


252,477. PAPER-FEEDING MACHINE. JOSEPH C. KENDLAND, Northampton, Mass., assignor to Mark H. Spaulding, Trustee, same place. Filed May 31, 1881. (No model.)

Claim.—1. The combination, in a paper-feeding machine, of a feeding apron or tapes for carrying the sheets of paper when placed thereon, two rolls placed one above the other, and with their peripheries in contact in approximately the plane of movement of said apron or tapes, and adapted to revolve vertically at an inclination to the line of movement of said apron or tapes, and a guide extending lengthwise the machine for the purpose of adjusting the sheets of paper into the same line of movement, substantially as described.

2. The combination, in a paper-feeding machine, of a feeding apron or tapes for carrying the sheets of paper when placed thereon, two rolls placed one above the other, with their peripheries in contact in approximately the plane of movement of said apron or tapes and adapted to revolve vertically at an inclination to the line of movement of said apron or tapes, a guide extending lengthwise the machine, and a roll adapted to be revolved above and by said apron or tapes or by the sheets moving thereon, substantially as and for the purpose set forth.

252,478. HARVESTER. STEPHEN McB. KATENDAUM, Golden, Colo. Filed Oct. 21, 1881. (Model.)

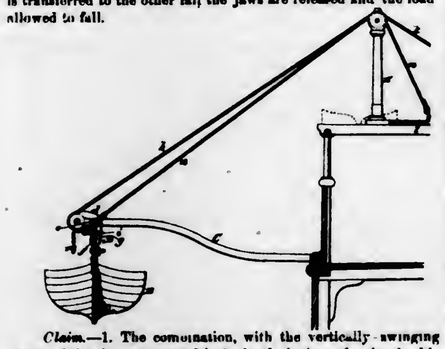


Claim.—1. In a harvester, the combination, with the platform A and the frame C, of the fender G, the roller H, and the sliding head-block F, substantially as herein shown and described, where-

by cut grain is made to fall evenly upon the platform, as set forth.

2. In a harvester, the combination, with the head-block F and fender G, of the connecting-bar O and lever P, substantially as herein shown and described, whereby the said fender can be adjusted as the height of the grain may require, as set forth.

3. In a harvester, the combination, with the head-block F, having notch K and socket M, and the fender G, of the pin J and hook L, substantially as herein shown and described, whereby the said head-block and fender can be readily connected and disconnected, as set forth.

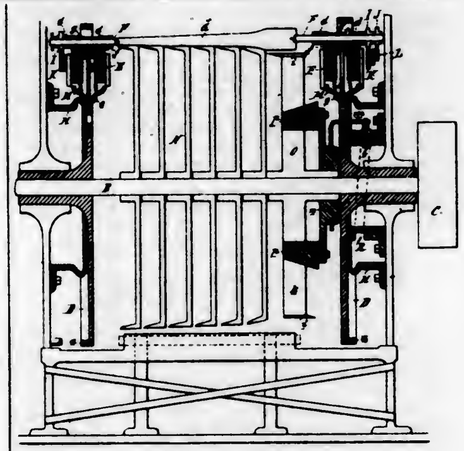


252,479. FENCE. ISRAEL L. LANDIS, Lancaster, Pa. Filed Jan. 18, 1881. (No model.)

Claim.—The combination of the flat top rails, B', having their ends lapped and halved, and having the vertical locking-groove *j* crossing said joint at right angles to the length of the rails, the batten D, inserted into said groove, the fence-post A, the holding-down pin above the said joint, the embracing-wire, and the tightening-wedge, all substantially as described.

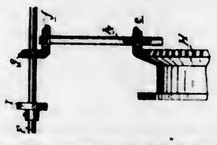
252,480. APPARATUS FOR RAISING, LOWERING, AND DETACHING BOATS. GODFREY G. LAURENCE, London, England, assignor to Philip Thomas Blyth, same place. Filed Aug. 10, 1881. (No model.) Patented in England June 24, 1876, in France Aug. 3, 1878, and in Belgium Mar. 11, 1879.

Brief.—The holding-jaws are kept closed by the strain upon the fall employed to raise and lower the load. When the strain is transferred to the other fall the jaws are released and the load allowed to fall.



Claim.—1. The combination, with the vertically-swinging davit, of the sheave arranged in its head, the jaws *f g*, the shackle arranged to be slipped over the said jaws, and the fall connected with the said shackle and passing over the sheave in the head of the davit, substantially as described.

2. In an apparatus for raising and lowering ships' boats, the combination, with the vertically-swinging davits C and the standards E, of the falls *h* and *n*, the heads *d*, provided with the jaws *f g*, the shackle *i*, with a wedge, *r*, arranged between it and the jaw *f*, and the link *p*, all substantially as above set forth, and for the purposes specified.



252,481. LATHE FOR TURNING ECCENTRIC OR POLYGONAL FORMS. WILLIAM H. LEHMANT, Defiance, Ohio. Filed July 27, 1881. (No model.)

Brief.—The lathe-spindles are mounted in rotating disks, and revolve around the cutters, which rotate in the opposite direction. The spindles rotate, and may have a radial movement with reference to the disks in which they are mounted. Eccentric or polygonal collars may be placed on the spindles, so as to ride on stationary bearings on the frame, thus compelling the spindle to move with the collar and reproduce its form in the blank.

Claim.—1. In a lathe for turning irregular forms, the rotating disks D and spindles *b b*, revolving in bearings movable radially in said disks, in combination with stationary guideways secured to the lathe-frame and cams secured on the spindles and traveling upon said stationary guideways, substantially as and for the purpose specified.

252,481.

2. The revolving disks D, provided with radial recesses, and the blocks E E, reciprocating in said recesses and carrying the revolving spindles F, in combination with cams secured on said spindles and guideways rigidly secured to the stationary lathe-frame, whereby the cams moving on the guideways will govern the radial movement of the spindles, substantially as and for the purpose specified.

3. The combination of spindle F, squaring-cam J, guideway L, and cutter-head O, containing expanding and contracting knife-stocks K, and mechanism, substantially as described, for operating said knife-stocks, as and for the purposes described.

4. In combination with a series of revolving cutter-heads, rotary disks carrying independent radially-movable spindles around said cutter-heads, stationary guideways upon the main frame, and cams secured to the spindles traveling on the stationary guideways, whereby the spindles can be moved radially to or from the cutter-heads to govern the shape of the object being turned, substantially as described.

5. The cutter-head O, provided with radial recesses, the knife-stocks *k*, sliding in said recesses and carrying knives at their outer ends, in combination with the disk n and the wedges *p*, said wedges being constructed to slide one in the rear of each knife-stock, and each having tongues to slide in undercut recesses in its knife-stock, whereby they will advance or retract the knife-stocks with a positive movement, substantially as described.

6. As a means for giving motion to the adjustable spindles F, the combination of spur-gear H, rotary disk D, feathered shaft A, miter-pinions *e f g*, and radially-adjustable blocks E, when arranged and operated as described.

7. In a lathe for turning irregular forms, the combination of a series of cutter-heads which simultaneously work upon the stick, in combination with two revolving spindles, stationary guideways secured to the lathe-frame, and exchangeable cams secured upon the spindles, whereby the movement of said cams upon the guideways will automatically and independently adjust the spindles, substantially as and for the purpose specified.

8. In a lathe for cutting spokes, the combination of a series of revolving cutter-heads, N and O, the radially self-adjusting spindles F F, the oval and squaring cams I and J, and involute guideways K, and circular guideway L, when operating and combined substantially as described.

9. The cutter-head O, knife-stocks *k*, wedges *p*, and the grooved disk n, carrying said wedges, in combination with the stationary grooved cam R, the roller *l*, and the arm m, substantially as and for the purpose specified.

252,482. GRAIN-BINDER. SYLVANUS D. LOCKE, Mechanic Falls, N. Y. Filed Mar. 21, 1881. (No model.)

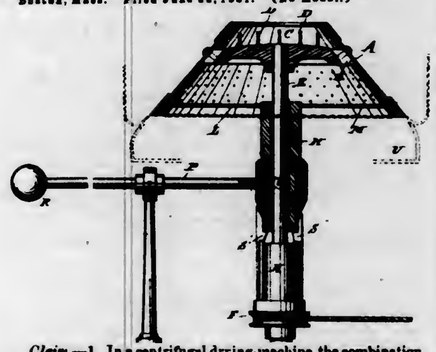
Claim.—1. In a cord-knotter, an elastically-yielding plate or leaf spring beneath one of the jaws of said knotter and opposing the other, to press upon the cord between the two.

2. In a cord-knotter, the combination of a jaw having a shoulder at or near its point, an opposing jaw, and an elastically-yielding plate or leaf spring between the two and pressing on the cord toward the face of the shouldered jaw.

3. In a cord-knotter, the combination of a rigid jaw having a shoulder at or near its point, an opposing rigid jaw overlying the first and slightly clearing its shoulder, so as to leave a space between, and an elastically-yielding plate or leaf spring between the two jaws bent or beveled upward at its end to pass by the shoulder into a recess in the point of the second jaw.

4. In a tying-bill, the combination of a jaw having curved or cord-deflecting surfaces, an opposing jaw, and an elastically-yielding plate or leaf spring acting between the two from the face of one toward the face of the other, and substantially parallel along its length with the face toward which it presses.

5. In a tying-bill, the combination of the rigid lower jaw having curved or cord-deflecting surfaces, the opposing upper jaw, and an elastically-yielding plate or leaf spring beneath the face of the upper jaw and acting against the cord toward the face of the lower jaw.



6. In a tying-bill, the combination of the rigid lower jaw having curved or cord-deflecting surfaces and shouldered at its point, the opposing upper jaw, and an elastically-yielding plate or leaf spring beneath the face of the upper jaw and inclined or beveled at its outer end upward past the shoulder on the lower jaw.

7. In a tying-bill, the combination of the rigid lower jaw having curved or cord-deflecting surfaces and shouldered at its point, the opposing upper jaw recessed or perforated near its point, and an elastically-yielding plate or leaf spring beneath the face of the upper jaw, bent upward at its outer end past said shoulder and taking into said recess.

8. In a tying-bill, the combination of the rigid lower jaw having curved or cord-deflecting surfaces and shouldered at its point, the opposing upper jaw rigidly secured to the heel of the bill and overlying said shoulder, with a space between, and an elastically-yielding plate or spring underlying the face of the upper jaw and pressing toward the face of the lower jaw.

9. In a tying-bill, the combination of the rigid lower jaw having curved or cord-deflecting surfaces and shouldered at its point, the opposing upper jaw rigidly secured to the heel of the bill and overlying said shoulder, with a space between, and an elastically-yielding plate or leaf spring between the two jaws and bent upward at its end to pass by the rib or shoulder into a recess in the upper jaw near its point.

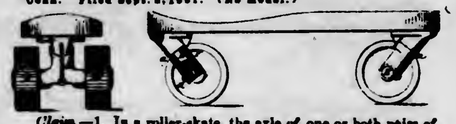
252,483. CENTRIFUGAL DRYING-MACHINE. THOMAS LONG, Boston, Mass. Filed June 23, 1881. (No model.)

Claim.—1. In a centrifugal drying-machine, the combination, with a conical perforated hood, of a movable bottom, substantially as herein shown and described.

2. In a centrifugal drying-machine, the combination, with the conical perforated hood A, of the top plate, C, and the movable bottom M, substantially as herein shown and described, and for the purpose set forth.

3. In a centrifugal drying-machine, the combination, with the conical perforated hood A, of the top plate, C, provided with short radial arms B', and of the movable bottom M, substantially as herein shown and described, and for the purpose set forth.

4. In a centrifugal drying-machine, the combination, with the perforated conical hood A, of the top plate, C, the shaft E, the bottom M, the sleeve H, and the springs S, substantially as herein shown and described, and for the purpose set forth.

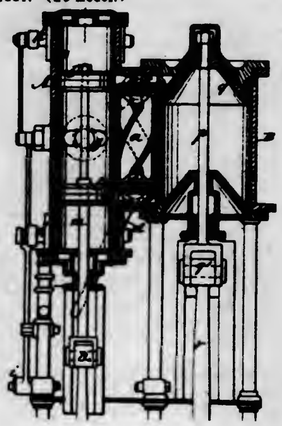


5. In a centrifugal drying-machine, the combination, with the perforated conical hood A, of the top plate, C, the bottom plate, M, the shaft E, the sleeves H and U, the springs S, and the pivoted and forked lever P, substantially as herein shown and described, and for the purpose set forth.

6. In a centrifugal drying-machine, the combination, with the perforated conical hood A, of the top plate, C, and the studs D D, substantially as herein shown and described, and for the purpose set forth.

7. A centrifugal drying-machine made substantially as herein shown and described, and containing the following elements, to wit: a rotary perforated hood and a vertically-adjustable bottom, whereby the machine can be charged and discharged without stoppage, as set forth.

8. The method herein described of discharging the contents of a centrifugal drying-machine, consisting in separating the bottom of the perforated hood from this hood, so that the contents will be discharged at the lower edges of this hood by the centrifugal force, as set forth.



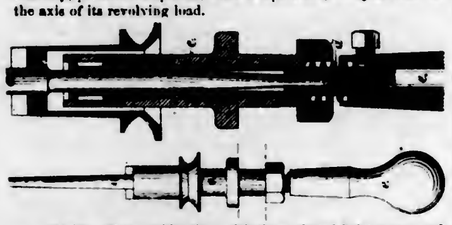
252,484. ROLLER-SKATE. ORNEL B. LUTHER, Torrington, Conn. Filed Sept. 8, 1881. (No model.)

Claim.—1. In a roller-skate, the axle of one or both pairs of wheels arranged upon a pivot on the foot-piece in the plane of the vertical central line of the foot-piece, but inclined to the horizontal plane of the foot at an angle of about forty-five degrees, combined with a spring-rod, *a*, parallel with the pivot, one end rigidly attached to the foot-piece, the other engaged with the axle, substantially as and for the purpose described.

2. In a roller-skate, the axle of one or both pairs of wheels arranged upon a pivot on the foot-piece in the plane of the vertical central line of the foot-piece, but inclined to the horizontal plane of the foot at an angle of about forty-five degrees, combined with a spring-rod, *a*, parallel with the pivot, one end rigidly attached to the foot-piece, the other engaged with the axle, and stops to limit the extent of turning of the axle or strain upon said spring, substantially as described.

252,485. COMPOUND ENGINE. GIDEON B. HARVEY, New York, N. Y., assignor to Jacob Lorillard, Trustee, same place. Filed Dec. 2, 1881. (No model.)

Claim.—1. In compound engines, the combination of a high and a low pressure cylinder, each having a single chamber and connected to the other by short direct ports, the high-pressure cylinder having steam-ports at its ends and exhaust-ports both at its mid-length and its ends, substantially as shown and described.

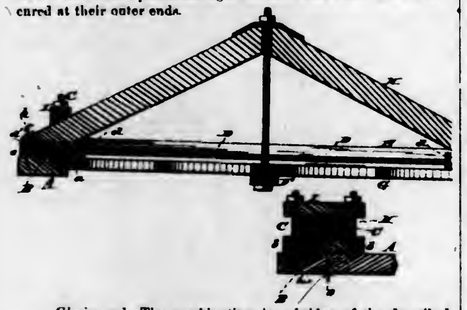


2. In compound engines, the combination of the high-pressure cylinder A, having two pistons upon the same rod, and provided with steam-ports *e'* at its ends and exhaust-ports *e* at its ends and *g* at its mid-length, and the low-pressure cylinder B, having a single piston and communicating with cylinder A by short direct ports *b b'*, the said cylinders having each a single chamber, substantially as shown and described.

3. The combination and arrangement of the stationary reversing-valves *c c* with the ports *b b'* and their connecting-cores between the high and low pressure cylinders of a compound engine, substantially as shown and described.

4. The combination of direct exhaust-ports *b b'*, connected by cores and reversing-valves *c* with the cylinders A B, substantially as shown, to allow reversal of the engine, and maintaining the proper lead of the high-pressure pistons.

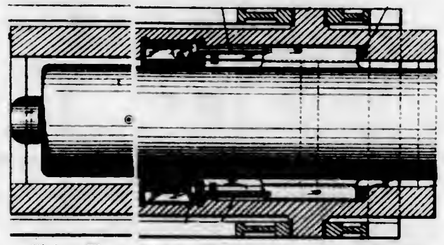
252,486. SPINDLE FOR SPINNING AND TWISTING MACHINES. THOS. MATON, Providence, R. I. Filed May 9, 1881. (No model.)



Brief.—A weight is secured to the lower end of the bolster, between which and the bolster-case a coiled spring is placed, which exerts a downward force on the bolster and forms a lateral resistance for and limits the oscillation of the same. The bolster being supported in the case by a ball and socket and allowed to yield laterally, permits the spindle, when in operation, to adjust itself to the axis of its revolving load.

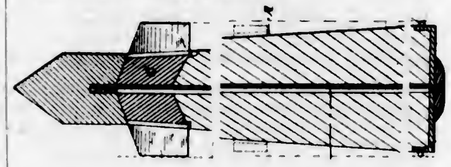
Claim.—The combination, with the socketed bolster-case and the bolster provided with the ball intermediately of its length and fitting in the socket of said case, of the weight *c*, secured to the lower end of the bolster, and the spring *d*, secured between said weight and the bolster-case, substantially as and for the purpose set forth.

252,487. BRIDGE. JOHN B. MCPHERSON, Bunker Hill, Ill. Filed June 28, 1881. (No model.)



Brief.—To secure the ends of the inclined struts in their shoes said shoes have lateral ears, and bolts extend upward through them; also through transverse bars crossing the upper face of the struts. The tension-chord passes through sockets in said shoes and are secured at their outer ends.

Claim.—1. The combination, in a bridge of the described class, of the end or bed timbers, A A, shouldered bolsters B, having perforated ears *b b* and longitudinal countersunk bore *d d'*, beaded chords D, made of wire rope, struts or braces H, beveled clamping-plates I, and nutted tie-bolts C C, all constructed and combined substantially as and for the purpose herein shown and set forth.



2. The bolster B, composed of a longitudinally-perforated base-plate, *a*, having shoulder *c* and laterally-projecting perforated ears *b b*, as and for the purpose herein shown and specified.

252,488. GUN AND GUN-CARRIAGE. DAVID M. MEFFORD, Toledo, Ohio. Filed Dec. 14, 1881. (No model.)

Claim.—The combination of the gun formed with the longitudinal flanges D, which are rigid with the gun and on opposite sides thereof, with the adjustable tilting frame having in the inner side of its longitudinal timbers the channels receiving said flanges, and also pneumatic buffers behind and elastic buffers in front of said flanges, whereby the gun will be guided and steadied while sliding in a line coincident with the line of its caliber, and at the same time be prevented from tilting independently of the frame, substantially as described.

252,489. PROJECTILE. DAVID M. MEFFORD, Toledo, Ohio. Filed Nov. 23, 1881. (No model.)

Claim.—1. An elongated projectile for ordnance, composed of a tapering wooden stock or body provided with a metal head of smaller diameter than the said body, and a metal shaft passing through the axis of the body and secured to the metal head, substantially as described, the metal shaft being adapted to give additional momentum and penetrative force to the projectile, and the wooden stock being constructed to strip off from the shaft at the point of impact while the head and the shaft pass on through the object fired at.

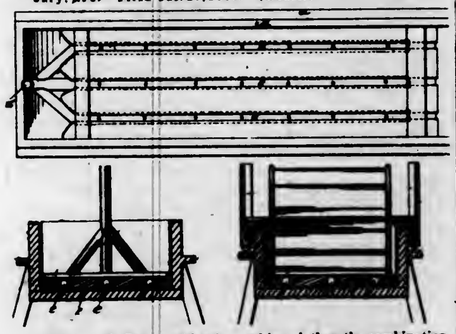
2. The combination, in an elongated projectile, of the body composed of wood or other light material having a metal head of smaller diameter than the body, with the metal re-enforcing plate at the rear end of the wooden body, and the central metal shaft passing through said body and connecting the plate with the head, substantially as described.

3. An elongated projectile for ordnance, composed of a wooden stock made cylindrical at its rear end, and having a taper from said cylindrical portion to its forward end, a metal head secured to its forward end, and having a diameter less than the diameter of the said wooden body, and the central supporting-shaft passing through the body and secured to the head, substantially as described.

4. An elongated projectile for ordnance, having a metallic head smaller in diameter than the caliber of the gun for which the projectile is made, with a tapering wooden stock or body, a central metal supporting-shaft, and laterally-projecting wings connected with the tapering stock of the projectile, substantially as described.

5. The combination, in an elongated projectile for ordnance, of the tapering wooden stock or body A, with the metal head, the metal supporting-shaft passing through the axis of the stock, and the metal ring L, fitted upon the tapering stock, and provided with laterally-projecting beads, said members being constructed and organized substantially as and for the purpose described.

252,490. BEDSTEAD. NATHAN T. MELVIN, Lodi, Ohio. Filed Nov. 26, 1881. (No model.)

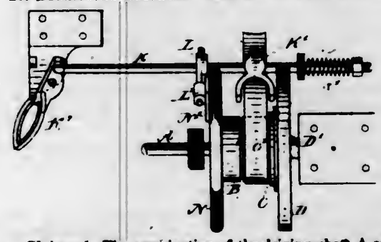


Claim.—1. In bedsteads, the posts thereof having lugs connected therewith in an angular or oblique relation to said parts, in

combination with the bars or rails of the side and end sections substantially as described, and for the purpose set forth.

2. In bedsteads, the rails or bars of the sides and sections of the ends provided with grooves *d*, in combination with the lugs connected with the posts, arranged to clamp the said bars between the lugs and posts, substantially as described.

3. A bedstead constructed entirely of rounded turned posts and made up in sections, consisting of the sides, ends, and posts connected together by clamping the sides and ends between the lugs and posts, substantially as described, and for the purpose specified.

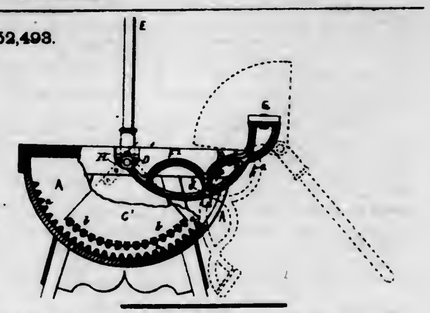


252,491. WASHING-MACHINE. THOMAS J. MURDOCH, Salisbury, N. C. Filed Oct. 27, 1881. (Model.)

Claim.—1. In a machine for washing clothes, the combination of a tank provided at its bottom with a series of longitudinal perforated pipes connected at one end of the tank with a pipe common to all for supplying them with steam, and a series of slats located longitudinally in and filling the space between the said pipes, and a movable frame supported on the tank to be operated by the attendant, and provided with a device, substantially as described, for acting on the clothes while they are subjected to the action of the steam, in the manner and for the purpose described.

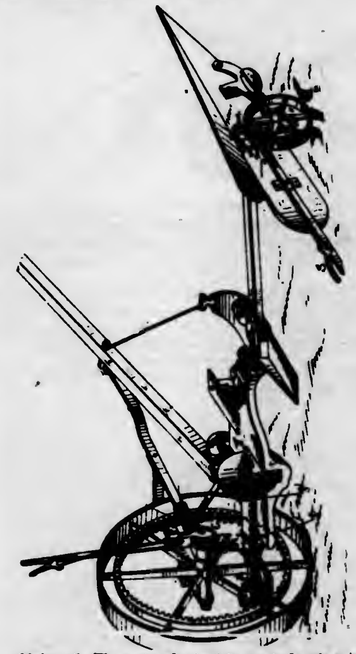
2. In a machine for washing clothes, the combination of a tank having in its bottom a series of pipes connected with a steam-supply, and a series of slats arranged in and filling the space between said pipes, with a traveling frame provided with a corrugated roller for acting on the clothes while they are subjected to the action of steam, substantially in the manner and for the purpose described.

252,492. STARTING AND STOPPING MECHANISM. BENJAMIN MUDGETT, Hawley, Mass. Filed Nov. 14, 1881. (No model.)



Claim.—1. The combination of the driving-shaft A and the driving-pulley B with the detached fixed shaft D' and the detached loose pulley C, whereby the machine is free to be moved independently of the loose pulley, substantially as described, and for the purpose set forth.

2. The combination of the belt-shipper K', the shipping-rod K, and the lever K² with the friction-arm L L' and the friction-pad N' on the friction-disk N, substantially as described, and for the purpose set forth.



252,493. WASHING-MACHINE. WILLIAM MEYER, Afton, Minn. Filed Apr. 21, 1881. (No model.)

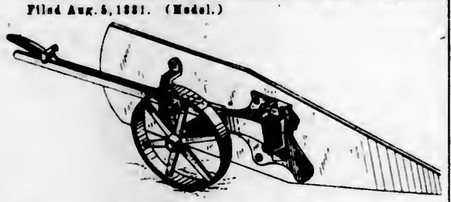
Claim.—The combination, with tub A and levers F' F², hinged thereto, and connected together by bar G, of the shaft D, provided with handle E, and journaled in arms F' F², and the segmental rubber secured adjustably to shaft D by set-screws I, passed through hubs H, whereby the rubber can be not only detached from its shaft, but the angle of the handle with reference to the rubber can be altered by the same means, as set forth.

252,493.

252,494. REAPING-MACHINE. WILLIAM K. MILLER, Canton, Ohio. Filed Aug. 5, 1881. (Model.)

Claim.—1. The seat and wheel-frame, in bearings in the rear open end of which the main drive-wheel axle is mounted, provided on its inner arm with a ratchet wheel or disk surrounding the axle-bearing, and having a sliding connection at its forward end with the pivoted tongue or tongue-frame, substantially as and for the purpose described.

2. The combination of the seat and wheel-frame, supported at its rear end upon the drive-wheel axle, the axle-frame secured at its forward end to and vibrating with the axle, the gear and cutter frame connected at its rear end with the rear end of the axle-frame, and at its forward end, through the hinged tongue or tongue-frame, with the forward end of the seat and wheel-frame, substantially as described.

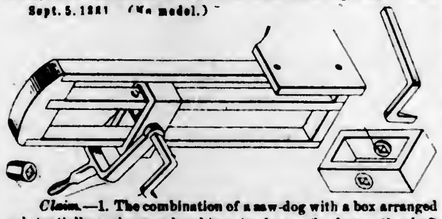


3. The combination of the axle-frame, secured at its forward end to and made adjustable with or upon the drive-wheel axle as a center, the forwardly-projecting cutter-frame hinged to said axle-frame in line with and made adjustable around the pinion-shaft, the wheel-frame provided with the fixed ratchet-disk surrounding the drive-wheel axle and connected at its forward end with the tongue, and the adjusting-lever pivoted and turning on said axle as a center, all arranged and operating substantially as and for the purpose described.

4. The combination of the wheel-frame having the fixed ratchet-disk surrounding the main drive-wheel axle, and connected at its forward end with the hinged tongue or tongue-frame, the axle-frame bar secured to and made adjustable with or upon the

axle as a center, and provided at its rear swinging end with a sleeve-bearing for the pinion-shaft, the cutter-frame hinged at its rear end upon said sleeve and at its forward end to the tongue or tongue-frame, and adjusting devices connecting said cutter-frame with the ratchet-disk on the wheel-frame for adjusting and holding the cutter-frame, substantially as described.

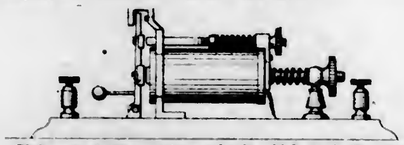
5. The combination of the wheel-frame with its ratchet-disk surrounding the axle, the axle-frame secured to and turning with the axle, and provided with means, operating in connection with said ratchet-disk, for holding it at any desired angle of relation to the wheel-frame, the cutter-frame hinged at its rear end to the rear end of the adjustable axle-frame, and connected at its forward end, through the hinged tongue or tongue-frame, with the forward end of the wheel-frame, and means, operating in connection with the ratchet-disk on the wheel-frame, for adjusting and holding said cutter-frame at any desired height, substantially as described.



252,495. MEANS FOR ADJUSTING THE GRAIN-WHEEL OF HARVESTING-MACHINES. WILLIAM K. MILLER, Canton, Ohio. Filed Aug. 8, 1881. (Model.)

Claim.—1. In a harvesting-machine, a grain-wheel connected by a swiveling arm with a sliding block adjustable in the arc of a circle on a curved way or track adapted to hold said block against displacement both laterally and in line with the path of the machine.

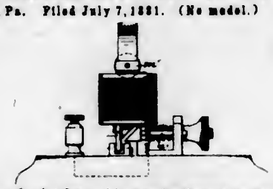
2. The grain-wheel mounted in a swiveling arm pivoted to an adjustable block moving on a curved way or track and provided with a rack-segment, in combination with the lever and its rack-segment for adjusting the same, substantially as described.



252,496. SAW-MILL DOG. JNO. HORN, Antwerp, Ohio. Filed Sept. 5, 1881. (No model.)

Claim.—1. The combination of a saw-dog with a box arranged substantially as shown, a breaking attachment fixed upon the shaft of the dog and in contact with a bearing-bar, and a spring located between the box and rear of the bearing-bar, for the purpose set forth.

2. A saw-dog located upon the lower side of a frame for grasping the under side of a log, in combination with a second saw-dog having a breaking attachment upon its shaft and mounted upon a box sliding upon said frame, and provided with a spring for holding the breaking attachment against a bearing-bar, substantially as described.

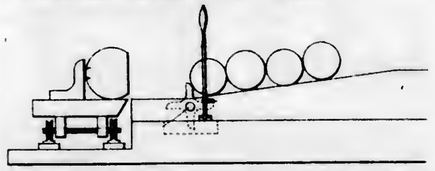


252,497. TELEGRAPHIC SOUNDER. GARRET S. MOTT, Philadelphia, Pa. Filed Nov. 17, 1881. (No model.)

Claim.—1. A telegraphic sounder in which an electro-magnet is combined with an armature-lever and stops, and an adjustable permanent magnet adapted to act on and attract the armature-lever with and in the same direction as the electro-magnet.

2. The combination of the electro-magnet with an armature-lever having two armatures, a non-adjustable retractor, and an adjustable permanent magnet on the same side of the armature as the electro-magnet, all substantially as set forth.

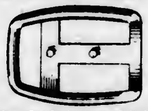
252,498. TELEGRAPHIC SOUNDER. GARRET S. MOTT, Philadelphia, Pa. Filed July 7, 1881. (No model.)



Claim.—1. A telegraphic sounder having a vibrating electro-magnet, a stationary adjustable armature, and fixed stops for the electro-magnet, substantially as described.

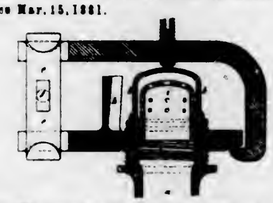
2. In a telegraphic sounder, the combination of a frame and a stationary armature with fixed stops and a pendent electro-magnet pivoted with its center of gravity out of a vertical line drawn through its pivoting-points, substantially as shown and described.

3. The combination of the frame and pendent pivoted electro-magnet having beveled poles m with the stationary adjustable armature at right angles thereto, and having a correspondingly-beveled face, substantially as set forth.



252,499. LOG-DECK OF SAW-MILLS. PETER HUSSER, Muscatine, Iowa. Filed May 17, 1881. (Model.)

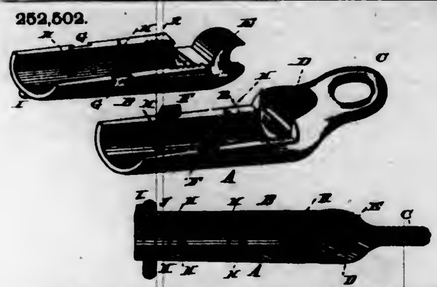
Claim.—1. In an inclined plane or log-deck of saw-mills, the combination, with rotary arms, of a suitable stop mechanism, substantially as shown, to hold said arms, but permit of their partial rotation by the weight of the log when the stop is tripped or released, substantially as and for the purpose set forth.



2. In an inclined plane or log-deck of a saw-mill, the combination, with rotating arms, of a stop mechanism consisting of a sliding bar operated by a suitable lever, substantially in the manner and for the purpose specified.

252,500. TRIMMING FOR HALTERS AND BRIDLES. JAMES S. HALSON, Springfield, Ohio, assignor to I. M. Hatcher, same place. Filed May 6, 1881. (No model.)

Claim.—A fastening for halters and bridles, consisting of an approximately rectangular frame having a longitudinal piece running from one end thereof to and connecting with a cross-bar near the other end, the parts being provided, respectively, with a stud or pin and lying in a different plane from the frame proper, as shown and described.

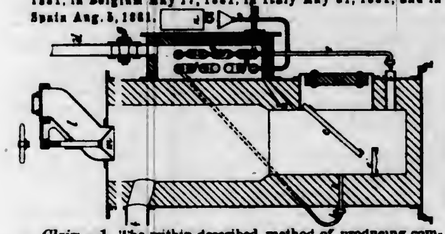


252,501. AUTOMATIC FIRE-EXTINGUISHER. PAUL ORIOLLE, Nantes, France. Filed Oct. 5, 1881. (No model.) Patented in France Mar. 15, 1881.

Claim.—The combination, with the lid *b* and pipe *a*, of the piece *g*, screwed on the end of pipe, the nut-rod *c*, carrying the screw *d*, and the fusible rod *e*, carrying therein a heat-conductor, *f*, as and for the purpose specified.

252,502. ROPE-CLAMP. NICHOLAS C. ORRICK, Canton, Miss. Filed Nov. 25, 1881. (No model.)

252,502.



Claim.—1. As an improvement in rope-clamps, the combination of the shell A, having eye C, recess D, and prongs H, with the shell B, having tongue E and prongs H, substantially as and for the purpose set forth.

2. As an improvement in rope-clamps, the semi-cylindrical shells A B, having prongs H, and provided respectively with a recess, D, and tongue E and with guides F and recesses G, substantially as set forth.

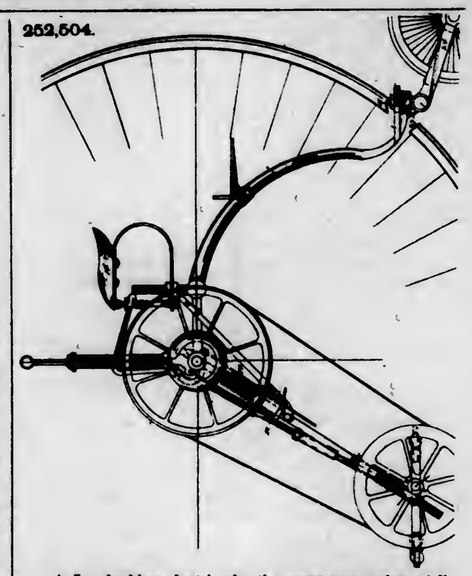
3. In a rope-clamp, the combination, with the shells A B, constructed substantially as described and having stud or studs I, of the ring J, having notch or notches K, corresponding with said studs, as set forth.

4. The combination of the shells A B, having respectively recess D and guides F, and tongue E and recesses G, both of said shells being provided with prongs H and screw-threads R, substantially as set forth.

252,503. METHOD OF AND APPARATUS FOR THE MANUFACTURE OF COMBUSTIBLE GAS. NICOLAUS AUGUST OTTO, Mülheim-on-the-Rhine, Germany. Filed May 24, 1881. (No model.) Patented in England May 4, 1881, in France May 10, 1881, in Belgium May 17, 1881, in Italy May 31, 1881, and in Spain Aug. 5, 1881.

Claim.—1. The within-described method of producing combustible gases in gas-producers, the same consisting in developing carbonic-acid gas and nitrogen by the combustion of carbonaceous fuel, then drawing off a part only of the carbonic acid and nitrogen at a point directly above the grate of the producer and below the main body of fuel, then converting the remaining portion of carbonic-acid gas and nitrogen into producer-gas, and finally introducing steam directly into the body of the incandescent fuel at a point above the grate of the producer, for converting the steam into carbonic oxide and hydrogen, which combine with the producer-gas, all substantially in the manner and for the purposes described.

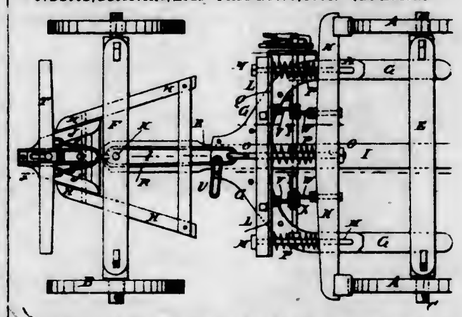
2. The gas-producer provided with passages *b b*, in combination with the chamber *a*, fine-pipe *d*, cock *g*, and steam-pipes *f*, *e*, and *h*, substantially as and for the purpose described.



252,504. TRICYCLE. EDOUARD C. F. OTTO, Peckham, County of Surrey, England. Filed Aug. 26, 1881. (No model.) Patented in England May 31, 1879.

Claim.—1. In a tricycle, the combination, substantially as before set forth, of the main axle, the backbone secured thereto, the fork of the following wheel hinged to the backbone, and another joint interposed between said fork and the main axle, operating at right angles to the hinge.

2. In a tricycle, the combination, substantially as before set forth, of the drive-wheels mounted on a common axle, the backbone connected to the axle and provided with fixed steering-handles, and the driving following wheel the fork of which is pivoted to the backbone and provided with a saddle.

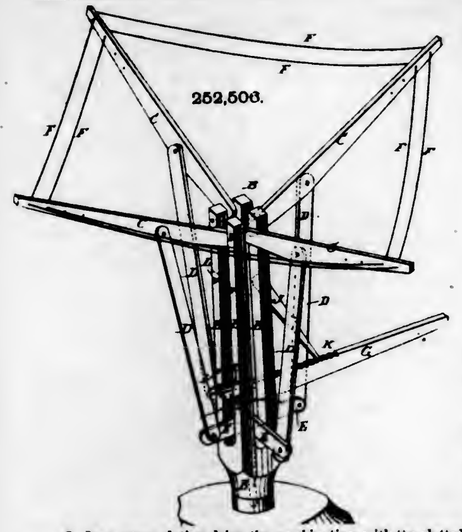


3. In a tricycle of the character described, the combination, substantially as before set forth, of the front seat mounted on the axle of and between the main or driving wheels, and the rear seat mounted above the following wheel.

252,504.

4. In a backbone for tricycles, the combination, substantially as before set forth, of the vertically-operating hinge-joint and the spring.

252,505. WAGON-BRAKE. WILLIAM B. PARCUTT and WILLIS J. BROCK, Batesville, Ark. Filed Nov. 8, 1881. (No model.)

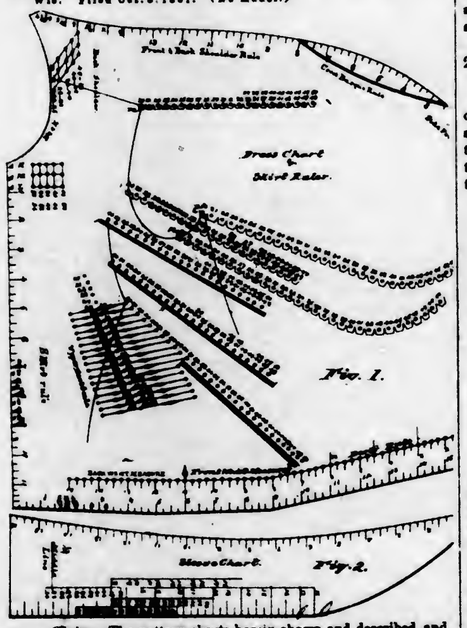


Claim.—1. In a wagon-brake, the combination, with the hounds G and the brake-bar N, of the stationary bar L, the rods M O M, and the springs P, substantially as herein shown and described, whereby the brake will be applied by the tension of the said springs, as set forth.

2. In a wagon-brake, the combination, with the hounds G, the double-tree T, and brake-bar N, of the stationary cross-bar L, the guide-rods M, the draw-rod O, the springs P, and the jointed connection rod or chain R S, substantially as herein shown and described, whereby the brake will be applied automatically when the draft is stopped and will be withdrawn by the draft-strain, as set forth.

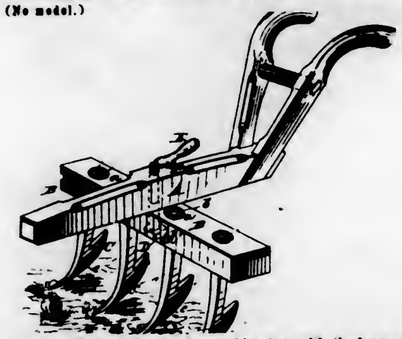
3. In a wagon-brake, the combination, with the brake-bar N, the stationary cross-bar L, the rods M O M, and the springs P, of the pairs of links V W and the rock-shaft Y, having arms X and lever Z, substantially as herein shown and described, whereby the power of the brake can be regulated and the brake withdrawn from the wheels, as set forth.

252,506. ROTARY CLOTHES-DRIER. HORACE PALMER, Lebanon, Conn. Filed Oct. 24, 1881. (Model.)



Claim.—1. A rotary clothes-drier constructed substantially as herein shown and described, and consisting of the slotted pivoted post B, the hinged bars C, carrying the clothes-lines F, the connecting-bars D, the crossed bars E, the lever G, and detaining device, as set forth.

2. In a rotary clothes-drier, the combination, with the slotted post B, the lever G, and detaining devices, of the hinged bars C, the connecting-bars D, and the crossed bars E, the upper one of which has a rounded projection or rise in the middle of its length, substantially as and for the purpose set forth.



3. In a rotary clothes-drier, the combination, with the slotted post B, provided with pins I, the hinged bars C, the connecting-bars D, and the crossed bars E, of the lever G, provided with the ratchet-teeth K, and the pawl J, substantially as and for the purpose set forth.

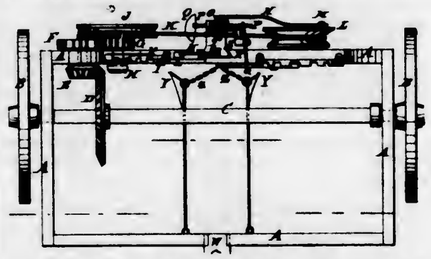
252,507. DRESS-CHART. E. ELLSWORTH PALMER, Baraboo, Wis. Filed Oct. 3, 1881. (No model.)

Claim.—The pattern-charts herein shown and described, and denoted, respectively, Fig. 1 and Fig. 2, of the configuration shown and provided with the series of measures, scales, and rules, arranged on the respective charts in the manner shown and described.

252,508. CULTIVATOR. MCDONALD PATE, SAMUEL O. MASON, and WILLIAM H. DAIL, Snow Hill, N. C. Filed Aug. 19, 1881. (No model.)

Claim.—In a cultivator, the combination, with the beam A, of the cross-beam B, carrying a series of cultivator plows or shovels, a clamping bolt and nut, and a locking-arm, E s, connected to said bolt and adapted to engage the beam A, for adjustably securing said beams together, substantially in the manner herein shown and described.

252,509. SWIVEL-BUTTON. SILAS O. PARKER, Littleton, N. H., assignor to the Littleton Patent Button Company, same place. Filed Oct. 29, 1881. (No model.)



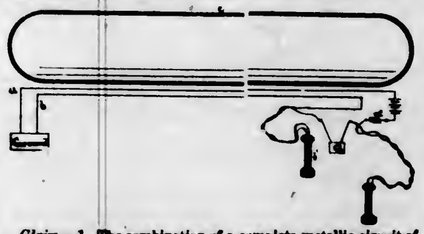
Claim.—1. In a swivel-button, the combination, with the tubular shank D, of the bar A and the spring C, contained in the tubular shank D, substantially as herein shown and described, and for the purpose set forth.

2. In a swivel-button, the combination, with the tubular shank D, having internal indentations or studs, E, of the bar A and the spring C, contained in the tubular shank D, substantially as herein shown and described, and for the purpose set forth.

252,510. COTTON CHOPPER AND CULTIVATOR. JAS. D. PATTERSON, Competition, Mo. Filed June 14, 1881. (No model.)

Brief.—The rod carrying the hoe is supported by a lever pivoted to a bracket formed upon a vibrating socket, through which said rod passes, whereby the hoe may be elevated or depressed while the machine is in motion. A lever and its connections, by which the hoe may be raised or lowered and the machine simultaneously thrown in or out of gear.

Claim.—1. The combination, with the hoe Q, of the rod P, supported by lever R, the socket O, the rod N, the pulley L, having crank-pin M, the band K, the pulley J, and gear-wheels G F E D, whereby said hoe is operated from the drive-shaft, as described.



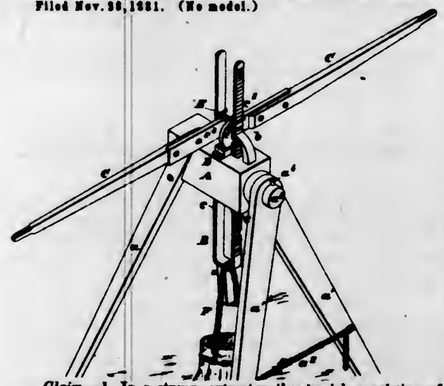
2. The combination of the socket O, hoe P Q, lever R, bracket S, sliding block T, lever I, and connecting-rod U with the vertically-grooved cross-bar A, and mechanism for vibrating said socket, substantially as and for the purpose set forth.

3. The combination, with the bar P, carrying the hoe Q, of the vibrating socket O, provided with the bracket S, and the lever R, pivoted to the said bracket, substantially as and for the purpose set forth.

4. The combination, with the slotted and grooved cross-bar A, the gear-wheels D E F, and the socket O, of the gear-wheel G, the block H, the lever I, the rod U, and the block T, substantially as and for the purpose set forth.

5. The combination, with the bar P, carrying the hoe Q, of the socket O, provided with the lever R, pivoted to the bracket S on the said socket, and mechanism for vibrating said socket, substantially as and for the purpose set forth.

252,511. ANTI-INDUCTION CABLE. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Filed July 14, 1881. (No model.)



Claim.—1. The combination of a complete metallic circuit of low resistance placed in the interior of the cable among the other conductors, with one of said conductors used as a primary circuit and several of said conductors used as secondary circuits, whereby the effects of induction are overcome, substantially as and for the purpose specified.

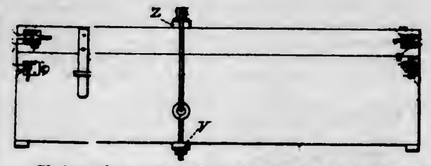
2. In a telegraph-cable, the combination of separately-insulated conducting-wires with a complete metallic circuit of low resistance, which is placed centrally among the said conducting-wires, as and for the purpose set forth.

3. A telegraph-cable containing several primary wires, in combination with a complete metallic circuit of low resistance placed centrally among the other conductors, whereby tertiary currents are induced, as and for the purpose set forth.

4. The combination of primary line *a*, key *a'*, or its equivalent, one or several secondary lines, *b*, and the low-resistance wire *c*, whereby tertiary currents are induced in said line or lines *b*, as and for the purpose set forth.

252,512. STUMP-EXTRACTOR. JOHN G. PEACH, Salem, Mo. Filed Nov. 26, 1881. (No model.)

Claim.—1. In a stump-extractor, the derrick consisting of block A, with stationary legs *a* and adjustable legs *a'*, as and for the purpose set forth.



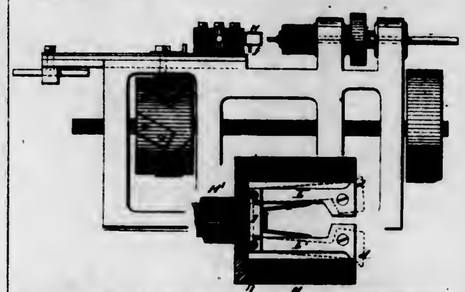
2. In a stump-extractor, the levers C, having eccentric heads *c'*, eccentrically connected together by the strap-bolt *c''*, as and for the purpose set forth.

3. In a stump-extractor, the cap D, secured to or resting upon the derrick, and forming the bearing-surface of the levers, substantially as set forth.

4. In a stump-extractor, the distance bolt or bar E, having heads *e*, as and for the purpose set forth.

5. The combination of derrick A *a a'*, yoke B, levers C, with eccentric heads *c'*, pawls *b*, resting upon the top of the derrick and engaging with the notches on the yoke, as and for the purpose set forth, connecting-bolt *c''*, straps or links *c'*, and clevises *e*, all substantially as set forth.

252,513. WAGON-BODY. ISAAC E. PHELPS, Wahoo, and WILLIAM F. SIMPSON, Scribner, Nebr. Filed June 29, 1881. (No model.)



Claim.—As a means of securing supplemental sides to a wagon, the bars V and E, the latter having notches at its ends, in combination with rods which are attached at one end to the bar V and carry at the other end cams or other securing devices adapted to the notched ends of bar E, as set forth.

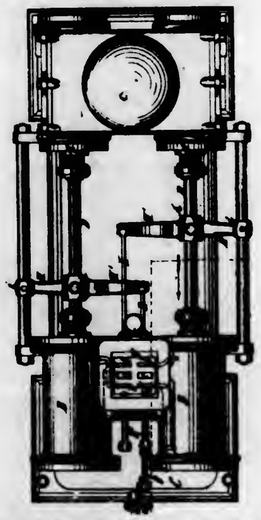
252,514. SAP-SPOUT. GEORGE J. RECORD, Conneaut, Ohio. Filed Nov. 22, 1881. (No model.)

Claim.—In a sap-spout, the combination, with the tapering tube A, of the eccentrically-perforated ring-flange B, substantially as herein shown and described, whereby additional security is obtained against the accidental detachment of the sap-bucket, as set forth.

252,515. METAL-SCREW MACHINE. MOSES W. RUDDUCK, Bridgeport, Conn., assignor to the Wheeler & Wilson Manufacturing Company, same place. Filed May 31, 1881. (No model.)

Claim.—1. In a screw-threading machine, the combination of the dies arranged in a holder, and in connection with a cross-head in said holder, said cross-head and dies free for longitudinal movement within said holder, a stop to arrest the advance of the die-holder at a predetermined point, whereby the continuous revolution of the screw being cut itself operates to draw the dies from the holder, such withdrawal of the dies permitting them to release the screw, and thereby cease their cutting, and mechanism, substantially such as described, to draw the dies back into the holder, whereby they are closed for a new cut, substantially as described.

2. In a screw-cutting machine provided with a device to hold the blank to be cut, the combination of a tool-holder arranged to present the several tools successively to perform their work upon the blank, the die-holder H, arranged in said tool-holder, combined with the levers L L', arranged therein, free for longitudinal movement, each carrying a part of the die, mechanism, substantially such as described, to arrest the cutting operation of the die, thus permitting the screw being threaded to withdraw said levers from the holder and open the dies, a stud or extension, *f*, from said levers outside said holder, and a cam arranged in the path of said stud as the die-holder passes from its position for one operation to its position for the next operation, whereby the dies as drawn out and opened by the screw itself will be returned and closed, substantially as described.



3. In a screw-cutting machine provided with a device to hold the blank to be cut, the combination of a tool-holder arranged to present the several tools successively to perform their work upon the blank, the die-holder H, arranged in said tool-holder, combined with the levers L L', arranged therein, free for longitudinal movement, each carrying a part of the die, mechanism, substantially such as described, to arrest the cutting operation of the die, per-

mitting the screw being threaded to withdraw said levers from the holder and open the dies, a stud or extension, *f*, from said levers outside said holder, and a cam arranged in the path of said stud as the die-holder passes from its position for one operation to its position for the next operation, whereby the dies so drawn out and opened by the screw itself will be returned and closed, with mechanism, substantially such as described, for adjusting said levers relatively to each other, substantially as described.

252,516. TREATMENT OF RESIN-OIL FOR MIXING PAINTS. FRANKLIN H. RUBB, Lawrenceburg, Ind., assignor of one-half to W. C. Smith, Washington Court-House, Ohio. Filed Dec. 3, 1881. (No specimens.)

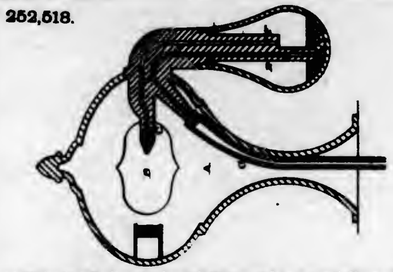
Claim.—The method described of treating resin-oil, consisting in adding thereto tungstate of soda, carbolic acid, benzine, gum-shellac, and japan, in or about the proportions specified.

252,517. DUPLEX PUMPING-ENGINE. GEORGE H. RUTHOLDS and THOMAS J. RIBBS, New York, N. Y., assignors of one-half to Cornelius H. Delamater and George H. Robinson, both of same place. Filed July 23, 1881. (No model.)

Claim.—1. In a duplex engine, the combination, with the two piston-rods and steam-cylinders, two slide-valves, levers to which said valves are connected and through which they are operated, of arms or cross-heads secured to said piston-rods, and rods whereby said arms or cross-heads are connected each with the valve-operating lever of the other engine, substantially as and for the purpose specified.

2. In a duplex engine, the combination of the steam-cylinders B, the piston-rods D, the valves *d*, the levers *g*, the arms or cross-heads H, bowed or curved in opposite directions at their inner ends, and the rods I, each connecting with the lever *g* of the other engine, substantially as and for the purpose specified.

3. In a duplex engine, the combination of two steam-cylinders arranged side by side, a single horizontal valve-seat formed above and between said cylinders, two valves working side by side upon said seat and controlling the admission of steam to and its exhaust from said cylinders, mechanism for working said valves, and a single steam-chest common to both cylinders, covering said valve-seat and containing both valves, substantially as specified.



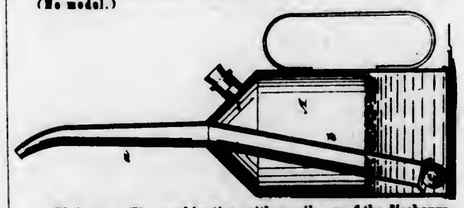
252,518. HYDROGEN LAMP OR CIGAR-LIGHTER. FRANK RUHN, Brooklyn, N. Y. Filed Nov. 16, 1881. (No model.)

Brief.—When the handle is swung from its vertical position the mercury or other liquid seal is displaced and the gas-pipe opened, allowing the passage of the hydrogen to the burner.

Claim.—1. The combination of the standard A, made hollow at its top and provided with the openings B, the gas-tip C, and mass of platinum sponge placed inside of the standard, and a handle containing a sealing medium, substantially as shown.

2. In a cigar-lighter, the combination of a standard with a swinging handle which is applied thereto, and in which handle is placed a liquid sealing medium to prevent the escape of the gas

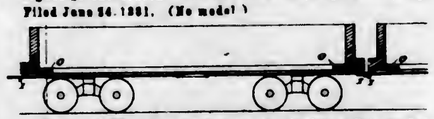
252,518.



until the handle is turned partially around, substantially as shown.

3. The combination of a standard and gas-generator with a connecting-pipe, G, the swinging handle containing the two pipes E F and a liquid sealing medium, and a gas-tip and a mass of platinum sponge, substantially as set forth.

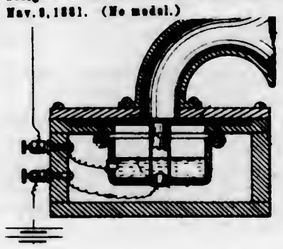
4. In a cigar-lighter, a gas-burner tip made of iridium, substantially as shown.



252,519. OIL-CAN. THOMAS M. RIGHTER, Sandy Run, and THOMAS E. GRIFFITH, Wilkes-Barré, Pa. Filed Nov. 16, 1881. (No model.)

Claim.—1. The combination, with an oil-can, of the discharge tube or nozzle extended down into the can, nearly to the bottom of the same, and provided with a bell-shaped mouth at its lower end and a ball-valve for closing the said lower end when the can is turned from an upright position, substantially as herein shown and described.

2. The discharge-tube *b*, tube *d*, valve *d'*, and valve *f*, combined with oil-can A, substantially as and for the purpose set forth.



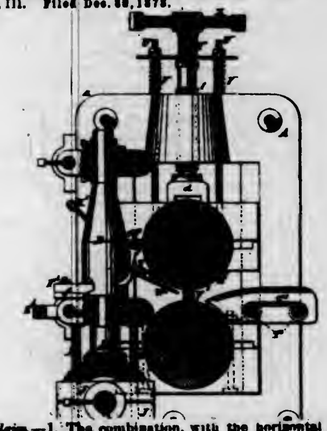
252,520. CAR-COUPLING. EDWARD J. ROBERTS, Ashland, assignor of one-fourth to W. W. Culbertson, Boyd County, Ky. Filed June 24, 1881. (No model.)

Claim.—1. The car-coupling composed of two flat overlapping heads, G, of which each has a lug, I, to occupy a circular orifice, H, in the opposing head, in combination with cam J, operating in a yoke, O, to enable the temporary depression of which-over head is to receive the lug of the other, substantially as set forth.

2. In combination with the overlapping and interlocking heads G H I and operating-cams J upon rotating and sliding shafts K, the slotted hangers M, and springs N, for automatic locking of the head to its elevated position, substantially as described.

252,521. ELECTRIC TELEPHONE. JAMES H. ROGERS, Washington, D. C., assignor to Frank Hume and L. G. Hine, same place. Filed Nov. 9, 1881. (No model.)

Claim.—1. The combination of the diaphragm, the downwardly-projecting non-conducting tube, the cup, the fluid-conductor, and its binding-screws.

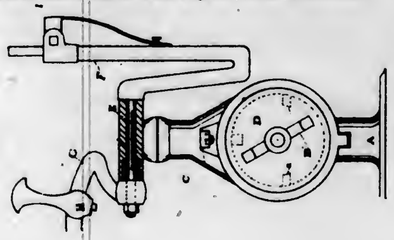


2. The combination of a battery, the line-wires, a diaphragm, a fluid-conductor forming part of the circuit, the non-conducting containing-cup, and a non-conducting tube projecting from the diaphragm, which projects into the fluid and serves to increase and decrease its cross-section at a given point between the end of the projection and the cup, substantially as set forth.

252,522. HAY-TEDDER. JOHN W. KUHL, Hifflinsburg, Pa. Filed Sept. 14, 1881. (Model.)

Claim.—The tedder-arms Q, having studs T and bails or brackets E', in combination with the slotted extensions E, having shoulders S' and stems S² moving or sliding vertically upon studs T, and in brackets E', and having teeth or prongs V, and the springs U, coiled upon the stems S² between shoulders S' and brackets E', substantially as set forth.

252,523. ROLLING-MILL. JOSEPH F. SANDBERG, New York, N. Y., assignor of one-third to Carl Israel Qvarnström, Donovan, Ill. Filed Dec. 30, 1878.

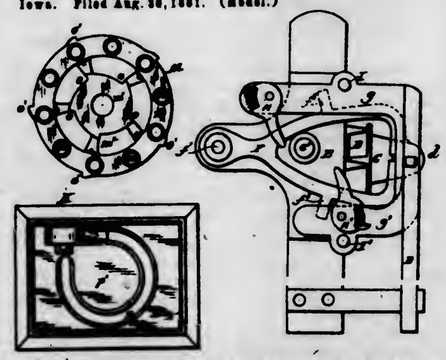


Claim.—1. The combination, with the horizontal rolls B C and vertical rolls D E, of the rock-shaft V'', plate W', lever X', and adjustable curved bar Z', substantially as described, and for the purpose set forth.

2. The combination, with the rolls B C, of the rock-shaft V'', plate W', lever X', adjustable curved bar Z', rolls D E, side cleats, F', and surfaces *f* between the side cleats, substantially as described, and for the purpose set forth.

252,524. ROOFING MATERIAL. L. LEWIS SACHSENMAIER, Cincinnati, Ohio. Filed Nov. 24, 1881. (No specimens.)

Claim.—The improved roofing material hereinbefore described, consisting of a fibrous or textile fabric having its interstices filled under pressure with a liquid compound of metallic and oily substances, substantially such as described, and its adhesive surface coated with dry pulverulent hydraulic cement.



252,525. SHOE-MAKER'S JACK. FRANK SCHIPPER and LUKE DOBBS, Aurora, Ind. Filed Sept. 24, 1881. (No model.)

Claim.—1. In a shoe-maker's jack, the combination, substantially as specified, of a hinged supporting-stand and a jack-supporting head, as E, adapted to receive the last-supporting parts and swiveled to turn in the supporting-stand, with the last-supporting parts fitted to turn in piece E, as set forth.

2. In a shoe-maker's jack, the combination, substantially as hereinbefore set forth, of stationary parts A A' B D and the movable parts C, E, F, G, and H, arranged to operate as specified.

252,526. CORN-PLANTER. LEVI SCOFIELD, Cedar Rapids, Iowa. Filed Aug. 26, 1881. (Model.)

Claim.—1. The seed-plate M, having a large annular top, m, provided with seed-pockets and with lateral notches or projections *o'*, and a smaller dependent hub, m', connected to the top by arms and provided with lateral ratchet-teeth, substantially as described.

2. A seed-plate having a concave center formed by a depressed hub, through which the seed-plate is centered upon a bolt below the horizontal line of its surface, substantially as described.

3. The combination of the seed-plate M and bolt *o'* with the bridge-plate having the central opening, whereby the seed-plate can be inserted and removed simply by dropping its hub through the opening in the bridge-plate or lifting it out of said opening, substantially as described.

4. The swinging lever F, substantially as represented in Fig. 8, having the open center, the front extension, *f*, and the lateral extensions *f'' f'*, or their equivalents, as herein set forth.

5. The plate E, substantially as represented in Fig. 7, having the front extension, *e*, and the vertical pin *e'*, and adapted for application to the cross-bar A, as herein set forth.

6. The combination of a revolving seed-plate having a reduced hub with the bar D, and with a plate, G, rigidly attached to and moving with the bar, and having two arms, *g g'*, two spring-pawls operating in opposite directions against the reduced hub, and two stops to limit the movement of the seed-plate, substantially as described.

7. The combination of the actuating-bar, the swinging lever, the seed-plate with downwardly-projecting hub, and the spring-pawls attached to the actuating-bar and operating on opposite sides of the hub, substantially as described.

8. The combination of the bar D, the plate G, the lever F, and the seed-plate M, substantially as described.

9. The combination of the bar D, the plate G, the lever F, the seed-plate M, and the bridge-plate J, substantially as described.

10. The combination of the bar D, the plate G, the lever F, the seed-plate M, and the supporting-plate E, having the central stud, *o'*, substantially as described.

11. The combination of the bar D, the plate G, the bridge-plate J, the lever F, the seed-plate, and the supporting-plate E, having the central stud, *o'*, substantially as described.

12. A seed-plate having a concave center formed by a depressed hub, through which the seed-plate is centered on a bolt or stud, and having openings through the sides of the concavity for the release of dirt, substantially as described.

13. The combination of the hopper-bottom having a nearly-annular unbridged slot, *p*, terminating at one end over the discharge-opening, as described, with an intermittingly-rotating seed-plate having pockets that move in line with said slot, whereby the grain is fed easily and regularly, and is never interrupted by clogging at any obstructing bridge, substantially as described.

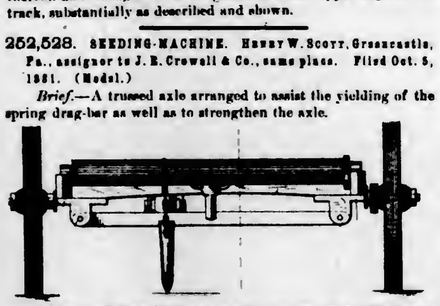
14. In a corn-planter, the combination of an actuating-bar, to which the pawls are attached for rotating the seed-plate, and a swinging lever to guide the bar, substantially as described.

15. The combination of an upper hopper-supporting plate and

a lower lever-supporting plate with the pawl-plate and guide-lever arranged between them, substantially as described.

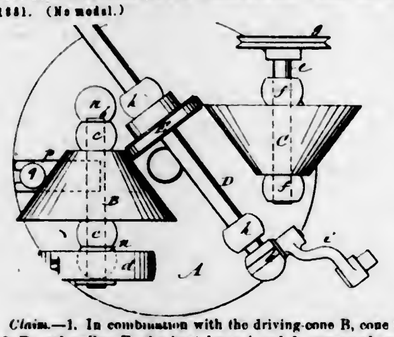
16. The combination of a reciprocating pawl-plate and its guide-lever with the reduced hub of the seed-plate, all said parts operating below the plate which forms the bottom of the seed-pockets, substantially as described.

252,527. DOOR-HANGER. ELIJAH U. SCOVILLE, Menlius, N. Y. Filed Nov. 10, 1881. (No model.)



Claim.—1. The combination, with the hanger A B, cap C, inclosed sheave S, and bolt *a*, of the supplemental plate D, secured to the cap by the bolt *a*, and having journaled on its lower end the roller R, arranged to engage the upper rear edge of the track, substantially as shown.

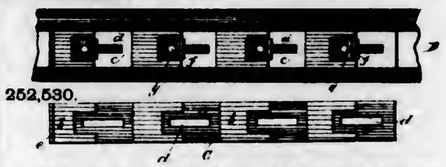
2. In combination with the hanger-strap A, provided with the head B, the sheave S, and bolt *a*, the cap C, provided with the recess *h*, and the supplemental plate D, fitted to said recess, and having the downward-extended shank E, with the roller R, journaled thereon and brought to bear against the rear upper edge of the track, substantially as described and shown.



252,528. SEEDING-MACHINE. HENRY W. SCOTT, Greencastle, Pa., assignor to J. R. Crowell & Co., same place. Filed Oct. 5, 1881. (Model.)

Brief.—A trussed axle arranged to assist the yielding of the spring drag-bar as well as to strengthen the axle.

Claim.—The main frame or axle-bar provided with the suspended truss rod or bar, in combination with the draw-bars and the yielding hoes hinged thereto, arranged and operating substantially as described, whereby the truss-rod is made not only to stiffen said frame or axle-bar, but also to facilitate the passage of the hoes over obstructions, as explained.

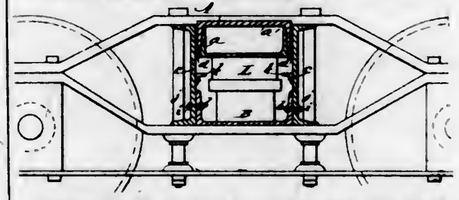


252,529. APPARATUS FOR THE TRANSMISSION OF POWER. JOSE DA SILVA SERTORI, Rio de Janeiro, Brazil. Filed June 23, 1881. (No model.)

Claim.—1. In combination with the driving-cone B, cone C, shaft D, and pulley E, the bent lever *i*, rod *k*, connected to a grooved boss on shaft D, spring *m*, connected to plate A, and treadle-rod *l*, substantially as shown and described, for operation as set forth.

2. In apparatus for transmitting power, the posts *c*, shaft *e*, gudgeons *n*, arm *p*, and screw *q*, combined with the shaft of driving-cone B and intermediate pulley, E, substantially as and for the purposes set forth.

252,530. NUT-LOCK. JOHN A. SIMPSON, Saddler's Creek, assignor to William D. Simpson, Anderson Court-House, S. C. Filed June 17, 1881. (No model.)



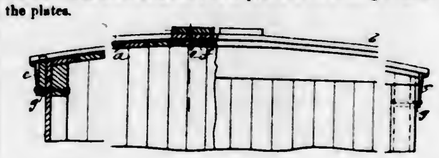
Claim.—1. In a combined fish-bar and nut-locking plate having recesses, nut-embracers, or nut-locking ears, head *c*, and rectangular slot *d*, running lengthwise of the plate, with its sides parallel, straight, and perpendicular to the face of the plate, and adapted to embrace and hold from turning the square shank of a bolt, constructed substantially as shown and described.

2. In a combined fish-bar and nut-locking device, in combination with the rails A and plate B, bolt and nut locking plate C, having head *c*, nut-embracers *b*, recesses *c*, and rectangular slot *d*, running lengthwise the plate, with its sides parallel, straight, and perpendicular to the face of the plate, with bolt *f*, having its shank square from its head to its threads, passing horizontally through plate B and rails A, with its square shank passing half the thickness of plate C into said rectangular slot *d*, and its threaded end extending beyond the face of the said plate to receive nut *g*, and nut *g*, adapted to fit on the threads of said bolt and between nut-embracers *b*, the whole combined, constructed, and arranged to operate substantially as described, and for the purposes set forth.

3. In a nut-locking device, the combination of bolt and nut locking plate C, having head *c*, nut-embracers *b*, recesses *c*, and rectangular slot *d*, running lengthwise the plate, with its sides parallel, cut straight, and perpendicular to the face of the plate, with bolt *f*, having its shank square from its head to its threads, and adapted to pass through the parts it is designed to bind into rectangular slot *d* half the thickness of plate C, and its threaded end extending beyond the face of said plate, and nut *g*, fitting on the threads of said bolt and between nut-embracers *b*, the whole constructed, combined, and arranged to operate substantially as shown and described, and for the purposes set forth.

252,531. CAR-TRUCK. GUSTAVUS B. SIMONDS, Albuquerque, N. Mex. Filed Oct. 31, 1881. (No model.)

Claim.—1. The transoms *c c*, provided with the stops *k k*, in combination with the truck-bolster A, substantially as and for the purposes set forth.



2. The truck-bolster A, formed of the flanged channel-plates *a a'*, the flange of the plate *a* fitting in the flange of the plate *a'*, substantially as shown and described.

3. The combination, with the channel bar or plate B, transverse plates *c*, and the springs L, of the channel-plate *a'*, provided with flanges *d*, substantially as and for the purpose set forth.

4. The transom-plates *c c*, bolted to the bottom channel bar or plate, B, and tied together by the tie-plates E, and provided with the stops *k k*, in combination with the bolster A, formed of the channel-plates *a a'*, substantially as and for the purposes set forth.

252,532. CAR-ROOF. GUSTAVUS B. SIMONDS, Albuquerque, N. Mex. Filed Oct. 21, 1881. (No model.)

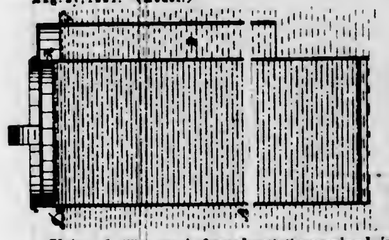
Brief.—The lower ends of the corrugated roof-plates are fastened to a spring-plate running along the side of and fastened to the car. The eaves-boards are scalloped to fit the corrugations in the plates.

Claim.—1. The corrugated plates *b b*, secured to the car at the eaves by the spring plates or flanges *c c*, substantially as and for the purposes set forth.

2. The corrugated plates *b b*, overlapping each other at the side edges, and secured at the ends to the car by means of the spring plates or flanges *c c*, substantially as and for the purposes set forth.

3. The scalloped eaves-boards *g g*, in combination with the corrugated plates *b b* and the spring plates or flanges *c c*, substantially as and for the purposes described.

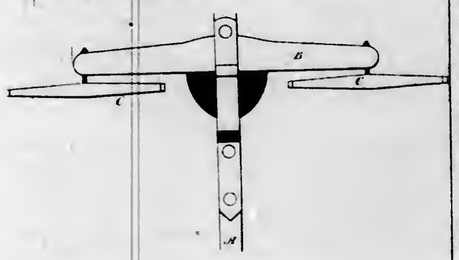
252,533. OPERA-CHAIR. ELDRIDGE J. SMITH, Washington, D. C. Filed June 5, 1880. (No model.)



Claim.—1. The combination, with the back of a chair which is constructed of spring-wire and slats, as described, of the metal bracket U, rigidly attached to the sides, as shown, and holding a wire of the back, whereby the lower portion of back is provided with a spring action, substantially as specified.

2. The combination, with the chair-seat which is constructed of spring-wire and slat fabric, of the support S, concave on its upper surface and adapted to sustain the seat at front and rear only, said seat being bolted to said support only at its front end, as shown, whereby a spring action is secured for the center of the seat, substantially as shown and described.

3. In a chair or settee, the end piece, A, having abutment B and forming the front leg, the wide flat stretcher E, and rear leg, C, secured together by bolts, which pass through both legs and the upper and lower portions of the stretcher, as shown, whereby a multiplicity of rounds and stretchers is obviated, substantially as described.

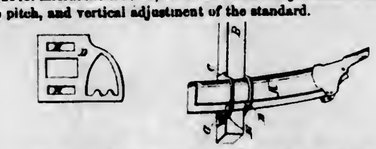


252,534. MILK-COOLER. ELLIS F. SMITH, Polo, Ill. Filed Aug. 27, 1881. (Model.)

Claim.—1. The can A, formed with the opening *h*, in combination with the chamber D, formed with opening *f*, the opening *h* being on a higher level than the opening *f*, substantially as and for the purposes set forth.

2. The can A, formed with the water-line mark *g*, and with the opening *h*, in combination with chamber D, formed with the opening *f*, the opening *h* being above and the opening *f* below the water-line, as and for the purposes specified.

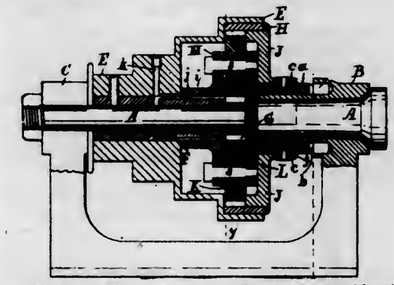
252,535. DOUBLE-TREE. EMANUEL SPEARS, La Fayette, Ind., assignor to Harding, Barbee & Co., same place. Filed Oct. 4, 1881. (No model.)



Claim.—1. The tongue A and double-tree B, pivoted to said tongue, combined with the elastic brace or buffer mounted upon said tongue, and supported in engagement with the double-tree to hold the same in position, as set forth.

2. A double-tree pivoted to the tongue, combined with an elastic brace or buffer in engagement with said double-tree at each side of said pivot, whereby any motion of said double-tree upon said pivot will compress and be resisted by said buffer, for the purpose set forth.

252,536. CULTIVATOR-STANDARD CLAMP. HARLOW C. STAHL, Ballville Township, Sandusky County, Ohio, assignor to the Fremont Cultivator Company, Fremont, Ohio. Filed May 11, 1881. (No model.)



Brief.—A standard-clamp composed of an upper and a lower slotted plate, each having an aperture for the standard and the upper one a set-screw to secure the standard in place. The slots in the plates cross each other at right angles, whereby provision is made for lateral inclination, forward and back adjustment to change the pitch, and vertical adjustment of the standard.

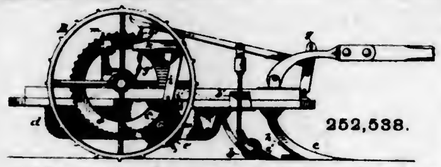
Claim.—1. The cultivator-standard clamp or coupling composed of the sliding plate C, encircling the standard A and provided with the longitudinal slots F F and the set-screw E, the plate D, also having aperture to fit the standard A and having cross-slots H H, the bolts G G, and the beam B, as shown and described.

2. The combination of the plates C and D, slotted and perforated as described, the hollow standard A, the set-screw E, the beam B, and the bolts G G, as and for the purposes set forth.

252,537. SPEED-GEARING. JOHN STEWART, Newark, N. J. Filed Dec. 3, 1881. (No model.)

Claim.—1. The combination, with a shaft, A, fixed bearing B, and gear G, rotated upon the shaft by cone E or its equivalent, of a flange, L, secured to the shaft, and carrying gears K, in connection with gear G, a ring-gear, H, connected with gears K, and suitably mounted to revolve freely upon the shaft, and means for securing the ring-gear to the flange L or bearing B at pleasure, substantially as herein set forth.

2. The construction for the locking device, consisting of the bolts *a* and collar *c*, combined with the hub of the disk J and operating to lock the disk to the fixed bearing B or flange L at pleasure, substantially as set forth.

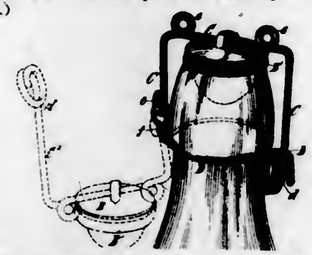


3. The combination, with the bolts *a*, hub *b*, and collar *c*, of the spring *f* and grooves *s s*, arranged and operated substantially as described.

4. The combination, with the flange L and studs *s s*, carrying the intermediate gears, K, of the brace M, arranged to revolve on the sleeve F, substantially as and for the purpose set forth.

5. In combination with the shaft A, cone E, and sleeve F, the speed-gearing, constructed substantially as described, and provided with the brace M and oil-channels *j k*, for distributing oil to the internal gearing, substantially in the manner set forth.

252,538. POTATO-DIGGER. HIRAM STRAIT, Troy, N. Y. Filed June 9, 1881. (Model.)



Claim.—1. In a potato-digger, the combination, with frame A, supported upon wheels B and casters *b*, of the forward share, *c*, having a central standard and T-shaped extension, *h*, arranged

with its points above the extremities of said share, and rear share, c', made scoop-shaped for elevating the broken soil, and provided with rearwardly-inclined teeth c^2, substantially as shown and described.

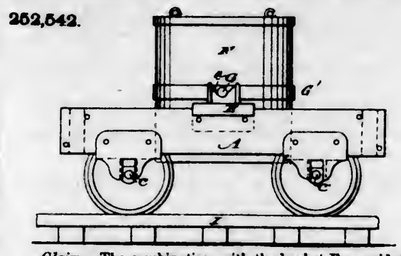
2. In a potato-digger, the combination of frame A, fingered cylinder c, having disks c', rearwardly-diverging side boards, d, wheels B, cog-wheels c^3, pinions c^4, uprights i i, perforated plates i' i', toggle-jointed levers k k, cross-bar l, having loops l', and tapering uprights m m, substantially as shown and described.

252,539. BOTTLE-STOPPER AND FASTENING THEREFOR. GEORGE B. STUART, Philadelphia, Pa. Filed May 5, 1881. (No model.)

Claim.—1. The combination of the stopper B B', the yoke C, having the eye e and coiled end forming the shoulder d, and the neck-wire D, having the twist f, and a catch, with which said shoulder d may be engaged, substantially as and for the purpose specified.

2. The combination of the stopper B B', the yoke C, having the eye e and coiled end forming the shoulder d, and also having one or more coils, e, in its upper part, and the neck-wire D, having the twist f, and a catch, with which said shoulder d may be engaged, substantially as and for the purpose specified.

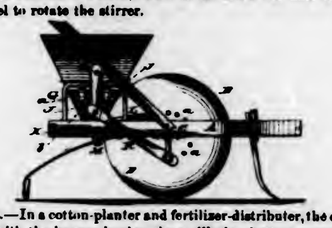
252,540. PUTTING UP BLANKETS. DAVID A. SWARNY, Pittsburg, Pa., assignor to himself and North West, same place. Filed Nov. 30, 1881. (No model.)



Claim.—The herein-described method of putting up blankets and similar articles, consisting of enveloping them in a casing of paper of strong texture, closely sealed or pasted, substantially as and for the purposes specified.

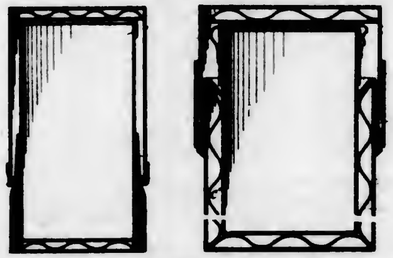
252,541. DOOR-SPRING. ALFRED E. TANNER, New Haven, Conn., assignor to Sargent & Co., same place. Filed Oct. 31, 1881. (Model.)

Claim.—The combination of the spiral spring, made fast at one end, with the spindle D, fixed at its opposite end and supported by a bracket, the said spindle constructed with the polygonal and cylindrical portions e f, and the locking-plate A, arranged to take its bearings upon the bracket and over the said polygonal or cylindrical parts of the spindle, substantially as and for the purpose described.



252,542. COMBINED HOISTING-BUCKET AND DUMP-CAR. JOHN F. TAYLOR, Sharon Springs, N. Y. Filed June 4, 1881. (No model.)

Claim.—The combination, with the bucket F, provided with the trunnions G, of the trunnion-beds E, having V-shaped tracks a, and secured upon the upper edge of the car-frame A, substantially as and for the purpose set forth.



252,543. COTTON-PLANTER. HERBERT C. TILLERY, Fort Deposit, Ala. Filed Sept. 29, 1881. (Model.)

Brief.—A vibrating bottom in two sections; adjustable device to regulate the vibration, and a crank from the axle of the main wheel to rotate the stirrer.

Claim.—In a cotton-planter and fertilizer-distributer, the combination, with the hopper having the oscillating bottom composed of the sections a and b, placed one above the other, and suspended from the hopper by the curved straps J J, of the perforated plate M, suspended from the bottom of the hopper, the lever L, slotted vertically at d, and perforated laterally at e and pivoted on the rod K, the spring N and the toothed wheel B, substantially as specified.

252,544. PACKING-BOX FOR FRUIT-JARS, &c. NELSON F TIPTON, Colony, Kans. Filed Nov. 28, 1881. (No model.)

Claim.—1. The combination of a box having a strengthening-jacket provided with a sloping upper portion, with a cover whose head is of a diameter approximately that of the exterior of the jacket, and whose rim at its lower edge fits tightly the sloping portion of the jacket, the box and cover forming a chamber between them, above the slope of the jacket, substantially as and for the purpose described.

2. The combination of a box formed with a sloping jacket solidly formed thereon, and having its upper edge provided with a rubber band encircling and projecting above it, with a cover approximately of the diameter of the jacket, and having a rubber band encircling and projecting under the edge, and within the interior of its rim, the cover and the jacketed box being united at two packed joints, substantially as and for the purpose described.

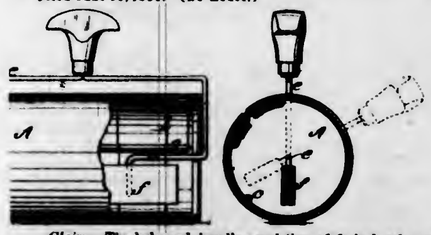
252,545. ELECTRIC RAILWAY-SIGNAL. CHARLES D. TIBBALS, Boston, Mass., assignor to the American Railway Signal Company, Portland, Me. Filed Aug. 29, 1881. (No model.)

Brief.—Two electro-magnets, one for operating the signal and the other for retaining it when set.

Claim.—1. The signal and main electro-magnet and its armature to control it, and a normally-closed main circuit, the armature

of the said magnet being arranged, as described, to be retained in either position up to the poles of the said magnet, or retracted therefrom while the said magnet is magnetized, in combination with a circuit-breaker in the said main circuit, whereby the main magnet may be demagnetized and its armature retracted, and an auxiliary magnet and circuit therefor, to govern the return movement of the armature from its retracted position up to the poles of the main magnet, substantially as described.

2. The signal and its controlling main electro-magnet and armature, arranged, as described, to remain in either position assumed while acted upon by the said magnet alone, and a normally-closed main circuit for said magnet, and an auxiliary electro-magnet in a normally-open branch of the said main circuit, adapted, when magnetized, to attract the said armature up to the poles of the main magnet, combined with a momentarily-operated circuit-breaker and closer in the said main and branch circuits, respectively, adapted to be operated by a train while passing them, and located at proper points, the former to break the main circuit and permit the retraction of the armature and the latter to close the auxiliary or branch circuit and cause the movement of the armature to the poles of its main magnet, substantially as and for the purpose described.

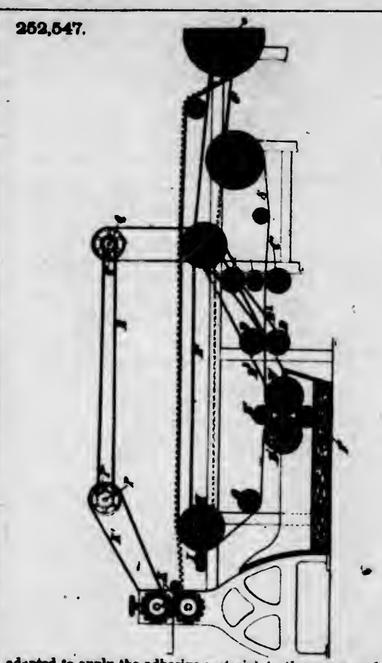


3. The signal and main magnet and its armature and retractor to control it, as described, the said magnet being in a normally-closed circuit, provided with a breaker adapted to remain closed except while positively opened by a train in passing, combined with an auxiliary magnet and circuit therefor, provided with a circuit-controller adapted for momentary action, the said auxiliary magnet being adapted to govern the movement of the armature from its retracted position up to the poles of the main magnet, substantially as set forth.

4. The signal and main magnet, its armature, and normally-closed circuit to control it, as described, combined with the auxiliary magnet in a normally-open branch of the main circuit and an auxiliary battery in the said branch, the effect of which is thus confined wholly to the said auxiliary magnet, and the circuit-controllers in the said main and branch circuits, substantially as described.

5. The signal and its controlling main and auxiliary magnets and circuits therefor, combined with an electric switch to open the said main circuit, it being adapted in its return movement, by which it closes the said circuit, to also operate the auxiliary circuit and magnet, substantially as and for the purpose described.

6. The herein-described circuit-breaker, consisting of a lever and anvil therefor, and spring by which the said lever is normally held in contact with its anvil, the said circuit-closer being mounted upon a sleeper or foundation chambered to permit an independent downward movement of the rail, and the end of the lever extended under the rail and operated thereby, substantially as described.



252,546. BLOTTER. THOMAS G. TOWNSEND, New York, N. Y. Filed June 16, 1881. (No model.)

Claim.—The balanced handle consisting of forked rod e and weight f, combined with the hollow blotting-roller A, substantially as and for the purposes set forth.

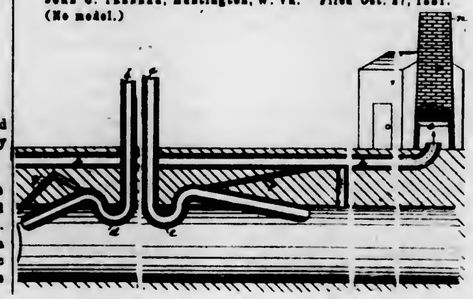
252,547. MACHINERY FOR MANUFACTURING PACKING AND LINING FABRICS. ROBT. H. THOMPSON, Brooklyn, N. Y. Filed Oct. 24, 1881. (No model.) Patented in England Mar. 10, 1881.

Claim.—1. The combination, with rollers between which a sheet or strip of paper forming the base of a packing or lining fabric is passed, of a tank containing adhesive material, rollers therein

adapted to apply the adhesive material to the paper, and a brush rotating in contact with the last said rollers for supplying the adhesive material to them, substantially as specified.

2. The combination, with a strip of paper for forming the base of a packing or lining fabric, rollers for passing it along, and means for applying adhesive material to it, of rollers for corrugating another sheet of paper or like material, means for moving this corrugated sheet along and into contact with the sheet of paper for forming the base of the fabric, so as to cause it to be secured thereto, and mechanism for driving the rollers, whereby the sheet of paper for forming the base of the fabric is moved along, and for driving the means whereby the corrugated sheet is moved along, capable of operating so as to vary the relative speeds of the two sheets, substantially as specified.

3. The combination, with the rollers D' G H and the corrugating-rolls K, of the cone-pulleys P' Q', and the frame B', screws B^2, and hanger B^3, substantially as specified.

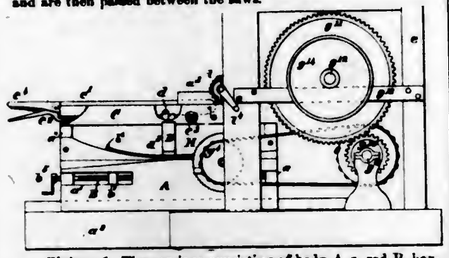


4. The combination, with the corrugating-rolls K, of the stationary pipes L L', substantially as specified.

5. The combination, with the corrugating-rolls K, of the stationary pipes L L' and sleeve L^2, substantially as specified.

6. The combination, with the corrugating-rolls K, the roller H, and the roller O, of the rollers D, substantially as specified.

7. The combination, with the corrugating-rolls K, the roller H, and the roller O, of the rollers D and the slipping belt O', substantially as specified.



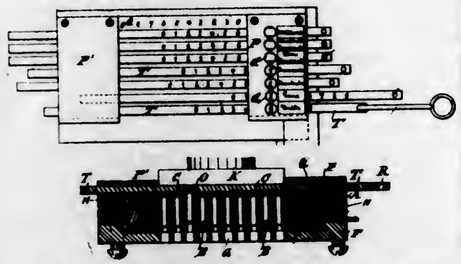
252,548. MODE OF VENTILATING SEWERS AND TRAPS. JOHN G. TRENHAM, Huntington, W. Va. Filed Oct. 27, 1881. (No model.)

Claim.—The combination, with a sewer provided with the waste-pipe *c*, opening into the sewer, and having a trap, *e*, of the air-pipe *h*, opening into a chimney, *n*, below its furnace *o*, and pipes *h p*, connecting the air-pipe *h* and sewer, whereby the sewer-gas is consumed, substantially as described.

252,549. STAVE-JOINTING MACHINE. CONSTANTINE T. TUBBS, Dauphine, Mo. Filed Nov. 8, 1881. (No model.)

Brief.—The staves are clamped in a frame, which bends them, and are then passed between the saws.

Claim.—1. The carriage consisting of body A *a*, rod B, having right and left screw-threads, blocks *b b'*, beam C, lever *c'*, and reciprocating bar D, as set forth.



2. The lever *c'* and reciprocating bar D, secured to the lever by links *d d*, and provided with block d^3, in combination with a carriage, substantially as described.

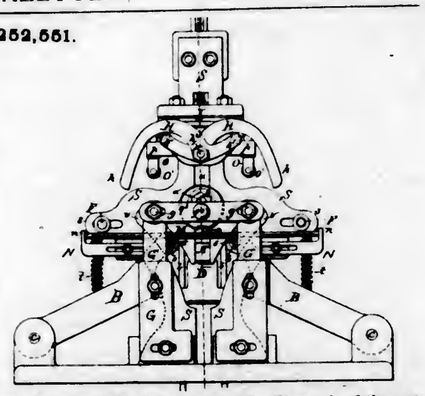
3. The combination of saw-tables G G, hangers K K, sliding in the said tables, hinged arms J J, and adjustable sash-beam I, as set forth.

4. The combination, with the hangers K K and hinged tables G G, of the shaft M, having right and left screw-threads, bevel-gear wheels m' n, vertical shaft N, bevel-gear wheel n^2, shiftable bevel-gear wheel n^3, shaft f^3, and lever O, as set forth.

5. The combination of sash-beam having downwardly-extending racks and adjustable in the grooved front guide-posts, shaft mounted on said posts and provided with spur-wheels engaging with said racks and ratchet-wheels, pawls engaging with the ratchet-wheels to lock the shaft and the sash-beam to its adjustment, hinged tables carrying saws, and hangers depending from the sash-beam and sliding in the tables, as set forth.

252,550. MACHINE FOR PERFORATING CHECKS AND DRAFTS. SIGMUND ULLMAN, New York, N. Y. Filed June 17, 1881. (No model.)

Claim.—1. In a machine for perforating checks and drafts, the combination, with the perforated die-plate F, of the punch-plate A, the punch-pins B, and the sliding bars T, with a notch, O, in the under side, substantially as herein shown and described, and for the purpose set forth.



2. In a machine for perforating checks and drafts, the combination, with the perforated die-plate F, of the punch-plate A, the punch-pins B, the slide-bars T, with a notch, O, in the under side, and of the plate P, provided with apertures Q, substantially as herein shown and described, and for the purpose set forth.

252,551. MACHINE FOR BENDING RAILS. SAMUEL VANSTON, Providence, R. I. Filed Oct. 17, 1881. (No model.)

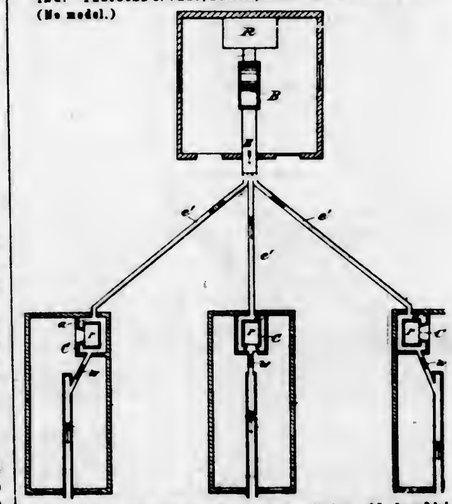
Claim.—1. The combination, with the pivoted levers B B and the levers H H, of a reciprocating follower provided with the former A, the bolts *g g*, and bearings F F, constructed to operate as and for the purpose set forth.

2. The combination, with the pivoted levers B B, provided

252,551.

with the rollers *b b* and the reciprocating former A, of the rests C C, constructed to be removed when the former has descended part of its stroke, and thus allow the free ends of the levers to bend the bail over the former, as described.

3. The combination, with the levers B B and H H and the reciprocating former, of the spring-pressed bolts *g g*, as described.

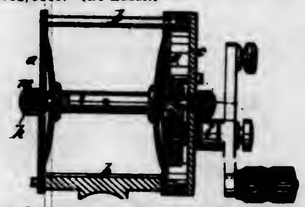


4. The combination, with the reciprocating former A, secured to a sliding head, and means for forcing the former on the blank, of the hinged lever B B, the supports C C, and means for detaching the same, the rests F F, bolts *g g*, and levers H H, the whole constructed to bend a bail at one operation, as described.

252,552. STOCKING. EUGENE VERMILYEA and CHARLES E. MORRIS, Millbury, assignors of one-half to Jonathan Luther, Worcester, Mass. Filed Oct. 26, 1878.

Claim.—As an improved article of manufacture, a stocking re-enforced at the heel by the straight inlaid layers of thread B', arranged between the loops which form the ribs of the stocking, substantially as described.

252,553. METHOD OF AND APPARATUS FOR REFRIGERATING. THEODORE S. VERY, Boston, Mass. Filed Jan. 19, 1881. (No model.)



Claim.—1. The improved method of utilizing cold air, which consists in forcing it first around or into a refrigerating-chamber

to preserve articles of food, and then into a drain or sewer to purify the same and prevent back action of gas.

2. The combination of a refrigerating apparatus, E, an air-forcing apparatus, B, a trunk, E, branch pipes *d'*, refrigerators C, and escape-pipes, all constructed and arranged to operate substantially as specified.

3. The combination of a refrigerating machine or apparatus, a series of refrigerating-chambers connected with said machine by pipes or conduits, and pipes leading from said refrigerating-chambers to drains or sewers, and air-forcing apparatus to force cold air from the refrigerating machine or apparatus first to the refrigerating-chambers and then into the drains or sewers, substantially as and for the purpose set forth.

252,554. FISHING-REEL. JULIUS VON HOPF, Brooklyn, E. D., assignor to himself and Charles F. Imbrie, New York, N. Y. Filed Nov. 12, 1881. (No model.)

Claim.—1. In a fishing-reel, the combination, with the frame *a b*, the cap *c*, and the axis *i*, having conical recesses in its ends, of the pivot-screws *h*, having conical ends, and the caps *m*, screwed upon the said pivot-screws, substantially as and for the purpose set forth.

2. In a fishing-reel, the combination, with the plates *a a*, and the arbor *c*, having beveled portion *k'*, of the sleeve *k*, having its outer end beveled, and the outer sleeve, *l*, substantially as and for the purpose set forth.

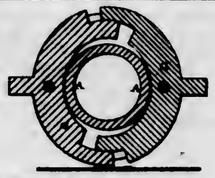
252,555. DISINFECTING COMPOUND. DWIGHT WARREN, Winsted, Conn., assignor to himself and William H. Taylor, same place. Filed July 23, 1881. (No specimens.)

Brief.—Takes sulphate of alumina, two and one-half parts, by weight; permanganate of potash, one part, and of bichromate of potash, one-fourth part. The first two, in the form of crystals, are mixed with the latter, finely powdered. In using the mixture is dissolved and mixed with the material to be disinfected.

Claim.—The herein-described disinfecting compound, consisting of sulphate of alumina, permanganate of potash, and bichromate of potash, in the proportions specified.

252,556. WATER-CLOSET DISINFECTING DEVICE. DWIGHT WARREN, Winsted, Conn., assignor to himself and William H. Taylor, same place. Filed July 23, 1881. (No model.)

Claim.—1. A disinfector for water-closets, urinals, &c., consisting of a tube having one or more apertures in its closed lower end, and containing a dissolvable disinfectant, and a cup containing a vaporizable disinfectant in the upper end of the said tube, substantially as shown and described.

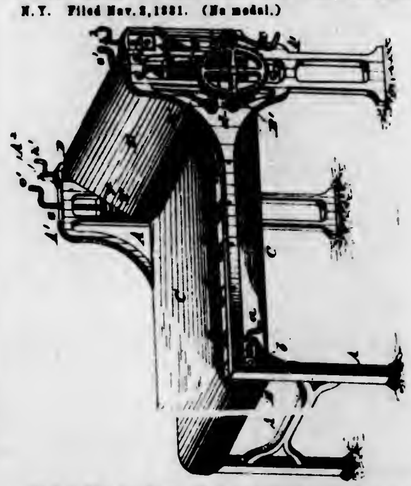


2. In a device for containing a disinfectant for water-closets, urinals, &c., the combination, with the tube A, of the cup-shaped vessel D and the perforated cap F, substantially as herein shown and described, and for the purpose set forth.

3. In a device for containing a disinfectant for water-closets, urinals, &c., the combination, with the tube A, of the shoulder or collar C, the wire loop J, and the double hook L K, substantially as herein shown and described, and for the purpose set forth.

252,557. MILLSTONE-DRIVER. LEWIS P. WEAVER, Jr., New Harmony, Ind. Filed July 2, 1881. (No model.)

Claim.—The combination of the L-shaped ring or band A, provided with the dowel-pins B, the top plate, C, the pivotal bolts D, and the driver G, made in two parts and having their ends bear against each other, so that the slightest movement of one part will react upon the other, substantially as described.



252,557.

252,558. DISTEMPER-PAINT. WILLIAM S. WELCH and LITTLETON F. WELCH, Westfield, N. J. Filed Jan. 5, 1881. (No specimens.)

Claim.—The composition of matter to be used as a calcimine, consisting of a watery mixture of paris-white or other pigment, a size, and a solution in water of nitrate of soda, chlorate of potash, and boric acid, substantially as described.

252,559. MACHINE FOR EXTRACTING GREASE FROM SKINS. EDWIN V. WHITAKER and JAMES HULL, Gloversville, N. Y. Filed Nov. 3, 1881. (No model.)

Claim.—The herein-described machine for removing grease and animal oils from skins while in the process of dressing, composed of the frame A, having slotted standards A' and A^2, and a series of rollers, *c c*, rollers B B', mounted in said frame and carrying the endless apron C, rollers D' and D, mounted respectively in the standards A' and A^2, and carrying the oblique endless apron E, pressure-springs F, and screws *b*, *c*, and *h*, for adjusting rollers B, D', and D, respectively, all constructed and combined to operate substantially in the manner and for the purpose herein shown and set forth.

252,560. TOY PISTOL. HENRY H. WHITCOMB, Bridgeport, Conn. Filed Nov. 10, 1881. (No model.)

Brief.—When the hammer falls the figure is tripped, and is drawn into the barrel by the spring to which is connected.

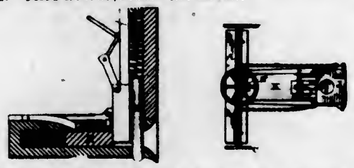
Claim.—1. In a toy pistol, the combination, with the barrel E, provided with the projection *k*, of the figure G, the spring *g*, and the pin *f*, substantially as and for the purpose set forth.

2. In a toy pistol, the combination, with the barrel E, provided with the slot *h* and the projection *k*, of the figure G, provided with the appendage *n*, the spring *g*, and the pin *f*, substantially as and for the purpose set forth.

3. In a toy pistol, the combination, with the hammer A, the sleeve *d*, and the spring-pressed pin *f*, of the slotted barrel E, provided with the projection *k*, the figure G, provided with the appendage *a*, and the spring *g*, substantially as and for the purpose set forth.

4. In a toy pistol, the combination, with the barrel E, provided with the slot *k*, the figure G, provided with the appendage *a*, and the spring *g*, of the trigger C, provided with the projection *c* on its forward part, substantially as and for the purpose set forth.

252,561. HARVESTER. WILLIAM H. WHITELEY, Springfield, Ohio. Filed Sept. 16, 1880. (No model.)

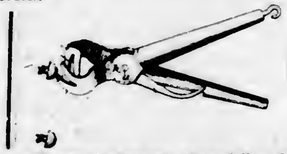


Claim.—1. The frame composed of the parts D E, the former rigidly and the latter movably attached to the harvester-frame B C, combined with a cross-bar, N, and interposed spring, as set forth, and for the purpose specified.

2. An endless apron for a harvester, and supporting-rollers for the same located at the ends of the apron-frame, combined with an automatic yielding mechanism to vary the distance between said rollers, all placed between said rollers and covered and concealed by the said apron, as set forth.

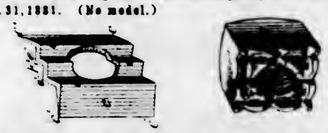
3. The frame composed of parts D and E, the former rigidly and the latter movably fixed in the harvester-frame B C, combined with the cross-bar L on the movable frame, and the rigid cross-bar N, and the interposed spring, substantially as set forth.

252,562. CAR-COUPLING. LAFAYETTE WILKINSON, Selpio, Ind. Filed Nov. 26, 1881. (No model.)



Claim.—1. The combination of one or more operating-shafts which are connected to the end of the car, suitable connecting-chains, a cranked rod, and a spring-actuated coupling-pin, the chains being wound upon the operating-shaft in opposite directions and connected to opposite ends of the cranked rod, substantially as shown.

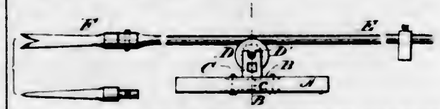
2. The guide which is secured upon the top of the draw-head, and which is slotted on its rear side so as to allow the pin to project through, a spring placed inside of the guide and bearing upon the top of the pin, and a coupling-pin having a shoulder formed on its rear edge, in combination with a spring-supporting block and a sliding spring-block which actuates the supporting-block, substantially as described.



3. The combination of one or more shafts secured to the end of the car, with the two connecting-chains which are made to wind in opposite directions upon the horizontal shaft, and which have their outer ends connected to a cranked rod which operates the spring-actuated coupling-pin, substantially as set forth.

252,563. IMPLEMENT FOR PUTTING BUTTONS ON SHOES. ALEXANDER G. WILKINS, Cooperstown, Pa. Filed July 23, 1881. (No model.)

Claim.—The combination-tool, substantially as described, consisting of the pivoted jaws having bifurcated griping-openings *d e*, arranged at right angle to each other, the pivoted awl provided with a stop, *a*, and the telescopic button-hook adapted to slide in and out of the hollow handle portion, for the purpose set forth.



252,564. NUT-LOCK. JOHN H. WILLIAMS, Pittsburg, assignor to himself and Hugh McDonald, Allegheny City, Pa. Filed Oct. 31, 1881. (No model.)

Claim.—1. The combination of bolt C, nut D, having parallel grooves *a* in and extending across its face, and the corrugated spring-washer E, having its ridges or corrugations extending parallel across the washer in one direction, and adapted in form and relationship to register with the grooves in the nut, substantially as set forth.

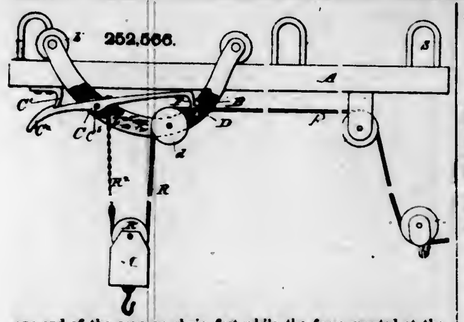
2. As a device for locking nuts on bolts, the corrugated spring-washer E, having sharp beveled edges *e e*, such edges extending beyond the plane of the ridges of the intermediate corrugations on the same side, as described, in combination with nut D, having parallel grooves *a* in its face adapted to receive the ridges of the washer, substantially as set forth.

252,565. COAL-EXCAVATOR. HENRY WILHELM, St. Charles, Ky. Filed June 23, 1881. (No model.)

Claim.—1. In a coal-excavator, the combination, with the rod and pick E F, of the swiveled block C and the supported grooved wheel D, substantially as herein shown and described, whereby said rod and pick are supported and easily operated to excavate long and deep trenches in any direction, as set forth.

2. In a coal-excavator, the combination, with the pick-rod E and pick F, supported on the fulcrum-wheel D, of the counter-balance H, substantially as and for the purposes described.

3. In a coal-excavator, the combination, with the bed-plate A, provided with face-plates B, of the trunnion-bed or pillow-block C, provided with a spindle, *c*, substantially as herein shown, and for the purpose described.



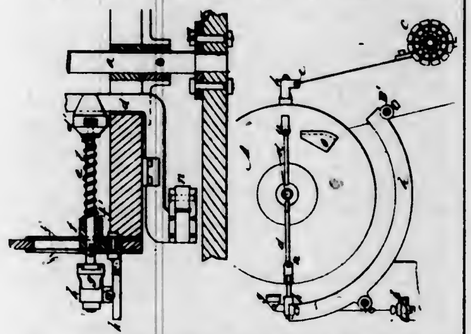
4. In a coal-excavator, the combination, with the swiveled pillow-block C, of the grooved wheel D, substantially as herein shown and described.

5. In a coal-excavator, the combination, with the rod and pick, of a vertically and horizontally revolving support, substantially as herein shown and described, whereby any desired direction may be given to the pick, as set forth.

252,566. HAY ELEVATOR AND CONVEYER. SIDNEY E. WILSON, Perry, Ill. Filed Oct. 31, 1881. (No model.)

Claim.—1. The frame B, consisting of the two equal curved bars provided with rollers *b* and *b'*, adapted to travel on beam A, and also provided with sheave *d* and rest D, adapted to assist in elevating a load of hay and holding it up after being elevated, substantially as described.

2. The combination of lever C, fulcrumed on axle C^3 in the frame B, and having its outer end, C^4, notched on the upper side for catch C', and having the other end bent downward and formed into fork F, with the chain or rope R, attached to the said lever C at the proper point between its fulcrum and fork, adapted to hold

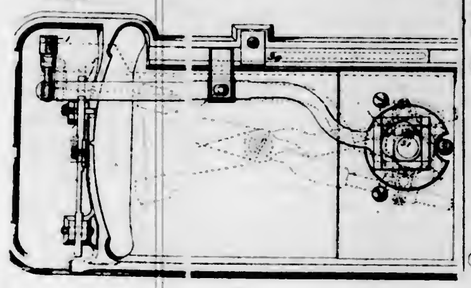


252,566.

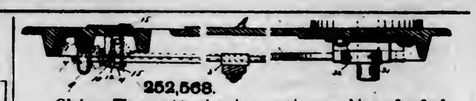
one end of the rope or chain fast while the force exerted at the other end raises the load, and then to hold the load, with the aid of rest D, to its elevation until it is conveyed away horizontally, substantially as described.

3. The combination of lever C, working on fulcrum C^3 in frame B, and having notched end C^4 and fork F, with sheave *d* and rest D, arranged and co-operating substantially as and for the purpose described.

252,567. CLOTH-MEASURING MACHINE. ALBERT WINTER, Plainfield, N. J. Filed Oct. 13, 1881. (No model.)



Claim.—1. In a cloth-measuring machine, the combination, with a drum, of radially-sliding clamps, and means, substantially as shown and described, for operating the said clamps, as set forth.

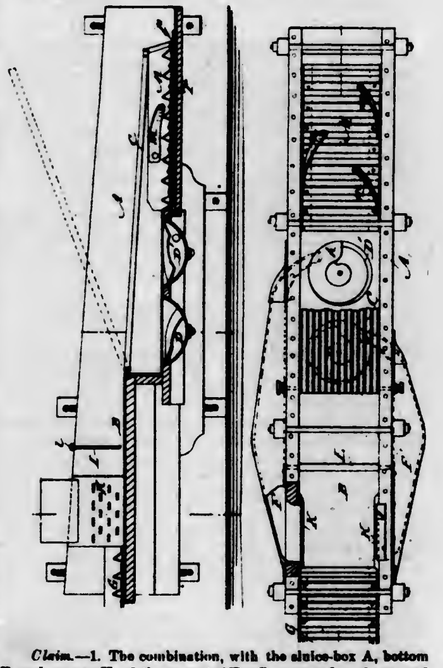


2. The combination, with measuring-drum A, of the rods *e*, carrying clamps *g*, and fitted for radial movement to clamp the cloth, substantially as shown and described.

3. The combination, with measuring-drum A, of the slide-rods *e*, clamps *g*, springs *l*, bent bars *d*, and cams *o*, substantially as shown and described, for operation as set forth.

4. The combination, with measuring-drum A, of the swiveling slide-rods *e*, torsion-springs *l*, clamps *g*, plates *k*, bent bars *d*, and cams *o*, substantially as shown and described, for operation as set forth.

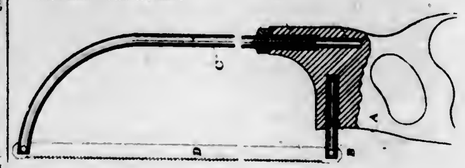
252,568. FEEDING MECHANISM FOR SEWING-MACHINES. CHAS. H. WOOD, Springfield, Mass. Filed Nov. 14, 1881. (No model.)



252,568.

Claim.—The combination, in a sewing-machine, of a feed-lever actuated by a cam and adapted to have a longitudinal and a lateral movement, a link pivoted at one end to the bed of the machine and at the other to said feed-lever, and a feed-bar carrying the feed and movably jointed to said lever, whereby, by the combined longitudinal and lateral movements of the feed-lever and the movement of the said link pivoted thereto, the feed is forced to make all its movements both vertically and horizontally, substantially as described.

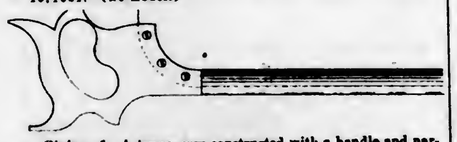
252,569. ORE-WASHER. WILLIAM E. WOOD, Denver, Colo., assignor to the Colorado Gold Having Sluice Box Company, same place. Filed Apr. 23, 1881. (Model.)



Claim.—1. The combination, with the sluice-box A, bottom B, and screens K, of the nugget-riffles G, arranged as shown and described, for the purpose specified.

2. The combination, with the sluice-box A, of the flood-gate I, having bearings *l* in the upper edge of the sides of the said sluice-box, and of sufficient weight to impede the flow of water in the flume, substantially as and for the purpose set forth.

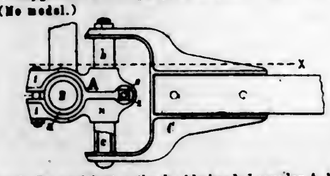
3. The combination, with the sluice-box A and the amalgamated plate P, of the riffles M, arranged in the discharge end of the said sluice-box over the amalgamated plate, so that the top edges will be on a level with the top of the pans, and provided with the mold-board-shaped plates or wings *m*, secured to its sides, substantially as and for the purpose set forth.



252,570. HANDSAW. JAC. R. WOODBURGH, Cincinnati, Ohio, assignor to Woodrough & McFarlin, same place. Filed Oct. 18, 1881. (No model.)

Claim.—1. In a handsaw, the combination, substantially as before set forth, of the handle, the heel-clip secured thereto, the adjustable back provided with a tightening-nut, and the blade secured with its respective ends to the heel-clip and the end of the adjustable back.

2. The combination, substantially as before set forth, of the handle A, the clip B, the barbed shank of which is driven into the handle, the saw-blade D, and the back C.

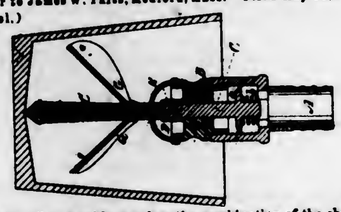


252,571. BACK-SAW. JAS. R. WOODSOMEN, Cincinnati, Ohio, assignor to Woodrough & McParlin, same place. Filed Oct. 18, 1881. (No model.)

Claim.—1. A tenon-saw constructed with a handle and narrow stiffening-back made of a single piece, the grooved edge of the stiffening-back meeting the grooved edge of the handle in a curve, substantially as before set forth.

2. The combination, substantially as before set forth, of the integral handle and narrow stiffening-back, the blade-retaining edges of which meet in a curve and have a continuous groove of uniform depth, and the saw-blade, the back and handle end of which meet in a corresponding curve to fit said groove.

252,572. CULTIVATOR. WILLIAM B. YOUNG, Alton, Ill., assignor to Hapgood Plow Company, same place. Filed Nov. 7, 1881. (No model.)

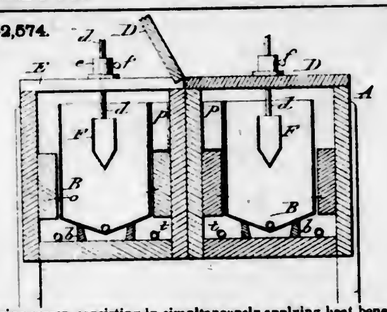


Claim.—1. In a cultivator, the double-headed coupler A, having two open-ring clasps in a cross direction to each other, made solid one piece, with mouthed ends and perforated lips, substantially as and for the purpose set forth.

2. In a cultivator, the double-headed coupler A, having two open-ring clasps in a cross direction to each other, made solid in one piece, with mouthed ends and perforated lips, and held in place by clamping-bolts with nuts, in combination with the thimble *a* and thimble *b*, substantially as and for the purpose set forth.

3. In a cultivator, the combination of the double-headed coupler A, having two open-ring clasps in a cross direction to each other, made solid in one piece, with mouthed ends and perforated lips, with compression-bolts and with thimble *a*, thimble *b*, axle-arm B, yoke C, having the arms *g g*, and with bolt *c*, substantially as and for the purpose set forth.

252,573. TUMBLER-WASHER. WALLACE H. BATE, Boston, assignor to James W. Tufts, Medford, Mass. Filed May 11, 1881. (Model.)



Claim.—In a tumbler-washer, the combination of the shell or body B, having a discharge orifice or orifices, a valve-spindle, C, working vertically through the shell of the valve and serving as a support upon which the tumbler revolves, and a revolving distributer, G, adapted to intercept the water issuing from the discharge orifice or orifices and deflect it against the interior surface of the tumbler, substantially as and for the purpose described.

252,574. DAIRY-VAT. DAVID H. BURRELL, Little Falls, N. Y. Filed Aug. 29, 1881. (No model.)

Claim.—1. The herein-described method of treating milk for

252,574.

raising cream, consisting in simultaneously applying heat beneath the milk-vessel and cold at the top of the contents of said vessel, whereby the cream or butter globules brought to the bottom of the vessel by the currents thus created therein are caused to expand and rapidly rise to the surface, substantially as specified.

2. In a milk-cooling apparatus, the combination, with a milk-vessel, of an open-top trough or conduit, suspended in substantially the upper half of the volume of milk contained in the vat, substantially as and for the purpose set forth.

3. In a milk-cooling apparatus, the combination, with a milk-vessel, of an open vertically-elongated trough or conduit extending longitudinally from end to end of the milk-vessel, and suspended therein with the top of the trough below the top of the milk-vat, substantially as shown and described.

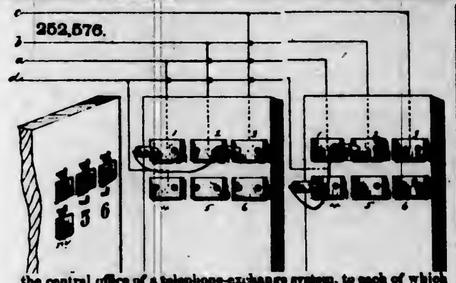
4. In a milk-setting apparatus, the combination of an outer vat, a milk-vessel arranged therein, an open-top trough suspended in said vessel, and a cover placed over the outer vat, substantially as and for the purpose described.

5. In a milk-setting apparatus, the combination, with the outer vat, A, having covers D, and perforated cross-pieces E, provided with caps *e*, of the milk-pans B, and the troughs or conduits F, provided with rods or tubes *d d*, said troughs being suspended within the milk-vessels and vertically adjustable therein by means of the engagement of the rods or tubes *d* with the caps *e* and thumb-screws *f*, substantially as shown and described.

6. In a milk-setting apparatus, the combination, with the covered vat A and open milk-pan B, placed therein, of the open-top trough or conduit F, suspended longitudinally within the milk-vessel, and the open-top troughs or ice-receptacle *p p*, arranged longitudinally on each side of said vessel at its upper part, substantially as and for the purpose described.

7. In a creamery or milk-cooling apparatus, the combination, with the outer vat, A, and milk-vessel B, of the suspended trough or conduit F, arranged within the milk-vessel, open-top troughs or ice-receptacles *p p*, resting in contact with the upper part of the milk-vessel, steam-pipes *t t*, arranged in the open space beneath the milk-vessel, and cover D, adapted to close the outer vat, substantially as shown and described.

252,575. CUTTING APPARATUS FOR HARVESTERS. EDWIN P. CURTIS, Worcester, Mass., assignor to the Richardson Manufacturing Company, same place. Filed Aug. 29, 1881. (No model.)

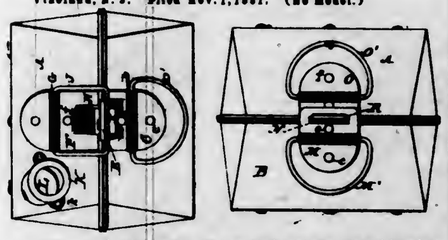


Claim.—1. A chafe-piece for harvester-cutters, consisting of a perforated or slotted plate having an upward-turned lip, flange, or wearing end, said piece being fitted or attached to the forward part of the finger-bar between adjacent fingers, substantially as shown, and for the purpose set forth.

2. The combination of independently-detachable chafe-pieces F, provided each with a bearing end or lip, F', formed of hardened steel, with the finger-bar A, the fingers B, and the scythe C in a harvesting-machine, said chafe-pieces being arranged on the finger-bar between fingers with their ends F' in position to form bearings for the scythe in rear of the rod and beneath the overhanging cutter-sections, substantially as herein shown and described.

252,576. MULTIPLE SWITCH-BOARD FOR TELEPHONE-EXCHANGES. LEROY B. FIRMAN, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Filed Jan. 7, 1881. (No model.)

Claim.—1. The combination of two or more switch-boards at

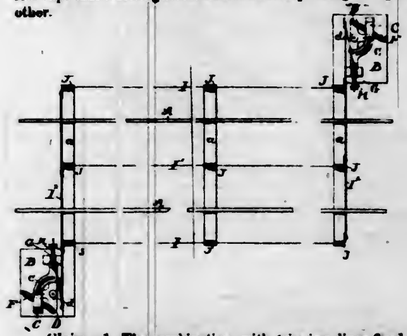


252,576.

the central office of a telephone-exchange system, to each of which the same telephone-lines are connected, whereby any two of these lines may be connected together upon either of the multiple switch-boards.

2. The combination of two or more multiple boards to which the lines of the terminal stations are connected, and means, as described, whereby the switchman may readily ascertain what lines are in use.

252,577. HEAT-ROASTER. THEODORE A. SANDERS, South Vineland, N. J. Filed Nov. 1, 1881. (No model.)



Claim.—1. The casting C, provided with the slotted bracket E, in combination with the casting F, provided with the lug I and clasp J, substantially as shown and described.

2. The combination of the pan A, provided with the castings O and F, the former having the hook R and the latter the lug I, and the pan B, having the castings M and C, the former provided with the slot N and the latter provided with the slotted bracket I, with means, substantially as shown and described, for locking the lug in the bracket, as and for the purpose described.

252,578. RAILWAY ALARM-SIGNAL. THOMAS H. GIBBON, Adamsville, N. Y., assignor of one-fourth to Archibald F. Law, Trustee, Marshall, Tex. Filed Oct. 6, 1881. (No model.)

Brief.—Falling rock or the like in tunnels or cuts is signaled to an approaching train through wires along the line connected with catches of spring signal-levers, which are rotated to display danger-signals at each end of a tunnel or cut when any of the wires are disturbed. The signal-shafts are so connected by an endless rope that resetting either causes a corresponding change in the other.

Claim.—1. The combination, with tripping-lines fixed adjacent to and running in line with a railway-track, arranged, substantially as described, for receiving the shock or pressure produced by the deposition of débris on said track, of spring-actuated signal-targets consisting essentially of a lever, D, carrying the target E, the spring F, and a spring-latch, G, the latter being connected to the tripping-lines, as described, and all adapted to operate as herein specified.

2. The combination, in a spring-actuated signal-target, with the lever D, provided with a target, E, and actuated by a spring, F, substantially as described, of a spring-latch, G, adapted to engage with the lever D to retain the signal-target in its closed position, as herein specified.

3. The combination, with the target-levers D of two spring-actuated signal-targets distantly located from each other, of the endless line K, attached to both levers D, as herein described, for the purpose of producing a simultaneous movement of both of said levers by the movement of either of them, as herein specified.

252,579. RECIPROCATING ENGINE. LAUCHLIN B. GRUBB, Washington, D. C., assignor to O. F. Keys, Marcus Greer, and Chauncey F. Greer, all of same place. Filed June 3, 1881. (No model.)

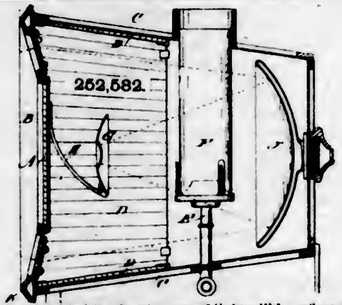
Claim.—1. In an engine, the combination, with a cylinder provided with ports for the induction and eduction of steam, of an oscillating piston having a shaft at one end provided with an exhaust-port across its top, both shaft and piston being provided with ports for the inlet of steam through the shaft and its exit on the face of the piston at or near its lower end, whereby, as the piston oscillates, the several parts are adapted to operate as set forth.

2. The cylinder A, provided with induction and eduction ports, in combination with an oscillating piston having induction-ports and an exhaust-port, and a disk, *m*, having an opening through it and an adjustable connection with the rod by which it is operated, by means whereof the size of the steam-induction port in the cylinder is regulated, substantially as and for the purpose set forth.

3. A piston for an oscillating engine, composed of a shaft and a piston-head with induction-ports through the shaft and head and an exhaust-port across the top of the shaft, substantially as set forth.

252,580. STEAM-RADIATOR. THOMAS P. HARDY, New York, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—A metallic radiating-tube formed in one piece and provided with three longitudinal depressions, *a b b*, which commence near the open foot and terminate within a short distance from the closed top thereof, leaving two channels, *g g*, a steam-chamber, *c*, at the top, and three chambers, *d e f*, extending from the upper steam-chamber down to the open foot, the chambers *e* and *f* communicating with the chamber *d* by the channels *g g*, substantially in the manner and for the purpose set forth.

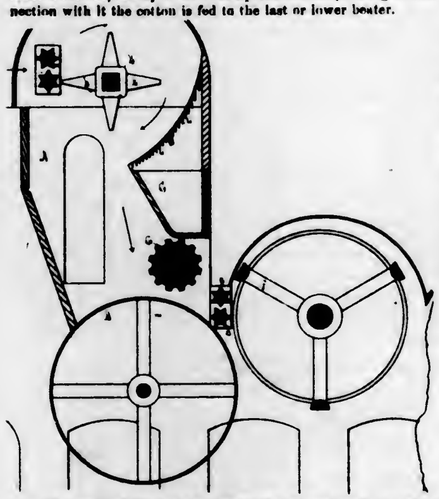


252,581. ESCAPEMENT FOR MOTORS. HOSMER H. HOSMER, Atlantic, assignor, by direct and mesne assignments, of one-half to John T. Hanna, Cass County, Iowa. Filed July 23, 1881. (No model.)

Claim.—In combination with a train of gear-wheels, the wheels F G, provided with the pins *p p*, and the pendulum-bar I, having its upper end recessed, substantially in the manner set forth, whereby an escapement is provided, for the purpose specified.

252,582. ILLUMINATED MIRROR. PETER LOTH and JULES STUDIO, New York, N. Y.; said Studio assignor to Thomas Miller, same place. Filed July 5, 1881. (No model.)

Claim.—1. An illuminated mirror constructed substantially as herein shown and described, and consisting of a mirror surrounded by a frame of ground glass, and having a lamp or burner



and reflector behind it, whereby rays of light will be reflected upon the face of the person looking into the mirror, as set forth.

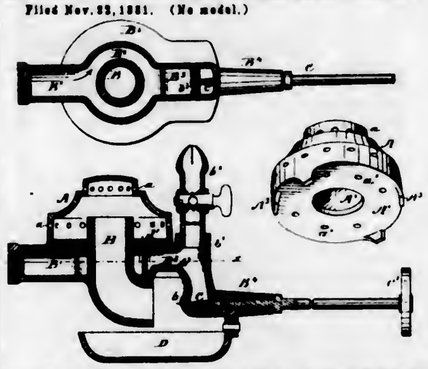
2. In an illuminated mirror, the combination, with the mirror A, surrounded by a frame, B, of ground glass, of the lamp or burner E, the reflectors I and J, and a supporting-frame, substantially as herein shown and described, and for the purpose set forth.

3. In an illuminated mirror, the combination, with the box C, provided with flat reflectors D, of the mirror A, surrounded by a ground-glass frame, B, the reflector G, fastened to the inner surface of the mirror A, the reflector J, fastened to the rear of the box C, and a lamp or burner, substantially as herein shown and described, and for the purpose set forth.

252,583. COTTON-OPENER. RICHARD KITSON, Lowell, Mass. Filed May 21, 1880. (No model.)

Brief.—A dead-air chamber having a grated inclined top is provided in the gage-box just underneath the beater first operating upon the cotton. The sand, leaf, and other foreign matter which may be loosened by the action of the fingers of the before-mentioned beater fall through the top of and into the dead-air chamber. The cotton then falls upon the rotating screen in the bottom of the gage-box, through which the lighter particles of leaf and dirt, loosened therefrom, is drawn by an exhaust. The wire cylinder is rotated, and by it and a compression-roll operating in connection with it the cotton is fed to the last or lower beater.

Claim.—1. The combination of the gage-box A, grasping-rolls *a*, breaker-shaft B, provided with the fingers *b b*, and the dead-air-chamber C, having a grated inclined top, substantially as described.



2. The combination, with mechanism for opening the cotton, of gage-box A, provided with the dead-air chamber C, having the grated top upon which the cotton acted upon by said opening mechanism falls, the rolls *e e*, and beater *f*, substantially as described.

3. The combination of gage-box A, gauze cylinder D, feed-rolls *e e*, and beater *f*, substantially as described.

4. The combination of the grasping-rolls *a a*, breaker-shaft B, provided with the fingers *b*, gage-box A, with the rolls *e e*, and gauze cylinder D, substantially as described.

5. The combination of the grasping-rolls *a*, breaker-shaft B, provided with the fingers *b*, gage-box A, provided with the dead-air-chamber C, cylinder D, feed-rolls *e e*, and beater *f*, substantially as described.

252,584. VAPOR-BURNER. MICHAEL MAHONY, Troy, N. Y. Filed Nov. 23, 1881. (No model.)

Claim.—1. The combination of a burner constructed in one piece, and consisting of the cap A and the flat bottom A', provided with openings *a'*, with a vaporizing-chamber provided with a central tube having its lower end carved to one side, an annular horizontal passage, B^2, having its whole top in contact with the flat bottom of the burner, and a flange or shelf, B^3, surrounding said chamber, substantially as and for the purpose described.

2. The combination of the cap A, having the bottom A' cast therewith, and provided with openings *a'*, with a vaporizing-chamber provided with a central tube, B, having its lower end carved to one side, an annular horizontal passage, B^2, a bridge, b^2, elevated above the floor of the passage B^2, and a shelf, B^3, surrounding said chamber, substantially as and for the purpose described.

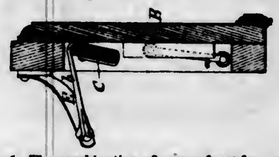
3. The combination of a burner provided with a bottom, A', made with openings *a'*, with a vaporizing-chamber having a horizontal annular passage, a shelf, B^3, surrounding said chamber, a controllable vapor-escape opening, *b*, under said chamber, and a controllable opening, *b'*, above the same, substantially as and for the purpose described.

4. The combination of a vaporizing-chamber having a central vertical pipe made with its lower end carved to one side, and a horizontal induction and eduction pipe, with a vapor-burner formed of a cap and bottom cast in one piece, said bottom having perforations *a'* and pendent lugs, substantially as and for the purpose described.

252,585. PLOW. FRANZ NITSCHMANN, Platonia, Tex., assignor to Franklin P. Walters and Charles A. Arnim, same place. Filed June 18, 1881. (No model.)

Claim.—The combination, with the adjustable standard-iron A and the handles, of the transverse bar G, clamp or hook bolt H, and the pivoted adjustable brace I, connected to the farrow-bar of said iron, substantially as specified.

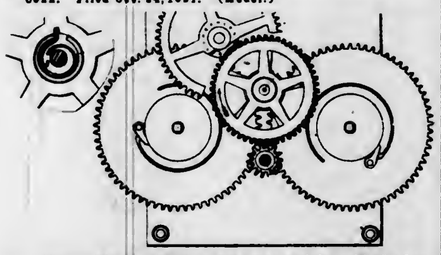
252,586. HAY-RAKE. MARLOVE BUTLER, Vernon, assignor to Pleasant C. McShannon, North Vernon, Ind. Filed Nov. 30, 1881. (Model.)



Claim.—1. In a controlling-lever for hay-rakes, the combination, with the end sections and their slide-joint connection, of the brace-section and the automatic catch, substantially as specified.

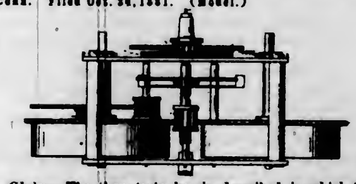
2. In a controlling-lever for hay-rakes, the combination, with the shouldered clamp-section F and its clamp-band C, of the handle G, its slide-joint cheek-plates *m*, the pivoted brace-section H, and the catch K, substantially as specified.

3. A controlling-lever for hay-rakes, having its handle and clamp sections connected by slide-joint plates, to which a brace-section having an oblique end and carrying one end of the clamping-band is pivoted, substantially as specified.



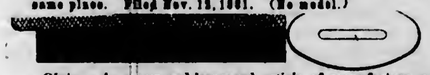
252,587. MUSIC-RACK FOR MUSICAL INSTRUMENTS. WILLIAM H. IVERS, Dedham, Mass., assignor to the Ivers & Pond Piano Company, of Massachusetts. Filed Oct. 20, 1881. (No model.)

Claim.—1. The combination of a case-front for a musical instrument with the rack B and links and a rocking bar connecting said rack to the case-front, said bar being pivoted to the rack at a point between the links and the upper edge of said rack, and serving to retain the rack immovable when the latter is in position for use, substantially as set forth.



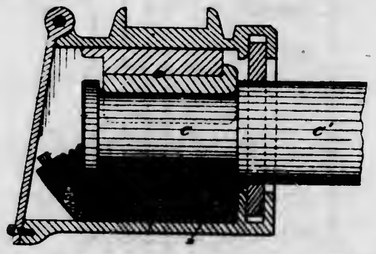
2. The combination, with the music-rack, of the case-front, links *a*, and rocking bar C, a spring secured to the back of the case-front, and cord or chain *b*, all operating substantially as set forth.

252,588. CLOCK-MOVEMENT. BENJAMIN B. LEWIS, Bristol, Conn. Filed Oct. 24, 1881. (Model.)



Claim.—The combination of the center pinion with the double wheel and spring for acting upon one part of said wheel, substantially as described, and for the purpose specified.

252,589. CLOCK-MOVEMENT. BENJAMIN B. LEWIS, Bristol, Conn. Filed Oct. 24, 1881. (Model.)

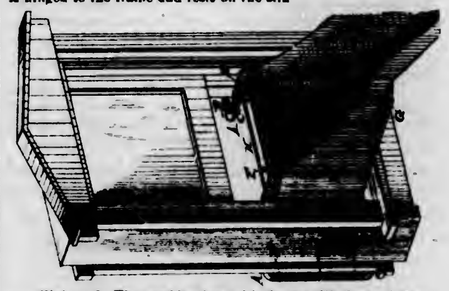


Claim.—The time-train herein described, in which the two driving-wheels mesh into and are connected by the intermediate pinion mounted on the shaft which drives the dial-wheels, while one of said driving-wheels meshes into the next pinion in and drives the remainder of the train, substantially as described, and for the purpose specified.

252,590. ILLUMINATING-CANDLE. RICHARD F. W. LOPER, Philadelphia, Pa., assignor to himself and Charles McKeone, same place. Filed Nov. 12, 1881. (No model.)

Claim.—As a new and improved article of manufacture, an illuminating-candle composed of a flat wick or core and a flattened or elliptical body molded or cast about the said flat wick, substantially as and for the purpose described.

252,591. CAR-AXLE BOX. JOHN C. RICHARDSON, Union City, Pa., assignor to Jennie R. Cooper, same place. Filed Oct. 26, 1881. (No model.)



Claim.—1. In a car-axle-lubricating device, a portable feed-box having a top provided with an oblong opening, for the purpose set forth, a packing or absorbent material held in place by the over-hanging ledges of the top, and a supply-spout located outside the sides of the box, for the purpose described.

2. A lubricator for railway or other car journals, provided with a sponge or other porous material, in combination with a portable box, E, having hinged barbed points *i* and *i'*, and a spout or tube, G, for the purposes as herein described and shown.

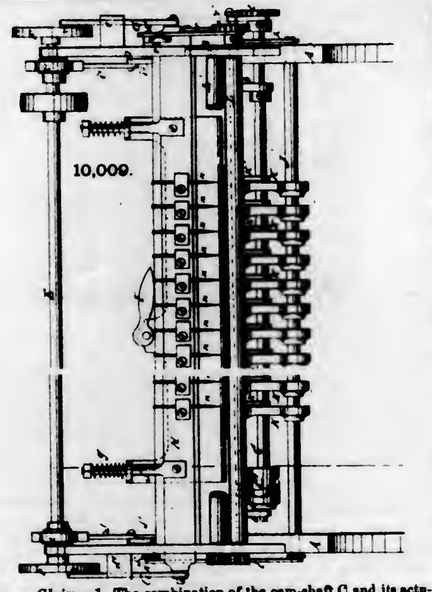
3. In a lubricator, a portable box or reservoir having barbed points attached at suitable places upon the inner surface for holding its feeding device in place, substantially as described.

252,592. FIRE-ESCAPE. BENJAMIN TAYLOR, Terre Haute, Ind., assignor of one-half to George A. Hartung, same place. Filed Aug. 10, 1881. (No model.)

Brief.—A flexible chute or tube is secured to a metal frame, which is fastened to the inside of the window-casing. A platform is hinged to the frame and rests on the sill.

Claim.—1. The combination, with the metallic frame A, having knees C C and spikes F, of the flexible tube E, substantially as herein described, for the purpose set forth.

2. As an improvement in fire-escapes, the combination, with the metallic frame A, having hinged platform G and guide-ropes H, of the flexible tube E, substantially as and for the purpose set forth.



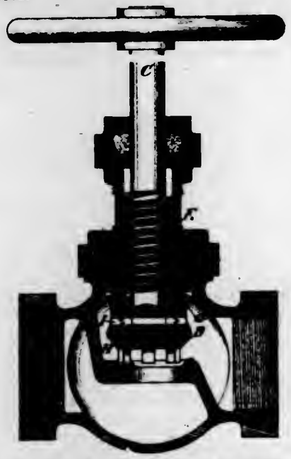
252,593. PROCESS OF EXTRACTING COPPER AND SILVER FROM THEIR ORES. JULIUS DERY, London, County of Middlesex, England. Filed Oct. 5, 1881. (No model.)

Claim.—1. The process of extracting copper and silver from their ores, which consists in lixiviating the ore with a solution of ferric sulphate and regenerating the resulting waste ferrous liquors by means of the concerted and combined action of chlorine and sulphurous-acid gases, for reuse, all in the manner and for the purposes substantially as described.

2. The process of converting ferrous sulphate to ferric sulphate, which consists in subjecting the solution of ferrous sulphate to the combined action of chlorine and sulphurous-acid gases, substantially as described.

REISSUES.

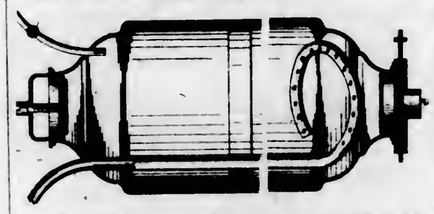
10,009. QUILTING-MACHINE. JOHN HAPPE and WILHELMINE NEWMAN, New York, N. Y.; said Newman assignor to said Happe. Filed Feb. 5, 1881. Original No. 138,716, dated Aug. 20, 1873.



Claim.—1. The combination of the cam-shaft C and its actuating mechanism, the rock-shaft J and its actuating mechanism, and the shuttle-carriers K on said rock-shaft, provided with slots, whereby they are adapted to straddle the cam-shaft, substantially as described.

2. The presser-foot having a series of holes, and its actuating mechanism, consisting of springs *g*, rod *f*, and cam-lever I, in combination with shuttle-carriers K, shuttle-races K', eccentric *i*, oscillating shaft J, rock-shaft *k*, rod *l*, crank *m*, and with the carriage-reciprocating mechanism, and with geared feed-rolls and the mechanism actuating them, substantially as described.

3. The cam *c* upon the shaft C, operating the needle-carriage through the pin *d*, in combination with the shuttle-carriers K, needles *a*, presser-foot H, rock-shaft J, and the gear mechanism for actuating the feed, all arranged substantially as described.



10,010. GLOBE-VALVE. FREDERICK LUKENHEIMER, Cincinnati, Ohio. Filed Oct. 6, 1881. Original No. 166,893, dated Aug. 3, 1875.

Claim.—1. In a regrinding globe-valve, a valve having a swiveled connection with the end of a valve-stem, both the valve and the stem being provided with a transverse smooth passage or hole for the insertion of a smooth frangible pin to temporarily lock the valve and stem immovably together, said pin being capable of fracture by the forcible closing of the valve after the latter has been reground, all substantially as and for the purpose described.

2. The combination of the collared stem C H, nut G, and valve D, all perforated, as described, for the insertion of the pin J through each one of said elements, substantially as described.

10,011. MANUFACTURE OF CREAM OF TARTAR. EDWARD MULLER, New York, N. Y., assignor, by mesne assignments, to the New York Tartar Company. Filed Dec. 24, 1881. Original No. 223,593, dated Dec. 16, 1879.

Claim.—1. The process of manufacturing cream of tartar from argols, which consists in exposing the argols in the presence of water alone, in about the proportions specified, to the action of steam under pressure of about sixty pounds to the inch, the steam being injected into the water, causing it to boil, and being permitted to escape from the converting-vessel, and finally separating the cream of tartar after crystallization, substantially as described.

2. The improvement in the art of treating argols to obtain a solution of the same, which consists in subjecting the argols while being dissolved to the pressure of steam admitted into a closed vessel near the bottom and allowing the escape of the same, substantially as described.

10,012. LOCK. WARNER H. TAYLOR, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Aug. 23, 1881. Original No. 179,899, dated Feb. 1, 1876; Reissue No. 8,379, dated Aug. 30, 1878.

Claim.—1. In a lock, a series of two or more pivoted vibrating tumblers, no two of which are opposite, and which are arranged to be operated successfully by a flat or plate key bitted alike on both edges and inserted either edge up through the series, substantially as herein described.

2. A flat or plate key bitted alike on both edges and provided with indentations or notches opposite each other, one on either edge, in combination with a series of pivoted oscillating tumblers, and a slotted retaining flange or ring to interlock with the indentations or notches and prevent the withdrawal of the key from the lock except when said key is vertical, and to assist in holding said key longitudinally while it is moving the tumblers to lock or unlock the lock, substantially as herein described.

3. In a lock constructed for a flat or plate key, a vibrating talon-lever, its inner curved edge being the intermediate talon for the key-bit and its outer or free end fitted into the bolt-talon and actuating the bolt, substantially as described.

4. The combination of a bolt carrying a stump or fence with a series of two or more tumblers which are pivoted upon a common center, but no two of which are opposite, the free end of said tumblers being broader than the greatest distance through which the tumblers are moved by the key, so that gatings may be made in said tumblers, into which the stump or fence of the lock may pass when the lock is unlocked.

5. In a lock, a passage or key way through which a flat or plate key may be inserted, and in entering which the key is first passed through a rotating key-guide, next through a slotted retaining-flange, and lastly through a series of vibrating tumblers, the longitudinal movement of the key being finally arrested by a stop placed in the rear of the vibrating and superimposed series of tumblers, substantially as herein described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

EDWARD MILLER & COMPANY *v.* THE BRIDGEPORT BRASS COMPANY.

Decided January 9, 1882.

1. AMBROSE'S REISSUE—LAMPS—NEW MATTER.

The invention specified in the second claim of the reissued patent (which is the one in question here) is not the same invention which was described and claimed in the original patent. The latter was for a double dome without a chimney, the peculiarity of the supposed invention being the use of the double dome as a means of dispensing with the chimney. It is not only obviously a different thing, but it is the very thing which the patentee professed to avoid and dispense with.

2. BROADENING THE CLAIM—ACTUAL MISTAKE—LACHES.

Dictum, also, that where the only mistake suggested is that the claim of the original patent is not so broad as it might have been, the mistake, if it was a mistake, was apparent upon the first inspection of the patent, and if any correction was desired it should have been applied for immediately, and the right to have it corrected was abandoned and lost by unreasonable delay.

3. SAME—SAME—MAY ENLARGE CLAIM—DEDICATION TO PUBLIC.

Dictum, also, that if a patentee who has no corrections to suggest in his specification, except to make his claim broader and more comprehensive, uses due diligence in returning to the Patent Office and shows how such mistake occurred, his application may be entertained; but it must be remembered that the claim of a specific device or combination and an omission to claim other devices and combinations apparent upon the face of the patent are in law a dedication to the public of that which is not claimed, and the legal effect of the patent cannot be revoked unless the patentee surrenders it and proves that the specification was so framed by real inadvertence, accident, or mistake, without any fraudulent or deceptive intention, and this should be done with all due diligence and speed.

4. PURPOSE OF REISSUE LAW—NOT FOR ENLARGING CLAIMS SPECIALLY.

Dictum, also, that it was not the special purpose of the legislation upon reissues to authorize the surrender of patents for the purpose of reissuing them with broader and more comprehensive claims, although under the general terms of the law such a reissue may be made when it clearly appears that an actual mistake has inadvertently been made, not from a mere error of judgment, but a real *bona fide* mistake, such as a court of chancery in cases within its ordinary jurisdiction would correct.

5. COMPARISON OF THE INSTRUMENTS—COURTS HAVE JURISDICTION OF QUESTION OF MISTAKE.

Dictum, also, that when the matter is apparent on the face of the instrument upon a mere comparison of the original patent with the reissue, it is competent for the courts to decide whether the delay was unreasonable and whether the reissue was therefore contrary to law and void.

APPEAL from the Circuit Court of the United States for the District of Connecticut.

Mr. J. S. Beach for the appellant.

Mr. C. R. Ingersoll for the appellee.

Mr. Justice BRADLEY delivered the opinion of the Court.

This is a suit brought to restrain the infringement of a patent and for an account of profits, &c. The patent was for an alleged improvement in lamps, and was originally granted to Joshua E. Ambrose, October 16, 1860, for fourteen years, and was extended for seven years longer. It was twice surrendered and reissued, once in May, 1873, and again in January, 1876. The court below dismissed the bill on the ground that the second reissue, on which the suit was brought, was not for the same invention which was described and claimed in the original patent.

We agree with the circuit court in the conclusion to which it came. The original patent described a combination of devices; among other things, two domes or reflectors, one above the other, elevated above a perforated cap, through which a wick-tube and a vapor-tube ascended. It was claimed that this combination of devices, especially including the two domes, which admitted the external air between them for producing a more perfect combustion, would make a lamp which, without a chimney and without danger of explosion, would burn those hydrocarbons which are volatile and contain an excess of carbon. The invention proved a failure, but it was found that the use of one of the domes, (and the other parts,) with the restoration of the chimney, would be a real improvement, and both plaintiff and defendant made such lamps in large quantities. Fifteen years after the original patent was granted the patentee, or rather his assignee, discovers that the improved lamp was really a part of his original invention, and that by inadvertence and mistake he had omitted to claim it. We think, however, that the court below was clearly right in holding that the invention specified in the second claim of the reissued patent, which is the one in question here, is not the same invention which was described and claimed in the original patent. The latter was for a double dome without a chimney, the peculiarity of the supposed invention being the use of the double dome as a means of dispensing with the chimney. The reissue is for a single dome with a chimney. It is not only obviously a different thing, but it is the very thing which the patentee professed to avoid and dispense with.

But there is another grave objection to the validity of the reissued patent in this case. It is manifest on the face of the patent when compared with the original that the suggestion of inadvertence and mistake in the specification was a mere pretense, or, if not a pretense, the mistake was so obvious as to be instantly discerni-

ble on opening the letters patent, and the right to have it corrected was abandoned and lost by unreasonable delay. The only mistake suggested is that the claim was not as broad as it might have been. This mistake, if it were a mistake, was apparent upon the first inspection of the patent, and if any correction were desired it should have been applied for immediately.

These afterthonghts, developed by the subsequent course of improvement and intended by an expansion of claims to sweep into one net all the appliances necessary to monopolize a profitable manufacture, are obnoxious to grave animadversion. The pretense in this case that there was an inadvertence and oversight which had escaped the notice of the patentee for fifteen years is too bald for human credence. He simply appealed from the judgment of the Office in 1860 to its judgment in 1876; from the Commissioner and Examiners of that date to the Commissioner and Examiners of this, and upon a matter that was obvious on the first inspection of the patent. If a patentee who has no corrections to suggest in his specification except to make his claim broader and more comprehensive uses due diligence in returning to the Patent Office and says "I omitted this," or "my solicitor did not understand that," his application may be entertained, and on a proper showing correction may be made; but it must be remembered that the claim of a specific device or combination and an omission to claim other devices or combinations apparent on the face of the patent are in law a dedication to the public of that which is not claimed. It is a declaration that that which is not claimed is either not the patentee's invention, or if his, he dedicates it to the public. This legal effect of the patent cannot be revoked unless the patentee surrenders it and proves that the specification was framed by real inadvertence, accident, or mistake, without any fraudulent or deceptive intention on his part, and this should be done with all due diligence and speed. Any unnecessary laches or delay in a matter thus apparent on the record affects the right to alter or reissue the patent for such cause. If two years public enjoyment of an invention with the consent and allowance of the inventor is evidence of abandonment and a bar to an application for a patent, a public disclaimer in the patent itself should be construed equally favorable to the public. Nothing but a clear mistake or inadvertence and a speedy application for its correction is admissible when it is sought merely to enlarge the claim.

The power given by the law to issue a new patent upon the surrender of the original for the correction of errors and mistakes has been greatly misunderstood and abused. It was first contained in the act of July 3, 1832, and the law was adopted in view of suggestions made in several judgments of this Court; but it was carefully confined to cases where the patent was invalid or inoperative by reason of a failure to comply with any of the terms and conditions prescribed by the law for giving a clear and exact description of the invention, and where such failure was due to inadvertence, accident, or mistake, without any fraudulent or deceptive intention. This being shown, a new patent with a correct specification was authorized to be issued for the same invention. The act of 1836 enlarged the power to grant reissues by adding an additional ground for reissue—namely, that the patentee had inadvertently claimed in his specification as his own invention more than he had a right to claim as new—and with that addition the law has continued substantially the same to the present time. The fifty-third section of the act of 1870, which was the law on this subject when the reissue in the present case was granted, was in the following words:

> Whenever any patent is inoper tive or invalid by reason of a defective or insufficient specification, or by reason of the patentee claiming as his own invention or discovery more than he had a right to claim as new, if the error has arisen by inadvertence, accident, or mistake, and without any fraudulent or deceptive intention, the Commissioner shall, on the surrender of such patent and the payment of the duty required by law, cause a new patent for the same invention and in accordance with the corrected specification to be issued to the patentee.

It will be observed that while the law authorizes a reissue when the patentee has claimed too much, so as to enable him to contract his claim, it does not, in terms, authorize a reissue to enable him to expand his claim. The great object of the law of reissues seems to have been to enable a patentee to make the description of his invention more clear, plain, and specific, so as to comply with the requirements of the law in that behalf, which were very comprehensive and exacting. The act of 1793, section 3, required an applicant for a patent—

> To deliver a written description of his invention and of the manner of using or process of compounding the same in such full, clear, and exact terms as to distinguish the same from all other things before known, and to enable any person skilled in the art or science of which it is a branch or with which it is most nearly connected to make, compound, and use the same. And in the case of any machine, he shall fully explain the principle and the several modes in which he has contemplated the application of that principle or character by which it may be distinguished from other inventions; and he shall accompany the whole with drawings and written references, where the nature of the case admits of drawings.

This careful and elaborate requirement was substantially repeated in the patent act of July 4, 1836, (section 6,) with this addition:

> And shall particularly specify and point out the part, improvement, or combination which he claims as his own invention or discovery.

Although it had been customary to append a claim to most specifications, this was the first statutory requirement on the subject. It was introduced into the law several years subsequent to the creation of reissues; and it was in the thirteenth section of this act of 1836 that provision was made for a reissue to correct a claim which was too broad in the original. Now, in view of the fact that a reissue was authorized for the correction of mistakes in the specification before a formal claim was required to be made, and of the further fact that when such formal claim was required, express power was given to grant a reissue for the purpose of making a claim more narrow than it was in the original, without any mention of a reissue for the purpose of making a claim broader than it was in the original, it is natural to conclude that the reissue of a patent for the latter purpose was not in the mind of Congress when it passed the laws in question. It was probably supposed that the patentee would never err in claiming too little. Those who have any experience in business at the Patent Office know the fact that the constant struggle between the Office and applicants for patents has reference to the claim. The patentee seeks the broadest claim he can get. The Office, in behalf of the public, is obliged to resist this constant pressure. At all events, we think it clear that it was not the special purpose of the legislation on this subject to authorize the surrender of patents for the purpose of reissuing them with broader and more comprehensive claims, although, under the general terms of the law, such a reissue may be made

where it clearly appears that an actual mistake has inadvertently been made. But by a curious misapplication of the law it has come to be principally resorted to for the purpose of enlarging and expanding patent claims; and the evils which have grown from the practice have assumed large proportions. Patents have been so expanded and idealized years after their first issue that hundreds and thousands of mechanics and manufacturers, who had just reason to suppose that the field of action was open, have been obliged to discontinue their employments or to pay an enormous tax for continuing them.

Now, while, as before stated, we do not deny that a claim may be enlarged in a reissued patent, we are of opinion that this can only be done when an actual mistake has occured, not from a mere error of judgment, (for that may be rectified by appeal,) but a real *bona fide* mistake, inadvertently committed, such as a court of chancery, in cases within its ordinary jurisdiction, would correct. Reissues for the enlargement of claims should be the exception and not the rule; and when, if a claim is too narrow—that is, if it does not contain all that the patentee is entitled to—the defect is apparent on the face of the patent and can be discovered as soon as that document is taken out of its envelope and opened, there can be no valid excuse for delay in asking to have it corrected. Every independent inventor, every mechanic, every citizen, is affected by such delay, and by the issue of a new patent with a broader and more comprehensive claim. The granting of a reissue for such a purpose after an unreasonable delay is clearly an abuse of the power to grant reissues, and may justly be declared illegal and void. It will not do for the patentee to wait until other inventors have produced new forms of improvement, and then, with the new light thus acquired, under pretense of inadvertence and mistake, apply for such an enlargement of his claim as to make it embrace these new forms. Such a process of expansion, carried on indefinitely, without regard to lapse of time, would operate most unjustly against the public, and is totally unauthorized by the law. In such a case, even he who has rights and sleeps upon them justly loses them.

The correction of a patent by means of a reissue where it is invalid or inoperative for want of a full and clear description of the invention cannot be attended with such injurious results as follow from the enlargement of the claim; and hence a reissue may be proper in such cases, though a longer period has elapsed since the issue of the original patent. But in reference to reissues made for the purpose of enlarging the scope of the patent, the rule of laches should be strictly applied, and no one should be relieved who has slept upon his rights, and has thus led the public to rely on the implied disclaimer involved in the terms of the original patent; and when this is a matter apparent on the face of the instrument upon a mere comparison of the original patent with the reissue, it is competent for the courts to decide whether the delay was unreasonable and whether the reissue was therefore contrary to law and void.

We think that the delay in this case was altogether unreasonable, and that the patent could not lawfully be reissued for the purpose of enlarging the claim and extending the scope of the patent.

The decree of the circuit court is affirmed.

U. S. Circuit Court—Eastern District of Missouri.

HERRING *v.* GAS CONSUMERS' ASSOCIATION.

Decided March 28, 1878.

1. INFRINGEMENT OF PATENT BY JOINT OWNER.
   A part owner of a patent has no right to use an infringing device. If he does, he is liable to his co-owner for the wrong done.
2. SAME—AMOUNT OF RECOVERY.
   When a part owner of a patent sues a co-owner for using an infringing device, the recovery, if any, will be in proportion to their respective interests.

Mr. J. H. Blair for the plaintiff.

Mr. H. B. Wilson and *Mr. John McGuffy* for the defendant.

TREAT, *D. J.:*

The plaintiff avers substantially that he is owner of an undivided two-thirds interest in the patent described, and that the defendant is owner of the other undivided one-third interest; that the defendant is using a device which is an infringement upon their common patent, and that he is so doing under cover of their common patent. Hence the claim for damages for said infringement—not for the entire amount thereof, but for plaintiff's proportion—to wit, two-thirds.

The direct question presented is whether an infringer of a patent can escape liability for his infringement because he is a joint owner of the original patent upon which the infringement occurs.

The cases cited do not reach the precise point raised by the bill. It is evident that if a stranger was guilty of the infringement he would be compelled to respond in damages. Can a part owner infringe the common patent and escape all liability? If he can, it is obvious that, however small his aliquot part, he can make the enjoyment of the patent valueless to his joint owner. He has, by virtue of the joint ownership, a right to use the patent, but he has no right, more than a stranger, to infringe the same. If there is an infringement the right of recovery is in the party wronged. All the joint owners should ordinarily be parties plaintiff; but if the wrong-doer is one who is guilty to the damage of the other joint owner, the latter should not be left remediless. As to such infringement they are strangers. All the joint owners are on the record, and the amount of the recovery determines their respective interests. The infringer cannot escape the consequences of his wrong to his joint owner by averring that he was by his infringement injuring not his joint owner alone, but himself also. In other words, he cannot, under cover of his interest in the common patent, shield every wrong-doer who may infringe that patent. He can, as to the other part owners, by infringing, become liable to them for the wrong done. The amount of recovery will be in proportion to their respective interests. Were this not so, the door would be open to the grossest frauds by one joint owner against all other joint owners.

The case of *Pitts* v. *Hall*, (3 Blatchf., 204,) and the comments thereon in Curtis on Patents, sec. 108 *et seq.*, do not cover this case. The question there discussed pertains to the use by one joint owner of the common property. The difficulties in maintaining an action for an infringement against a joint owner who merely uses the common patent may be insurmountable. As to that no opinion is expressed. In this case an entirely new and distinct proposition is presented—viz., one of the sev-

eral joint owners is not using the common patent, but an infringing patent. His defense is that inasmuch as he had a right to use the original patent without question from his joint owners, despite the decision in *Pitts* v. *Hall*, *supra*, he has a right also to use any infringing patents, on the ground that his right to use the original being vested in him, his use of other and infringing patents did not cause any wrong or injury to himself as joint owner. In other words, the defendant contends that as one joint owner he could use the common patent without being liable to account to the other joint owners; that he could not be sued as an infringer for using what he had a right to use by virtue of his proprietary interest; and therefore if he used an infringing device he was only injuring himself in what he had a proprietary right to forbid. This would be correct if no interest except his own were involved, for a man may do what he pleases with his own, and *volenti non fit injuria* would be, *a fortiori*, applicable in such a case. If a stranger were using the infringing patent this action would unquestionably lie against him; and the question before us is whether it will lie against a joint owner, or, in the language of the bill, whether he, under cover of his joint ownership, can infringe and escape liability. So far as he acts outside of his interests or rights or powers as a joint owner there is no adequate reason for treating him *quoad hoc* otherwise than as a stranger. If this be not so, then one joint owner may destroy, without remedy, the rights of the other joint owners.

Demurrer overruled.

U. S. Circuit Court—Southern District of New York.

GARDNER v. CROSSMAN *et al.*

Decided August 4, 1881.

PLEADINGS—NEW BILL.

Where parties acquiesce in going on in a circuit court under complaint and answer filed in the State court, it will not be necessary to file a new bill in equity in the circuit court.

Messrs. Richards & Heald for the plaintiff.
Messrs. Scudder & Carter for the defendants.

BLATCHFORD, *J.*:

On more careful consideration I am of opinion that my ruling on the objection to cross-question 395 was wrong, and that the objection ought to be overruled.

13

As both parties acquiesced in going on in this court under the complaint and answer in the State court, without the filing of a new bill in equity in this court, and as the plaintiff treated the answer of the defendants as a general denial of the agreement set up in the complaint, by proceeding to prove such agreement as set up, it is proper that it should be so treated by this court. In addition to this, I think it is a fair construction of the answer that it denies the existence of the agreement set up in the complaint. The putting in of a general replication to it so treats it. But I think the defendants must be held to such answer, and that while they are entitled to all that legitimately flows from it, they are not entitled now to amend it. No sufficient reason is shown for allowing it to be amended, and the motion to amend it must be denied and an order be entered to carry into effect the foregoing decision.

U. S. Circuit Court—Southern District of New York.

MACAULEY v. THE WHITE SEWING MACHINE COMPANY *et al.*

Decided September 20, 1881.

SUSPENSION OF INJUNCTION—AFFIDAVIT.

Motion for a further suspension of the issuance of an injunction denied for the insufficiency of the affidavit.

Mr. C. W. Betts for the plaintiff.
Mr. S. A. Duncan for the defendants.

BLATCHFORD, *J.*:

The issuing of the injunction was suspended for two months, "with a view to enable the defendants either to change their machinery or to obtain a license from the complainant under said letters patent." The affidavit for this motion sets forth only that the officers of the company have been endeavoring to change the machine of the company so as to avoid infringement, and to that end have tried several different forms of mechanism; that no one of such forms has proved so reliable as to warrant its adoption, and that they are in good faith making further experiments to accomplish said result. There is no suggestion by affidavit that there is any probability of success. As to the license-fee offered to be deposited in respect of future machines, I am not satisfied that it is a proper and adequate fee, even if, on other grounds, the relief asked were proper.

The motion as made is denied.

Erratum.

OFFICIAL GAZETTE, January 24, 1882, Volume 21, page 235, Patent No. 252,835, in title, name of assignee, for "John H. Wilson" read *Joseph H. Wilson*.

Subscriptions for 1882.

The OFFICIAL GAZETTE is published every Tuesday, two volumes a year, commencing in January and July. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound volumes, $3.50 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Amendment of Rule 46.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., December 8, 1881.

Rule 46 (Rules of Practice, revised September 1, 1880) is hereby amended by the addition of the following provision, viz:

When the person before whom the oath or affirmation is made is not provided with a seal his official character shall be established by competent evidence, as by a certificate from a clerk of a court of record or other proper officer having a seal.

This amendment will take effect January 15, 1882.

V. D. STOCKBRIDGE,
Acting Commissioner.

Approved:
S. J. KIRKWOOD,
Secretary.

A certificate of the official character of a magistrate, stating date of appointment and term of office, may be filed in the Patent Office, which will obviate the necessity of separate certificates in individual cases.

Issue of January 24, 1882.

DESIGNS.

12,701 to 12,705, inclusive.—TEA-TRAY.—*Walter M. Conger*, Newark, N. J. Applications filed June 18, 1881. Term of patents 14 years.

12,706.—COOKING-STOVE.—*Oliver B. Keeley*, Spring City, Pa. Application filed December 19, 1881. Term of patent 7 years.

12,707 to 12,710, inclusive.—ORNAMENTING CLOTH.—*Dwight C. Sumner*, New York, N. Y. Applications filed December 27, 1881. Term of patents 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,036.—THREAD.—*Clark Thread Company*, Newark, N. J. Application filed December 27, 1881.
"A bar."

9,037.—CLARET-WINE.—*Eschenauer & Co.*, Bordeaux, France. Application filed December 27, 1881.
"The word-symbol 'RED SEAL.'"

9,038.—CLARET-WINE.—*Eschenauer & Co.*, Bordeaux, France. Application filed December 27, 1881.
"A representation of the letter 'E.'"

9,039.—CLARET-WINE.—*Eschenauer & Co.*, Bordeaux, France. Application filed December 27, 1881.
"The word-symbol 'WHITE SEAL.'"

9,040.—CLARET-WINE.—*Eschenauer & Co.*, Bordeaux, France. Application filed December 27, 1881.
"The word-symbol 'GOLD SEAL.'"

9,041.—OVERALLS.—*Henry Bernheim*, New York, N. Y. Application filed December 14, 1881.
"The picture of a man sewing."

9,042.—TACKLE-BLOCKS.—*Penfield Block Company*, Lockport, N. Y. Application filed December 10, 1881.
"A foul anchor."

9,043.—BRANDY.—*Cazade, Crooks & Reynaud*, New York, N. Y. Application filed August 19, 1881.
"The fanciful border and the representation of the stars."

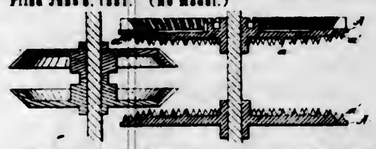
9,044.—STOVE-ENAMEL.—*Benjamin D. Milliken*, Boston, Mass. Application filed January 4, 1882.
"The word 'PRIDE.'"

9,045.—MUSTARD AND ALL KINDS OF SPICES.—*H. F. A. Pinckney & Co.*, Philadelphia, Pa. Application filed December 15, 1881.
"The symbol consisting of the shield, belt, and scrolls."

9,046.—CERTAIN TOILET PREPARATION.—*H. K. & F. B. Thurber & Co.*, New York, N. Y. Application filed December 22, 1881.
"The representation of the fabled fountain of youth in the foreground of a tropical scene, the figures of an aged man and a youth, and the words 'FOUNTAIN OF YOUTH' and 'FUENTE DE REJUVENECIMIENTO.'"

9,047.—AUGERS AND AUGER-BITS.—*F. F. Tennis*, New York, *W. K. Wilson* and *L. K. Kumbel*, Brooklyn, N. Y., and *Emory L. Bates* and *R. E. Bond*, Fiskdale, Mass. Application filed May 23, 1881.
"The word 'SNELL.'"

LABELS.



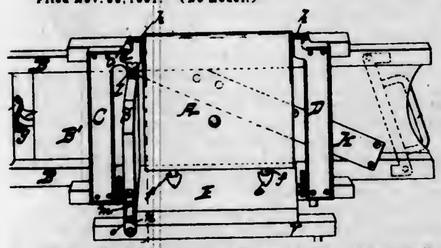
2,601.—Title: "BOND'S NON CORROSIVE CYLINDER OIL."—*James C. Bond*, Chicago, Ill. Application filed December 29, 1881.

2,602.—Title: "THE GREAT MOUNTAIN SAGE REMEDY FOR FEVERS." *R. C. Schroeder & Co.*, Raton, N. Mex. Ter. Application filed December 28, 1881.

PATENTS

GRANTED JAN. 24, 1882.

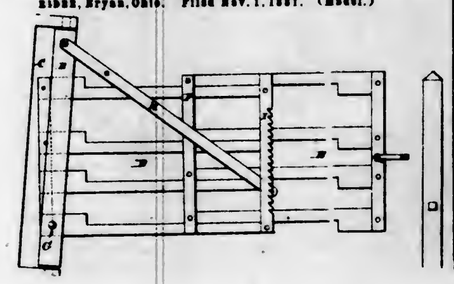
252,594. CORN-SHELLER. HENRY A. ADAMS, Sandwich, Ill. Filed June 6, 1881. (No model.)



Claim.—1. In a corn-sheller, a straight runner having the points of its outer teeth gradually receding, substantially as described.

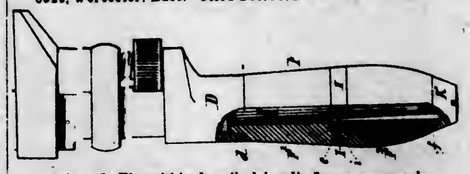
2. In a corn-sheller, a straight runner provided with gradually-receding teeth on the outer portion of its face or faces, in combination with bevel runners, substantially as and for the purpose set forth.

3. A straight runner, A, provided with a bevel in the outer portion of its face, on which are arranged gradually-receding teeth *a'*, substantially as described.



4. A straight runner, A, provided with a bevel on the outer portion of its face, composed of a series of steps or offsets, *a'*, and having teeth *a'* arranged on these offsets, substantially as described.

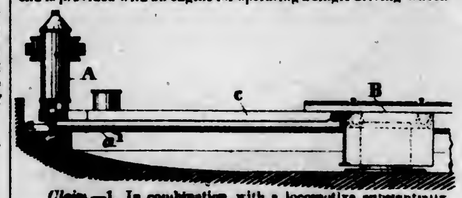
252,595. VEGETABLE-SLICING MACHINE. JOHN W. ANDERSON, Lancaster, Pa., assignor to Adam B. Groff, same place. Filed Nov. 25, 1881. (No model.)



Claim.—The folding presser and guard A, hinged horizontally to extensions *h h*, or their equivalents, on the frame C, provided with projections *p p* on its face, and stops *f f* on its lower margin, registering with the notches *e e* in the top of table E, and operating both to press an article, Z, between it and the gage B' before the knife K and adapted to be laid back out of the way on the top of frame C in the manner and for the purpose set forth.

252,596. SWINGING AND SLIDING GATE. MYRON F. CALTRIDER, Bryan, Ohio. Filed Nov. 1, 1881. (Model.)

252,597. SCREW-WRENCH. JOHN H. CORE and FREDERICK L. CORE, Worcester, Mass. Filed Dec. 19, 1881. (No model.)

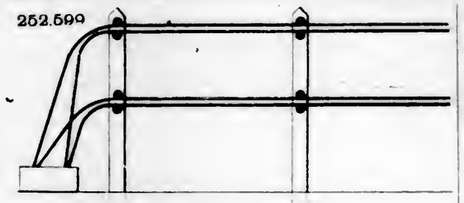


Claim.—1. The within-described handle for screw-wrenches, composed of the wood portions F F', respectively provided with end shoulders, *d e i f*, and the re-enforce or ring I, surrounding the junction of said wood parts, with its exterior surface finished off flush with the surface of the wood, as hereinbefore set forth.

2. The combination, with the wrench-bar shank A' and ferrule D, of the wood thimbles or parts F F', having end shoulders, *d e* and *i f*, and matching surfaces *m m'*, the metal re-enforce ring I, surrounding the center or junction of the wood thimbles and finished flush with the exterior thereof, and the cupped tip-nut K, as hereinbefore shown and described.

252,598. STEAM-LEVER. JNO. B. COLLIS, Altoona, Pa. Filed Nov. 15, 1881. (No model.)

Brief.—A lever-arm is hinged to a turn-table, and at the outer end is provided with an engine for operating a single driving-wheel.



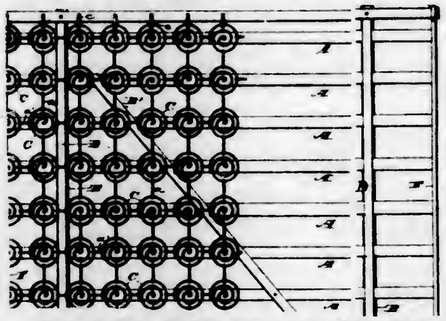
Claim.—1. In combination, with a locomotive substantially such as described, the hinged lever-arm and the turn-table, as and for the purpose set forth.

2. The locomotive A, having the single driving-wheel *a*, in combination with the arm *c*, having the hinge-connections, and the turn-table B, as described.

252,599. ELECTRIC-WIRE FENCE. JOSEPH H. CONNELLY, Pittsburg, Pa. Filed Mar. 8, 1881. (No model.)

Claim.—A wire fence having one or more of its wires insulated, and with its or their ends connected respectively with the opposite poles of an electric battery to form the circuit of the current or currents generated by the battery, substantially as herein described, and for the purpose set forth.

252,599



252,600. EXPLOSIVE COMPOUND. CARL DITTMAR, New York, N. Y. Filed Nov. 7, 1881. (No specimens.)

Claim.—1. The process for forming a new explosive compound, which consists in the formation of a chlornitrosaccharose or nitro-sugar by dissolving cane-sugar or sucrose in chlorhydrin and then converting the same into a nitro compound, substantially as described.

2. The compound hereinbefore described, provisionally termed "chlornitrosaccharose."

252,601. SPRING BED-BOTTOM. OSCAR S. FOSTER and WILLIAM S. FOSTER, Utica, N. Y. Filed Oct. 22, 1881. (No model.)

Claim.—1. In a spring bed-bottom, the combination, with the longitudinal slats having springs secured thereto, the said springs being secured together by suitable links, and side rails secured to the outside rows of springs by suitable metallic loops, of semi-elliptic springs rigidly secured to the side rails, substantially as set forth.

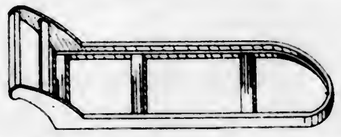
2. In a spring bed-bottom, the combination, with the longitudinal slats having springs secured thereto, the said springs being secured together by suitable links, side rails secured to the outside rows of springs by suitable metallic loops, and metallic straps passing through the top coil of the end springs and secured to the side rails in any suitable manner, of semi-elliptic springs the ends of which are rigidly secured to the side rails, substantially as set forth.

3. The combination, with the longitudinal slats A, braces B, springs C, and metallic straps F, of the semi-elliptic springs D, secured to the braces B, and connected at their opposite ends to the side rails, substantially as set forth.

252,602. CAR-COUPLING. EDWARD P. GOODRICH, Ypsilanti, Mich. Filed Aug. 17, 1881. (No model.)

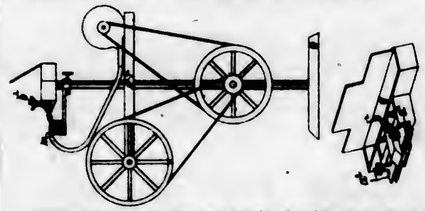
Claim.—1. The combination, with the draw-head A, having flaring mouth C, recess E, and chamber F, of the gravity coupling-hook I, having hooks K M and beveled nose or point L, as described, for the purpose set forth.

2. The combination, with the draw-head A, having flaring mouth C, recesses E F, abutment G, and shoulder H, of the herein-described removable gravity coupling-hook I, as and for the purpose shown and specified.



3. In a car-coupling, the combination, with the draw-head, of a longitudinally-sliding detachable coupling-hook, as herein described, for the purpose set forth.

252,603. MUCILAGE-RECEPTACLE. WILLIAM KNEELAND, New York, N. Y., assignor to Sidney C. Thompson, same place. Filed Sept. 12, 1881. (No model.)

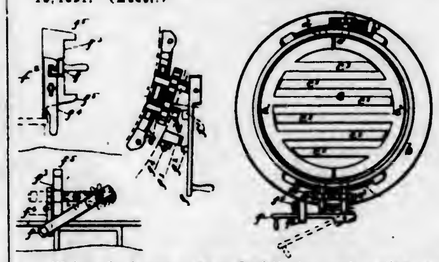


Claim.—In a mucilage-receptacle, comb *d'*, in combination with spring *d*, attached to the cover of a vessel, as shown and described.

252,604. LOUNGE-FRAME. JNO. F. KOMP, Chicago, Ill. Filed Nov. 14, 1881. (No model.)

Claim.—In a lounge-frame, the bent piece of wood *b*, forming the two sides and the foot of the frame, for the purpose specified, substantially as set forth.

252,605. MACHINE FOR BRAZING BAND-SAWS. JOHN F. KOMP, Chicago, Ill. Filed Jan. 11, 1881. (No model.)



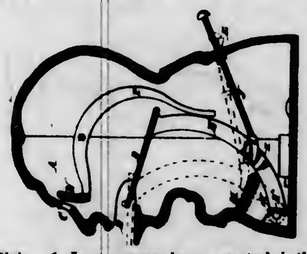
Claim.—1. In a machine for brazing band-saws, the box a, with slot a', containing charcoal or other similar substance, for the purpose of confining the heat, in combination with a blow-pipe apparatus, for the purpose specified, substantially as set forth.

2. In a machine for brazing band-saws, the box K, with the clamps a^1 a^2, in combination with the box a, with the slot a', containing charcoal or other similar substance, substantially as set forth, for the purpose specified.

3. In a machine or apparatus for brazing or soldering, the combination of a bed-plate, K, and means for maintaining the articles to be brazed in proper relative position upon the bed-plate of a charcoal-receptacle, a, whereby the articles to be brazed may be embedded in charcoal to co-operate with a flame in heating the soldering material.

252,606. GRATE. JOSEPH KNAUPA, St. Louis, Mo. Filed Oct. 12, 1881. (Model.)

Claim.—1. A grate composed of the two grate-sections, provided with front and rear pivot-bars bearing in sliding carriers placed in suitable ways, both front bars and one of the rear bars being provided with gear-wheels, the gear-wheels on front bars being arranged to mesh together, and the gear-wheel on rear pivot-bar being arranged to engage a rack-bar placed alongside the way, supporting the carrier on which said bar rests, substantially as set forth.



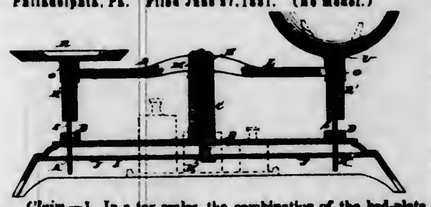
2. The combination of the fire-pot having formed through it horizontal openings with carriers made shorter than and placed in said openings, and provided with bearings to receive the pivot-bars of the grate-sections, whereby a lateral motion may be given the grate-sections, substantially as set forth.

3. In a stove, the combination of a fire-pot formed with openings through it, carriers made shorter than and placed and supported in said openings, and ways placed alongside and provided with bearing for the grate-sections, the tilting grate-sections, and means for operating, substantially as set forth.

4. The combination of the grate-sections, the front pivot-bars of which are extended through the casing of the stove, the one having the operating-lever hinged to it, the said lever having a lug placed thereon and arranged to enter a slot formed in the end of the other front pivot-bar when the grates are in a horizontal position and firmly lock the grates in such position, substantially as set forth.

5. The combination of the hinged lever having hook *f'* on its side next the stove, the bar *f*, fixed to the stove and having a slot formed in its front to receive the hinged lever, and the latch arranged to catch over the hook on the hinged lever and hold the said lever from an outward movement, substantially as set forth.

252,607. TOY MONEY-BOX. LOUIS KYNER and ALFRED C. REX, Philadelphia, Pa. Filed June 27, 1881. (No model.)



Claim.—1. In a toy money-box, a receptacle in the form of the human head provided with an open mouth, in combination with a pivoted tongue adapted to be retained within the mouth by a spring or its equivalent, and forced out by pressure applied at the instant, said tongue upon its withdrawal discharging the money into the box, as in the act of swallowing, substantially as and for the purpose specified.

2. In a toy money-box, a receptacle in the form of the human head provided with an open mouth, in combination with a tongue adapted to be pressed out by pressure applied at the instant, and withdrawn by a spring, and movable eye-balls adapted to operate upon the withdrawal of the tongue, as in the act of swallowing money, substantially as and for the purpose specified.

3. In a toy money-box, a receptacle, A, in the form of a head provided with a mouth, B, and eye-holes C, in combination with a tongue, D, secured to a lever, E, pivoted at F, spring M, rod J, or its equivalent, and pivoted eye-balls N, substantially as and for the purpose specified.

252,608. TOY SCALES. LOUIS KYNER and ALFRED C. REX, Philadelphia, Pa. Filed June 27, 1881. (No model.)

Claim.—1. In a toy scales, the combination of the bed-plate B, with its standard C, lever L, working in said standard upon knife-edge M and kept in place by cap F, said lever being provided on its ends with knife-edges N, pan R, and basket U, both provided with recessed blocks O, having the bottoms closed with plates P, which are riveted thereto, and hubs E', to which are secured rods S, plate I, provided with lugs J and holes K and H', and held in place by wire H, passed through hole H' and bent over, substantially as shown and described.

2. In a toy scales, the combination of the bed-plate B, standard C, provided with slot E, plate I, provided with holes K K and H', wire H, lever L, pans R and U T, and their rods S, as and for the purpose specified.

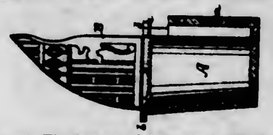
3. In a toy scales, the pan R, cast solid with the recessed blocks O, the bottom of said blocks being covered with plates P, riveted thereto, as shown and described.

252,609. DRIVE-CHAIN. CHARLES H. LOW, Sandwich, Ill., assignor of one-half to J. Phelps Adams, same place. Filed Aug. 29, 1881. (No model.)

Claim.—1. In a drive-chain, a rectangular link provided with a coupling end bar of oval form lengthwise, substantially as and for the purpose set forth.

2. In a drive-chain, a coupling end bar on one link of oval form lengthwise, in combination with a coupling-hook on the adjacent link cut away to provide flaring openings at the ends of the hooks, substantially as and for the purposes set forth.

252,610. EAR-RING. HERBERT O. MACKINNEY, Providence, R. I. Filed Oct. 17, 1881. (No model.)

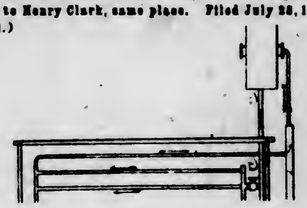


Claim.—1. The bow of an ear-ring provided with the hook A, hinged to one arm of the bow, and arranged to turn in a segment of a circle between stops located as described, said hook being adapted to engage the opposite arm of the bow, substantially as described, and for the purposes specified.

2. In combination with the hook A of an ear-ring, the disk *d*, with the lips *l l*, or equivalent flange *f*, all substantially as described, and for the purpose specified.

3. The hook A of an ear-ring, provided with the lips *l l*, in combination with the disk *d*, substantially as specified.

252,611. FEED-CUP FOR BIRD-CAGES. JOHN HAENSSLER, Brooklyn, N. Y. Filed Nov. 15, 1881. (No model.)

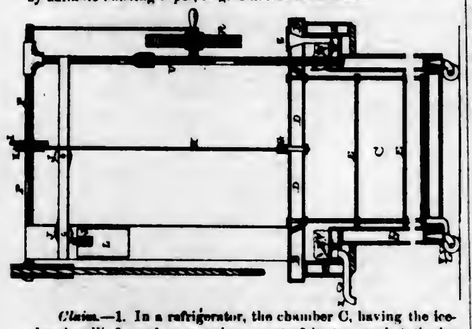


Claim.—1. The feed-cup A, combined with the shield B and flexible wires or bands *c*, and with a projection or projections, which, together with said wires or bands, will insure the connection of the parts A and B, substantially as described.

2. The feed-cup A, constructed with inner recess, *d*, and outwardly-projecting flange *b*, in combination with the detachable shield B and flexible wires or bands *c*, substantially as described.

3. In a bird-cage, a feed-cup provided with a separable partly or wholly transparent shield, B, and with bands *c*, for uniting the two into one portable structure, substantially as described.

4. The feed-cup A, provided with recess *d*, and combined with the partly or wholly transparent shield B, which is set into said recess and firmly united to said cup into one structure, substantially as herein shown and described.

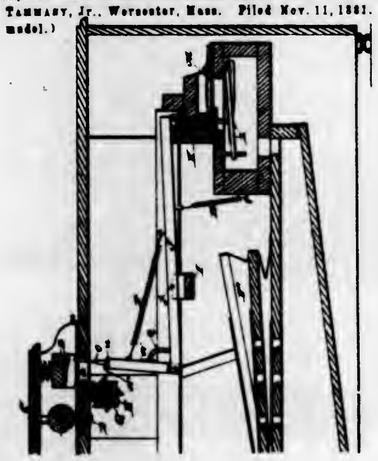


252,612. EVAPORATING SALT-BRINE. ALEXANDER MCBEAN and JAMES H. WATSON, Tawas City, Mich., assignors of one-third to Henry Clark, same place. Filed July 28, 1881. (No model.)

Claim.—The method of manufacturing salt, the same consisting of maintaining a constant and rapid circulation of hot water from the boiler to the blocks and return, as contradistinguished from a similar circulation of steam, as set forth.

252,613. REFRIGERATOR. JNO. MCMURRAY, Lexington, Ky. Filed Oct. 28, 1881. (No model.)

Brief.—Keeps both ice and provisions in partial vacuum produced in both the chamber and its hollow walls by a peculiar air-pump consisting of wheel with a hollow rim, which serves as a pump-barrel, being pivoted at one side of periphery to an air-pipe leading from the chambers to be exhausted. The lower half of the hollow rim is filled with mercury which, as the wheel is turned a half-revolution, flows by its gravity through the rim, keeping in the lower half, and thereby acting as a piston, driving the air out of that half through a valve and filling the space before occupied by mercury with air from refrigerator. A reverse motion of the wheel performs similar operation in other half of wheel, and so on, each oscillation of wheel exhausting air. The door of refrigerator is in its top, which, with the shelves attached, is lifted vertically by suitable hoisting-ropes, to give access to contents.



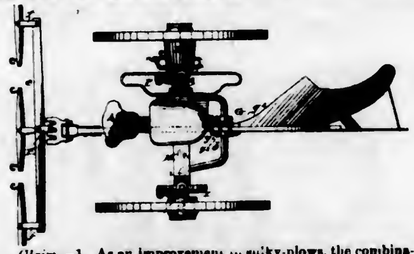
Claim.—1. In a refrigerator, the chamber C, having the ice-chamber E', formed as an enlargement of its top, so that the ice can be placed out of the way of the vertically-moving shelves E, substantially as set forth.

2. In a refrigerator, the chamber C, having both the ice-chamber E' and the water-chamber W formed around its top, substantially as specified.

3. The combination of the wheel R, containing a dense liquid, and provided with suitable valves, with a weighted lever, 3, quadrant 2, pinion 1, and the pipe which connects with the refrigerating-chamber, substantially as shown.

4. The wheel R, attached to the end of a pipe which is connected with one or both of the chambers B C, and provided with suitable valves, so that when rocked or moved from side to side the dense liquid contained in the wheel will exhaust the air from the chamber or chambers, substantially as described.

252,614. AUTOMATIC MUSICAL INSTRUMENT. JOHN MCTAMMANY, Jr., Worcester, Mass. Filed Nov. 11, 1881. (No model.)



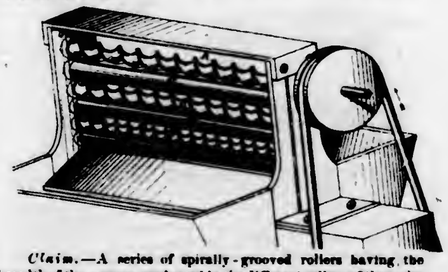
Claim.—1. In an automatic musical instrument, the combination of a valve-rod, a lever operating the same, and a music-sheet with a vertical arm hinged to said lever, and a spring which retracts said arm, substantially as set forth.

2. The finger O, in combination with shouldered arm N, fluted roll H, springs P and R, stop Q, the lever J and its valve, valve-rod, driving-shaft, and actuating mechanism, substantially as set forth.

3. In a mechanical musical instrument, the combination of a case having slots *a* in its top with a series of levers for opening the reed-valves, a series of upright arms hinged to said levers and provided with fingers O, and the fluted roll, adapted and arranged to engage with and depress any one of said arms as it is drawn into its rearmost position by the action of the music-sheet, substantially as set forth.

252,615. SULKY-PLOW. HERMAN MILLER, New Ulm, Minn., assignor of one-half to M. Mallon, same place. Filed Oct. 15, 1881. (No model.)

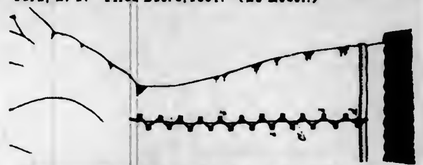
Brief.—A sliding notched hub moved by a spring-lever engages a similar fixed hub on the wheel, when the crooked axle turns with the wheel and raises the plow. The lever has this sidewise rocking capacity to engage the clutch in addition to the ordinary forward and back movement against its rack to raise the plow by hand and to lock it in any position. A sand-cap covers all the parts at the inner end of the wheel-hub.



Claim.—1. As an improvement in sulky-plows, the combination, with the axle and plow-beam, of the device for securing them together, consisting substantially of the two-part hub G, encircling the axle, the upper half of which is formed with laterally-projecting lugs *g g*, and is grooved transversely to receive the plow-beam, and the lower half with similar lugs, *g'*, all being held securely together by clips *g²*, which embrace the lugs, substantially as and for the purpose herein shown and specified.

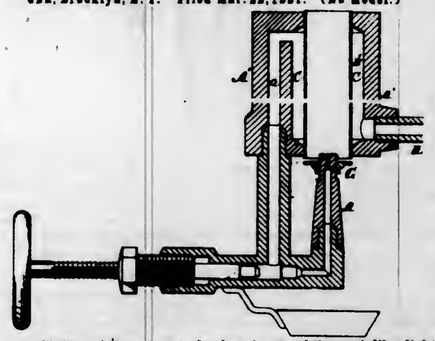
2. The combination of the lever *l* with the sliding toothed hub N upon the axle, the bent rod O, pivoted and engaging said hub, the axle-skein P, flanged at its inner end, and the wheel with the toothed hub-rim, said members being constructed and organized substantially as and for the purpose described.

3. The combination, with the toothed hub N, axle-skein P, toothed hub-rim, and rod O, of the sand-cap R, provided with openings for the lower arm of said rod, and arranged to cover the said parts, substantially as described.



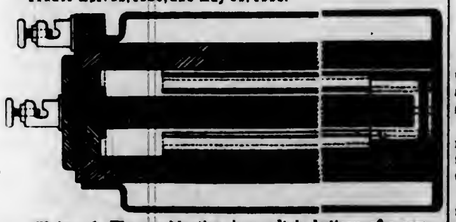
252,616. MACHINE FOR SHELLING PEASE. FELICE MOLINI, San Francisco, Cal. Filed Aug. 2, 1881. (No model.)

Brief.—The invention consists in mounting in a single machine, in conjunction with plain rollers, a series of spirally-grooved rollers having the breadth of the grooves graduated in the different rollers of the series.



Claim.—A series of spirally-grooved rollers having the breadth of the grooves graduated in the different rollers of the series mounted in a framing, in conjunction with plain rollers, in combination with said plain rollers and framing, substantially as set forth.

252,617. GLOVE-FASTENING. SAMUEL MONTGOMERY, New York, N. Y. Filed Dec. 8, 1881. (No model.)

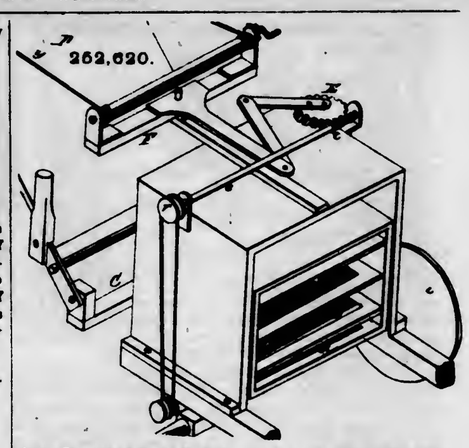


Claim.—As an improved article of manufacture, the glove with the wrist-opening provided with spring closing-studs on each side of the same, and a lacing-cord secured at one end to the glove and having a ring or ball on the other end, the studs permitting the cord to be laced or unlaced, and automatically closing after the passage of the cord in either direction, thus preventing catching into materials or fabrics with which the said studs may come in contact, substantially as shown and described.

252,618. LIQUID-HYDROCARBON BURNER. ALFRED S. HEDGES, Brooklyn, N. Y. Filed Mar. 22, 1881. (No model.)

Claim.—An apparatus for burning naphtha and like light hydrocarbon oils, composed of the externally-threaded burner A, the annular chamber C, having thick outer walls of cast metal and thin inner walls of wrought metal, the passage *a*, connecting with the said chamber at its top, the inlet E, connecting with the said chamber at its bottom, and the internally-threaded disk G, the burner and the disk being placed coincident with the passage through the thin internal walls of the chamber C, and the whole being constructed, combined, and arranged substantially as and for the purpose herein set forth.

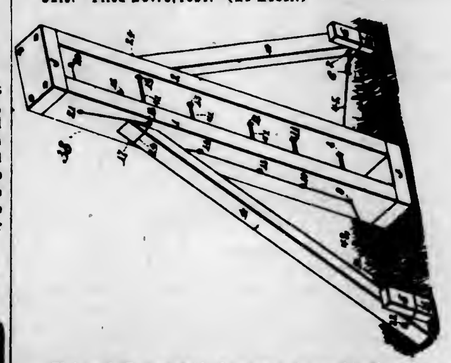
252,619. VOLTAIC BATTERY. AUGUST F. W. PARTS, Philadelphia, Pa. Filed Nov. 14, 1881. (No model.) Patented in France Apr. 22, 1880, and May 28, 1880.



Claim.—1. The combination, in a voltaic battery, of a compound solution of chloride of zinc and bichromate of ammonia with an anode of zinc and a cathode of carbon.

2. A cathode of carbon slotted so as to form a row or cluster of connected bars, substantially as and for the purpose set forth.

252,620. STRAW-CARRIER OF THRASHING-MACHINES. POMPEIUS PHILIPPI, Boardstown, Ill. Filed Sept. 28, 1881. (No model.)



Claim.—1. The combination, with a thrashing-machine and the carrier attachment thereof, of mechanism, substantially as shown and described, for automatically imparting to the carrier a continuous lateral swinging motion, substantially as and for the purpose set forth.

2. In a thrashing-machine, the combination of the carrier-frame D, pivoted frame F, shaft *s*, worm *t*, worm-wheel E, crank-arm *u*, connected thereto, and the pivoted arm *v*, said arm being suitably connected to the frame F, substantially as and for the purpose set forth.

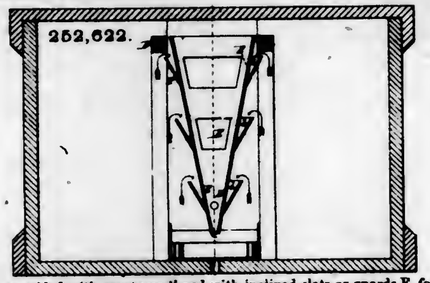
3. In a thrashing-machine, the combination of the pivoted carrier-frame D, the pivoted support C, the frame-work B, and mechanism, substantially as described, for imparting to the carrier a continuous lateral swinging motion, substantially as and for the purpose specified.

252,621. PORTABLE FENCE. SAMUEL K. RAEE, West Elkton, Ohio. Filed Nov. 3, 1881. (No model.)

Claim.—1. In a portable fence-post, the combination of two united uprights having a rail-receiving space between them, and a continuous wire stitched through said uprights to form rail-rests, substantially as and for the purpose set forth.

2. The combination, with braces and a fence-post having rail-rests formed by vertical stitches of a continuous wire, of horizontal stitches of said wire near the top of the post to form loops for the tops of the braces, substantially as and for the purpose set forth.

3. The combination, with braces and a fence-post having rail-rests formed by stitches of a continuous wire, of bottom ties formed by outward prolongation of such wire from the bottom of the post to attaching-points near the feet of the braces, substantially as and for the purpose set forth.



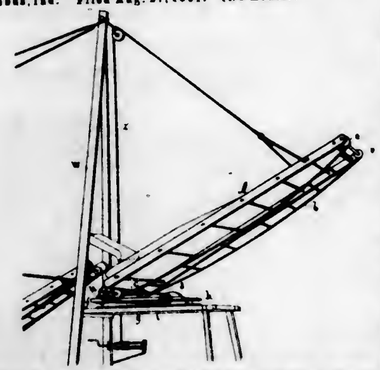
4. The combination of united uprights 1 and 2, braces 4, stakes 5, and the continuous wire forming rail-rests 41, brace-loops 24, brace-ties 42, and stake-loops 25, substantially as and for the purpose set forth.

5. The combination, with main posts 38 and rails 40, supported by said posts, of the perforated middle post, 36, consisting of a single upright, to which the rails are stitched by a continuous wire, substantially as and for the purpose set forth.

252,622. REFRIGERATING APPARATUS. J. THORNTON REED, Boston, Mass. Filed July 26, 1881. (No model.)

Claim.—1. A tank or receptacle for containing refrigerants,

252,622.



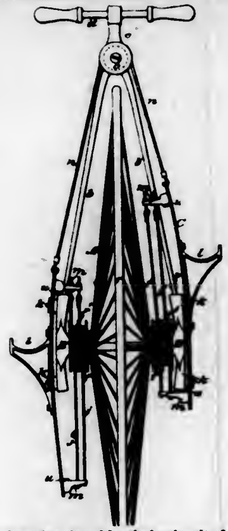
provided with apertures E and with inclined slats or guards F, for the purpose of admitting the ascending air and the gases at different levels and allowing them to pass over the refrigerants employed, substantially as and for the purpose set forth.

2. The within-described process or method of refrigerating, the same consisting in withdrawing the heavier air and gases from the compartment which contains the meats or other perishable articles at varying distances from its bottom and causing them to pass over the refrigerant, by which they are absorbed, substantially in the manner and for the purpose described.

3. In a refrigerator, a receptacle for refrigerants having its sides formed with apertures at different levels, substantially as and for the purpose described.

252,623. STRAW-STACKING MACHINE. MARSHAL T. REEVES, Columbus, Ind. Filed Aug. 27, 1881. (No model.)

Claim.—1. In combination with fixed frame *i*, having circular track *h* formed thereon, pivoted frame *f*, trucks *g*, horizontal shaft *e*, and straw-carrier A, attached to said shaft and movable thereon, all constructed and operating substantially as set forth.



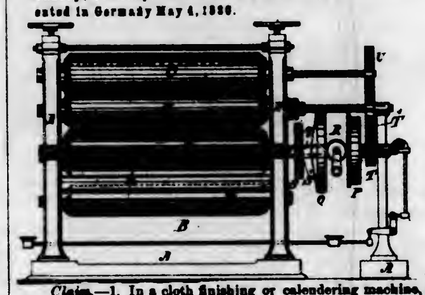
2. In combination with frame *i*, frame *f*, centrally pivoted thereto, straw-carrier A, supported at its lower end by shaft *e*, chain or cord *x*, and a windlass for raising and lowering said straw-carrier, and pulley *v*, over which said chain passes, said pulley being arranged vertically above the pivotal point of frame *f*, substantially as and for the purpose set forth.

3. Vertical pin *l*, serving both as a shaft for double-bevel wheel *m* and as a pivot for frame *f*, in combination with frames *f* and *i*, gear-wheels *p m t*, shafts *s* and *e*, and straw-carrier A, substantially as set forth.

252,624. BICYCLE. JEAN E. RICHARD, New York, N. Y. Filed May 28, 1881. (No model.)

Claim.—1. The combination, in a bicycle, of the following-named coacting elements—that is to say: the main driving-wheel fixed on an axle between the branches *b b* of the fork, the said fork having its branches socketed in elongated bearing-boxes B B, the said boxes arranged to form bearings for the ends of the axle, the drums *f f f f'*, arranged in pairs on the axle between the driving-wheel and the boxes B B, and provided with internally-arranged clutches, as shown, the cords *j j'*, arranged on the drums and secured thereto, and secured also to the reciprocating bars C C, and the said reciprocating bars provided with brackets for the feet, all arranged as set forth, whereby the clutches act upon both ends of the driving-wheel shaft simultaneously to rotate the driving-wheel, as specified.

252,624.



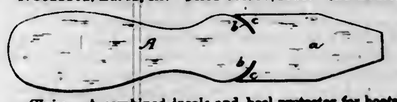
2. The combination, in a bicycle having its driving-wheel arranged to be rotated by means of clutches and drums on its axle through the medium of cords and reciprocating bars, of the said driving-wheel and the clutches, drums, and operative cords, with the bearing-boxes B B, sheaves *k k*, covered bars C C, provided with provisions *m m*, having arms of unequal length, cord or rope *n*, sheave *o*, and adjustable brackets *l l*, all arranged to operate substantially as and for the purposes set forth.

3. The combination, in a bicycle wherein the main or driving wheel is rotated by means of reciprocating bars, of the bearing-boxes B, keeper-sheaves *k*, curved bar C, provided with brackets for the feet and provisions *m* for attachment of the cords, and the rubber pads *u u*, all arranged to operate as and for the purposes set forth.

4. The combination, with the concave rim of a bicycle-wheel, of the tubular rubber tire *r*, the wire or rod *s*, and the securing-bolts *t*, provided with heads having eyes through which the said wire passes, and with nuts to draw the tire closely into the concavity of the rim, all arranged to operate substantially as set forth.

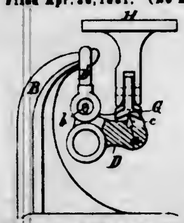
5. As a means of attaching a tubular tire to a bicycle or similar vehicle, bolts with eyes or holes in their heads arranged in the concave rim of the wheel, and a wire or rod arranged to pass through said eyes in the bolt-heads inside of the tire, substantially as set forth.

252,625. CALENDER FOR CLOTH AND OTHER FABRICS. ALEXANDER T. SAMPERT and LUDWIG H. VOLLERT, Meerane, Saxony, Germany. Filed Nov. 3, 1881. (No model.) Patented in Germany May 4, 1880.



Claim.—1. In a cloth finishing or calendering machine, the combination of the endless apron H with the rolls D E F, the roll D having a greater diameter than the other rolls, all arranged and operating substantially as described, for the purpose specified.

2. In a cloth finishing or calendering machine, the combination of an endless apron with the rolls D E F G, the roll D having a greater diameter than either of the other rolls, all arranged and operating substantially as and for the purpose shown and described.



3. In a cloth finishing or calendering machine, the combination, with the guide-roll D and calendering or finishing roll E, of the differential gear P, Q, R, S S', and T T, all arranged and operating substantially as and for the purposes specified.

252,626. COMBINED INSOLE AND HEEL-PROTECTOR. WM. T. SCHENCK, Huron, Ill. Filed Oct. 17, 1881. (No model.)

Claim.—A combined insole and heel-protector for boots and shoes, formed of a single piece of leather having one end cut in the form of a sole, A, and the other end in the form of a counter or extension, *a*, with curved slits *b* between them, and flaps *c*, adapted to be secured to the insole, substantially as and for the purpose described.

252,627. SCALE-PLATFORM SUPPORT. WM. E. SELLECK, Chicago, Ill. Filed Apr. 26, 1881. (No model.)

Claim.—1. The scale-platform, the T-bracket, the T-bearings, and swinging lever provided with knife-edges *a* and *b*, in combination with the swinging rod, substantially as and for the purpose described.

2. In platform-scales, the combination of a goose-neck and yoke provided with eyes, and a swinging lever provided with knife-edges *a* and *b*, said knife-edges resting in the eyes of said yoke, substantially as and for the purpose hereinbefore described and set forth.

3. The combination, with a scale-platform, of a swing-lever provided with side flanges, and of a T-bracket pivoted to said platform and adapted to operate between these flanges, substantially as and for the purpose described.

4. The combination, with the bracket H, supporting the platform, and with the knife-edge *a*, of a T-bracket resting upon the knife-edge and provided with a convex bearing-surface supporting the bracket H, and operating substantially as described.

5. The bracket G, in combination with the swinging L-shaped lever provided with the knife-edge *a* and side flanges, *c c*, rising above the bearing-face of the bracket G upon the knife-edges, substantially as described.

6. The combination, with a scale-platform and with the bracket H, pivoted to the T-bracket and provided with a rounded end, of a T-bracket operating upon a knife-edge and provided with a convex face engaging with the bracket H, substantially as and for the purpose described.

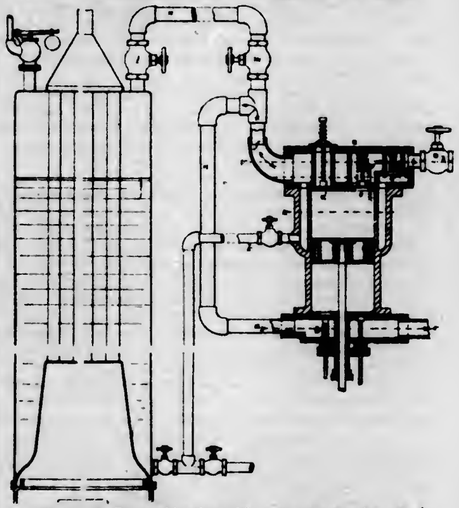
252,628. COMBINED SINKER AND FISH-HOOK HOLDER. SYLVESTER E. SMITH, St. Louis, Mo. Filed Apr. 15, 1881. (No model.)

Claim.—1. A sinker for fishing-lines, formed in imitation of a fish and provided with a holding device for the fish-hook, as described, and for the purpose set forth.

2. A fish-hook holder formed with a tubular recess, *b*, in combination with the cam B, all arranged as herein described, and for the purpose set forth.

3. A sinker for fishing-lines, provided with a device for holding the fish-hook and an eye, *a'*, located as described, for the attachment of the line, as described, and for the purpose set forth.

252,629. GATE. WILLIAM O STICKLER, Hillsdale, Mich. Filed Nov. 2, 1881. (Model.)

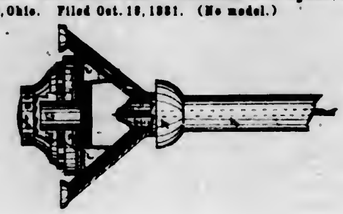


Claim.—In a gate, the combination, with the hinged scantling B, having recesses or notches C C, of the crane G, one of the vertical posts of which, I, is provided with a notch, P, and connected

252,629.

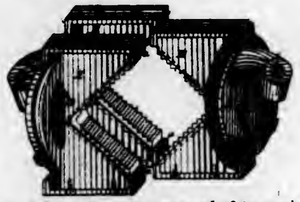
to said scantling by sleeves or bands O and the pin or key Q, substantially as and for the purpose set forth.

252,630. COMBINED STEAM AND AIR ENGINE. EDWARD H. STRAHAN, Baltimore, Md. Filed Jan. 21, 1881. (No model.)



Claim.—1. In combination with a steam-generator, an air-compressing cylinder surrounded, or partially surrounded, by a water-jacket, the water of which has means of communication with the water in the boiler or with other source of water-supply, and also with the steam-space of the boiler and with the air from the compressor at boiler or cylinder pressure, substantially as herein specified.

2. In combination with a steam-generator, an air-compressing cylinder surrounded, or partially surrounded, by a water-jacket, the water of which is in communication with the steam from said boiler and with air from the compressor, substantially as herein specified.



3. In combination with an engine-cylinder, an air-compressing cylinder surrounded by a water-jacket, and appropriate pipes for combining and conducting the compressed air and the steam generated in said water-jacket by the heat from the compressed air to the said engine-cylinder, substantially as herein specified.

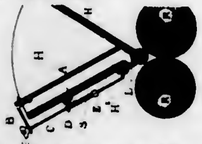
252,631. VAPOR-BURNER. FREDERICK W. SWEETMAN, Cleveland, Ohio. Filed Oct. 19, 1881. (No model.)

Claim.—In a vapor-burner, the combination of the tubular supports, gas-generator, and combustion-chamber, shield and needle-valve mechanism, jet-openings, and guide-pipe in alignment with the needle-valve and leading into the said combustion-chamber, substantially as set forth, and for the purpose specified.

252,632. PIPE-GRIPE. WILLIAM B. TAPPO, Hartford, Conn. Filed Oct. 31, 1881. (No model.)

Claim.—1. In a pipe-gripe composed of two main parts for attachment to the separate jaws of a vise, the combination of the back plate and the recessed jaw provided with the removable tooth-plate, said jaw being loosely secured to the back plate by coupling-strips extending over the margin of the back plate, substantially as and for the purposes set forth.

2. In a pipe-gripe composed of two main parts for attachment to the separate jaws of a vise, the combination of the back plate, the front or jaw plate, the jaw formed thereon, the separable tooth-plate, and the coupling-strips, serving to hold the several parts substantially in the manner shown and described.



3. The recessed jaw formed upon the face plate and grooved in its front edge and the separate steel tooth-plate bent to correspond with the recessed jaw and fitting the groove therein, said jaw being mounted and arranged upon a back plate, the several parts being held in place by coupling-strips which extend over the margin of the back plate, substantially as shown and described.

4. In a pipe-gripe of the character herein set forth, the face and back plates correspondingly inclined on their bearing-surfaces, substantially as and for the purposes set forth.

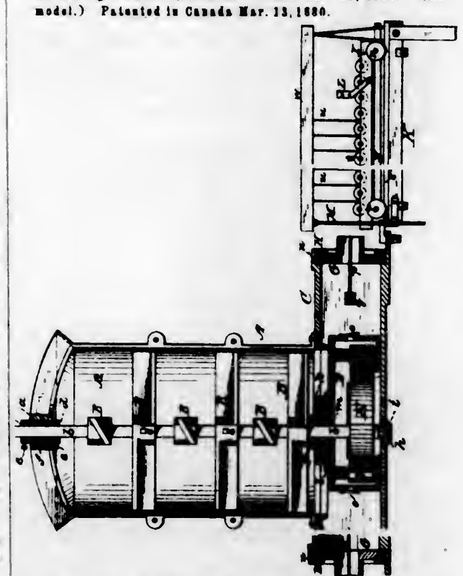
5. In a pipe-gripe, the combination of the back plate and the face plate bearing the jaw or jaws, the two plates being coupled at their margins, substantially as set forth.

6. In a pipe-gripe, the two plates, made movable one upon the other, coupled at their margins and provided with a centrally-disposed stud, substantially as shown, and for the purposes set forth.

252,633. FEED-HOPPER. JAS. E. WALSH, Peoria, Ill. Filed Aug. 17, 1881. (No model.)

Claim.—1. In combination with the feed-hopper H, the board A, pivoted at its upper corners to the ends of said hopper, the angle-irons B B, rods C C, springs S S, braces D D, set-nuts E E and K K, slide L, and roll F, as and for the purpose set forth.

2. In automatic feeders for grain-hoppers, the board A, pivoted at its upper corners to said hopper, in combination with the angle-irons B B, rods C C, springs S S, set-nuts E E K K, and braces D D, substantially as and for the purpose specified.



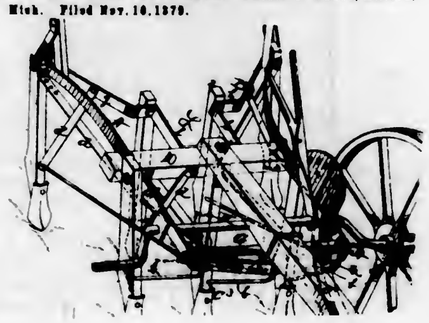
252,634. ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Oct. 3, 1881. (No model.)

Claim.—The method of manufacturing electrical cables, consisting in first taking a strip of flexible metal having longitudinal grooves successively on opposite faces of the strip, placing insulated wires in said grooves, then inclosing the whole between two wider strips of lead, and uniting the edges of same, substantially as described.

252,635. PROCESS OF PREPARING STEEL FOR WATCH-SPRINGS. ERWIN J. WATSON and HORACE W. WILLSON, Worcester, Mass. Filed July 27, 1881. (No specimens.)

Claim.—The process of preparing partially hardened and tempered steel for watch, eyeglass, and other springs by first polishing the same when of a size several degrees larger in cross-section than it is required to be when finished, then reducing it to the proper finish size by rolling, hammering, or otherwise, and polishing it, and afterward tempering and coloring the same by first exposing it to sufficient heat to obtain the required color, and immersing it in a cooling or tempering bath of ether or ammonia, substantially as described.

252,636. BRICK AND TILE MACHINE. AUGUSTUS WHELAN, Aldborough, Ontario, Canada. Filed Nov. 19, 1881. (No model.) Patented in Canada Mar. 13, 1880.



Claim.—1. In a brick or tile machine, the square shaft *b*, passing through correspondingly-formed openings in journals *f g*, at the upper and lower ends thereof, and having removably and adjustably connected to it the knives or cutters B, the same having square openings, through which the shaft passes, and held thereon by set-screws *s*, substantially as and for the purpose set forth.

2. In a brick or tile machine, the combination, with the shaft *b*, carrying knives or cutters B, and eccentric E, of the plunger D, provided with friction-rollers F, and valves *o*, substantially as and for the purpose specified.

3. In a brick or tile machine, the plunger D, having air-valves *o*, elongated opening *m*, and friction-rollers F, in combination with the shaft *b*, carrying eccentric E, and the cap or plate *l*, substantially as and for the purpose set forth.

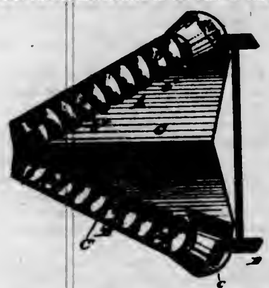
4. In a brick or tile machine, the cylinder A, shaft *b*, knives or cutters B, eccentric E, in combination with the hollow base C, provided with hinged doors H and molds G, and the plunger D, constructed as described, and having the friction-rollers F, substantially as and for the purpose specified.

252,637. WHEEL-CULTIVATOR. PHILIP F. WELLS, Milford, Mich. Filed Nov. 10, 1879.

Claim.—1. In a wheel-cultivator, the combination, with the handle or lever J, of the cultivator-frame consisting of the front and side bars, A' A A, the separate rear bar, B, the latter provided with inclined portions *g g*, and connected to the cross-bar D by a rectangular portion formed with the sides *l l*, thereby constituting the deep recess L between the side bars, A A, and the central standards, substantially as set forth.

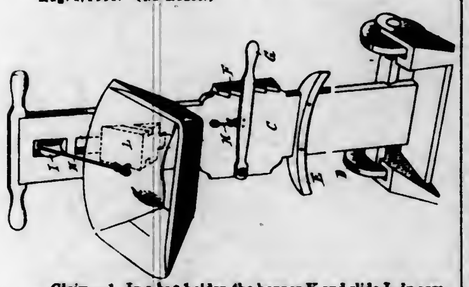
2. The wheel-cultivator frame composed of the two pieces A and B and cross-bars D and G, the said pieces A B bent substantially as shown and described, and for the purposes set forth.

3. The combination of the frame A B, constructed as described, the front bar, G, the plow-standards, the draw-rods *b*, and lateral braces *d*, substantially as and for the purposes herein set forth.



252,638. LEADING-STAFF FOR BULLS. STEPHEN M. WELLS Wethersfield, Conn. Filed Sept. 27, 1881. (No model.)

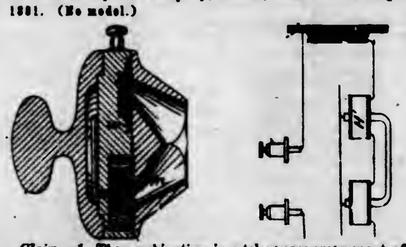
Claim.—The hook B', provided with the spring-tongue C, forming on its inner side part of the circle with B', and the projecting point B², extending to the rear of C, said point being longer from the circle of the hook than the inner diameter of the ring placed in the animal's nose, substantially as and for the purpose described.



252,639. SNOW-PLOW. NELSON WITTS, Alma City, Minn. Filed Dec. 5, 1881. (No model.)

Brief.—The plow has the general form of an ordinary pilot, the lower margins of the metal being curved outward and upward to form channels, in which are situated rotary augers. Boxes having horizontal cutters are formed in the rear of said channels.

Claim.—As an improvement in snow-plows, the combination, with the wedge-shaped projection C, having curved edges C', and boxes C², having horizontal cutters C', of the rotary augers A B, situated in channels formed by the curved edges C', all arranged and operating substantially as herein shown and specified.



252,640. BAG-HOLDER. PERRY ALLEN, Flint, Mich. Filed Aug. 6, 1881. (No model.)

Claim.—1. In a bag-holder, the hopper K and slide L, in combination with the cord H, pulley I, lever G, ratchet F, and the shaft C, having a slot to receive the slide L, substantially as specified.

2. In a combined bag-holder and truck, and in combination with the shaft C thereof, the slide L, having an inclined front face and provided with grooves in its sides, the hopper K, having tongues to fit in the grooves in the slide, and the pin J for securing the hopper and slide together, substantially as and for the purpose specified.

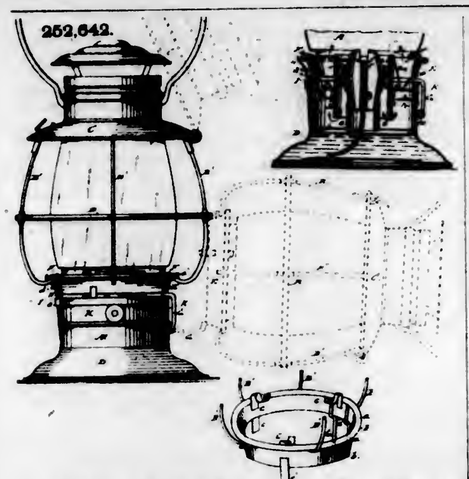
252,641. COMPOUND TELEPHONE. GEORGE LEE ANDREW, London, County of Middlesex, England, assignor to the American Bell Telephone Company, Boston, Mass. Filed Aug. 8, 1881. (No model.)

Claim.—1. The combination, in a telephonic instrument, of a transmitter provided with a variable resistance consisting of a layer of finely divided or granulated carbon or similar conducting material confined in a loose state between two metallic surfaces, one of which is a vibrating diaphragm, and a receiving-telephone consisting of a magnet of horseshoe or equivalent form, having a coil or helix on each pole and a vibrating diaphragm common to both poles and separate from the vibratory diaphragm of the transmitter.

2. In a telephonic instrument, the combination, substantially as hereinbefore described, of a transmitter provided with a variable resistance consisting of a layer of granulated conducting material confined in a disintegrated state between two metallic plates, one of which is a vibrating diaphragm, and a receiving-telephone consisting of soft-iron cores carrying helices, the said cores mounted upon and connected together by a soft-iron yoke or keel piece, the whole forming a neutral or electro magnet operating only when connected in a battery-circuit, and a vibrating diaphragm or resonant plate common to and actuated by both poles.

3. In a telephonic instrument, the combination of a transmitter provided with a variable resistance and a vibrating diaphragm to operate the same, a receiving-telephone consisting of a bipolar magnet carrying a helix on each pole, said helices being arranged successively in electrical series with the variable resistance, a vibrating plate or diaphragm common to both poles, and a triune mouth-piece, whereby the impact of the sound-waves is evenly distributed to the transmitter and receiving diaphragms simultaneously, and directed immediately upon said diaphragms at the respective centers of electric and magnetic force.

4. In a direct-acting telephonic transmitter, the combination, substantially as hereinbefore set forth, of a variable resistance consisting of granulated carbon or similar conductor, a case for the same consisting of a fixed metallic plate and an extremely thin vibrating diaphragm of any suitable metal, separated from one another by means of an annular shoulder of non-conducting material, and a metallic perforated plate placed over and in contact with the thin-metal vibrating diaphragm, and acting to protect the same and maintain it in position.



5. The combination, in a telephonic instrument, of a battery transmitting-telephone constructed substantially as hereinbefore described and a magneto receiving-telephone having a neutral electro-magnet the helices or coils of which are in direct electrical circuit with the variable resistance of the transmitter and connected in series therewith, as and for the purpose set forth.

6. The combination of a magneto-telephone, a segmental diaphragm therefor, a variable resistance in circuit with the helices of said telephone, means, as indicated, for varying the same, and a case for the whole provided with a cap perforated with a trifurcate speaking or listening tube, all substantially as described.

7. A compound telephone comprising a battery or variable-resistance transmitter, a magneto-electric receiver, and an inclosing-case, said transmitter and receiver being provided with separate diaphragms, and the mouth-piece of the inclosing-case communicating with the space in front of both diaphragms, substantially as described.

252,642. LANTERN. ALFRED L. BAKER, WILLIAM T. RUPPS, and BENJAMIN F. OSGRATHER, Bellaire, Ohio. Filed Aug. 23, 1881. (No model.)

252,642.

Claim.—1. In a lantern, the dividing-band E, located between the globe and upper base-band, outside the former, substantially as described, and for the purpose set forth.

2. In a lantern, the dividing-band E, in combination with the air-passages F and I, substantially as described and shown.

3. In a lantern, the combination of the globe, the air-passages F and I, and the dividing-band E, substantially as described and shown.

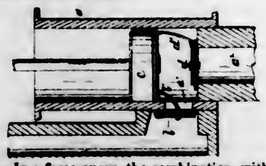
4. In a lantern, the combination of the globe, the air-passages F and I, the dividing-band E, and the air-chamber R, substantially as described and shown.

5. In a lantern, the combination of the air-chamber R, the dividing-band E, and the air-passages F and I, O and S, constructed and arranged substantially as described and shown.

6. In a lantern, the dividing-band E, provided with globe-supports *c c c*, substantially as described and shown.

7. In a lantern, the dividing-band E, combined with the globe-guard, substantially as described and shown.

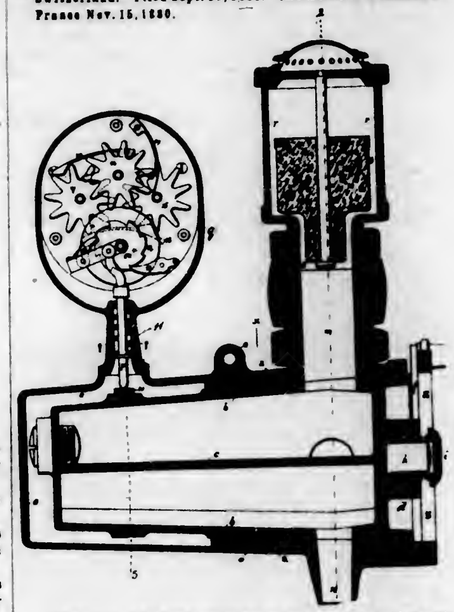
8. In a lantern, the dividing-band E, combined with the globe-guard and the hinge G, substantially as described and shown.



9. In a lantern, the upper base-band, K, with its ear *e*, combined with the locking-spring H, substantially as described.

10. In a lantern, the upper base-band, K, with its hooks *g g g*, and the burner guard-cylinder L, substantially as described.

11. In a lantern, the guard B, without a top wire in whole or part, and with vertical rods B', the upper ends of which are adapted to hinge and lock the reflector, the several parts constructed and arranged substantially as described and shown.



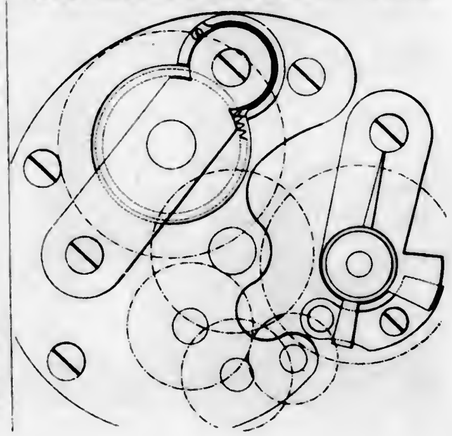
12. In a lantern, the combination of the following elements, viz: a single globe supported only upon detached supports, a dividing-band, an air-passage below such band, an air-chamber below such globe, unobstructed openings into such air-chamber from the interior of the globe and from the external air, and obstructed passages from such air-chamber into the interior of the burner, the several elements constructed and arranged substantially as described and shown.

252,643. PUMP. GEORGE S. BARTLETT, Leon, Iowa. Filed July 16, 1881. (No model.)

Claim.—In a force-pump, the combination, with the valves *b* and *d* and piston *c*, of the tripping-rod *b'*, having one end made fast to the valve *b* and its other end carried through the valve-opening *a'* and bent upward into the cylinder, and the tripping-rod *d'*, having one end made fast to the hinged end of the valve *d* and its other end carried upward into the cylinder to a position about level with the upper end of the tripping-lever *b'*, substantially as set forth.

252,644. MEASURING-FAUCET. J. HEINRICH BLUM, Zurich, Switzerland. Filed Sept. 18, 1881. (No model.) Patented in France Nov. 15, 1880.

Claim.—1. The liquid-measure made as a cock provided with a hollow plug which is divided into two chambers by a partition running in the plane of the long axis of the plug, substantially as specified.



2. The barrel *a*, having openings 1 2, in combination with the plug *b*, partition *c*, openings 3, 4, 5, and 6, and supply and delivery pipes, substantially as set forth.

3. The combination of the barrel *a*, with openings for water and for air, with the plug *b*, with openings for water and for air, and the partition *c*, substantially as and for the purposes set forth.

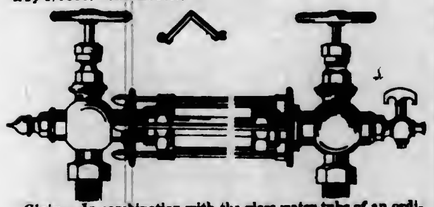
4. In combination with the barrel *a*, plug *b*, having openings therein, as set forth, for the passage of the liquid to be measured, the float *s*, and valve *u*, case *r*, and tongue *y*, for preventing the entrance of air to the holder when filling the chamber of the cock, as set forth.

5. The chambered plug *b* and eccentric 10, in combination with the spring-rod *p* and registering mechanism, substantially as set forth.

252,645. CLICK-SPRING FOR WATCHES. ANTOINE L. G. BURE, Geneva, Switzerland. Filed Sept. 12, 1881. (No model.)

Claim.—The click and curved spring made in one piece, in combination with the segmental bearing around which the curved spring passes, substantially as specified.

252,646. MANIFOLD COPYING-BOOK. JOHN R. CARTER, Toronto, Ontario, Canada. Filed Nov. 8, 1881. (No model.)



Claim.—A blank-leaf check-book composed of double leaves, one half of which are bound together, while the other half fold in as fly-leaves, both being perforated across, so that they can readily be torn out, and the black leaf bound into the book next to the cover, and provided with the tape secured across its end, the said black leaf having the transferring composition on one of its sides only.

252,647. NUT-LOCK. BENJAMIN F. GLICK, Grenola, Kans. Filed Nov. 8, 1881. (No model.)

Claim.—The combination, with the screw-bolt A, having a suitable shoulder or groove, *e*, of the screw-nut B, having connected thereto a suitable spring-pawl, *b*, said nut having a dovetailed recess, *f*, for the reception of the dovetailed guard-plate C, having opening *g* for the insertion of a key, substantially as and for the purpose specified.

252,648. WATER-GAGE. JOHN COOK, Chicago, Ill. Filed May 4, 1881. (No model.)

Claim.—In combination with the glass water-tube of an ordinary steam-gage, the within-described reflector, consisting of two upright reflecting-surfaces arranged at or about right angles to each other, with their inner vertical edges abutting and their outer edges standing apart, to reflect the light in diagonal lines and increase the sight without increasing the diameter of the gage-glass, substantially as described.

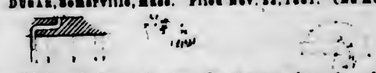
252,649. JUG. JOSEPH COOK, Akron, Ohio, assignor of one-half to the Akron Stoneware Company, same place. Filed Oct. 13, 1881. (No model.)

Claim.—1. A jug having on its top a mouth or nozzle and two or more lugs, the tops of the mouth and lugs being in a plane parallel to the bottom, substantially as and for the purpose hereinbefore set forth.

2. A jug having at its top a mouth, a vent, and two lugs, the tops of said mouth, vent, and lugs being in the same plane and parallel to the bottom of the jug, substantially as shown, and for the purpose specified.

3. A jug provided upon its top with projecting lugs or bosses the tops of which are in a plane parallel to the bottom, substantially as shown, for the purpose specified.

252,650. COUNTERSINK ATTACHMENT FOR AUGERS. CHAS. W. CUTTER, Erie, Pa., assignor of one-half to URIAH E. LOMAS, same place. Filed Aug. 26, 1881. (No model.)



Claim.—1. A countersink-cutter made of two flat pieces having their cutting-edges located as shown, and for the purpose set forth, in combination with clamping-screws, substantially as described.

2. A countersink-cutter having a gage provided with a solid body, and held in place by the heads of two clamping-screws, which admit of the vertical adjustment and removal of the gage without removing the screws, all substantially as and for the purposes set forth.

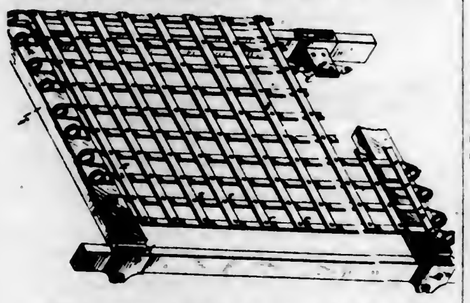
3. A countersink-cutter consisting of two plates having their cutting-faces located as shown, a gage provided with an imperforate body, and all held in place by clamping-screws placed on each side of the auger, substantially in the manner described, and for the purpose set forth.

252,651. VALVE-GEAR FOR STEAM-ENGINES. EBENEZER DUNBAR, Somerville, Mass. Filed Nov. 23, 1881. (No model.)

Claim.—1. In a valve-gear for steam-engines, the valve and its stem and actuating-eccentric, combined with multiplying connecting mechanism between the said eccentric and valve-stem, arranged as described, whereby the effective movement of the valve across its seat is more rapid than that derived directly from the eccentric, and the valve has no effective movement during a portion of the movement of the said eccentric, substantially as and for the purpose set forth.

2. The combination of the eccentric and rod and gear connected therewith, to be oscillated thereby, with the pinion and wrist-pin and valve-stem connected therewith, the said pinion and gear being properly proportioned to cause the wrist-pin to oscillate in an arc greater than half a circle, whereby the movement of the valve from one to the other extreme position occupies less time than the stroke of the piston, substantially as and for the purpose described.

252,652. ALTERATIVE AND TONIC BITTERS. DANIEL W. EDWARDS, Beloit, Wis. Filed Nov. 18, 1881. (Specimens.)



Claim.—The herein-described composition of matter, constituting a new medicinal compound to be used for the purpose of the treatment and cure of the diseases or ailments mentioned in the foregoing specification, and to be administered in doses substantially as hereinbefore specified, consisting of the ingredients stated in the foregoing formula and substantially in the proportions set forth, to wit: fluid extract of hops, one pound; fluid extract of red cinchona, eight ounces; fluid extract of sarsaparilla, six ounces; fluid extract of dandelion, six ounces; fluid extract of burdock, six ounces; fluid extract of yellow dock, six ounces; fluid extract of golden seal, six ounces; fluid extract of mandrake, four ounces; oil of winter-green, three-fourths of an ounce; oil of sassafras, three-eighths of an ounce; oil of lemons, three-eighths of an ounce; oil of horse-mint, one-fourth of an ounce; granulated, loaf, or other fine clarified sugar, six pounds; alcohol, (about ninety-four per cent.,) two gallons, with pure water sufficient to make in all twelve gallons.

252,653. MANUFACTURE OF CARBONATE OF POTASSIUM. CHARLES R. ENGEL, Montpellier, (Hérault,) France, assignor to the Society of Carbonate of Potash, same place. Filed Nov. 21, 1881. (No specimens.) Patented in France Dec. 30, 1880.

Claim.—1. The method of producing carbonate of potassium from other salt of potassium by forming a double carbonate of potassium and magnesium in the manner explained and separating the carbonate of potassium from said double carbonate by boiling or by heating in a dry state, substantially as described.

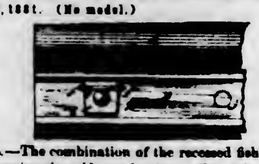
2. The method of obtaining a double carbonate of magnesium and potassium by treating by carbonic-acid gas a mixture of carbonate of magnesium, or free magnesia, with an aqueous solution of a salt of potassium, substantially as hereinbefore described.

252,654. BED-BOTTOM. CALVIN H. FITCH, Middletown Springs, Vt. Filed Nov. 26, 1881. (No model.)

Claim.—1. The bed-bottom A, composed solely of crossed strips of sheet metal united at their intersections by suitable fastenings, so as to be securely held together, and adapted to be hooked to springs to support the same at its ends only, substantially as described.

2. In a bed-bottom, the combination of a bottom proper, spring-hooks to engage and support such bottom at its ends only, end cross-bars to which such spring-hooks are secured, sockets at the ends of such cross-bars, and a framing to which such sockets are bolted to sustain the whole, substantially as described.

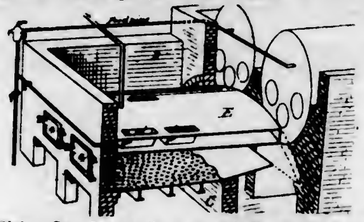
3. The cross-bars of a bed-bottom, provided with sockets, combined with the side rails, abutments thereupon against which the sockets rest, and bolts to lock said sockets and cross-bars upon the rails, substantially as described.



4. The cross-bars of a bed-bottom, adapted to receive the bottom proper, combined with sockets on said cross-bars, the side rails, a plurality of headed pins or their described equivalents arranged upon said rails, and bolts to secure the said sockets in place upon the rails, said pins serving as fulcra for the sockets, which, in applying the bottom to the rails, are used as tension devices to take up the sag of the bottom, substantially as described.

5. The cross-bars of a bed-bottom, provided with sockets to secure them to the side rails, said sockets having side plates to clasp the rails, and slotted connecting-plates, combined with a plurality of abutments on the rails, whereby the adjustment of the cross-bars necessary to take up the sag of the bottom is secured, substantially as described.

6. The cross-bars and a bed-bottom secured thereto, combined with side rails, sockets on said cross-bars to connect the bars and rails, abutments on said rails to effect the adjustment and holding of the cross-bars longitudinally of the rails, and bolts to lock said sockets to the rails and prevent vertical displacement, substantially as described.



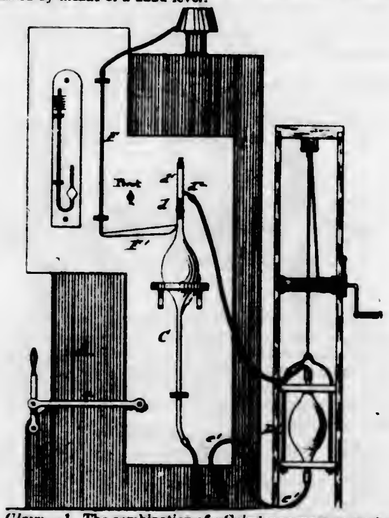
7. The cross-bars to support the bottom of a bed, provided with sockets adapted to straddle the rails, and adjustably secured to said rails by means of superficial abutments on the upper faces of such rails, and bolts engaging such sockets and bearing against the bottoms of such rails, substantially as described.

252,655. NUT-LOCK. JOHN FREDERICK, Pittsburg, Pa., assignor of one-fourth to Charles Frederick, same place. Filed July 27, 1881. (No model.)

Claim.—The combination of the recessed fish-bars B, washer C, having converging sides and recess *e*, the spring-yoke *g*, bolt *h*, and nut *i*, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

252,656. BOILER-FURNACE. JOSEPH GRUBER, Fremont Centre, Mich. Filed Sept. 7, 1881. (No model.)

Claim.—In a furnace, the water-arch E, supported midway between the grate and top of the furnace, and provided with openings *b*, leading to the fire-box and connected to the boiler by suitable pipes, whereby it is adapted to support and dry refuse fuel without burning the same before it passes the feed-openings, and at the same time to heat the feed-water, substantially as shown and described.

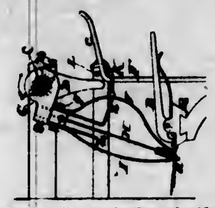


252,657. PIPE-COUPLING. JOSEPH C. GITTENS, New York, N. Y. Filed June 17, 1881. (No model.)

Claim.—In a pipe-coupling, a male member consisting of a tube having formed in its shell, at its inner end, a curved recess, and a female member consisting of a socket provided with an inwardly-projecting pin for engaging the said recess, in combination with a perforated screw-plug inserted into the enlarged part of the socket and a packing-ring surrounding the male member of the coupling and interposed between the end of the screw-plug and the shoulder at the bottom of the enlarged part of the socket, substantially as described.

252,658. VACUUM-PUMP. HENRY GOEBEL, New York, N. Y. Filed Aug. 5, 1881. (No model.)

Brief.—The pump is supported on a pivoted frame, which is oscillated by means of a hand-lever.



Claim.—1. The combination of a Geissler vacuum-pump having a discharge-valve at the upper part and an evacuating-tube connected thereto below the valve with an oscillating supporting-frame and a vertically-movable mercury-reservoir, substantially as set forth.

2. The combination of a Geissler vacuum-pump applied to an oscillating supporting-frame and having a discharge-valve at the upper end, with a mercury-supply reservoir, with pipes for connecting the upper and lower ends of the Geissler pump with the supply-reservoir, and with means for hoisting the latter, substantially as set forth.

3. In a Geissler vacuum-pump, the combination of a Geissler pump, C, having a discharge-valve, *d*, at the upper end, with an evacuating-tube, F, connected thereto below the discharge-valve by a trough-shaped portion, F′, which increases in depth toward the pump and extends at right angles, or nearly so, from the main part of the evacuating-tube F, substantially as and for the purpose set forth.

252,659. EMBROIDERING-MACHINE. CHARLES A. V. GOEBEL-BACH, New York, N. Y. Filed June 18, 1881. (No model.)

Brief.—For feeding of beads or pearls to the embroidering-needles, so that they may be attached to the fabric by the embroidering-threads.

Claim.—1. A bead-feeding device for embroidering-machines, having as its essential elements a stem, H, having a thin curved lower extremity, *f*, opposing springs I J, for controlling the movements of the beads upon the said stem, and means, substantially as described, for giving simultaneous movement to the stem H and springs I J in unison with the movements of the stitch-forming mechanism of the embroidering-machine, all substantially as and for the purpose herein set forth.

2. The combination, in a bead-feeding apparatus for embroidering-machines, of the rock-shaft C, stem H, having a thin curved lower extremity, opposing springs I J, arm K, and a bar or stop, L, the whole combined to provide for the feeding of the beads to the curved lower end of the stem H in unison with the reciprocating movement of the needle of an embroidering-machine, all substantially as and for the purpose herein set forth.

3. The combination, with the double-pointed needle, and of the griping device of an embroidering-machine, of the posts F, having an incline, *e*, the rock-shaft C, having arms D, the stem H, having the thin curved lower extremity, *f*, the opposing springs I J, and a boss, G, or equivalent means for connecting the stem and springs to the rock-shaft, the whole arranged for joint use and operation, substantially as and for the purpose herein set forth.

252,660. PIN-JEWEL HOLDER. FERDINAND GUEBARD, Portland, Oreg. Filed Nov. 23, 1881. (Model.)

Brief.—The balance-disk is laid on *h*, its shaft passing down into slot *f*, and the hole in the disk is placed loosely over the ruby-pin, which is clamped between *b* and *c c*. Shellac is placed on the pin and heat applied to the whole until the proper degree is indicated by the spring-thermometer *g*.

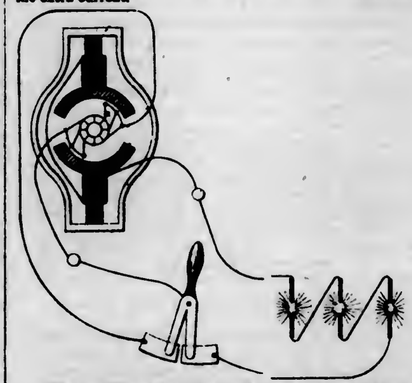
Claim.—A pin-jewel holder consisting of the parts *a b c d e f g h i j* as a whole and in combination, as described, and for the purpose set forth.

252,661. MANUFACTURE OF BOLTS. CHARLES HALL, New York, N. Y. Filed Dec. 2, 1881. (No model.)

Claim.—1. In a machine for forging bolt-heads, a die having a hole of the size and shape of the head, in combination with a plunger that is designedly made sufficiently smaller than the die for a fin to be thrown out around the head for the discharge of the surplus metal from the die, substantially as set forth.

2. The method herein specified of making bolt-heads, consisting in feeding into the machine more of the rod or bar than is required for forming the head, pressing up the bolt-head in the die by means of a plunger, forming a fin around the bolt-head of the surplus metal, and removing such fin and finishing the top of the bolt-head by cutting or grinding after the bolt is delivered from the machine, substantially as set forth.

252,662. CAR-BRAKE. CHARLES HICHAM, Watertown, N. Y. Filed Nov. 26, 1881. (No model.)

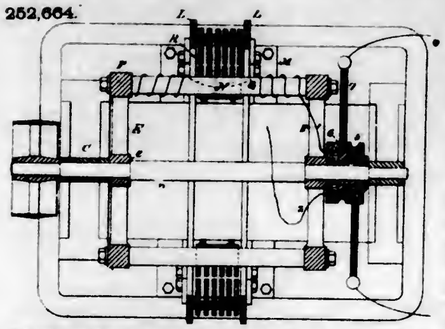


Claim.—1. The brake-shoes and their operating-levers, and a link pivoted at one end to one of the said levers, combined with a movable bearing-block for the other lever mounted in the other end of the said link, and means to adjust its position in said link, substantially as described.

2. The lever and link forked to embrace it and slotted at its end, as described, combined with the bearing-block guided in the said slots, and its adjusting set-screw and threaded socket therefor, held in the end of the said slots, substantially as set forth.

252,663. SHORT-CIRCUITING SWITCH FOR DYNAMO-ELECTRIC MACHINES. WM. HOCHHAUSEN, New York, N. Y. Filed Nov. 7, 1881. (No model.)

Brief.—A switch is arranged to close a short circuit around the field-magnets before breaking the main circuit, thereby weakening the field-magnets and preventing excessive sparking from the extra current.



Claim.—The combination, with a dynamo-electric machine, of a switch for making and breaking the main-line connection with the machine and circuit-connections to said switch, as described, whereby a short circuit around the field-of-force magnets is formed before the main-line connection is broken.

252,664. MAGNETO-ELECTRIC MACHINE. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Sept. 3, 1881. (No model.)

Brief.—The field-magnets are formed of straight bars carrying central pole-pieces and supported at the ends by spider-frames. Coils are wound to produce consequent poles. The magnets so formed rotate within the armature, being excited through the brushes. The armature is formed of several magnetically-insulated annular plates having internal radial projections, about which the generating-coils are wound. These coils may be connected for quantity or tension in any desired order or number. The machine generates alternate currents.

Claim.—1. The combination, substantially as described, of two parallel disks or spider-frames and longitudinal cross bars or rods connecting said frames and wound with sets of magnetizing-helices, connected to one another and to a source of electric energy in the manner described, so as to produce at the middle portion of

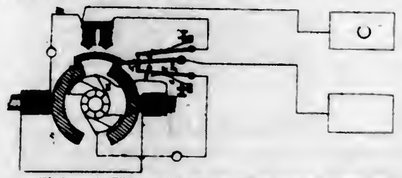
252,664.

the rods consequent poles, alternately north and south, in the successive rods or bars.

2. The combination, substantially as described, of the spider frames or wheels E, the longitudinal cross bars or rods uniting said frames, and two coils or helices wound at right angles to the axis of said bars and separated from one another at the center of the bar, the coils or helices being wound as described, so as to produce a consequent pole at the portion of the bar between them.

3. The combination of the longitudinal rods or bars adapted to receive coils or helices wound at right angles to their longitudinal axis, and pole pieces or projections consisting of a sleeve or casing adapted to embrace the bars and to be secured thereto in any suitable manner, and provided with a number of projecting teeth or polar extensions projecting at right angles from the bars.

4. The combination of the annular embracing rings or plates seated in an opening in the base-plate, and two or more plates secured between said embracing rings or plates, insulated from one another and from the embracing-rings, and provided each with a number of radial projections extending inwardly toward the axis of the machine.



5. The combination of the annular holding-plates L, annular plates P, secured together between the plates L and magnetically insulated from one another, said plates being provided with inwardly-extending radial projections, as shown, and coils or helices embracing said radial projections, as and for the purpose described.

6. The combination, substantially as described, of a number of annular plates secured together, non-magnetic insulating material interposed between the plates, so as to separate them magnetically and at the same time allow the circulation of air-currents, inwardly-extending radial projections upon said plates, and coils or helices embracing said projections, in the manner described.

7. The combination of the plates L, seated in the base-plate of the machine, annular plates P, and angular plates M, substantially as described.

252,665. POLARITY-PROTECTOR FOR DYNAMO-ELECTRIC MACHINES. WILLIAM HOCHHAUSER, New York, N. Y. Filed Nov. 7, 1881. (No model.)

Brief.—The device is designed to protect the field-magnets from reversal by counter-currents, as those from an electrolytic bath. A switch-lever connected with the main line is provided with an armature placed within the magnetic influence of the field-magnet poles, whereby, when the machine is running, contact is made on one side of the lever, closing the main line. Upon the other side of the switch is a contact connected with a safety-branch, in which is an electro-magnet, which, when charged, attracts the switch-armature away from the field-magnets, thereby closing the safety-branch and breaking the main line. The safety-magnet comes into action whenever, by reason of reverse currents, the field-magnets are so much weakened as to allow the switch-armature to fall back. In its normal condition a short circuit for the field-magnets is closed through the safety-branch.

Claim.—1. The combination, with a dynamo-electric machine, of an electro-magnetic switch the armature of which is placed within the attractive influence of the field-of-force magnets of the machine, contact stops or points with which said switch is adapted to make contact in its two opposite positions, said stops being connected, one with the machine and the other with a safety or branch circuit, and an electro-magnet in said branch circuit, all combined as described, so that in one position of the switch the safety-circuit is broken and in the other position the safety-circuit is closed and held closed by the magnet in said circuit, the main or principal circuit from the machine being simultaneously broken.

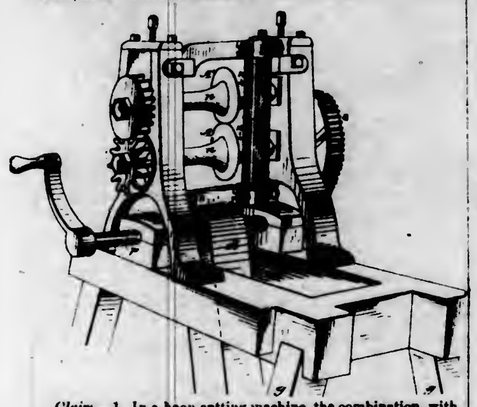
2. The combination, with a dynamo-electric machine, of an electro-magnetic switch actuated in opposite directions in the manner described, contact-stops with which said switch makes connection in its two extreme positions and in its intermediate positions, and circuit-connections to the machine, to the main circuit, and to a safety or branch circuit, all combined as set forth, so that when the switch is in one extreme position the main circuit is closed and the branch circuit broken, when in the other extreme position the branch circuit is closed and the main circuit from the machine broken, and when in an intermediate position a short circuit for the machine is provided.

3. The combination, with a dynamo-electric machine, of a polarity-preserving switch provided with yielding contact devices adapted to close the main or principal circuit to the machine when the switch-lever is in an extreme position under the influence of the field-magnet pole, and to preserve the contact and connection to the machine when the switch-lever is in an intermediate or central position, as described.

4. The combination, with a dynamo-electric machine, of an electro-magnetic switch, centering devices for restoring said switch to an intermediate or central position after having been thrown to one extreme position or the other, and circuit-connections, as described, adapted to furnish a short circuit for the currents generated by the machine when the switch is in such central or intermediate position.

5. The combination, with a dynamo-electric machine, of an electro-magnetic switch adapted to hold the circuit from the machine to the main or principal circuit closed when the machine is running, mechanical retracting devices for said switch, and a contact stop and connections to a safety or branch circuit containing an electro-magnet, said stop being adapted to close the circuit to the branch when the switch is retracted by the mechanical devices.

6. The combination, with a polarity-preserving switch adapted to assume two extreme positions and an intermediate or central position, of yielding contact devices for said switch, both of which are closed when the switch is in an intermediate position, and stops, as described, to prevent the yielding contacts from preserving contact when the switch is thrown to one side or the other of its central position.

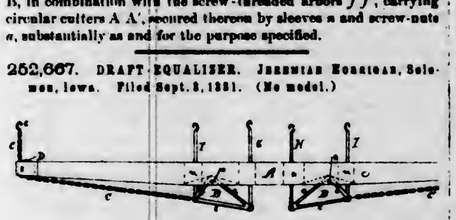


7. The combination, with a dynamo-electric machine, of a polarity-preserving switch, an electro-magnet in a branch or safety circuit for holding the branch or safety circuit closed, and following contacts for the branch circuit adapted to preserve the connection for the branch when the magnet releases its hold upon the switch, substantially as and for the purpose described.

8. The combination, with a dynamo-electric machine, of a safety switch-lever, centering devices for holding said switch-lever in a central or intermediate position, yielding and following contact devices closed when the switch is in its central position and adapted to preserve contact when the lever is drawn to one side, an electro-magnet constantly in the circuit of the machine for carrying the switch in one direction, circuit-connections, as described, to the machine, the line, and a branch circuit, and an electro-magnet in said branch circuit for carrying the switch in the other direction.

9. The combination, with a dynamo-electric machine, of an electro-magnetic switch, an electro-magnet constantly in the main-circuit connection from the machine for holding the switch in one extreme position, an electro-magnet in a branch or safety circuit for holding the switch in another extreme position, centering and retracting devices for holding the switch in an intermediate position or restoring it to such position when released from the influence of its actuating-magnets, and circuit-closing devices operated by the switch for closing the safety-circuit and machine-circuit when the switch is in its extreme positions, and for closing a short circuit for the machine when the switch is in an intermediate position.

10. The combination, with a dynamo-electric machine, of an electro-magnetic switch, an electro-magnet constantly in the machine-circuit for actuating the switch in one direction, an electro-magnet in a branch or safety circuit for holding the switch retracted, and circuit-connections, as described, to the machine, the line, and the safety-circuit, whereby the circuit from the machine to the line is closed in one position of the switch, while in the other position of the switch the latter connection is broken and a connection between the line and the safety or short circuit around the machine is substituted.



252,666. HOOP-CUTTING MACHINE. LEONARD HOLT, Concord, N. H. Filed Nov. 23, 1881. (No model.)

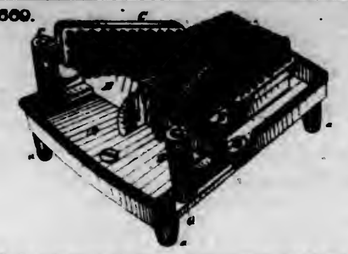
Claim.—1. In a hoop-cutting machine, the combination, with the upright adjustable roller B, of the circular cutters A A', having their edges beveled or inclined, substantially as and for the purpose set forth.

2. In a hoop-cutting machine, the upright adjustable roller B, in combination with the screw-threaded arbors *f f'*, carrying circular cutters A A', secured thereon by sleeves *s* and screw-nuts *a*, substantially as and for the purpose specified.

252,667. DRAFT-EQUALISER. JEREMIAH HOGGATAR, Solomon, Iowa. Filed Sept. 3, 1881. (No model.)

Claim.—In a three-horse equaliser, the combination of the triple-tree A, provided with the sheaves D D, the angle-levers B B, consisting of the long arms *a* and the short arms *b*, and the rods or chains C C F G H I, all constructed and combined to operate substantially as shown, and for the purposes described.

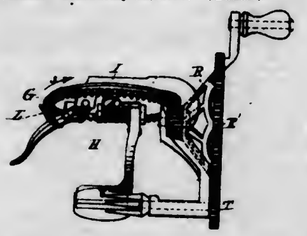
252,668. CLOCK-MOVEMENT. ARTHUR B. HOTCHKISS, Cheshire, Conn. Filed May 27, 1881. (No model.)



Claim.—1. A clock-movement having a front plate, back plate, and intermediate half-plate, and a wheel arranged substantially in the same vertical transverse plane with said half-plate, the latter aiding to support the mainspring and main wheel, substantially as set forth.

2. A clock-movement having three plates, the actuating mechanism being supported by the intermediate and back plates, and the portion of the train between the center wheel and escapement being supported by bearings in the front and rear plates, as described.

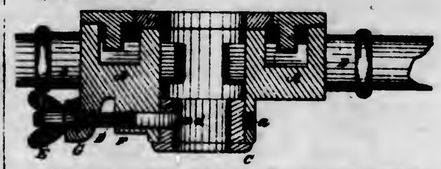
252,669. FOOT-SCRAPER. ROBT. B. HOVEN, Erie, Pa. Filed May 21, 1881. (No model.)



Claim.—1. In a boot cleaning and scraping apparatus, the combination, with the bottom and side brushes, of the frame-work B B' B'', standards E E, with springs G G, and pivoted frames F F, the part B of said frame serving as a scraper, and being provided with a deflector, *b*, and said frame B B' B'' being adapted, substantially as shown, to be attached to a pan or to a floor or door-step.

252,669.

2. In a foot-cleaning apparatus, a sole-scraper having a deflector, *b*, substantially as and for the purposes set forth.



252,670. APPLE-PARER. FREDERICK W. HUDSON, Leominster, Mass. Filed May 12, 1881. (Model.)

Claim.—1. The combination, with the cone-frame R, of gears Q and R', for operating geared table G and gear T, substantially as and for the purposes set forth.

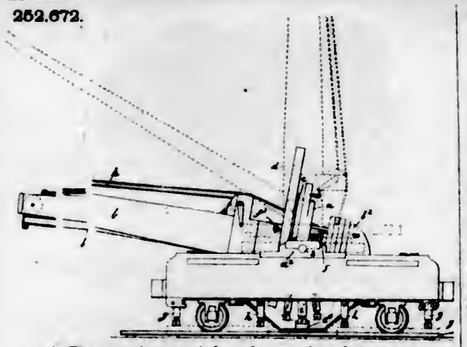
2. The combination of the geared table G, provided with an enlarged socket, and the elevated head of the pivot H of said table, with the cam X and frame I, whereby the knife pivoted to the geared table is actuated, substantially as and for the purpose described.

252,671. PIPE-CUTTING ATTACHMENT FOR SCREW-CUTTING-DIE STOCKS. ALBERT H. JARECKI, Erie, Pa. Filed Apr. 8, 1881. (No model.)

Claim.—1. A die-stock body having on one side of its neck lugs F and G, with openings and sockets, as described, and an opening, *a*, on the opposite side of the neck, in combination with the die D and nut E, substantially as shown.

2. The combination, with a die-stock body having an opening, *a*, on one side of its neck and lugs F and G on the opposite side of said neck, in which lugs are openings and socket, as shown, of a thimble, C, with openings *c* on one side thereof.

3. A die-stock body having lugs or enlargements upon its lower face, in which are openings or recesses for holding a pipe-cutting die and its operating-nut, into which the said die enters by passing through an opening or passage across the neck or central opening of said stock.



252,672. WRECKING AND CONSTRUCTION CAR FOR RAILROADS. LUTHER K. JEWETT, Fitchburg, Mass. Filed Oct. 31, 1881. (No model.)

Claim.—1. The combination, with the car, of a pivoted mast provided with a boom, counterbalanced mast *b b'*, provided with a pivoted boom, *b'*, the mast being adapted to be turned down nearly horizontally when the car is to be run on the track, substantially as described.

2. The car and the weighted or counterbalanced mast and its turn-table, combined with the pivoted ring *a*, substantially as described.

3. The car and the pivoted ring *a* to support the mast, combined with the ring-timbers to lock the ring *a*, substantially as described, when the mast is to be retained in upright position.

252,672.

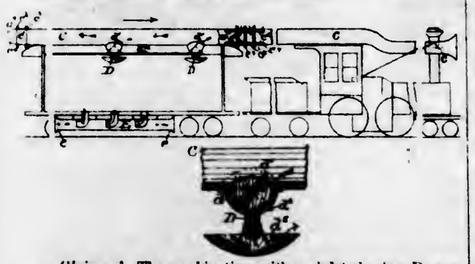
4. The car and counterbalanced mast, pivoted ring to support the mast, and the step-sill, combined with a locking device to engage the lower end of the mast with the step-sill, substantially as described.

5. The car and its attached rack a^4 and the pivoted ring a, combined with the ring-timbers, their worm-gears, and the cords or chains connected with the shaft of the worm-gears to operate them and the ring-timbers, substantially as described.

6. The combination, with the car, of the jack-screws g, pivoted to the corners of the car, substantially as described.

7. The combination, with the car, of the jack-screws g h, pivoted thereto, substantially as described.

8. The combination, with the car and its pivoted jack-screws, of the leveling-blocks g^3, adapted to be sustained by the ties, substantially as described.



9. The car and turn-table and tipping mast, combined with the step-sill, step thereon, and means, substantially as described, to adjust the step on the step-sill.

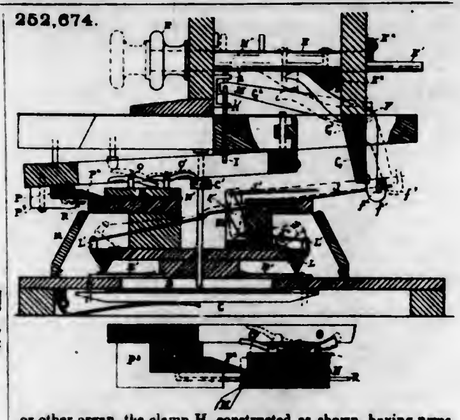
10. The car, turn-table, and tipping mast, combined with the step, step-sill, and jack-screws, connected with the car and with the step-sill, to operate substantially as described.

11. The car, its tipping mast, and boom, combined with the track-timbers m^3, post n^2, and jack-screw n, to operate substantially as described.

12. The car, its tipping mast, boom, and turn-table, combined with the track-timbers m^3, braces F, and suitable screws to hold the said braces and car in proper position, substantially as described.

252,673. VENTILATING CARS. HILTON C. JONES, Green Island, N. Y. Filed Oct. 3, 1881. (No model.)

Claim.—1. The combination, with an inlet air-pipe, D, provided with the head d, as herein described, of the reversible valve d', fixed in the head d and adapted to deflect and govern the entering air-currents, as herein set forth.



2. The combination, with an inlet air-pipe, D, provided with a reversible valve or deflector, d', of the air-distributer d^3, arranged in relation to the pipe D, as and for the purpose herein specified.

3. In an organized system of ventilation for railway-cars, the combination, with a fresh-air-supply pipe, C, constructed and arranged as herein described, and provided with branch pipes D, furnished with reversible valves or deflectors d', of the exhausting air-pipe E, provided with the reversible elbow branch pipes F, and arranged in relation to the supply-pipe C, as and for the purpose herein specified.

252,674. REED-ORGAN STOP-ACTION. WASHINGTON C. KAUFFMAN, Reading, Pa. Filed Oct. 25, 1881. (No model.)

Claim.—1. In combination with the pull-stop frame of a reed

252,674.

or other organ, the clamp H, constructed as shown, having arms h h' and a set-screw, H', in combination with the rocker-bar arm or lever G^3, rocker-bar G, and organ-action bell-cranks F, F', or F^2, rods J J' J^2, lever K, and mutes L, as and for the purpose specified.

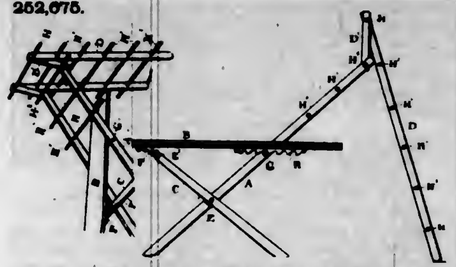
2. In combination with the pull-stops E and modulator-blocks E^2, as described and claimed, the bell-crank F, constructed, as shown, with bifurcated arm and single prong, whereby a single opening of the stop-mute L may be obtained through the operation of the rods J J' J^2, lever K, and mutes L, substantially as shown, and for the purpose described.

3. In combination with the pull-stops E and the modulator-blocks E^2, the bell-cranks F', constructed, as described, with two prongs, whereby, through the operation of two pull-stops upon the same, a full and half or medium opening of the stop-mute L will be produced by a single connection to the mute L, as described, substantially as and for the purpose set forth.

4. In combination with the pull-stops E and the modulator-blocks E', or their equivalent, the bell-cranks F^2, constructed, as shown, with three prongs, whereby, through the operation of three pull-stops upon the same, a very small, medium, and full opening of the stop-mute L will be produced by a single connection to said mute L from the bifurcated end f' through the rods J, J', and J^2, washers f^2, and lever K, to posts L', and mutes L, substantially as described, and for the purpose specified.

5. The combination of the stop-pulls E, provided with the modulator-blocks E^2, with the series of bell-cranks F F' F^2, constructed and arranged, as described, so that a single pull-stop shall have one half of its modulator-blocks seated on a prong of one bell-crank and the other half on a prong of another bell-crank placed alongside of the first, whereby, on drawing the pull-stop, the modulator-block, operating two different bell-cranks, will cause two different stop-mutes to be opened in two different degrees by combination with two different mutes through the rods J J' J^2, lever K, posts L', and mute L, as described, and substantially as and for the purpose set forth.

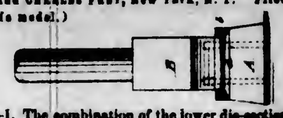
6. In combination with a reed or other organ, a rocker-bar, G, constructed as shown and described, provided with the usual arm or lever, G^3, and having trunnions or bearings G', fulcrum-pin groove G^2, notches G^4, arrester-bar or equivalent G^5, when combined with the bell-cranks F, F', or F^2, rods J J' J^2, lever K, posts L', and mutes L, clamp H, and set-screw H', together with pull-stops E and modulator blocks E^2, substantially as and for the purpose described.



7. In a reed-organ, the combination of the mutes L with the posts L', rods J J' J^2, lever K, and washer f^2, bell-cranks F F' F^2, rocker-bar G, and pull-stops E, substantially as shown, and for the purpose specified.

8. The sole-leather washer or nuts f^2, or their equivalent, in combination with the gripe-pocket f^3 of the bell-cranks F F' F^2, rods J J' J^2, lever K, and mutes L, as shown, and for the purpose specified.

9. The positively-operating radial lever P, with its wedges P^2, fulcrum-pin P', supporting slide P^3, and manipulating-rod R, in combination with the coupler-action of a reed-organ, whereby the octave-coupler is put in and out of connection and retained in either position in a solid state of rest, substantially as shown, and for the purpose described.



252,675. COMBINED IRONING-TABLE AND CLOTHES-BARS. HENRY KUHLER, Eureka, Ill. Filed Apr. 30, 1881. (No model.)

252,675.

Claim.—The ironing-board B, having set-offs F F and ratchet R, in combination with the legs C C, cross-bar E, extended legs A A, having cross-bars G, H', H', and H^3, short strips D' D', and strips D D, having cross-bars H H', substantially as and for the purpose specified.

252,676. DIE FOR STRIKING UP BRACELET-STOCK. FRANK KELLER and CHARLES FEDY, New York, N. Y. Filed June 25, 1881. (No model.)

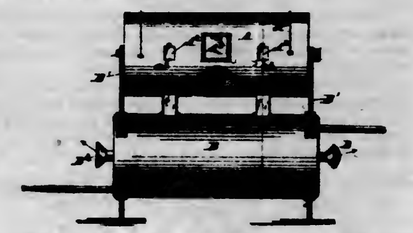
Claim.—1. The combination of the lower die-section, A, having a central raised and corrugated portion, a, a vertical guide-shoulder, b, back of the same, and guide-pins d, with an upper die-section, B, having a corrugated portion, a', a recess, b', of less depth than the guide-shoulder b, back of the corrugated portion a', and socket-holes d', vertically above the guide-pins d, all arranged substantially as and for the purpose set forth.

2. As an improvement in dies for striking up corrugated strips, a lower die-section, A, having a raised corrugated portion, a, and an upper die-section, B, having corrugated portion a', the corrugations of the parts a a' diminishing gradually in width while increasing in height from one end to the other of the dies, in combination with guide and stop devices, by which the motion of the upper die is controlled, substantially as set forth.

252,677. AUTOMATIC FIRE-ALARM. ISIDOR KITSEE, Cincinnati, Ohio. Filed Oct. 25, 1881. (No model.)

Claim.—1. In an automatic fire-alarm, the bed-plate A, provided with swinging arm C, having suitable alarm devices attached thereto, in combination with fusible brace D, as and for the purpose intended, substantially as described.

2. The combination, in an automatic fire-alarm, of an armature and electro-magnet connected to current-wires, with the fusible brace D, and bed-plate A, provided with sounding-alarm, said bed-plate further provided with swinging arm C, carrying a spring-borne clapper and suitable for operating both electric and other alarm devices, substantially as described.



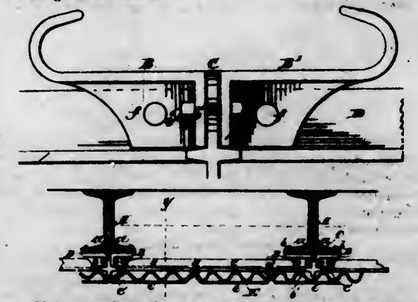
3. In an automatic fire-alarm, the bed-plate A, carrying spring-supported gong A', and swinging arm C, provided with spring-borne clapper c', in combination with fusible brace D, substantially as described.

4. In an automatic fire-alarm operated by melting of fusible connections, the combination of the gong A', provided with inverted sliding cup A^2, and mounted on a vertical post, a^3, provided with helical spring a^4, with tube C', having interior flanges, c^2, and clapper c', controlled by helical spring c^3, substantially as described.

5. In an automatic fire-alarm operated by melting of fusible connections, the combinations of the bed-plate A, having gong A', provided with inverted sliding cup A^2, and mounted on a vertical post, a^3, provided with helical spring a^4, with fusible retaining-key E, and swinging arm C, depending tube C', having interior flanges, c^2, and further provided with gong-clapper c', controlled by helical spring c^3, substantially as described.

6. In an automatic fire-alarm operated by melting of fusible connections, the bed-plate A, provided with spring-supported gong A', and electro-magnet E, connected with current-wires, in combination with fusible brace D, and swinging arm C, provided with armature r, and gong-clapper c', adapted, when operated, to simultaneously sound the gong and make and break electric communications, substantially as described.

252,678. FIRE-ANNIHILATOR. ISIDOR KITSEE, Cincinnati, Ohio. Filed Nov. 7, 1881. (No model.)



Claim.—1. In a gas or vapor fire-annihilator, a magazine adapted to contain chemical ingredients in separation, held in position by fusible connections the rupture of which brings said chemicals into contact, in combination with a receiving-generator, substantially as described.

2. In a fire-annihilator, the combination of a receiving-generator having suitable induction and eduction openings with a vessel divided into compartments for storage of chemical ingredients, which, when combined, generate a required gas or vapor, substantially as described.

3. In a gas or vapor fire-annihilator, the chamber A, divided into compartments, and provided with a gravity-weight, A^2, and weighted eduction-traps A^3, the whole sustained in position by easily-fusible connections, in combination with a receiving-generator, B, provided with suitable receiving-conduits and eduction-openings, substantially as described.

252,679. METALLIC LATHING. ABRAHAM KNISELY, Chicago, Ill. Filed Oct. 13, 1881. (No model.)

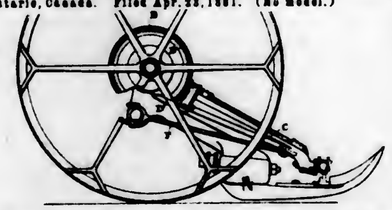
Brief.—The divided clamp is bolted to a plate that is slipped onto the furring, and the lathing is fastened to the furring by wires woven under and over the lathing and passing through holes in the flange of the furring.

Claim.—1. A divided clamp consisting of two sections, B B', adapted to receive and support the furring or angle iron, and to be attached to the girder or beams to furnish a support for metallic lathing, substantially as specified.

2. A divided clamp consisting of two sections, B B', adapted to be attached to the girders or beams, in combination with a plate or support, C, for the furring or angle iron, for securing the furring or angle iron in position, substantially as and for the purposes specified.

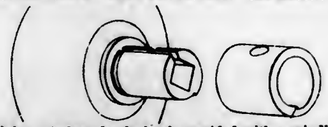
3. The binding-wire e, in combination with the furring or angle iron D, having openings for the passage of the wire e, and metallic lathing E, for attaching the lathing to the furring or angle iron by winding the wires under the lathing and over the furring, substantially as specified.

4. A divided clamp consisting of two sections, B B', and a plate or support, C, in combination with the furring or angle iron D, having openings for the passage of wire, metallic lathing E, and binding-wires e, for securing metallic lathing to girders or beams, substantially as specified.



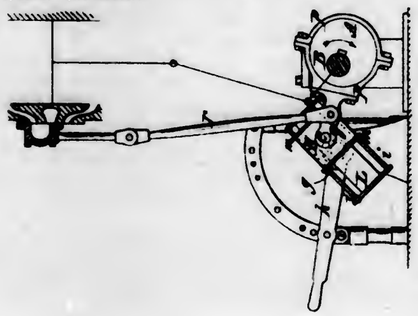
252,680. STAIR-CARPET FASTENER. MAURICE KRIGEL, New York, assignor to himself and William Lang, Brooklyn, N. Y. Filed Dec. 9, 1881. (No model.)

Claim.—1. The combination, with an angular corner-plate, of sliding and pointed pins and mechanism whereby the same are forced in line with the axis of the fastener to the outside of the same, substantially as and for the purpose set forth.



2. The combination of an angular corner-plate, A, having inclined triangular corner portions, *b*, with sliding and pointed pins *d*, guided at the under side of the corner-plate, and actuated by a center pinion intermeshing with rack-shaped shanks of the pins, substantially as set forth.

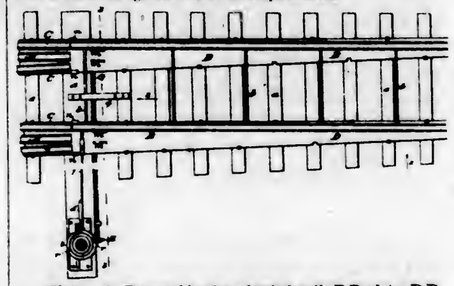
252,681. HARVESTING-MACHINE. LEWIS H. LEE, Toronto, Ontario, Canada. Filed Apr. 23, 1881. (No model.)



Claim.—In a harvesting-machine, the combination, with the differential gearing B B' and vibrating arm C for operating the cutter-bar, of the oblique brace F, arranged underneath said arm, one end of said brace being connected by a ball-and-socket joint to the outer end of said arm and the other end connected by a similar joint to the main frame of the machine at a point below the main axle, whereby the vibrating arm is braced and supported while it is permitted to vibrate, substantially as described.

252,682. KNOB ATTACHMENT. BYRON H. LOCKWOOD, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Oct. 11, 1881. (No model.)

Claim.—A door-knob shank provided with a spindle-socket and with a longitudinal radial slot, and a transverse slot intersecting the longitudinal slot, substantially as set forth, the two slots communicating with the spindle-socket, whereby the shank may be clamped and held firmly upon a door-knob spindle by any suitable means, substantially as set forth.

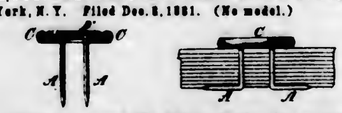


252,683. VALVE-OPERATING MECHANISM. LOUIS C. LUCMAN, Water Valley, Miss., assignor of two-thirds to Julius A. Crowell and Isaac S. Crowell, both of same place. Filed June 6, 1881. (No model.)

Claim.—The combination, with the shaft B, provided with the crank-arm *d*, connected to the piston-slide *f*, and the eccentric A, provided with the strap *p*, having arm *q*, connected by the rod *r* to the valve-stem *v*, of the lever *h*, the rock-shaft *g*, carrying the guide L, provided with the guide-rods *i*, and the slide-block R, provided with the lugs *m*, substantially as and for the purpose set forth.

252,684. RAILWAY-SWITCH. ALEXANDER E. MCDONALD, New York, N. Y. Filed Mar. 1, 1881. (No model.) Patented in Canada Sept. 30, 1879.

Brief.—The fixed portions of the spring switch-rails are secured to the base-plates and ties beyond the same. A locking-handle, which controls lugs for securing the movable rails, enters a notched disk operated by the switch-lever, whereby the movable rails are secured against accidental displacement.

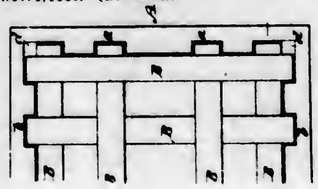


Claim.—1. The combination of switch-rails B B, plates D D, tie-bar *b*, cross-bar *q*, and lugs *m m*, substantially as set forth.

2. The combination of switch-rails B B, pitman *f*, crank *e*, shaft E, disk *s*, notches *r r* therein, lever H, shaft G, ears *m m* thereon, and means for locking the lever H in place when it enters notch *r*, substantially as set forth.

3. The combination, with ears *m m*, plates D D, slotted for the passage of said ears, and switch-rails B B, fastened rigidly to the remote ends of said plates and to the ties beyond, free or unattached for the remainder of their length, and their free ends adapted to be engaged by the lugs *m m*, substantially as set forth.

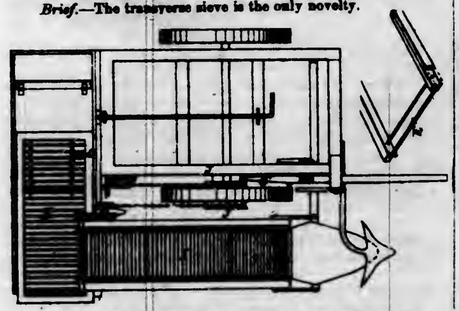
4. A stub-switch consisting of the combination of main track A A, divergent track or tracks C C, base-plates D D, fixed thereto at one end, switch-rails B B, fixed rigidly to the opposite ends of the plates and to the ties beyond the plates, and their portions toward the rails C C being free or unattached to the plates, whereby, when they are sprung to either side to coincide with the divergent rails, the strain thereby caused is resisted by the plates D D, substantially as set forth.



252,685. METALLIC FASTENER. GEORGE W. MCGILL, New York, N. Y. Filed Dec. 8, 1881. (No model.)

Claim.—1. A metallic fastener having its separate shanks formed of round wire with their penetrating ends pin-pointed and their opposite ends pin-headed, as shown, and inserted in the countersunk holes *b b* of the washer or cap, and secured therein by the washer and cap being connected together, as shown, substantially as and for the purposes described.

2. In combination with the separate pin-shanks A, washer B, and cap C, the packing-disk D, inserted between the washer and cap above the pin-heads, substantially as and for the purposes described.



252,686. SPRING. EUGENE A. MCLEAN, West Bay City, Mich. Filed Nov. 4, 1881. (No model.)

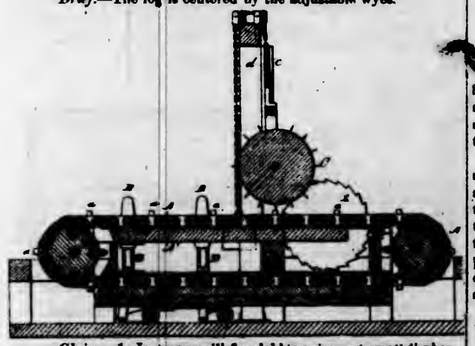
Claim.—The combination, with the strips B, of a uniform size, arranged in pairs alternately at right angles to each other, and having the parallel pairs resting alternately upon the ends and near the center of the pairs, of the box A, provided with the channels or grooves *a b* in its inner walls to receive the ends of the inner plates, and the corner enlargements or channels *d* to receive the ends of both sets of outer plates, substantially as and for the purpose set forth.

252,687. POTATO-DIGGER. JOSEPH J. HEIERDINGER, Cincinnati, Ohio. Filed Mar. 7, 1881. (Model.)

Brief.—The transverse sieve is the only novelty.

Claim.—The transverse sieve E, constructed of side pieces having wires E'', which pass entirely through one side piece and half the distance through the opposite side piece, a cap, E', being adapted to fit over the one side piece covering the ends of the wires, as herein set forth.

252,688. PROCESS OF TREATING HIDE IN THE MANUFACTURE OF COUNTER-STIFFENERS. WILLIAM H. METCALF, Brooklyn, N. Y. Filed May 26, 1881. (No specimens.)



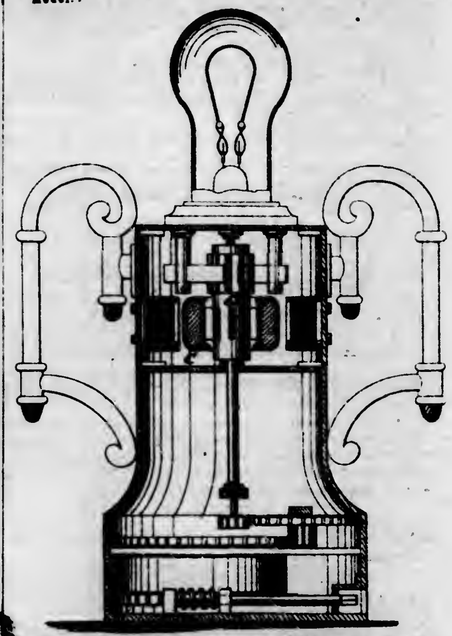
Claim.—1. The hereinbefore-described process for treating or waterproofing hide counter-stiffeners, which consists in saturating with a solution of benzine, paraffine, and drying-oil, as set forth.

2. The composition for waterproofing hide counter-stiffeners, consisting of paraffine, benzine, and linseed-oil, in the proportions substantially as specified.

252,689. CIRCULAR-SAW MILL. CHAS. J. L. MEYER, Fond du Lac, Wis. Filed Sept. 6, 1881. (No model.)

Brief.—The log is centered by the adjustable wyes.

Claim.—1. In a saw-mill for slabbing ties and small timber, the adjustable bed or wyes B' B', in combination with the log-carriage and saws, substantially as and for the purposes shown and described.

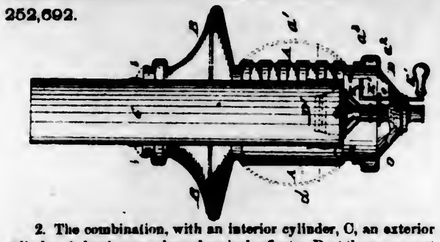


2. The combination, in a mill for cutting ties or small cants, of parallel saws *s s*, chain-carriage A A', the adjustable and reciprocating bed or wyes B' B', and the wheel-dog C, substantially as shown.

252,690. PORTABLE DISTRIBUTING-RESERVOIR. DAVID E. HILLER, Harrisburg, Pa., assignor of one-half to George Winters, same place. Filed Feb. 7, 1881. (Model.)

Claim.—An attachment for trunk-hose of steam fire-engines, consisting of a receptacle provided with a nipple for the attachment of the trunk-hose and with smaller nipples for the attachment of branch hose, whereby the volume of water thrown by the engine may be broken up or its force diminished, substantially as and for the purpose set forth.

252,691. COMBINED ELECTRIC LAMP AND GENERATOR. ELIZABETH MORRY, New York, N. Y. Filed Jan. 10, 1881. (No model.)

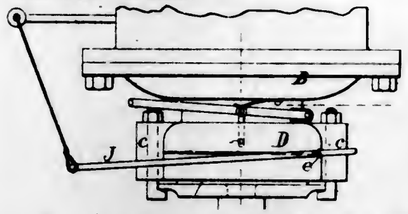


Claim.—1. In a portable electric lamp, the combination of a Siemens or other like electric generator, a spring-actuated motor, and an intermediate spindle common to said motor and generator, all inclosed within the stand of the lamp, and a burner on top of the stand, substantially as described.

2. In a dynamo-electric lamp, the combination of a portable stand, an electric burner located at the top of the same, a spring-actuated motor at the base of the stand, a centrally-arranged vertical spindle actuated by said spring-motor, an armature connected to said spindle, a commutator also connected to said spindle, the field-magnets secured to the sides of the stand, the brushes, the posts of which are rigidly fixed to the inside of the stand, and the circuit-wires leading to the carbon-arch in the vacuum-globe, substantially as described.

252,692. GAS-LAMP. CHAS. W. MUCHALL, Wiesbaden, Germany, assignor to Wm. E. Brashie, New York, N. Y. Filed Dec. 6, 1881. (No model.) Patented in Germany Apr. 20, 1880.

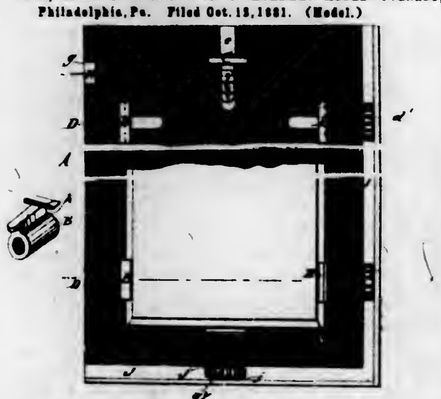
Claim.—1. In a gas-lamp, the combination, with an interior cylinder supported on the gallery of the burner, of an exterior cylinder provided with an enlarged conical reflector at the upper part, of a fixed supporting-cup, and of devices whereby the outer cylinder is retained concentrically to the inner cylinder both at its upper and lower ends, substantially as set forth.



252,692.

2. The combination, with an interior cylinder, C, an exterior cylinder, A, having an enlarged conical reflector, B, at the upper part and a cylindrical contracted portion, *a'*, at the lower part thereof, of a fixed supporting-cup, D, having an annular shoulder, *a²*, and guide-rim *a³*, of centering-springs *a a*, binding upon the lower contracted portion, *a'*, of the outer cylinder, and of a detachable gallery, *b*, retaining the upper end of the same, substantially as set forth.

3. The combination, in a gas-lamp, with the switch of the burner, of a crank-lever, E', applied to the switch and extended below the closed cup D, so as to operate the switch from the outside, substantially as described.

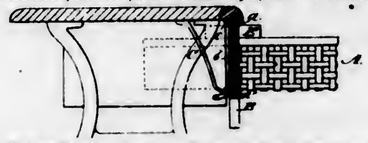


252,693. DRAIN-PIPE DIE. WILLIAM L. OGDEN, Newark, N. J., assignor of one-half to Isaac Ogden, same place. Filed June 7, 1881. (No model.)

Claim.—1. In combination with the vent-passage of a clay-pipe mold or die, a rod closing the passage by a movement at right angles thereto, and mechanism for opening and closing the same by hand, substantially as herein set forth.

2. The combination of the mold D, formed with the slit *a*, and provided with lugs *c c*, for uniting the parts above and below the slit, and the frame J, provided with the wire *e*, arranged to pass through the slit and operated by hand to cut off the finished pipe, as herein shown and described.

252,694. STEREOTYPE-PLATE HOLDER. ANDREW CYBERD, Philadelphia, Pa. Filed Oct. 15, 1881. (Model.)

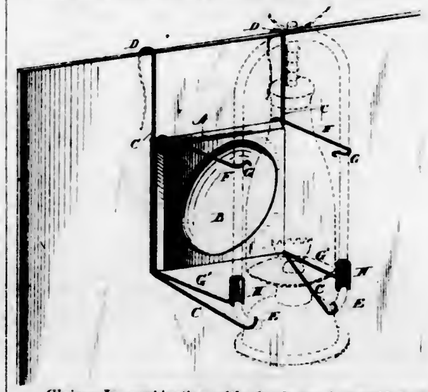


Claim.—1. The combination, with the block A, having slots *f g*, and the gage-block C, having holes *i*, of the headed pin H, pressed by a coiled spring, *k*, and having a reduced end to enter one of the holes *i*, as and for the purpose specified.

2. In combination with the stereotype-block, the right and left hand screw-rods D D and the clamps B B, substantially as and for the purposes set forth.

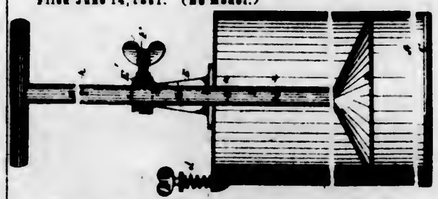
3. The stereotype-block A, formed with the slots *a*, *b*, *c*, *d*, *e*, *f*, and *g*, in combination with the simultaneously-moving clamps B, clamp F, and gage-block C, substantially as and for the purposes set forth.

252,695. SEWING-MACHINE WORK-BASKET. JOS. LE ROY PARKINSON, Cambria, Wis. Filed May 5, 1881. (Model.)



Claim.—The board or wing B, provided with the receptacles A and E, and provided with the perforated corner-plates *a a'*, in combination with the bracket C, screw-plate *c*, and screw bolt or rod *b*, substantially as and for the purposes specified.

252,696. LUBRICANT. WILLIAM PARKINSON, Boston, Mass., assignor to Wm. Sewall Whitney, same place. Filed Dec. 16, 1880. (Specimens.)

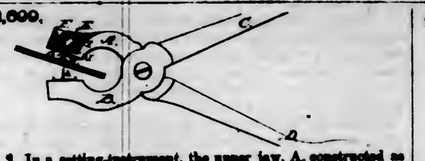


Claim.—A lubricating composition composed of gum-resins, animal or vegetable oils, and pulverized black lead, compounded in the manner and substantially in the proportions described.

252,697. LANTERN-BRACKET. WILLIAM H. PHELPS, Marshall, Mich. Filed June 21, 1881. (Model.)

Claim.—In combination with the frame A, provided with wires C, having hooked ends D and E, the wires F and G', the first mentioned provided with hooks G and the last mentioned with bearings H, the whole adapted to hold a lantern and support the same upon the dash-board of a vehicle or other fixture, substantially as specified.

252,698. BUTTER-CUTTER. JOHN PENSCH, Jr., Erie, Pa. Filed June 14, 1881. (No model.)

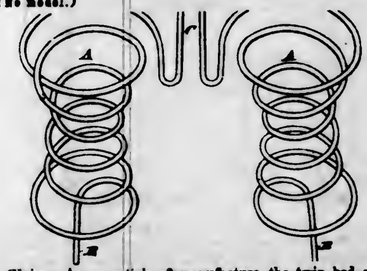


Claim.—In a butter-cutting apparatus, the combination of the cylinder A with yoke E, plunger B with stem B', working through said yoke, and the set-screw F within said yoke, for clamping said stem, substantially as and for the purposes set forth.

252,699. BUTTON-SETTING INSTRUMENT. GEO. W. PERRYCK, Providence, R. I. Filed Nov. 17, 1881. (No model.)

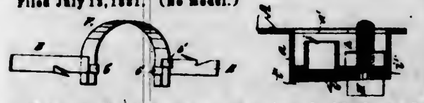
Claim.—1. In a setting-instrument, the upper jaw, A, provided with the recess E, spring I, groove G, and die H, constituting the folding mechanism for the button, substantially as and for the purpose specified.

252,699.



2. In a setting-instrument, the upper jaw, A, constructed as described, in combination with the lower jaw, B, having serrated recess *a*, whereby the button and fastening device are connected together, substantially as specified.

252,700. SHAFT-COUPLING. JOHN H. RIDDLE, Akron, Ohio, assignor to Conrad C. Auble, same place. Filed Nov. 26, 1881. (No model.)



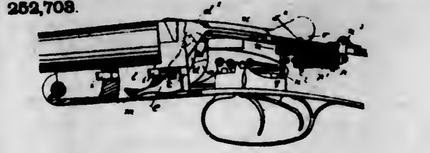
Claim.—A shaft-coupling consisting essentially of wedge-shaped key-seats at or near the ends of the shafts, the least depth being near said ends, a sleeve constructed in one piece to receive said shaft ends, and provided with a keyway, an independent key adapted to enter said keyway and fit the key-seats, and a case surrounding said sleeve and key, the whole constructed and arranged substantially as shown.

252,701. SPRING FOR BED-BOTTOMS. THOMAS A. RHODES and WILLIAM H. RHODES, Paynesville, Ky. Filed Oct. 15, 1881. (No model.)

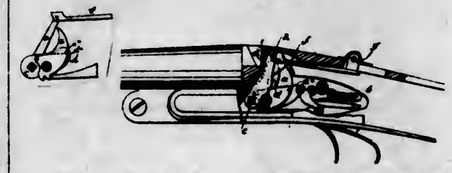
Claim.—As an article of manufacture, the twin bed-spring herein shown and described, consisting of the two oppositely-coiled springs A A, provided with the straight depending terminals B B, and with the connecting portion C, disposed in straight lines terminating in semi-circular curves lying within the lateral extent of the upper coils of each spring, as shown and described.

252,702. WIRE FENCE. HOWARD RUARK, Centre Rutland, Vt. Filed July 13, 1881. (No model.)

Claim.—1. The hollow iron post A, formed with the quadrangular T-slotted chamber *a*, in combination with the bolt H and nut A, washers *i i'*, and the barbed plate B, whereby the barbed plate B or wire is secured to the post, substantially as shown and described.



2. The post A, cast with the T-slotted chambers open one side, in combination with the washers *i* and *i'* and the bolt H and nut A, substantially as and for the purposes set forth.



3. The washer *i'*, formed with the flange *i²*, and the step *j*, in combination with the bolt H, nut A, washer *i*, and the T-slotted chamber of the post, substantially as and for the purposes set forth.

4. In a wire fence, the combination, with the barbed wires or plates B, having split or divided ends, of the spring-cross E, having its ends split or divided, as shown and described.

252,703. BREECH-LOADING FIRE-ARM. HENRY SCOTT, Birmingham, England, assignor to John P. Clabrough, same place. Filed July 28, 1881. (No model.) Patented in England July 10, 1879.

252,703.

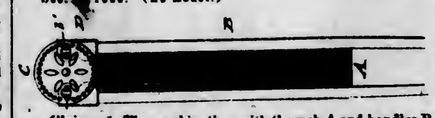
Claim.—1. In drop-down guns, the combination of the internal hammers having side shoulders, *a² a²*, the cross-axis *c*, having at each end a side-shouldered cocking-arm, *d*, and a vertical arm, *e*, and the slide *f*, jointed to the upper part of the arm *e*, as and for the purpose specified.

2. The spring-actuated safety-slide *n*, having peg *n²*, and the spring-catch *s*, in combination with the triggers having shoulders *g*, substantially as shown and described.

3. The spring-actuated catch *s*, provided with stud *s²*, the hand-lever *u*, having recess *v*, and the safety-slide *n*, substantially as shown and described, combined for operation as set forth.

252,704. COMBINED DRILL AND COUNTERSINK. WILLIAM H. SOUTHWICK, New Bedford, Mass. Filed Aug. 26, 1881. (No model.)

Claim.—A metal-boring tool consisting of a cylindrical drill having beveled enlargements on opposite sides of its upper end, provided with a clearance-space between the said enlargements and the drill-shank, and having flutes extending from the point of the drill into the clearance-space, substantially as set forth.

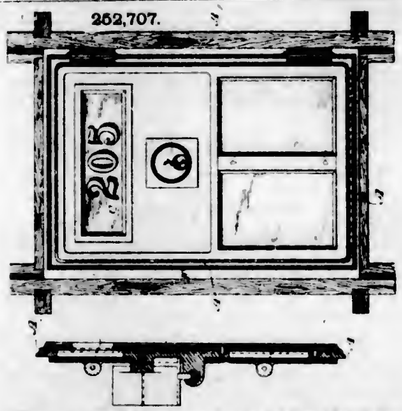


252,705. MILL FOR GRINDING AND REDUCING GRAIN, &c. JOHN STEVENS, Neenah, Wis. Filed Dec. 16, 1879.

Claim.—1. A dress for the rolls of roller-mills, composed of a series of parallel ribs having blunt non-cutting crests and trending lengthwise of the roll.

2. In a grinding-mill, the combination of two rolls driven at different peripheral speeds, and having a dress composed of a series of parallel ribs trending lengthwise of the roll and formed with blunt non-cutting crests.

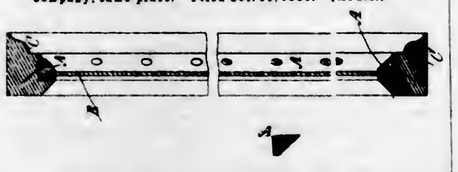
252,706. FAN. CHARLES STRICKROOT, New York, N.Y. Filed Dec. [illegible], 1880. (No model.)



Claim.—1. The combination, with the web A and handles B B of a fan, the latter being provided with end caps or mountings, D, having inwardly-bent and pronged lugs, of center disks, C, having holes equidistantly from the center, through which the prong or prongs are sprung, substantially as and for the purpose set forth.

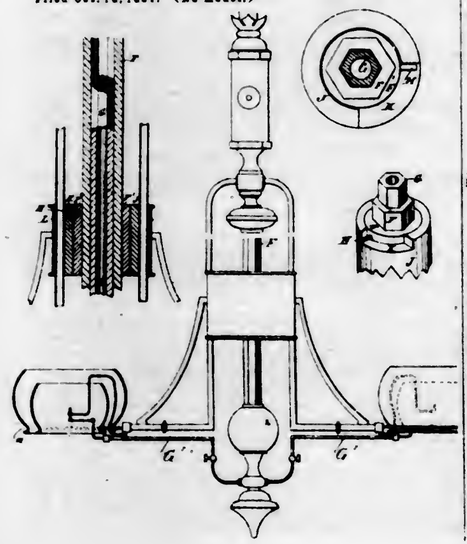
2. An end cap or mounting for fans, having lower fastening side lugs, *a a*, upper side lugs, *b b*, with one or more bent-up prongs, and an end lug, *d*, substantially as shown and described.

252,707. WINDOW-GLASS FASTENER. THEOPHILUS TANNER, Osage, Nebr. Filed June 23, 1881. (No model.)



Brief.—The glass is set in a groove in a rubber strip, the groove being narrower at the top than at the bottom.

252,707.



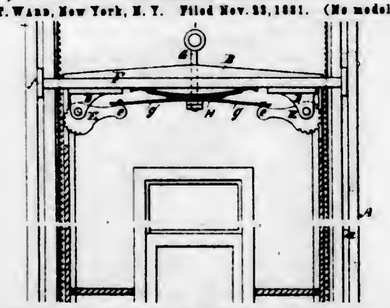
Claim.—As an article of manufacture, a fastener for window-glass, consisting of the rubber strip A, triangular in cross-section, and provided with the groove *a*, narrower at the top than the bottom, to receive and hold the edge of the glass, substantially as and for the purpose set forth.

252,708. POST-OFFICE LOCK-BOX. WARREN H. TAYLOR, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Oct. 10, 1881. (Model.)

Claim.—An improved door for a pigeon-hole, composed of a rim or frame, A, of metal, having in front of it a plate or panel, B, of other material—such as hard rubber, wood, paper, or other like suitable hard substance—substantially as and for the purposes specified.

252,709. DROP-LIGHT CHANDELIER. JOHN TRIGGS, New York, N. Y., assignor to Hester Caroline Triggs, same place. Filed Oct. 18, 1881. (No model.)

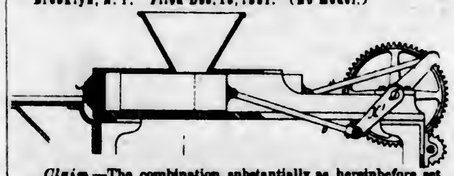
Claim.—1. The combination, with a drop-light chandelier provided with arms carrying burners and globes at their ends, of a sliding drop-light tube provided with arms carrying burners and globes at their ends and fitting into the globes on the fixed arms, substantially as herein shown and described, and for the purpose set forth.



2. The combination, with a drop-light chandelier provided with arms carrying burners and globes at their ends, of a drop-light tube provided with arms carrying burners and globes fitting into the globes of the fixed arms, and of U-shaped bent gas-burner tubes attached to the end of the fixed arms, substantially as herein shown and described, and for the purpose set forth.

3. In a drop-light chandelier, the combination, with the fixed arms and the drop-light arms, of globes on the fixed arms, of globes on the drop-light arms and fitting in the globes on the fixed arms, of U-shaped bent gas-burner tubes at the ends of the fixed arms, and of forked gas-burner tube at the ends of the drop-light arms, substantially as herein shown and described, and for the purpose set forth.

4. In a drop-light chandelier, the combination, with the tube F of the sliding drop-light tube G, of the ring F', the stud H, and the sleeve J, provided with a recess, K, in its upper edge, substantially as herein shown and described, and for the purpose set forth.

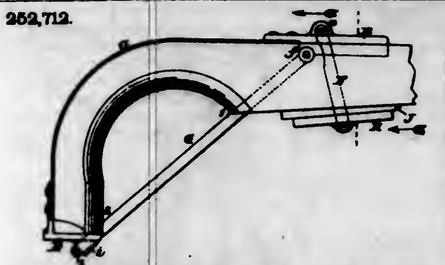


5. The combination, with a sliding drop-light chandelier, of a swinging arm attached to the lower end of the sliding drop-light tube, and carrying a burner and globe fitting within the globe of one of the fixed burners of the chandelier, as described.

252,710. SAFETY ATTACHMENT FOR ELEVATORS. FRANK T. WARD, New York, N. Y. Filed Nov. 23, 1881. (No model.)

Claim.—The combination, with the bars A, having gutters in their side edges and racks on their inner faces, of the cross-head B, having brackets D, and guide-plates with the heads *f*, the cams E, pivoted in said brackets and having arms *e*, the springs *g*, attached to said arms and overlapping each other, the semi-elliptical spring H, and the hoisting-rope eyebolt G, passing through cross-head and springs, substantially as shown and described.

252,711. MACHINE FOR SLOTTING SOAP. JAMES ATKINS, Brooklyn, N. Y. Filed Dec. 16, 1881. (No model.)

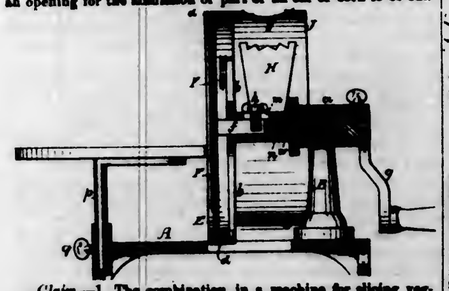


Claim.—The combination, substantially as hereinbefore set forth, of the soap-receptacle constructed with a longitudinal partition dividing it into two compartments, the feed-hopper and delivery-spout common to both compartments of the soap-receptacle, the swinging knife pivoted to the delivery-spout, the plungers working in the compartments of the soap-receptacle, and the crank-shaft imparting to the plunger alternate movements, for the purpose specified.

252,712. BENDING PLOW-HANDLES. GEO. C. AVERY, Louisville, Ky. Filed June 28, 1881. (No model.)

Claim.—1. As an improvement in the art, holding in place the bent portion of the stick or bar by tying together the ends of the curve or curved portion of the stock in substantially the manner described.

2. As a novel contrivance for tying up the bent stock during the usual setting and curing process, the spring-plate C, provided



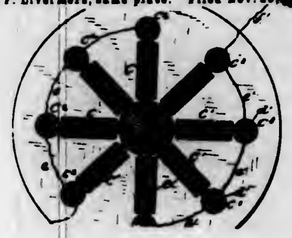
252,712.

at one end with a device for the end of the stick to bear against and at the other end with a slotted bearing-plate, B, in combination with a tie-rod, C, pivoted centrally to said plate and adapted to engage with the device against which the stick end bears, and a clamping-plate, H, and centrally-arranged link-bar F, pivoted at its ends to said plates E and H, all substantially in the manner specified, for the purposes set forth.

252,713. VEGETABLE-CUTTER. GEORGE H. BACKMIER, Philadelphia, Pa., assignor of one-half to Henry R. Shoch, same place. Filed Nov. 26, 1881. (No model.)

Brief.—The knives are attached to a square spindle, which is adjustable in an opening in the driving-shaft to and from the slotted face-plate by means of a set-screw and spring. The driving-shaft has attached to it a serrated knife operating within a hinged segmental guard, which guard is provided at its top with an opening for the admission of part of an ear of corn to be cut.

Claim.—1. The combination, in a machine for slicing vegetables, &c., of a slotted face-plate, means for rotating the same, and knives *f*, adapted to the slots and secured to a spindle of square or other angular cross-section, adapted to a recess of corresponding shape in the shaft of the face-plate, as set forth.



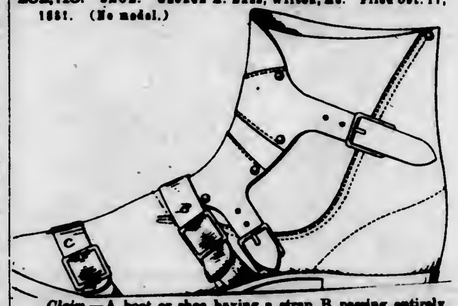
2. The combination of the slotted face-plate and its shaft D, having a recess, *w*, and slot *m*, with the knives F, the knife-spindle *f*, and the thumb-screw A, as set forth.

3. The combination of the slotted face-plate E, the shaft D, having a recess, *w*, and slot *m*, the knives F and their spindle *f*, the thumb-screw A, and the spring *u*, as set forth.

4. The combination of the segmental guard J, having an opening, *y*, with the shaft D, having a radial blade, H, as set forth.

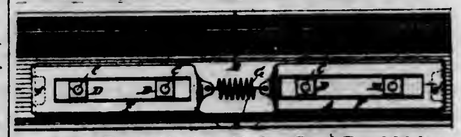
5. The combination of the base A, the face-plate E, the shaft D, having a blade, H, and the segmental guard J, having an opening, *y*, and hinged to the base as described, whereby it can be thrown back in order to expose the shaft and the parts carried thereby, as set forth.

252,714. TRANSMITTER FOR TELEPHONES. SAMUEL H. BARTLETT and HENRY E. WAITE, New York, N. Y., assignors to Charles F. Livermore, same place. Filed Nov. 23, 1881. (No model.)



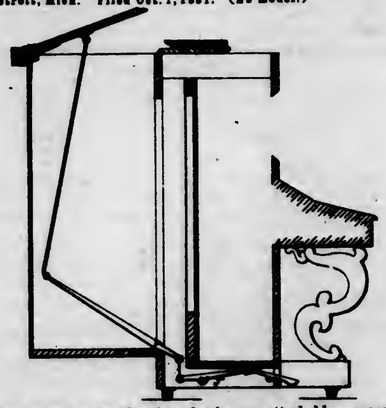
252,714.

Claim.—1. In a transmitter for telephones, a cork floor-supported loosely in its supporting-stand, substantially as described, whereby it is left unhammered and free to vibrate therein, in combination with a microphone suspended from its lower face and receiving its disturbances through molecular action in the cork resulting from the action of the sound-waves impinging upon its surface.



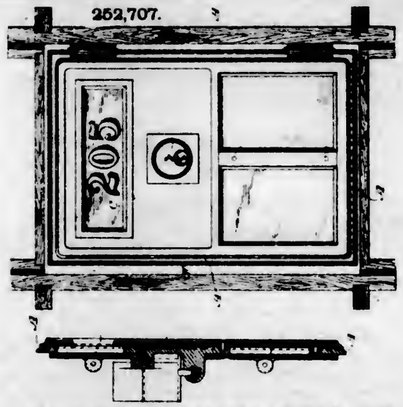
2. The microphone consisting of a central hub, bars or rods radiating therefrom, hollow rings or cylinders mounted thereon, and outer supports for said spokes or rods, connected with each other and with the line-wires, substantially as described.

252,715. SHOE. GEORGE H. BASS, Wilton, Me. Filed Oct. 17, 1881. (No model.)



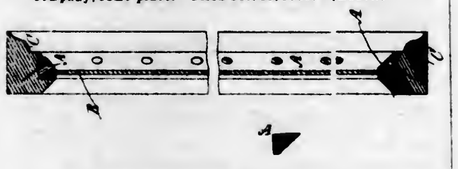
Claim.—A boot or shoe having a strap, B, passing entirely over the instep portion of the upper, and a strap, C, over the toe portion, all substantially as shown and described.

252,716. NUT-LOCK. JAMES C. BRAMER and JOHN M. RICHARDSON, Carthage, Mo. Filed Aug. 15, 1881. (Model.)



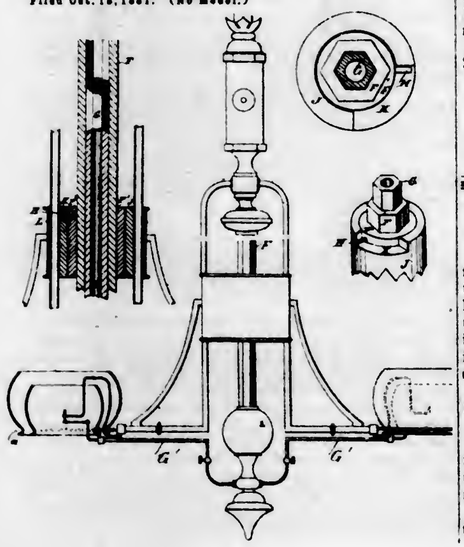
Claim.—The combination, with plates F, nuts D, and fish-bars B, of the spiral spring G, substantially as herein shown and described, whereby the plates F are severally kept in position, as set forth.

252,717. PIANO-CASE. JAMES BROOKS and JOHN P. BROOKS, Detroit, Mich. Filed Oct. 1, 1881. (No model.)



Claim.—An upright piano having an attachable resonant chamber, provided with a swell-lid secured to the apertured rear wall of the instrument, as and for the purpose set forth,

252,707.



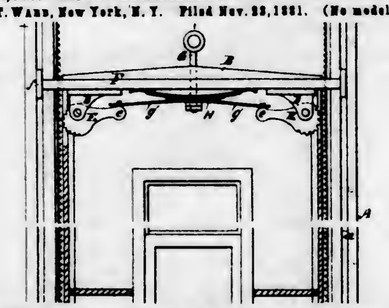
Claim.—As an article of manufacture, a fastener for window-glass, consisting of the rubber strip A, triangular in cross-section, and provided with the groove *a*, narrower at the top than the bottom, to receive and hold the edge of the glass, substantially as and for the purpose set forth.

252,708. POST-OFFICE LOCK-BOX. WARREN H. TAYLOR, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Oct. 10, 1881. (Model.)

Claim.—An improved door for a pigeon-hole, composed of a rim or frame, A, of metal, having in front of it a plate or panel, B, of other material—such as hard rubber, wood, paper, or other like suitable hard substance—substantially as and for the purposes specified.

252,709. DROP-LIGHT CHANDELIER. JOHN TRIGGS, New York, N. Y., assignor to Hester Caroline Triggs, same place. Filed Oct. 18, 1881. (No model.)

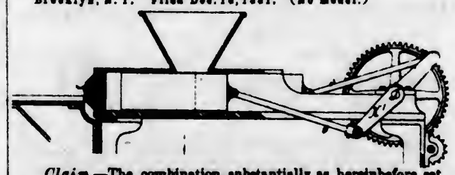
Claim.—1. The combination, with a drop-light chandelier provided with arms carrying burners and globes at their ends, of a sliding drop-light tube provided with arms carrying burners and globes at their ends and fitting into the globes on the fixed arms, substantially as herein shown and described, and for the purpose set forth.



2. The combination, with a drop-light chandelier provided with arms carrying burners and globes at their ends, of a drop-light tube provided with arms carrying burners and globes fitting into the globes of the fixed arms, and of U-shaped bent gas-burner tubes attached to the end of the fixed arms, substantially as herein shown and described, and for the purpose set forth.

3. In a drop-light chandelier, the combination, with the fixed arms and the drop-light arms, of globes on the fixed arms, of globes on the drop-light arms and fitting in the globes on the fixed arms, of U-shaped bent gas-burner tubes at the ends of the fixed arms, and of forked gas-burner tube at the ends of the drop-light arms, substantially as herein shown and described, and for the purpose set forth.

4. In a drop-light chandelier, the combination, with the tube F of the sliding drop-light tube G, of the ring F', the stud H, and the sleeve J, provided with a recess, K, in its upper edge, substantially as herein shown and described, and for the purpose set forth.

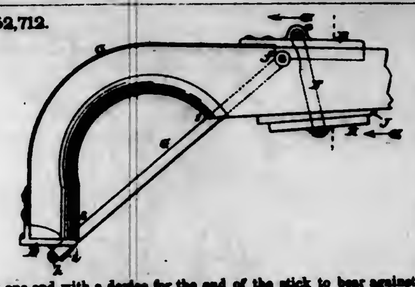


5. The combination, with a sliding drop-light chandelier, of a swinging arm attached to the lower end of the sliding drop-light tube, and carrying a burner and globe fitting within the globe of one of the fixed burners of the chandelier, as described.

252,710. SAFETY ATTACHMENT FOR ELEVATORS. FRANK T. WARD, New York, N. Y. Filed Nov. 23, 1881. (No model.)

Claim.—The combination, with the bars A, having gutters in their side edges and racks on their inner faces, of the cross-head B, having brackets D, and guide-plates with the heads *f*, the cams E, pivoted in said brackets and having arms *e*, the springs *g*, attached to said arms and overlapping each other, the semi-elliptical spring H, and the hoisting-rope eyebolt G, passing through cross-head and springs, substantially as shown and described.

252,711. MACHINE FOR SLOTTING SOAP. JAMES ATKINS, Brooklyn, N. Y. Filed Dec. 16, 1881. (No model.)

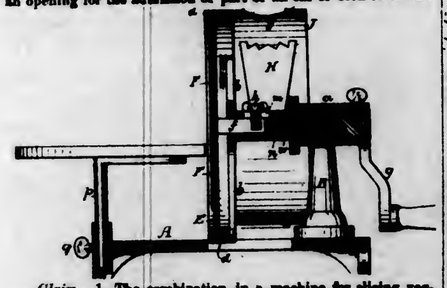


Claim.—The combination, substantially as hereinbefore set forth, of the soap-receptacle constructed with a longitudinal partition dividing it into two compartments, the feed-hopper and delivery-spout common to both compartments of the soap-receptacle, the swinging knife pivoted to the delivery-spout, the plungers working in the compartments of the soap-receptacle, and the crank-shaft imparting to the plunger alternate movements, for the purpose specified.

252,712. BENDING PLOW-HANDLES. GEO. C. AVERY, Louisville, Ky. Filed June 24, 1881. (No model.)

Claim.—1. As an improvement in the art, holding in place the bent portion of the stick or bar by tying together the ends of the curve or curved portion of the stock in substantially the manner described.

2. As a novel contrivance for tying up the bent stock during the usual setting and curing process, the spring-plate C, provided



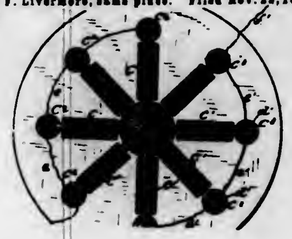
252,712.

at one end with a device for the end of the stick to bear against and at the other end with a slotted bearing-plate, E, in combination with a tie-rod, G, pivoted centrally to said plate and adapted to engage with the device against which the stick end bears, and a clamping-plate, H, and centrally-arranged link-bar F, pivoted at its ends to said plates E and H, all substantially in the manner specified, for the purpose set forth.

252,713. VEGETABLE-CUTTER. GEORGE H. BACKMIER, Philadelphia, Pa., assignor of one-half to Henry R. Shoch, same place. Filed Nov. 23, 1881. (No model.)

Brief.—The knives are attached to a square spindle, which is adjustable in an opening in the driving-shaft to and from the slotted face-plate by means of a set-screw and spring. The driving-shaft has attached to it a serrated knife operating within a hinged segmental guard, which guard is provided at its top with an opening for the admission of part of an ear of corn to be cut.

Claim.—1. The combination, in a machine for slicing vegetables, &c., of a slotted face-plate, means for rotating the same, and knives *f*, adapted to the slots and secured to a spindle of square or other angular cross-section, adapted to a recess of corresponding shape in the shaft of the face-plate, as set forth.



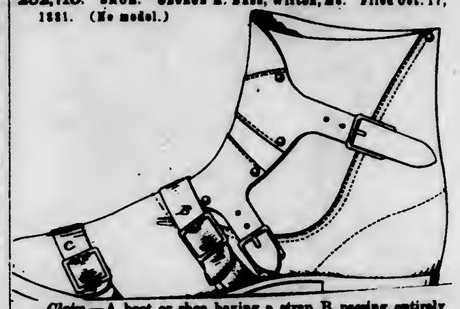
2. The combination of the slotted face-plate and its shaft D, having a recess, *w*, and slot *m*, with the knives F, the knife-spindle *f*, and the thumb-screw A, as set forth.

3. The combination of the slotted face-plate E, the shaft D, having a recess, *w*, and slot *m*, the knives F and their spindle *f*, the thumb-screw A, and the spring *a*, as set forth.

4. The combination of the segmental guard J, having an opening, *y*, with the shaft D, having a radial blade, H, as set forth.

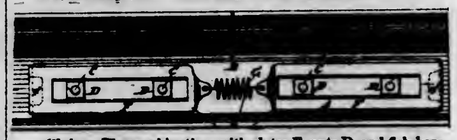
5. The combination of the base A, the face-plate E, the shaft D, having a blade, H, and the segmental guard J, having an opening, *y*, and hinged to the base as described, whereby it can be thrown back in order to expose the shaft and the parts carried thereby, as set forth.

252,714. TRANSMITTER FOR TELEPHONES. SAMUEL H. BARTLETT and HENRY B. WAITE, New York, N. Y., assignors to Charles F. Livermore, same place. Filed Nov. 23, 1881. (No model.)



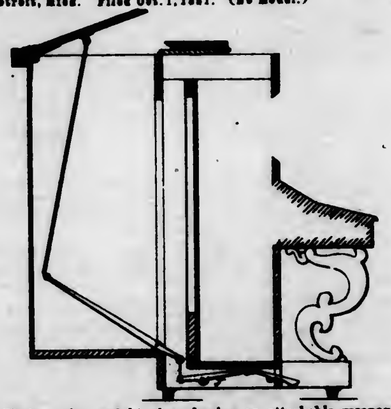
252,714.

Claim.—1. In a transmitter for telephones, a cork floor upheld loosely in its supporting-stand, substantially as described, whereby it is left untrammeled and free to vibrate thereon, in combination with a microphone suspended from its lower face and receiving its disturbances through molecular action in the cork resulting from the action of the sound-waves impinging upon its surface.



2. The microphone consisting of a central hub, bars or rods radiating therefrom, hollow rings or cylinders mounted thereon, and outer supports for said spokes or rods, connected with each other and with the line-wires, substantially as described.

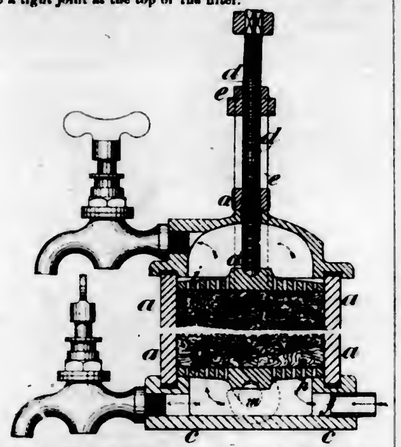
252,715. SHOE. GEORGE H. BASS, Wilton, Me. Filed Oct. 17, 1881. (No model.)



Claim.—A boot or shoe having a strap, B, passing entirely over the instep portion of the upper, and a strap, C, over the toe portion, all substantially as shown and described.

252,716. NUT-LOCK. JAMES C. BRAMER and JOHN H. RICHARDSON, Carthage, Mo. Filed Aug. 15, 1881. (Model.)

Claim.—The combination, with plates F, nuts D, and fish-bars B, of the spiral spring G, substantially as herein shown and described, whereby the plates F are severally kept in position, as set forth.

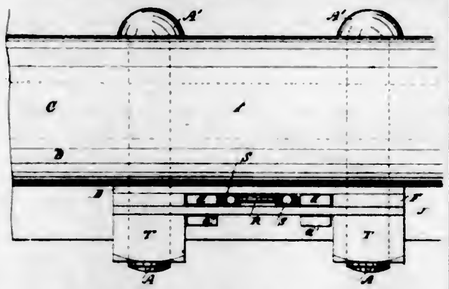


252,717. PIANO-CASE. JACOB BECKER and JOHN P. BECKER, Detroit, Mich. Filed Oct. 1, 1881. (No model.)

Claim.—An upright piano having an attachable resonant chamber, provided with a swell-lid secured to the apertured rear wall of the instrument, as and for the purpose set forth.

252,718. WATER-FILTER. ANDREW BELL, Manchester, County of Lancaster, England. Filed July 5, 1881. (Model.)

Brief.—The filter is provided with a screw which compresses the filtering media, when desired, by means of a movable grid. The screw also operates a bridle, acting to hold the parts together, which hinges on the lugs *m* at the base. The wing-nut *o* assists to make a tight joint at the top of the filter.



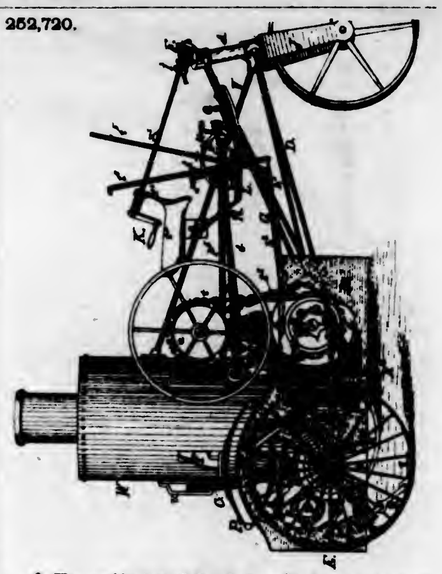
Claim.—1. The combination of the cylinder *a*, adapted to receive filtering media, and the cover and base with a bridle, *e*, hinged to the base, a screw, *d*, and nut *o*, all substantially as described.

2. The combination of the filtering-cylinder, cover, base, and movable grids, between which the filtering media are contained, with a bridle connected to the base, a screw bearing on one of the grids, and a nut on the screw adapted to bear on the cover, all substantially as set forth.

3. The combination of the cover and the recessed base, one having an inlet and the other an outlet, with a reversible cylinder containing filtering media and loose grids, the lower one adapted to rest on the base, substantially as specified.

252,719. NUT-LOCK. ALBERT BERRYHILL, Pittsburg, Pa. Filed Sept. 13, 1881. (No model.)

Claim.—1. In a nut-lock, the combination, with the bolts A and nuts T, of the recessed plate F, the slotted plate J, the blocks O, and the wedge or filling piece R, substantially as herein shown and described, and for the purpose set forth.



2. In a nut-lock, the combination, with the bolts A and nuts T, of the recessed plate F, the slotted plate J, the plate D, the blocks O, and the wedge or filling piece R, substantially as herein shown and described, and for the purpose set forth.

252,720. ROAD-ENGINE. HARRY H. BAIRSTOW, Latrobe, Pa. Filed June 28, 1881. (No model.)

Claim.—1. The combination of the curved axle *a*, pedestals C' C', arch-piece C, sleeve Y, slotted brackets *c' c'*, keeper U, springs P P, and the boiler W, substantially as and for the purposes herein specified.

2. The combination of the axle *a*, gear-wheel *m*, sleeve *w'*, arms S', links S, and the traction-wheel E, substantially as and for the purposes herein specified.

252,720.

3. The combination of the platform P², slotted wheel-cover M, sliding disk *s'*, and the sleeve-hub *w'*, all arranged substantially as and for the purposes herein specified.

4. The combination of the arms S', links S, eyebolts *r'*, sleeves T, springs *i*, and the traction-wheel E, substantially as and for the purposes herein specified.

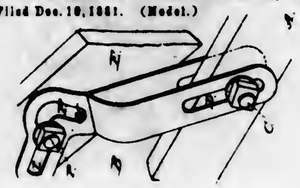
5. The combination of the shaft *v*, sprocket-cone *a k*, smooth cone *c d*, gear *s*, chains *t t'*, tightening *c c'*, and the treadles N O, substantially as and for the purposes shown and described.

6. The combination of the boiler W, brackets *w*, threaded rods D D' G, brace V, sleeve A, and the caster J, substantially as and for the purposes herein specified.

7. The combination of the caster J, worm-gear F, worm I, shaft *x'*, crank K, and the seat *f'*, substantially as and for the purposes herein specified.

8. The combination of the equatorial gear-wheels $m' m^2$, friction-faces $b' b^2$ formed thereon, independent brakes $h^1 h^2$, and the treadles $b^2 b^1$, substantially as and for the purposes herein specified.

9. The steering caster-wheel yoke-sleeve A, having a rearward inclination from vertical at the top with relation to the engine, in combination with the caster-wheel B, provided with a circumferentially-concaved face, substantially in the manner and for the purposes shown and described.

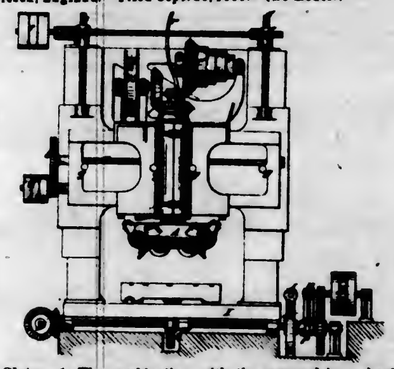


252,721. FRUIT-JAR COVER. GEORGE H. BROWN, New Windsor, Md. Filed Dec. 16, 1881. (No model.)

Claim.—1. In combination with the jar having the inclined ribs *a*, the cover provided with the bails B B and rollers *c*, substantially as set forth.

2. In combination with the jar having the inclined ribs *a*, the cover C, having a central knob and annular track, the bails B B, and rubber-tired rollers *c c*, as set forth.

252,722. PLOW-HANDLE. WILLIAM P. BROWN, Zanesville, Ohio. Filed Dec. 10, 1881. (Model.)

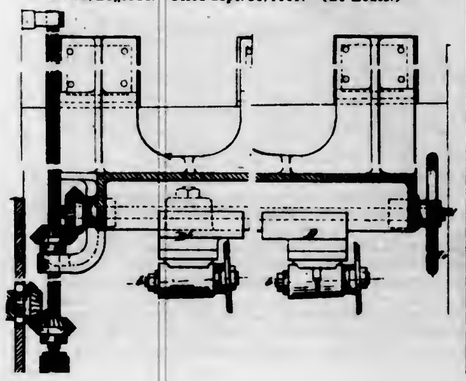


Claim.—1. The combination, with the handle E, beam A, and bolts C and P', of the handle-brace B, having a curved slot in its upper end, formed with an intermediate shouldered head or bearing, substantially as specified.

2. The handle-brace B, having at its upper end the curved slot F, formed with an intermediate shouldered head, G, a rear extension, L, and a forward and downward extension, N, substantially as specified.

252,723. COMPOUND FOR FLAVORING COFFEE. FRANK BACH, San Francisco, Cal. Filed Nov. 29, 1881. (No specimens.)

Claim.—A compound consisting of roasted figs, vanilla, and honey, united in about the proportion and for the purpose herein described.

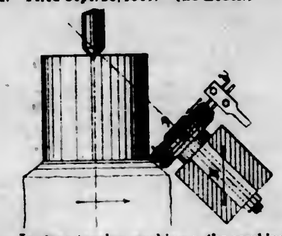


252,724. MACHINERY FOR DRESSING STONE. JOHN D. BRUNTON and FRANK H. J. TRIER, Westminster, County of Middlesex, England. Filed Sept. 26, 1881. (No model.)

Claim.—1. The combination, with the power-driven chuck and positively-driven rotating cutting-disks carried by the same, of means, substantially as hereinbefore described, whereby the lubricant may be introduced into the interior of the chuck through the central shaft which imparts movement to the cutting-disks.

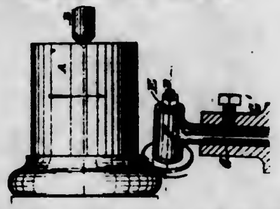
2. The herein-described machinery for dressing stone, comprising the rotating power-driven chuck and positively-driven rotating cutting-disks carried by the same, means, substantially as described, for introducing lubricating fluid to the interior of the chuck, the chuck-carrying slide or slides, and the guides for said slides, arranged and operated as herein set forth, to enable the chuck and cutting-disks to be adjusted in various directions in relation to the stone to be operated on, the stone-carrying table, with means for traversing the same, and rail-tracks for the circulation of the table, with or without devices for varying the tilt or inclination of the chuck, the whole arranged and combined together, to operate in the manner and for the purpose hereinbefore set forth.

252,725. MACHINERY FOR DRESSING STONE. JOHN D. BRUNTON and FRANK H. J. TRIER, Westminster, County of Middlesex, England. Filed Sept. 26, 1881. (No model.)



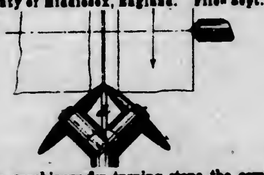
Claim.—1. The combination, with a top-dressing machine, of arris-tools mounted in pivoted adjustable sockets adapted to be set so as to produce arrises either lengthwise or crosswise of the bed or table, and arranged and operated substantially as hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of the tool-holder, the arris-cutter, the pivoted adjustable socket for the same, adapted to be set so as to cause the tool to cut lengthwise or crosswise of the stone, and mechanism for reciprocating the tool-holder crosswise of the stone.



3. The combination of the tool-holders D D', the arris-tools mounted and arranged in the tool-holders in the manner substantially as herein described, the cross-shafts H H', the means for actuating the same, and the bracket on which said tool-holders are supported and move, substantially as hereinbefore set forth.

252,726. TURNING OR SHAPING STONE. JOHN D. BRUNTON and FRANK H. J. TRIER, Westminster, County of Middlesex, England. Filed Sept. 26, 1881. (No model.)

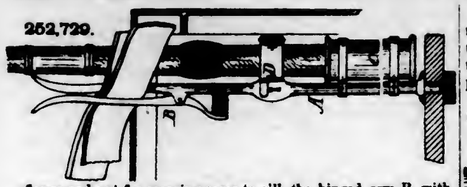


Claim.—In stone-turning machinery, the combination, with a slide-rest, of two or more circular cutters mounted on one and the same axis or spindle and arranged at an angle, so as to take off successive layers or strata of stone, substantially as and for the purpose hereinbefore set forth.

252,727. TURNING OR SHAPING STONE. JOHN D. BRUNTON and FRANK H. J. TRIER, Westminster, County of Middlesex, England. Filed Sept. 26, 1881. (No model.)

Claim.—In machinery for turning stone, the combination, with a holder or a slide-rest, of a circular cutter free to revolve, and arranged with its cutting-edge at such an angle to the revolving stone as to cut or produce concave surfaces, substantially as hereinbefore described and illustrated.

252,728. APPARATUS OR MEANS FOR TURNING OR SHAPING STONE. JOHN D. BRUNTON and FRANK H. J. TRIER, Westminster, County of Middlesex, England. Filed Sept. 26, 1881. (No model.)

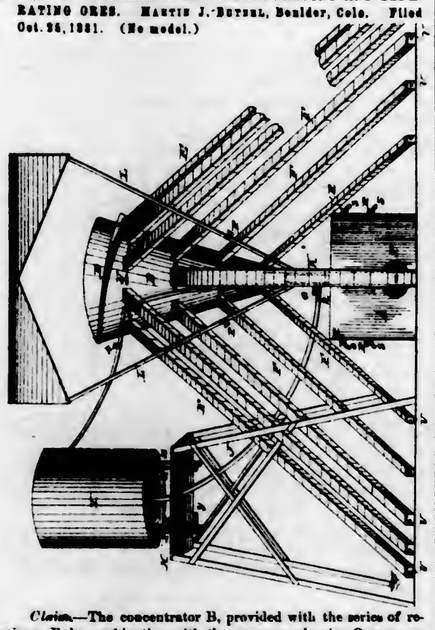


Claim.—In machinery for turning stone, the combination, with a rest or holder, of two circular cutters free to revolve by contact with the revolving stone, and arranged opposite to and at an angle to each other and to the surface of the stone, substantially as and for the purpose hereinbefore described.

252,729. COMBINED WHIP AND REIN HOLDER. HENRY RUSCH, Sprottsville, Ohio. Filed Nov. 11, 1881. (No model.)

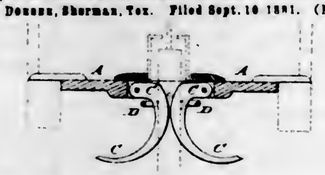
Claim.—The herein-described lock-socket whip-holder and rein-holder combined, and consisting of the rod A, having the

252,729.



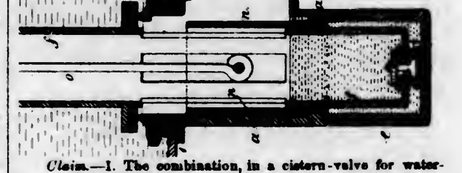
flange and nut for securing same to sill, the hinged arm B, with its spring, forming the rein-holder clamp, the socket C, and the hinged band and lock D, as shown and described.

252,730. INTERCONVERTIBLE CRIB AND TABLE. SANFORD S. BURR, Winnetka, Ill. Filed Nov. 18, 1881. (No model.)



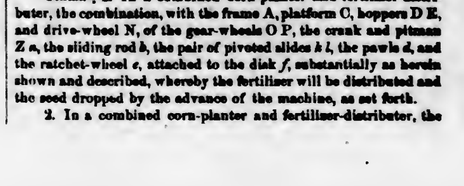
Claim.—An interconvertible crib and table, comprising the crib ends A and the crib sides B and top and shelf D E, adapted to be connected to and interchangeably used with said crib ends in the manner and for the purposes herein specified.

252,731. APPARATUS FOR CONCENTRATING AND SEPARATING ORES. MARTIN J. BUTSEL, Boulder, Colo. Filed Oct. 25, 1881. (No model.)



Claim.—The concentrator B, provided with the series of receivers F, in combination with the water-supply pipe O, ore-conveying pipes L, the water-pipe J, and tank I, the several parts being arranged with relation to each other substantially in the manner as and for the purpose herein shown and described.

252,732. COTTON-PLANTER. ANTHONY W. BYERS and JAMES C. DOBBS, Sherman, Tex. Filed Sept. 10 1881. (No model.)



Claim.—In a cotton-planter, the combination, with the slotted hopper-bottom A, of the hinged and curved cut-off C and the spring D, substantially as herein shown and described, whereby the escape of seed will be prevented except as forced out by the prongs of the feed-wheel, as set forth.

252,733. CARRIAGE-AXLE BOX. FRANK A. GARNER, Brookline, Mass. Filed Dec. 8, 1881. (No model.)

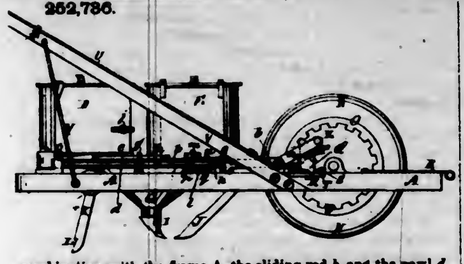
Claim.—The axle-box A, formed with the reduced externally-threaded portion *c*, the enlarged internally-threaded portion *b*, and the oil-groove *a*, in combination with the screw-cap C, secured to the hub B, and the nut or sleeve E, formed with the flange *h'*, the axle being provided with the collars or rings *f*, *g*, and *h* and made shorter than the axle-box, substantially as described.

252,734. VALVE FOR WATER-CLOSET CISTERNS. CLARA E. CARR and GEORGE D. SCOTT, New York, N. Y., Executrix and Executor of William S. Carr, deceased. Filed Oct. 22, 1881. (No model.)

Claim.—The slotted tube *c*, passing through the service-box and forming a valve-seat at its upper end, in combination with the tube *l*, valve *m*, and stopper *n*, the tube *l* being slotted below the valve and above the stopper, substantially as and for the purposes set forth.

252,735. VALVE FOR WATER-CLOSET CISTERNS. CLARA E. CARR and GEORGE D. SCOTT, New York, N. Y., Executrix and Executor of William S. Carr, deceased. Filed Oct. 22, 1881. (No model.)

Claim.—1. The combination, in a cistern-valve for water-closets, of the cylinder *a*, pipe to the water-closet, water-cylinder *c*, tube *f*, valve *h*, around the same, and small valve *i* at the lower end, substantially as and for the purposes set forth.

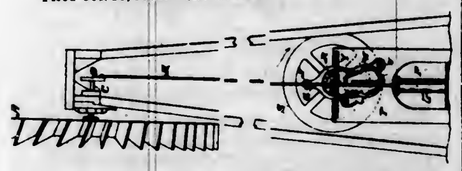


2. The sleeve *n*, sliding upon the slotted portion of the tube *f*, and to which sleeve the wire or connection to the water-closet is attached, in combination with the valve *h*, cylinder *a*, water-cylinder *c*, and seat for the valve *h*, substantially as set forth.

252,736. CORN-PLANTER AND FERTILIZER-DISTRIBUTER. WILLIAM CASSILL, Hamden Junction, assignor to himself and John T. Ogier, Hamden, Ohio. Filed Sept. 5, 1881. (No model.)

Claim.—1. In a combined corn-planter and fertilizer-distributer, the combination, with the frame A, platform C, hoppers D E, and drive-wheel N, of the gear-wheels O P, the crank and pitman Z *a*, the sliding rod *b*, the pair of pivoted slides *k l*, the pawls *d*, and the ratchet-wheel *e*, attached to the disk *f*, substantially as herein shown and described, whereby the fertilizer will be distributed and the seed dropped by the advance of the machine, as set forth.

2. In a combined corn-planter and fertilizer-distributer, the



252,736.

combination, with the frame A, the sliding rod *b*, and the pawl *d*, having a slot in its extended outer end, of the stationary stud *g*, substantially as herein shown and described, whereby the movements of the said pawl are controlled, as set forth.

3. In a combined corn-planter and fertilizer-distributer, the combination, with the pair of pivoted slides *k l* and the sliding rod *b*, of the pins *n o* and *p g*, substantially as herein shown and described, whereby the said slides will be operated to cut off and drop the fertilizer, as set forth.

252,737. WINDMILL-MOTOR. BLANCHARD CHAMBERLAIN, Bellefontaine, Ohio, assignor to Joseph E. Wilson, same place. Filed Oct. 15, 1881. (No model.)

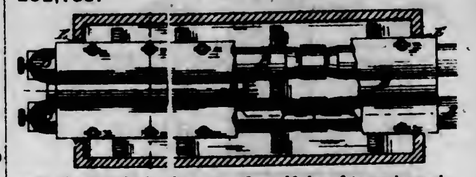
Claim.—1. In combination with the vertical reciprocating rod, the vibrating rack-yoke G, pivoted thereto, and the pivoted guide-arms T T', pressed inward by springs U U', the guide-arms being intermediate of the springs and rack-yoke, substantially as and for the purposes set forth.

2. The combination, with the vertically-reciprocating rod and the vibrating rack-yoke, of the detachable clip L, for pivoting the vibrating rack-yoke to the vertical reciprocating rod, substantially as and for the purposes set forth.

3. The rack-yoke G, formed with cogs *g g'* and studs *h i j*, as set forth.

4. The combination of the vibrating rack-yoke, bearing-plate P, pivoted guide-arms T T', springs U U', central guiding-rib, W, and studs *e*, *e'*, and *h*, substantially as and for the purposes set forth.

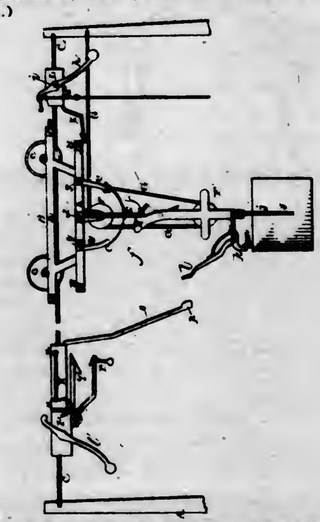
252,738. DEVICE FOR CRUSHING SUGAR, SALT, &c. ERNEST F. CHESEBRO, Willimantic, Conn. Filed Dec. 14, 1881. (No model.)



Claim.—A device for breaking up or crushing crystals, consisting of the spikes or blades C, formed with or connected to the arms B, in combination with the shank *a* and a suitable handle, A, substantially as and for the purpose set forth.

252,739. VULCANIZING INDIA-RUBBER AND GUTTA-PERCHA COVERINGS AND COATINGS OF TELEGRAPHIC CABLES. HENRY A. CLARK, Boston, Mass. Filed Dec. 10, 1881. (No model.)

Claim.—1. The vulcanization of a cable composed of telegraphic or telephonic or electric wires embedded in india-rubber or gutta-percha or other vulcanizable gum, which surrounds and sep-



252,739.

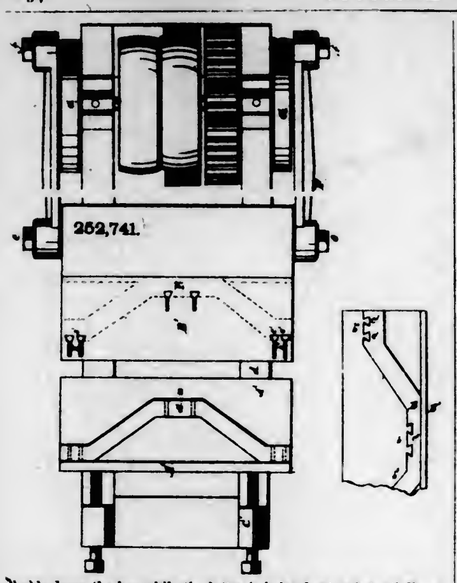
arates the several wires by means of a mold shaped to receive such cable and hold it in a straight position while the india-rubber, &c., is being vulcanized, all substantially as described, for the purpose specified.

2. In the vulcanization of cables for telegraphic or telephonic or electric wires in molds adapted to receive them and confine them in a straight position while being so vulcanized, the projection of such molds at and from each end of the vulcanizing oven or chamber, substantially as and for the purpose described.

252,740. HOISTING AND CONVEYING APPARATUS. FRANCIS A. CLARKSON, Black Rock, Vt. Filed July 16, 1881. (No model.)

Claim.—1. The combination of the carriage B, provided with grooved rollers *c*, the pivoted loop-latches D, and the suspended pivoted bail E, the sheaved hook H, provided with double sheaves F and its pivoted arm, and the ropes G with each other, with the cable C, and with the stopping-blocks L and P, provided with the dumping-block N, substantially as shown and described.

2. The combination of the hook H, provided with the pulley F', bail E, rope G, pulleys F, braces *e*, united by the clevis *f*, with the carriage B, substantially as described.



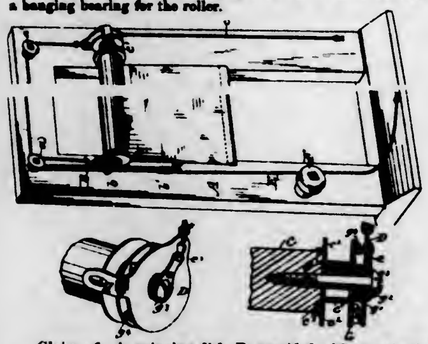
3. The combination of the catch *q* and the pivoted lever-catch *r* with the block P, provided with a clamp that is operated by the levers *l'* to retain the carriage at any desired point on the cable C, for the purpose of manipulating the bucket by means of the ropes G, as herein shown and described.

4. The stopping-block L, provided with a hook-catch, K, clamps *h i*, and loop M, in combination with the cable C, substantially as shown.

5. The combination of the movable dumping-block N, provided with arm *o* and plate *p*, with the block P, clamp *l'*, catch *q*, and pivoted lever-catch *r*, substantially as described.

252,741. MACHINE FOR BENDING AND PUNCHING ARCH-BARS. CHRISTOPHER G. CROSS, Chicago, assignor to Williams, White & Co., Moline, Ill. Filed Aug. 15, 1881. (No model.)

Claim.—1. The dies or formers for making arch or truck bars, consisting of a male and female die or former, each having a straight center, diagonal or oblique sides, and straight ends, the male die having the supporting-plate A', upon which the bar to be bent rests, and the female die having the supporting-plate B', which



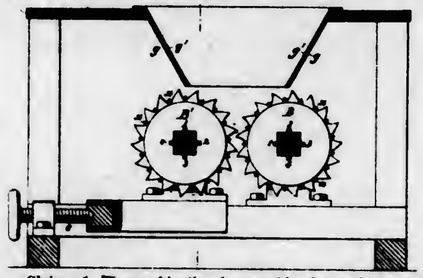
holds down the bar while the latter is being bent, substantially as described.

2. The dies or formers for making arch or truck bars, consisting of the male die A and the female die B, each having a straight center, diagonal or oblique sides, and straight ends, the male die being provided with base or supporting plate A′ and strengthening-plate A″, and the female die being provided with supporting-plate B′ and strengthening-plate B″, substantially as described.

3. The dies or formers for making arch or truck bars, consisting of a male and female die, each having a straight center, diagonal or oblique sides, straight ends, and a supporting-plate, and a back or strengthening plate, as described, the female die having dovetailed grooves to receive and hold punches, and the male die having openings for the punches to enter, between which dies the bar is bent and punched, substantially as described.

252,742. CURTAIN-FIXTURE. JOSEPH DARLING and BRADFORD M. GRISWOLD, Fairview, Pa. Filed Sept. 7, 1881. (No model.)

Brief.—A collar on the cord-spool of the roller passes through a slot in the swinging disk and is journaled in a hanger attached thereto. A projection on the inner face of the swinging disk is moved against projections on the end of the cord-spool to hold the roller in position. The curtain-roller is suspended by a cord fastened at one end to the swinging disk and at the other end to a hanging bearing for the roller.



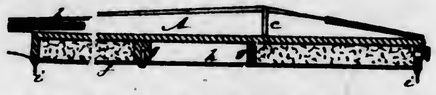
Claim.—1. A swinging disk, D, provided with a projection on its inner face, and having a slotted arm, through which passes the curtain-cord, in combination with a second disk secured to the end of the curtain-roller, and provided with a spool, d', a series of lugs or projections, g', and a collar, g^2, substantially as and for the purpose described.

2. The combination of a swinging disk having a projection, d'', a hanging piece or bearing, e, supported by said disk, a second disk secured to the curtain-roller, and provided also with a collar which passes through a slot in said swinging disk, and a cord passing through a slotted arm in said swinging disk, substantially as described.

3. In a curtain-fixture, the combination of the main cord for supporting the same, a swinging disk to which one end of said cord is attached, a hanging piece or bearing supported by said swinging disk, devices, as specified, for rolling and unrolling the curtain and holding the same in position, and a double knob for securing said main cord, substantially as described.

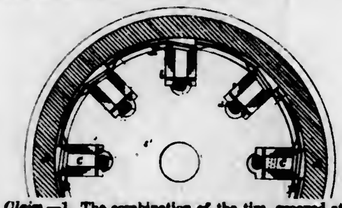
4. The combination of swinging disk D, main cord B, attached thereto, disk G, provided with fastening devices, as specified, guide-piece b, to which the other end of said cord is attached, link b', cord E, and knob F, substantially as described.

252,743. COKE-CRUSHER. JOSIAH E. DAVIS, Greensburg, Pa. Filed May 3, 1881. (No model.)



Claim.—1. The combination, in a machine for crushing coke, of a pair of rolls, each consisting of rings having large teeth with contiguous bases and smaller teeth between said large teeth, as set forth.

2. The combination of the crushing-rollers, each consisting of a series of toothed rings, with a hopper made in two parts, $g\,g'$, each comprising an end plate and side plates, the side plates of one overlapping and being guided by the side plates of the other, whereby lateral expansion and contraction of the hopper are permitted, as set forth.



3. The combination of the angular shaft having a key-seat with toothed rings having corresponding angular openings and key-seats, as set forth.

252,744. VIOLIN. NICHOLAS B. DENNYS, Singapore, Straits Settlements. Filed Nov. 30, 1881. (No model.)

Claim.—A violin in which the board A, the sides $e\,e$, the back board, f, the partitions $g\,g$, and the door h are constructed, arranged, and combined as shown, and for the purpose specified.

252,745. CAR-WHEEL. JOHN V. DIPEMORE, Norwood, Mass. Filed Dec. 15, 1881. (No model.)

Claim.—1. The combination of the tire, grooved at its inner periphery as described, with the wheel-body and the series of spiral springs, arranged in sockets therein and in the tire, as set forth.

2. The combination of the tire, grooved at its inner periphery as described, with the body, the series of spiral springs arranged therein and in the tire, as set forth, and with the series of cams arranged in such body and to operate with the springs, substantially as specified.

3. The combination of the tire, grooved at its inner periphery as described, with the body, the series of spiral springs arranged therein and in the tire, as set forth, and with the cams, screw-bolts, and nuts applied to such body and arranged with the springs, substantially in manner and to operate as shown and explained.

4. The wheel-body, made in sections $a\,a'$ and socketed as described, in combination with the grooved tire and with the springs arranged in the sockets and tire, substantially in manner as set forth.

252,746. PROCESS OF MANUFACTURING BARBED WIRE. THOMAS H. DOBEN and CHARLES G. WASHBURN, Worcester, Mass. Filed Nov. 21, 1881. (No model.)

Claim.—1. The improved process of manufacturing four-pointed barbed wire, consisting in, first, running the ends of two barb-wires diagonally across the wire to be barbed, one on each side thereof; second, coiling said ends into a double coil, F, with the ends D′ and E′ left projecting in opposite directions; and, third, setting back the last-cut ends D and E of the barb-wires against the coils a and b by a sudden and quick blow and straightening out the ends at right angles, or nearly so, to the main wire, for the purposes set forth.

2. In the process of manufacturing four-pointed barbed wires, straightening the barb ends, and setting them back to lock their respective coils by a quick and sudden blow, substantially as described.

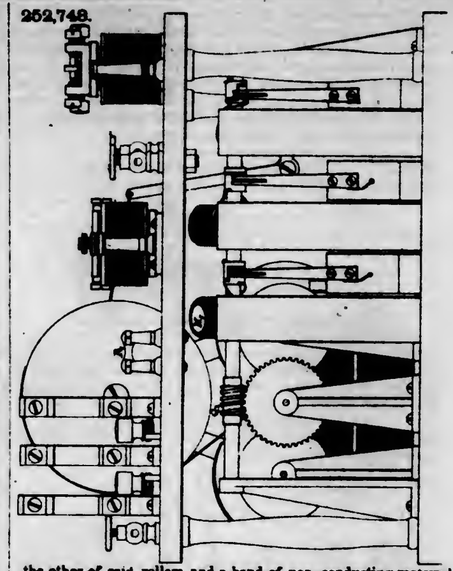
3. A four-point barb for wire-fencing, consisting of two wires spirally coiled with the coils approximately parallel throughout, but having a portion of the last coils at one or both ends slightly bent, as explained, so as to lock the two barb-wires together, substantially as described.

252,747. ANGLE-BRICK AND MOLD. JAMES F. EDWARDS, Washington, D.C. Filed Nov. 22, 1881. (Model.)

Claim.—1. An angle-brick having one of its longitudinal faces equal in length to that of a normal brick, and having a bevel face inclining at an obtuse angle from the plane of said longitudinal face and equal in extent to the width of a normal brick, substantially as and for the purpose described.

2. An obtuse-angled-wall structure composed of rectangular bricks of a normal or definite length and angle-bricks, each of the latter having one of its longitudinal faces equal in length to that of a normal brick, and having a bevel face inclining at an obtuse angle from the plane of said longitudinal face, which bevel face is equal in extent to the width of a full brick, substantially as and for the purpose described.

3. An angle-brick mold constructed substantially as described, and having the inner wall of its side a' equal to the length of a full brick and its side b' equal to the width of a full brick, and having also these two sides jointed together for forming a variable angle, as described.



4. An angle-brick mold having its two sides which form the exposed faces of the brick connected together by an adjustable joint for varying said angle, as described.

5. An angle-brick mold having its two sides which form the exposed faces of the brick connected by a rule-joint with concave and convex edges, as described.

6. An angle-brick mold having its two sides which form the exposed faces of the brick connected by an adjustable joint, and a set-screw for fixing the position of the adjustable section, as described.

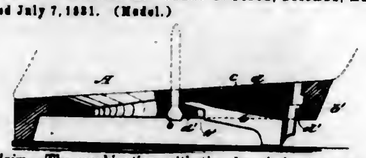
252,748. ELECTRIC LIGHTING APPARATUS. HOSEA W. FARNUM, Newport, R. I., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 19, 1880.

Claim.—1. The combination, substantially as hereinbefore set forth, of a generator of electricity, a circuit of conductors uniting the poles of said generator, one or more electric lamps included in said circuit, a rheostat consisting of flat metallic ribbon which is included in said circuit, two rollers, one composed of conducting and the other of non-conducting material, arranged substantially as described, for winding said ribbon back and forth from one to the other of said rollers, and a band of non-conducting material interposed between the several convolutions of the ribbon upon the non-conducting roller.

2. The combination, substantially as hereinbefore set forth, of a generator of electricity, a circuit of conductors uniting the poles of said generator, one or more electric lamps included in said circuit, a rheostat consisting of a ribbon of conducting material, which is capable of adjustment by being wound from a conducting to a non-conducting roller, and the reverse, and an additional actuating-roller for winding said ribbon in one direction or the other.

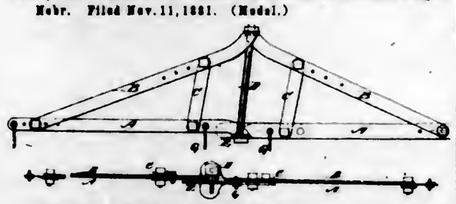
3. The combination, substantially as hereinbefore set forth, of a generator of electricity, a circuit of conductors uniting the poles of said generator, one or more electric lamps included in said circuit, a rheostat consisting of a ribbon of conducting material included in said circuit, which is capable of adjustment by being wound from a conducting to a non-conducting roller, and the reverse, and mechanism for winding said ribbon in one direction or the other, consisting of a roller, a driving-shaft, a shifting-pinion, and two toothed wheels which are driven in opposite directions by the same motor.

4. The combination, substantially as hereinbefore set forth, of a generator of electricity, a circuit of conductors uniting the poles of said generator, one or more electric lamps included in said circuit, a rheostat included in said circuit, consisting of a ribbon of conducting material, the resistance of which is capable of adjustment by winding the ribbon from a conducting to a non-conducting roller, and the reverse, a motor which effects such adjustment by moving in one direction, and a shifting or reversing device controlled by one or more independent electro-magnets, the respective action of which is determined by a regulator actuated by the current which passes through the rheostat.



5. The combination, substantially as hereinbefore set forth, of a generator of electricity, a circuit of conductors uniting the poles of said generator, one or more electric lamps included in said circuit, and a rheostat or artificial resistance (included in said circuit) consisting of a thin flat metallic ribbon having a large radiating-surface.

252,749. PIPE-CUTTER. CHARLES PERTON, New York, N. Y. Filed Oct. 18, 1881. (No model.)

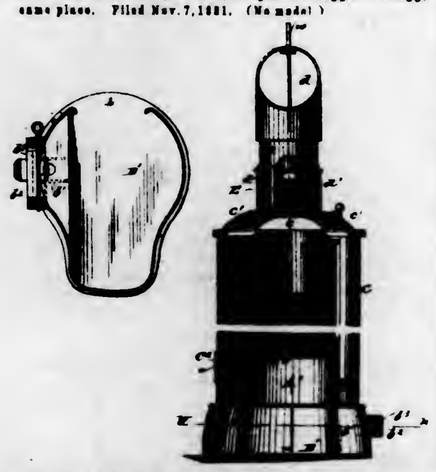


Claim.—The combination of the casing provided with an overhanging stationary jaw, the nut having a threaded bore and a shank arranged within the lower end of the casing, the transverse removable pins extending through the casing and shank of the nut, the movable block arranged within the casing and provided at its upper end with a pipe-cutting device, and a threaded rod extending through the opening in the nut and swiveled to the movable block, all substantially as and for the purpose described.

252,750. HORSESHOE. JAMES B. FINCH, Bozeman, Mont. Filed July 7, 1881. (Model.)

Claim.—The combination, with the shoe A, having recesses *a'*, elastic cushion *c*, and nail *c*, of the removable calk *b*, provided with flanges *b'*, substantially as shown and described, whereby said calk may be removed on withdrawing nail *c* without removing shoe A from the foot.

252,751. HARROW-EVENER. HERMANN H. FISCHER, Osage, Nebr. Filed Nov. 11, 1881. (Model.)



Claim.—1. The herein-described harrow-evener, consisting of two triangular frames hinged together at their bases, as set forth.

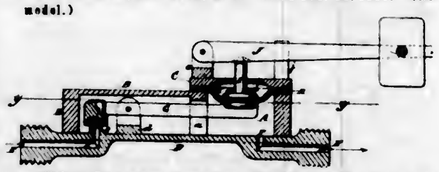
2. In a harrow-evener, the combination, with the harrow-frame F and the double-tree H, of the two triangular frames A B C and the hinging rod D, substantially as herein shown and described, as set forth.

3. An improved harrow-evener, consisting of the triangular frames A B C, hinged together at their bases and provided with the plate E, secured to the under side of one of the bars A, with its end projecting beyond said bar under the end of the other bar, substantially as and for the purpose set forth.

252,752. HEATING AND VENTILATING CARS. MICHAEL D. FITZGERALD, Bloomington, Ill., assignor to Maggie R. Flagg, same place. Filed Nov. 7, 1881. (No model.)

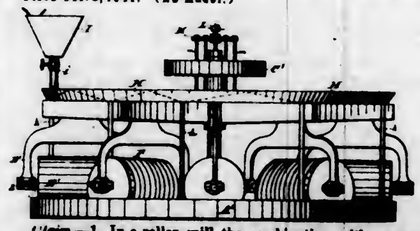
Claim.—1. In a heater and ventilator for cars, the combination of the base-chamber B', having opening *b*, its rear extended portion having ventilating-shaft D, communicating therewith, heater or furnace A, having smoke-pipe a^2, extending through upper portion of ventilating-shaft, casing C, surrounding top and sides of heater or furnace and having openings *c* through the top thereof, and register *c'* and air-chamber *b'*, located in base B, and communicating with space between casing and heater or furnace, and provided with opening b^2 and damper b^3, substantially in the manner, as and for the purpose herein shown and described.

2. In a heater and ventilator for cars, the combination of base-chamber B', having opening *b* and ventilating-shaft D, communicating therewith, heater or furnace A, having smoke-pipe extending through upper portion of ventilating-shaft, surrounding casing C, having registers c' c^2, connecting-pipe E, provided with valve or damper *e*, and air-chamber *b'*, having opening b^2 and damper b^3, said pipe E and air-chamber *b'* communicating with the space between casing C and heater or furnace, substantially in the manner as and for the purpose herein shown and described.



3. In a heater and ventilator for cars, the combination of base-chamber B', having opening *b*, ventilating-shaft D communicating therewith, and having damper or dampers *d'* near its upper end, and movable cowl or hood *d*, heater or furnace A, having smoke-pipe extending through upper portion of shaft D, outside casing, C, having registers c' c^2, pipe E, having valve or damper *e*, and air-chamber *b'*, having opening b^2 and damper b^3, said pipe E and air-chamber *b'* communicating with space between casing and heater or furnace, the several parts constructed and arranged relatively to each other substantially as herein shown and described.

252,753. CIGAR-HOLDER. WM. J. FITZGERALD, New Haven, Conn., assignor to Hobart B. Ives, same place. Filed July 22, 1881. (No model.)



Claim.—The cigar or cigarette holder consisting of the parallel spring-plates A, having each a curved meeting jaw, B, and provided with a compressible spring, C C, between their uniting rivets or points *a*, substantially as and for the purpose set forth.

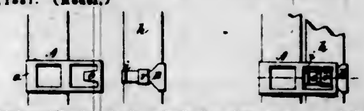
252,754. PNEUMATIC-PRESSURE REGULATOR. HUGH F. FITZPATRICK, New York, N. Y. Filed Feb. 13, 1881. (No model.)

Claim.—In a pressure-regulator, the separately-made bottom plate, D, provided with the valve-channels E F, the inlet-valve seat or nipple *e*, raised above the surface of said plate, and pivoting-lug *d*, in combination with the valve-lever G, fulcrumed to the said lug *d* and provided with valve *g* and diaphragm H, secured directly to the ends of said lever, and with the covers B C, stud I, and weighted lever J, all constructed and operating as shown and described.

252,755. ROLLER-MILL. CHARLES GATES, Brooklyn, Ohio. Filed Oct. 8, 1881. (No model.)

Claim.—1. In a roller-mill, the combination, with a central shaft and a stationary crown-gear, of a series of rolls and pinions and a series of spiral conveyers, said rolls and conveyers being constructed, substantially as described, to receive both a rotary motion on their own axes and a circular motion around the central shaft.

2. In a roller-mill, the combination, with the trough, of a spiral conveyer and a protecting disk or wheel secured to the outer end of the conveyer and of slightly greater circumference than the latter, substantially as set forth.



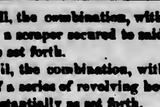
3. In a roller-mill, the combination, with the conveyer and its supporting-arm, of a scraper secured to said arm, substantially as and for the purpose set forth.

4. In a roller-mill, the combination, with a series of spiral conveyers and rolls, of a series of revolving hoppers, H, and a stationary hopper, I, substantially as set forth.

5. In a roller-mill, the combination, with the central shaft, the rolls, and their operating mechanism, of a plate, M, supported by bolts *m* and vertically adjustable, substantially as described.

6. The combination, with the central shaft, of the sleeve C and arms C^2, the supports D, and the rolls adapted to turn on their own axles, and gearing, substantially as described, for revolving said rolls around the central shaft, substantially as set forth.

252,756. CORSET-CLASP. WILLIAM F. GILBERT, Birmingham, Conn., assignor to Alvin E. Hewitt, same place. Filed Nov. 14, 1881. (Model.)

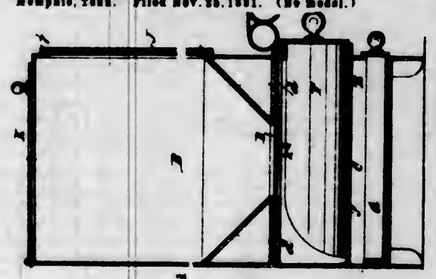


Claim.—The herein-described clasp for corsets, consisting of the one part, A, constructed with tongues or projections *a d*, bent down over the respective edges of the steel, and with a tongue, *c*, in an opening in the portion which extends beyond the edge of the steel, the said tongue projecting toward the steel, combined with the other part, B, constructed with an eye, *r*, to receive the said tongue *c*, and with an upwardly and outwardly projecting shoulder, *i*, to enter the opening in the other part, and with projections to clasp the said part B to its steel, substantially as described.

252,757. FIRE-KINDLER. ERWIN H. GLASKIN, Lower Cape, New Brunswick, Canada. Filed June 10, 1881. (No specimens.)

Claim.—1. The process of producing fire-kindling blocks, which consists in mixing dry sawdust with resin and oil, in the proportions, respectively, of five parts, one part, and one-sixteenth of one part, and then placing the mass in suitable molds and compressing it to the degree of one thousand pounds, or thereabout, to the square inch, for the purpose of compacting it into hard non-friable blocks, as set forth.

2. As an improved article of manufacture, a fire-kindling block composed of five parts sawdust, one part resin, and one-sixteenth part oil mixed together and densely compacted, so that the block is hard and non-friable, as specified.

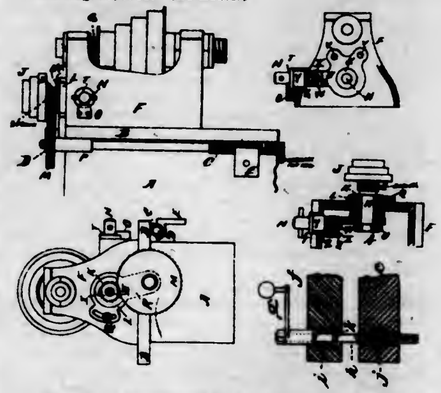


252,758. HOOF-PROTECTOR. JOHN M. GOODMAN, Mill Creek, Pa. Filed Oct. 5, 1881. (No model.)

Claim.—1. The hoof-protector herein shown and described, formed of the oppositely-curved parts A and B, formed of the bottom plates, *a* and *b*, and the side flanges, *c* and *d*, the parts being adapted to be secured to the feet of the animal, substantially as and for the purposes set forth.

2. The parts A and B, formed of the bottom plates, *a* and *b*, and the side flanges, *c* and *d*, and provided with the hook *e* and eye *f*, in combination with the hooked connecting-rod K and the strap H, substantially as and for the purposes set forth.

252,759. CANISTER OR STORE-CAN. DAVID F. GOODYEAR, Memphis, Tenn. Filed Nov. 25, 1881. (No model.)



Claim.—1. The can A, divided into the compartments B and C, in combination with the slide D and removable scoop F, substantially as and for the purpose set forth.

2. The compartment B, having a hopper-shaped bottom, in combination with the slide D and compartment C, having the scoop F, substantially as and for the purpose set forth.

3. The slotted semi-cylindrical sleeve E, secured to the bottom of the compartment B, in combination with the scoop F and the tray G, substantially as and for the purpose set forth.

4. The slotted semi-cylindrical sleeve E, secured under the compartment B, in combination with scoop F, substantially as and for the purpose set forth.

252,760. ENGINE-LATHE. GEORGE A. GRAY, JR., Covington, Ky., assignor to George A. Gray, Jr., & Co., Cincinnati, Ohio. Filed Aug. 26, 1881. (No model.)

Claim.—1. The combination of bed A, having flange B, projecting outward therefrom, carriage-nut E, fitted to engage with the under side of the lead-screw, and the lead-screw C, journaled under the flange B and contacting against the under side thereof, substantially as and for the purpose set forth.

2. The combination of lead-screw C, having gear fitting end D, series of change-gears S, having a constant difference in number of teeth, as specified, stud-bearing K, arm R L, fitted to be adjusted on and around said stud-bearing, idle-gear M, journaled in a fixed position to said arm, stud H, arranged to be revolved by the lathe, as usual, and pinion I, fixed on said stud, and having its number of teeth equal to the constant difference between the gears S multiplied by the number of threads per inch on the lead-screw C, all constructed and arranged to operate substantially as and for the purpose set forth.

3. The combination, with reverse tumbler U and hand-cam N Y Z, of the sliding plug X, fitted to slide in the tumbler U, and having a transverse hole to serve as a bearing for the cam-pin Z, constructed and arranged to operate substantially as and for the purpose set forth.

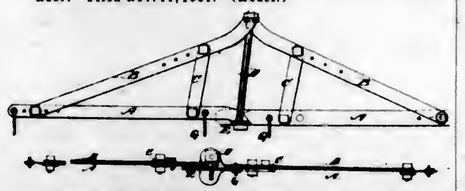
4. The combination, with the reverse tumbler U and hand-cam N Y Z, of the plug X, fitted to slide in the tumbler and to furnish a bearing for the cam-pin Z, and having collar *a*, or equivalent projection, arranged to contact with the tumbler and serve as a stop to the sliding motion of the plug, all constructed and arranged to operate substantially as set forth.

5. The combination, with the reversing-tumbler, of the cam-body Y, having handle N and collar T, of the bearing which supports the cam-body, and the clamp O, bolted to said bearing and fitted to clamp the collar T against said bearing, all constructed and arranged to operate substantially as and for the purpose set forth.

6. The combination, with the lathe-carriage *c*, tilting rest *f*, pivoted above the carriage *c*, and crank-screw *h g*, for adjusting the tilting rest *f*, of the cylinders *i* and *j*, fitted in said carriage and rest, and bored and tapped to serve as bearing and nut for the screw *h*, substantially as and for the purpose set forth.

252,761. STEM-WINDING WATCH. CHAS. W. GROSCHE, New York, N. Y. Filed Aug. 23, 1881. (No model.)

Claim.—1. The combination, with the minute-wheel, the barrel-arbor wheel, the first winding-wheel, the second winding-wheel, and its carrying-lever, of the locking-lever adapted to engage with a stationary catch for holding the wheel-carrying lever in either

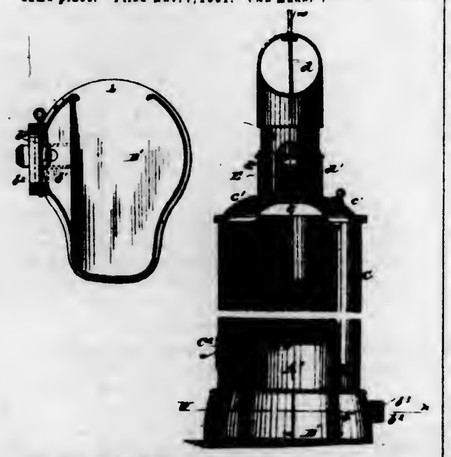


Claim.—The combination of the casing provided with an overhanging stationary jaw, the nut having a threaded bore and a shank arranged within the lower end of the casing, the transverse removable pins extending through the casing and shank of the nut, the movable block arranged within the casing and provided at its upper end with a pipe-cutting device, and a threaded rod extending through the opening in the nut and swiveled to the movable block, all substantially as and for the purpose described.

252,750. HORSESHOE. JAMES B. FINCH, Bozeman, Mont. Filed July 7, 1881. (Model.)

Claim.—The combination, with the shoe A, having recesses *a'*, elastic cushion *c*, and nail *e*, of the removable calk *b*, provided with flanges *b'*, substantially as shown and described, whereby said calk may be removed on withdrawing nail *e* without removing shoe A from the foot.

252,751. HARROW-EVENER. HERMANN H. FISCHER, Osage, Nebr. Filed Nov. 11, 1881. (Model.)



Claim.—1. The herein-described harrow-evener, consisting of two triangular frames hinged together at their bases, as set forth.

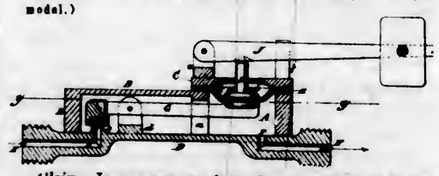
2. In a harrow-evener, the combination, with the harrow-frame F and the double-tree H, of the two triangular frames A B C and the hinging rod D, substantially as herein shown and described, as set forth.

3. An improved harrow-evener, consisting of the triangular frames A B C, hinged together at their bases and provided with the plate E, secured to the under side of one of the bars A, with its end projecting beyond said bar under the end of the other bar, substantially as and for the purpose set forth.

252,752. HEATING AND VENTILATING CARS. MICHAEL D. FITZGERALD, Bloomington, Ill., assignor to Maggie E. Flagg, same place. Filed Nov. 7, 1881. (No model.)

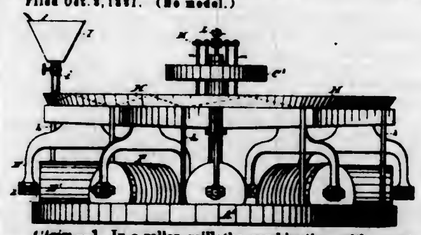
Claim.—1. In a heater and ventilator for cars, the combination of the base-chamber B', having opening *b*, its rear extended portion having ventilating-shaft D, communicating therewith, heater or furnace A, having smoke-pipe a^2, extending through upper portion of ventilating-shaft, casing C, surrounding top and sides of heater or furnace and having openings *c* through the top thereof, and register *c'* and air-chamber *b'*, located in base B, and communicating with space between casing and heater or furnace, and provided with opening b^2 and damper b^3, substantially in the manner, as and for the purpose herein shown and described.

2. In a heater and ventilator for cars, the combination of base-chamber B', having opening *b* and ventilating-shaft D, communicating therewith, heater or furnace A, having smoke-pipe extending through upper portion of ventilating-shaft, surrounding casing C, having registers *c' c²*, connecting-pipe E, provided with valve or damper *e*, and air-chamber *b'*, having opening b^2 and damper b^3, said pipe E and air-chamber *b'* communicating with the space between casing C and heater or furnace, substantially in the manner as and for the purpose herein shown and described.



3. In a heater and ventilator for cars, the combination of base-chamber B', having opening *b*, ventilating-shaft D communicating therewith, and having damper or dampers *d'* near its upper end, and movable cowl or hood *d*, heater or furnace A, having smoke-pipe extending through upper portion of shaft D, outside casing, C, having registers *c' c²*, pipe E, having valve or damper *e*, and air-chamber *b'*, having opening b^2 and damper b^3, said pipe E and air-chamber *b'* communicating with space between casing and heater or furnace, the several parts constructed and arranged relatively to each other substantially as herein shown and described.

252,753. CIGAR-HOLDER. WM. J. FITZGERALD, New Haven, Conn., assignor to Hobart B. Ives, same place. Filed July 22, 1881. (No model.)



Claim.—The cigar or cigarette holder consisting of the parallel spring-plates A, having each a curved meeting jaw, B, and provided with a compressible spring, C C, between their uniting rivets or points *a*, substantially as and for the purpose set forth.

252,754. PNEUMATIC-PRESSURE REGULATOR. HUGH F. FITZPATRICK, New York, N. Y. Filed Feb. 12, 1881. (No model.)

Claim.—In a pressure-regulator, the separately-made bottom plate, D, provided with the valve-channels E F, the inlet-valve seat or nipple *e*, raised above the surface of said plate, and pivoting-lug *d*, in combination with the valve-lever G, fulcrumed to the said lug *d* and provided with valve *g* and diaphragm H, secured directly to the ends of said lever, and with the covers B C, stud I, and weighted lever J, all constructed and operating as shown and described.

252,755. ROLLER-MILL. CHARLES GATES, Brooklyn, Ohio. Filed Oct. 8, 1881. (No model.)

Claim.—1. In a roller-mill, the combination, with a central shaft and a stationary crown-gear, of a series of rolls and pinions and a series of spiral conveyors, said rolls and conveyors being constructed, substantially as described, to receive both a rotary motion on their own axes and a circular motion around the central shaft.

2. In a roller-mill, the combination, with the trough, of a spiral conveyor and a protecting disk or wheel secured to the outer end of the conveyor and of slightly greater circumference than the latter, substantially as set forth.

3. In a roller-mill, the combination, with the conveyor and its supporting-arm, of a scraper secured to said arm, substantially as and for the purpose set forth.

4. In a roller-mill, the combination, with a series of spiral conveyors and rolls, of a series of revolving hoppers, H, and a stationary hopper, I, substantially as set forth.

5. In a roller-mill, the combination, with the central shaft, the rolls, and their operating mechanism, of a plate, M, supported by bolts *m* and vertically adjustable, substantially as described.

6. The combination, with the central shaft, of the sleeve C and arms C', the supports D, and the rolls adapted to turn on their own axles, and gearing, substantially as described, for revolving said rolls around the central shaft, substantially as set forth.

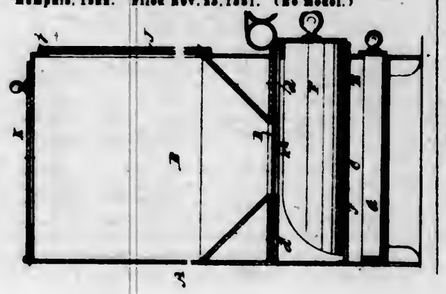
252,756. CORSET-CLASP. WILLIAM F. GILBERT, Birmingham, Conn., assignor to Alvin B. Hewitt, same place. Filed Nov. 14, 1881. (Model.)

Claim.—The herein-described clasp for corsets, consisting of the one part, A, constructed with tongues or projections *a d*, bent down over the respective edges of the steel, and with a tongue, *c*, in an opening in the portion which extends beyond the edge of the steel, the said tongue projecting toward the steel, combined with the other part, B, constructed with an eye, *r*, to receive the said tongue *c*, and with an upwardly and outwardly projecting shoulder, *i*, to enter the opening in the other part, and with projections to clasp the said part B to its steel, substantially as described.

252,757. FIRE-KINDLER. EDWIN E. GLASKIN, Lower Cape, New Brunswick, Canada. Filed June 10, 1881. (No specimens.)

Claim.—1. The process of producing fire-kindling blocks, which consists in mixing dry sawdust with resin and oil, in the proportions, respectively, of five parts, one part, and one-sixteenth of one part, and then placing the mass in suitable molds and compressing it to the degree of one thousand pounds, or thereabout, to the square inch, for the purpose of compacting it into hard non-friable blocks, as set forth.

2. As an improved article of manufacture, a fire-kindling block composed of five parts sawdust, one part resin, and one-sixteenth part oil mixed together and densely compacted, so that the block is hard and non-friable, as specified.

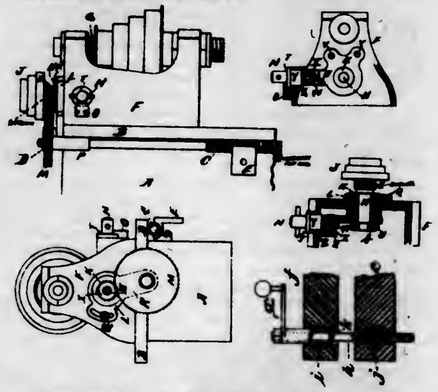


252,758. HOOF-PROTECTOR. JOHN M. GOODMAN, Mill Creek, Pa. Filed Oct. 6, 1881. (No model.)

Claim.—1. The hoof-protector herein shown and described, formed of the oppositely-curved parts A and B, formed of the bottom plates, *a* and *b*, and the side flanges, *c* and *d*, the parts being adapted to be secured to the feet of the animal, substantially as and for the purpose set forth.

2. The parts A and B, formed of the bottom plates, *a* and *b*, and the side flanges, *c* and *d*, and provided with the hook *e* and eye *f*, in combination with the hooked connecting-rod K and the strap H, substantially as and for the purpose set forth.

252,759. CANISTER OR STORE-CAN. DAVID F. GOODYEAR, Memphis, Tenn. Filed Nov. 23, 1881. (No model.)



Claim.—1. The can A, divided into the compartments B and C, in combination with the slide D and removable scoop F, substantially as and for the purpose set forth.

2. The compartment B, having a hopper-shaped bottom, in combination with the slide D and compartment C, having the scoop F, substantially as and for the purpose set forth.

3. The slotted semi-cylindrical sleeve E, secured to the bottom of the compartment B, in combination with the scoop F and the tray G, substantially as and for the purpose set forth.

4. The slotted semi-cylindrical sleeve E, secured under the compartment B, in combination with scoop F, substantially as and for the purpose set forth.

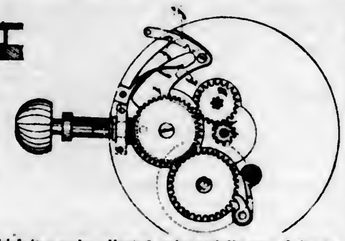
252,760. ENGINE-LATHE. GEORGE A. GRAY, Jr., Covington, Ky., assignor to George A. Gray, Jr., & Co., Cincinnati, Ohio. Filed Aug. 30, 1881. (No model.)

Claim.—1. The combination of bed A, having flange B, projecting outward therefrom, carriage-nut E, fitted to engage with the under side of the lead-screw, and the lead-screw C, journaled under the flange B and contacting against the under side thereof, substantially as and for the purpose set forth.

2. The combination of lead-screw C, having gear fitting end D, series of change-gears S, having a constant difference in number of teeth, as specified, stud-bearing K, arm R L, fitted to be adjusted on and around said stud-bearing, idle-gear M, journaled in a fixed position to said arm, stud H, arranged to be revolved by the lathe, as usual, and pinion I, fixed on said stud, and having its number of teeth equal to the constant difference between the gears S multiplied by the number of threads per inch on the lead-screw C, all constructed and arranged to operate substantially as and for the purpose set forth.

3. The combination, with reverse tumbler U and head-cam N Y Z, of the sliding plug X, fitted to slide in the tumbler U, and having a transverse hole to serve as a bearing for the cam-pin Z, constructed and arranged to operate substantially as and for the purpose set forth.

4. The combination, with the reverse tumbler U and head-cam N Y Z, of the plug X, fitted to slide in the tumbler and to furnish a bearing for the cam-pin Z, and having collar *a*, or equivalent projection, arranged to contact with the tumbler and serve as a stop to the sliding motion of the plug, all constructed and arranged to operate substantially as set forth.



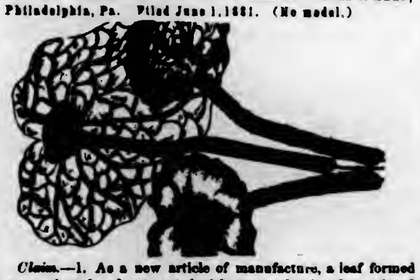
5. The combination, with the reversing-tumbler, of the cam-body Y, having handle N and collar T, of the bearing which supports the cam-body, and the clamp O, bolted to said bearing and fitted to clamp the collar T against said bearing, all constructed and arranged to operate substantially as and for the purpose set forth.

6. The combination, with the lathe-carriage *e*, tilting rest *f*, pivoted above the carriage *e*, and crank-screw *h g*, for adjusting the tilting rest *f*, of the cylinders *i* and *j*, fitted in said carriage and rest, and bored and tapped to serve as bearing and nut for the screw *h*, substantially as and for the purpose set forth.

252,761. STEM-WINDING WATCH. CHAS. W. GREGORY, New York, N. Y. Filed Aug. 23, 1881. (No model.)

Claim.—1. The combination, with the minute-wheel, the barrel-arbor wheel, the first winding-wheel, the second winding-wheel, and its carrying-lever, of the locking-lever adapted to engage with a stationary catch for holding the wheel-carrying lever in either

252,761



position to which it may be adjusted, substantially as and for the purpose specified.

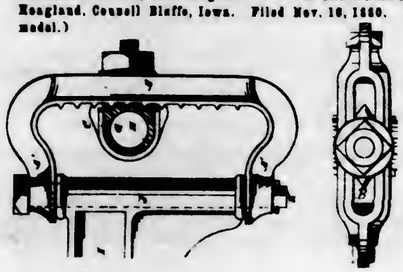
2. The combination, with the wheel-carrying lever and its second wheel, the barrel-arbor wheel, and the minute-wheel, of the notched locking-lever and a spring adapted to move said locking-lever into engagement with its catch and to move said wheel-carrying lever to bring its wheel into engagement with the wheel on the barrel-arbor, substantially as specified.

3. The combination, with lever I, of the locking-lever J, pivoted to said lever, adapted to engage with a stationary catch, and having an arm, *k*, and the spring *l*, bearing on said arm, substantially as and for the purpose specified.

4. The combination, in a watch, with the dial-plate, the back plate, and the first winding-wheel or stem-wheel, of a block fitting and clamped between said plates, steady-pins for holding it against lateral movement, and a bearing for said wheel, formed partly in said dial-plate and partly in said block, substantially as and for the purpose specified.

252,762. ARTIFICIAL LEAF AND PLANT. CARL I. HANS, Philadelphia, Pa. Filed June 1, 1881. (No model.)

Claim.—1. As a new article of manufacture, a leaf formed of paper, shaped and cut, coated with wax, and painted or printed with oil color, the latter being on the surface of the wax coating, substantially as and for the purpose set forth.



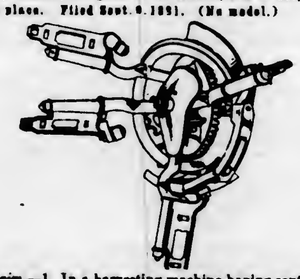
2. In artificial leaves and flowers, stems formed of fibrous material having the ends of the threads thereof spread out, making sockets, flaring beds, or places of attachment, as at *a*, substantially as and for the purpose set forth.

3. Stems formed of fibrous material with a core of wire and saturated or coated with wax, substantially as and for the purpose set forth.

4. Stems formed of fibrous material saturated or coated with wax, rubbed or teased, substantially as and for the purpose set forth.

5. Paper leaves coated with wax and colored in oil, in combination with stems of fibrous material having stiffening-cores and wax coatings, substantially as and for the purpose set forth.

252,763. COUPLING FOR CULTIVATOR-BEAMS. JAMES T. HAMILTON, Hallue, Ill., assignor to himself and WILLIAM E. ROAGLAND, Council Bluffs, Iowa. Filed Nov. 10, 1880. (No model.)



Claim.—1. In a cultivator, a coupling for the plow-beams, having a section, A A′, provided with the slot B and adapted to receive the forward end of the plow-beam, in combination with an eyebolt or connection with the sleeve or axle, for allowing vertical play of the section to raise and lower the forward end of the plow-beam, substantially as and for the purpose specified.

2. In a cultivator, a coupling for the plow-beams, having a section, A A′, provided with the slot B and adapted to receive the forward end of the plow-beam, in combination with an eyebolt having a body, C, to receive the axle-sleeve, a screw-threaded stem, E, to receive a nut, and shoulder or flange D, to enter the slot B and sustain the section in a vertical position when the parts are together, substantially as and for the purposes specified.

3. In a cultivator, a coupling for the forward end of the plow-beams, having a section, A A′, provided with a slot, B, with the edges or faces adjacent to the slot serrated or grooved, and adapted to receive the forward end of the plow-beam, in combination with an eyebolt, C D E, and sleeve G, having a serrated or grooved face to engage the corresponding face of the part A for maintaining the coupling in a vertical position and adding steadiness to the parts, substantially as specified.

4. In a cultivator, a coupling for attaching the plow-beams, consisting of the section A A′, having a slot, B, the eyebolt C D E, the sleeve G, having the longitudinal opening H, the plate I J, and the bolt K, all constructed and arranged substantially as and for the purposes specified.

252,764. REAPING-MACHINE. JOHN HANAIS, Brantford, Ontario, Canada, assignor to A. Harris, Son & Co., (Limited,) same place. Filed Sept. 9, 1881. (No model.)

Claim.—1. In a harvesting-machine having continuously-revolving reeling and raking mechanism, a rake-arm having a spindle upon which the rake-holder rotates, said arm made so that the axis of its spindle, if prolonged, would strike the axis of the joint-bolt connecting it to the crown-wheel, in combination with a friction-roller attached to the rake-holder and working upon a stud, the axis of which, if prolonged, would strike the axis of the joint-bolt and also the axis of the crown-wheel, for the purpose of allowing the friction-rollers to track smoothly on its guide at all points in the revolution of the crown-wheel and in the rotation of the rake upon the spindle of the rake-arm, substantially as described.

2. A rake-arm hinged to the crown-wheel and carrying a rake-holder hinged thereon, the axis of the hinge, if prolonged, intersecting the axis of the joint-bolt connecting the rake-arm to the crown-wheel, and the friction-roller supported on the rake-holder, its axis, if prolonged, also intersecting the pivot of the rake-arm, in combination with a gate hinged to the guiding-track at an opening in said track on the grain side of the machine, for the purpose of raising the rake-arm, rake-holder, and rake, after passing the cutters, to pass over the grain on the platform.

3. In combination with a rake-arm hinged to the crown-wheel, a rake-holder hinged thereon, said rake-holder having a downward and inward inclined projecting arm provided with a friction-roller centered on the axis of the joint-bolt, as described, and a projection adapted to engage with a notch in said arm to permit a slight movement of the rake-holder, so that when the teeth of the rake have passed the cutters and come in contact with the grain the rake-head is thrown into a slanting position, for the purpose of preventing the rakes, when reeling, from disturbing the grain on the platform when the rakes are raised to pass over the platform.

4. A rake-arm hinged to the crown-wheel and carrying a rake-holder hinged thereon, said rake-holder having a downward and inward inclined projecting arm provided with a friction-roller centered on the axis of the joint-bolt, as described, in combination with a projecting flange secured to or cast upon the guiding-track at a point just in front of the cutter-bar, for the purpose of keeping the rakes in a vertical position when reeling the grain to the cutters.

5. A rake-arm hinged to the crown-wheel and carrying a rake-holder hinged thereon, said rake-holder having a downward and inward inclined projecting arm provided with a friction-roller centered on the axis of the joint-bolt, as described, in combination with a gate hinged to the guiding-track at an opening on the grain side of the machine, which, when closed, causes the rakes to keep a vertical position and sweep the grain from the platform.

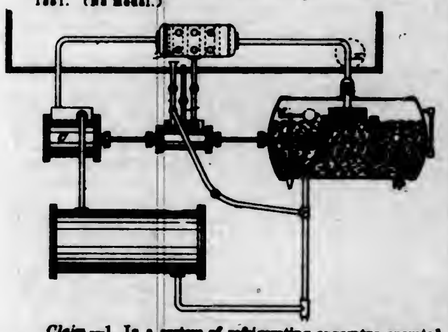
6. A rake-arm hinged to the crown-wheel and carrying a rake-holder hinged thereon, said rake-holder having a downward and inward inclined projecting arm provided with a friction-roller centered on the axis of the joint-bolt, as described, in combination with a movable track or throat at the delivery side of the platform, for the purpose of controlling the delivery of the sheaf in different conditions of crop.

7. A rake-arm hinged to the crown-wheel and carrying a rake-holder hinged thereon, said rake-holder having a downward and inward inclined projecting arm provided with a friction-roller centered on the axis of the joint-bolt, as described, in combination with eccentric washers and step in the rake-holder, for the purpose of adjusting the rakes at either end to the platform.

8. A rake-arm hinged to the crown-wheel and carrying a rake-holder hinged thereon, having a downward and inward inclined projecting arm provided with a friction-roller centered on the axis of the joint-bolt, as described, in combination with the cam-stud on which said roller revolves, for the purpose of adjusting the roller to the guiding-track.

9. The lever N, consisting of two parts, N′ N″, and the spring O between said parts, in combination with a crown-wheel having suitable projections for operating said lever and connections, substantially as described, between the lever and the gate in the guiding-track, as set forth.

10. In a harvesting-machine having continuously-revolving reeling and raking mechanism, a rake-arm the axis of its spindle, if prolonged, intersecting the axis of the joint-bolt connecting it to the crown-wheel, and a rake-holder hinged on said arm, in combination with a friction-roller attached to the rake-holder and working upon a stud the center line of which, if prolonged, would intersect the axis of the joint-bolt and also the axis of the crown-wheel, for the purpose of allowing the friction-roller to track smoothly on its guide at all points in the revolution of the crown-wheel.



252,765. GALVANIC PAD. LUDWIG HECHINGER, Rochester, N.Y. Filed May 10, 1881. (No model.)

Claim.—1. In a galvanic pad, the combination of the slotted disks provided with the square notches *d d d* in the outer edges and the holes *f f f* coincident therewith, and the thin metallic clasps *g g*, fitting flush in the notches and clasped through the holes, as shown and described, and for the purpose specified.

2. In a galvanic pad, the combination of the interior disks provided with slots crossing at right angles, and the exterior disks imperforate and provided with corrugations or grooves crossing the adjoining slots at right angles, as herein shown and described.

252,766. DYNAMIC DRY-AIR REFRIGERATING APPARATUS. HERRMANN HILL, South Norwalk, Conn. Filed Sept. 14, 1881. (No model.)

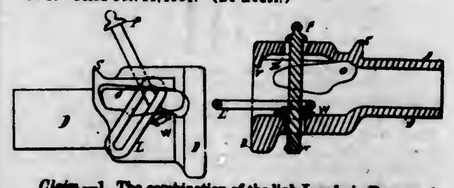
Claim.—1. In a system of refrigerating apparatus operated dynamically, the means of utilizing the heat of compression by transferring it to the cylinder of the expanding-engine to expand the air in it and thereby increase its power in operating a compressor, as hereinbefore set forth.

2. An air or gas expanding engine in a chamber or jacket containing a liquid, as water or other suitable element, whereby the heat of compression is transferred to the air performing work in the expanding-engine, as hereinbefore set forth.

3. The combination of an air or gas expanding engine, located in a liquid medium for absorbing and transferring heat, with a prime or first compressor for giving the initial power, and by which a second compressor may be operated, as hereinbefore set forth.

4. The combination of a prime air-compressor with an expanding-engine located in a liquid for transferring the heat of compression and a tank or reservoir for distributing the cold in a chill-room or preserving-chamber, as hereinbefore set forth.

5. The combination of an expanding-engine in a tank or reservoir for holding a transferring-liquid, as hereinbefore described, with an exchange-chamber having circulating-pipes connecting with the cooling-room, whereby the temperature of the air in its passage between the expanding-engine and the chill-room is equalized, as hereinbefore set forth.



6. The combination of an expanding-engine with the air-reservoir in a chill-room and an intermediate chamber for exchanging and equalizing the temperature of the air while under pressure, as hereinbefore set forth.

7. The exchange-chamber L, formed with a water-receptacle, through which tubes extend to receive the cold air from the expanding-engine and transfer its cold to the air passing toward the chill-room and again absorb the heat from the air as it passes to the expanding-engine, as hereinbefore set forth.

8. The combination of the supplemental engine with the air-chamber in the chill-room and the chill-room itself, and so connected to the other portions of the apparatus that the overplus of pressure and cold air may be utilized from time to time, as hereinbefore set forth.

9. The combination of the perforated inlet-pipe with the valve-chest of the air-expanding engine, located in a chamber or jacket, as hereinbefore set forth.

252,767. CAR-COUPLING. CHARLES L. HORACK, Brooklyn, N.Y. Filed Oct. 14, 1881. (No model.)

Claim.—1. The combination of the link L and pin P, secured to the draw-head D, said draw-head being constructed with the recess Y on its face and with the side opening, O, for the purpose of passing through the same the stationary link L, substantially as described.

2. The combination of a link, L, and pin P, secured to the draw-head D, said draw-head being provided with the side opening, O, for the purpose of passing through the same the end of the stationary link L, substantially as described.

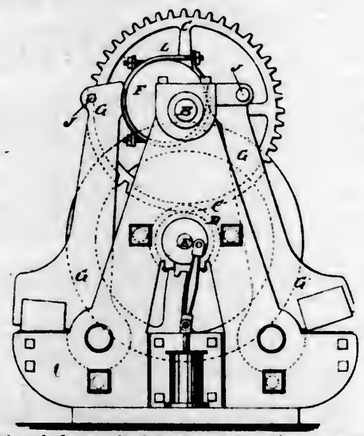
3. The combination of the link L and pin P, secured to the draw-head D, said draw-head being constructed with the side opening, O, for receiving the stationary link L, and the lip X, for preventing it from sliding out of the draw-head after another link has been introduced, substantially as described.

4. The combination of the stationary link L, pin P, and washer W with the draw-head D, said draw-head being constructed with the side opening, O, for the purpose of passing through it the rear end of the stationary link, and with the lip V, for protecting the washer and the forward end of the stationary link when in an elevated position.

5. The combination of a link, L, and pin P, secured to the draw-head D by means of the washer W, said draw-head being provided with the side opening, O, for the purpose of passing through the same the end of the stationary link L, substantially as described.

6. The combination of the link L and pin P, secured to the draw-head D by means of the washer W, said draw-head being constructed with the recess Y on its face, and with the side opening, O, for the purpose of passing through the same the stationary link L, substantially as described.

7. The combination of the link L and pin P, secured to the draw-head D by means of the washer W, said draw-head being

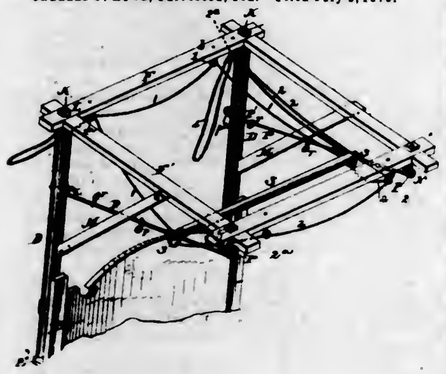


constructed with the side opening, O, for receiving the stationary link, and the lip Z, for preventing it from sliding out of the draw-head after another link has been introduced, substantially as described.

8. The combination of the link L and pin P, secured to the draw-head D by means of the washer W, said draw-head being constructed with the side opening, O, the lips V and Z, and the recess Y, all substantially as specified.

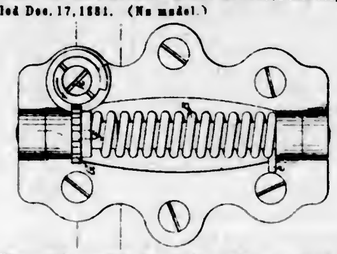
9. The combination of the link L, pin P, and washer W with the draw-head D, the upper part of the lower pin-hole in said draw-head being made to conform with the lower side of the washer W, substantially as described.

10. The combination of a stationary link, pin, and washer with a draw-head, the latter being provided with a side opening for receiving the stationary link when not required for coupling purposes, and constructed with a shoulder or projection back of said opening, for the purpose of protecting the stationary link.



252,768. MECHANISM FOR CONVERTING ROTARY INTO OSCILLATING MOTION. JULIUS HORNIG, Jersey City, N. J. Filed Aug. 6, 1881. (No model.)

Claim.—1. In a mechanism for converting rotary into oscillating motion, the combination, with the rotating eccentric F and the oscillating lever G, of the roller I or segment I' and the break-pin J, substantially as herein shown and described, whereby the breaking of the said lever will be prevented should its movement be obstructed, as set forth.

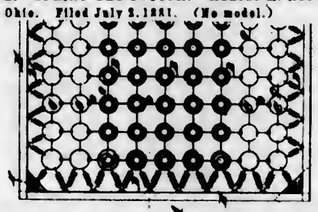


2. In a mechanism for converting rotary into oscillating motion, the combination, with the eccentric-strap L and the break-pin J, of the arm M N, having a slot or clearance-space, O, substantially as herein shown and described, whereby the said arm will be kept from being broken should the oscillating lever be obstructed, as set forth.

252,769. COMBINED MOSQUITO-BAR FRAME AND CANOPY. CHARLES P. HOWE, Galveston, Tex. Filed July 8, 1879.

Claim.—The combination, with the rectangular detachable canopy-frame, of bolts K, rigidly securing it to the posts D D, the folding brace-arms M, the inclined guide-rods P, connected to posts D and also to eyebolts at the outer ends of the canopy-frame, the bar S, adapted to slide on the said inclined rods P, and cords 1 and 2, arranged in the manner and for the purposes described.

252,770. SPRING-HINGE. HENRY HOWSON, Philadelphia, Pa. Filed Dec. 17, 1881. (No model.)



Claim.—The combination of the pintle, spring, and leaves of a spring-hinge with a worm and worm-wheel, substantially as described.

252,771. MANUFACTURE OF GELATINE AND GLUE FROM ANIMAL REFUSE OR OFFAL. ALFRED JEAN HUET, Paris, France. Filed Dec. 29, 1881. (No specimens.)

Claim.—The improvement in the manufacture of glue and gelatine, consisting in treating the gelatine-yielding materials with chloride of aluminum, as and for the purpose described.

252,772. SPRING BED-BOTTOM. MARCUS A. HUNT, Cincinnati, Ohio. Filed July 5, 1881. (No model.)

Claim.—1. A suspended spring-bed consisting of a series of vertically-arranged hour-glass springs connected to each other at the top and bottom by hooks or links, in combination with a surrounding quadrilateral frame and links connecting both the upper and lower portions of the vertical springs with the upper and lower edges of the surrounding frame, substantially as and for the purposes described.

2. The combination, with a series of vertically-arranged springs, B, and a surrounding frame, A, of the adjustable link-springs D, consisting of two sections, each provided with a hooked end, *d*, and a spiral coil, *d'*, the said coils intertwining with each other and the hooks of the two sections being connected respectively with the vertical springs and the surrounding frame, substantially as described.

3. In combination with the vertically-arranged spiral springs and surrounding supporting-frame, the adjustable intertwining spiral coils *d'*, each provided at its outer end with a hook, *d*, which are connected respectively to the vertical springs, and the spool arranged entirely within the coils *d' d'*, substantially as and for the purposes described.

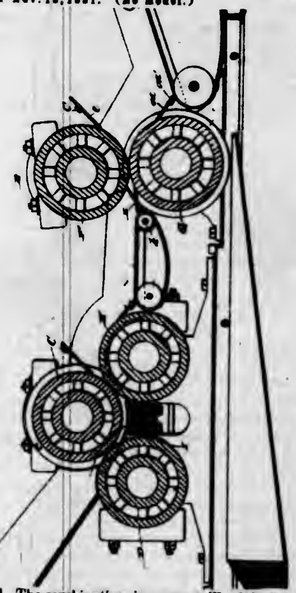
4. A quadrilateral suspending-frame of a spring bed-bottom, composed of slats E E, attached to corner supporting-blocks, F and separated by blocks *f*, substantially as herein set forth.

5. A spring bed-bottom composed substantially of the frame A, a series of vertically-arranged spiral springs attached transversely to each other by two series of transverse hooks or links, e and all connected to the said frame by the adjustable spring connecting-links D, as herein set forth.

252,773. ROTARY STEAM-ENGINE. PETER T. HYDEN and ADOLPH LARSON, Chicago, Ill. Filed May 16, 1881. (No model.)

Claim.—1. In a rotary steam-engine, the cylinder-plate C, provided with pins *b b*, slit K, steam passage or chamber W, bearing *c*, outlets M M, and cover N, in combination with cylinder-plate B, substantially as described and shown, and for the purpose set forth.

252,773.



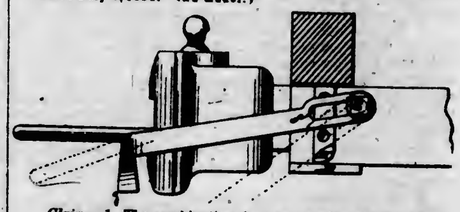
2. In a rotary steam-engine, the cylinder-plate B, provided with holes *a a*, steam passage or chamber W, bearing *c*, slit K, steam-passages *g g*, chamber H, ledges *h h*, and cap F, having inlets G G, in connection with cylinder-plate C, and in combination with valve L, substantially as described and specified, and for the purpose set forth.

3. The sliding valve L, composed of pieces *l* and *k*, at right angles to each other, in combination with chamber H and slit K, whereby the steam is let in and shut off, substantially as described and shown.

4. The combination, in a rotary steam-engine, of the rod P, arm R, spring T, shoulders *s s*, rod J, and valve L, substantially as described and shown.

5. The combination, in a rotary steam-engine, of the cylinder-plate C, provided with pins *b b*, slit K, steam-passage W, outlets M M, cover N, and bearing *c*, the cylinder-plate B, provided with holes *a a*, bearing *c*, steam-passage W, slit K, steam-passages *g g*, chamber H, cover N, the cap F, having inlets G G, pipe *r*, with regulating-cock *t*, valve L, having ports *l* and *k*, rod J, spring V, arm R, rod P, spring T, shoulders *s s*, wheel O, shaft E, and piston D, having ends *d d* and packing-rings Q Q, all substantially as described and shown, and for the purpose set forth.

252,774. SUGAR-MILL. CHARLES S. JOHNSON, New Orleans, La. Filed Nov. 18, 1881. (No model.)

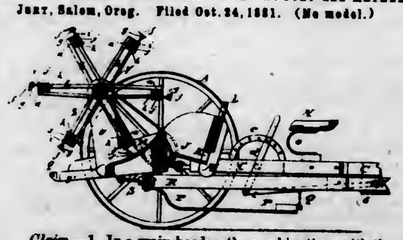


Claim.—1. The combination, in a cane-mill, of the herein-described two separate sets of rolls, the rolls of the second set having their axes arranged on an inclined plane which inclines backwardly or rearwardly toward the rolls of the first set of rolls, substantially as described.

2. The combination, in a cane-mill, of the herein-described first set of rolls with a second separate set of rolls of greater diameter than the rolls of the first set, substantially as shown and described, said sets of rolls being driven at the same rate of speed, whereby the speed at which the bagasse is drawn between the larger rolls of the second set will be greater than that at which the bagasse has been drawn between rolls of the first set, as and for the purpose set forth.

3. The combination, in a cane-mill, of the first set of grooved rolls with the second set of grooved rolls of larger diameter, the axes of which are arranged in an inclined plane which inclines backwardly and rearwardly toward the first set of rolls, substantially as described.

4. The combination, in a cane-mill, of the rolls C D E with the guide I, the scraper-plate J, rock-shaft J', and the weighted arm connected with said rock-shaft, substantially as described.

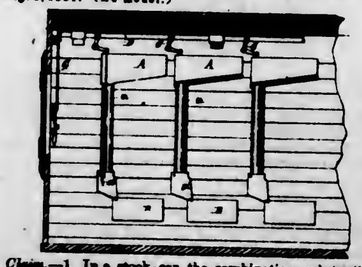


252,775. CAR-COUPLING. FERDINAND JOHNSON, Toledo, Ohio. Filed July 2, 1881. (No model.)

Claim.—1. The combination, in a car-coupling, of the draw-head with the swinging bail, formed with an abutment, *g*, at the front and with rear slotted ends, said bail being pivoted by pins passing through its slots, and being arranged to elevate the link to a horizontal position, ready for coupling, substantially as described.

2. The combination, in a car-coupling, of the draw-head with the pivoted bail formed at its front portion with the curved recess *f*, for receiving the link, and with the wedge-shaped abutment *g*, projecting downwardly at right angles to the bail and having an upward taper, substantially as described.

252,776. GRAIN-HEADER. JOHN W. JOBY and ARTHUR B. JOBY, Salem, Oreg. Filed Oct. 24, 1881. (No model.)



Claim.—1. In a grain-header, the combination, with the reel-bars a, the curved platform H, and the receiving-box I, of the lugged plates *i*, the rods *h* and their springs *j*, the knife-holding plates *g*, and the knives *f*, substantially as herein shown and described, whereby the grain-heads will be cut from the stalks and deposited in the box, as set forth.

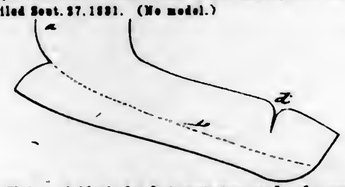
2. In a grain-header, the combination, with the wheels and axle A B, the tongue C, the curved platform H, and the frame R, of the receiving-box J, having opening K and gate L, and the swinging platform P, substantially as herein shown and described, whereby the heads are received and can be readily marked, as set forth.

3. In a grain-header, the combination, with the axle B, the curved platform H, and the hinged tongue C, provided with the keeper *b*, of the hinged frame R and means for sliding the same forward and backward in the said keeper, substantially as herein shown and described, whereby the front edge of the platform can be adjusted at any desired distance from the ground, as set forth.

252,777. STOCK-CAR. ISIDOR KITSEE, Cincinnati, Ohio. Filed Aug. 9, 1881. (No model.)

Claim.—1. In a stock-car, the combination, substantially as specified, of feed-box A, a measuring-spout, *a*, closed at its lower end by a valve, *a'*, with a valve-rod, a crank, C, and crank-actuating bar D.

2. The combination, substantially as herein before set forth, of feed-boxes A, their measuring-spouts *a*, valves *a'*, and valve-rods with cranks C, sliding rod D, lever E, sliding bar F, its connecting-links, and lever G, said parts being arranged to simultaneously supply the troughs B with feed, as set forth.

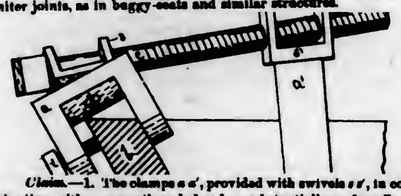


3. In a stock-car, the combination of reservoir H, divided measuring-vessel I, and pipes J with lever K, sliding bar L, and lever M, arranged to operate substantially as specified.

4. The combination, substantially as before set forth, of the car-body, the stalls arranged in longitudinal series therein, the water-troughs for said stalls, a water-supply vessel at one end of the car having pipes leading therefrom to supply the troughs, and the nipples for discharging into said troughs, the opening in each nipple being larger than those intervening between it and the supply-vessel.

5. The combination, substantially as specified, of the car-body and staples O with stall-sides composed of side pieces, N, eye-straps *n*, and pins *o*.

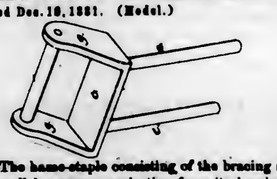
6. The combination, as specified, of the car-body having vertical staple-bars *q'*, secured thereto, with a chain and sliding ring, *q*, and a securing device consisting of two pivoted members, Q, and a locking-member, *q*, for the purpose set forth.



252,778. FOOT-PROTECTOR. WM. KLEIN, New York N. Y. Filed Sept. 27, 1881. (No model.)

Claim.—A blank for foot-protectors, made of a continuous U-shaped piece with a rounded-off toe part, *a*, side extension-flaps, *b*, and inner slits, *d*, near the rear ends of the blank, substantially as set forth.

252,779. CLAMP. ANDREW KRAISS, New Milford, Ohio. Filed Dec. 14, 1881. (No model.)

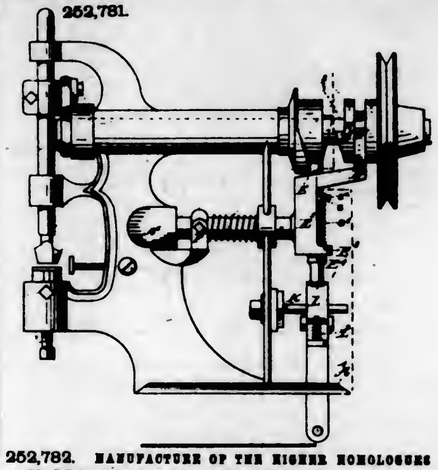


Brief.—The device is designed for holding the parts together in forming glue joints, and is especially adapted to putting together miter joints, as in buggy-seats and similar structures.

Claim.—1. The clamps *a a'*, provided with swivels *c c'*, in combination with a screw-threaded rod, *c*, substantially as described.

2. The screw-threaded rod *c*, in combination with and diagonal to swivels *c c'* and clamps *a a'*, substantially as described.

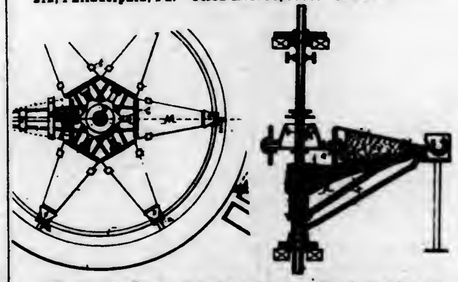
252,780. HAME-STAPLE. CHRISTIAN LARSEN, Black Earth, Wis. Filed Dec. 16, 1881. (Model.)



Claim.—The hame-staple consisting of the bracing shoulder-piece *a*, the parallel prongs *c*, projecting from its bearing-face *d*, the oblique perforated lugs *g*, extending from its outer face, and the roller-bearing, substantially as specified.

252,781. BUTTON-HOLE-CUTTING MACHINE. CHARLES H. LAMBARD, Middleborough, Mass., assignor of one-half to Horatio Barrows, same place. Filed Oct. 31, 1881. (No model.)

Claim.—In a button-hole-cutting machine, the combination of the clutch device and the lock-pin E with the lock-pin-withdrawing device, consisting of the arms L L, springs L^1 L^2, bar L^3 L^4, and stationary throw-off pins K K, all operating together substantially as described, and for the purpose set forth.



252,781.

252,782. MANUFACTURE OF THE HIGHER HOMOLOGUES OF PHENOL, NAPHTHOL, AND RESORCIN. ADOLF LIEBMANN, Berlin, Prussia, Germany. Filed Aug. 16, 1881. (Specimens.)

Claim.—The process above described for the transformation of phenol, naphthol, and resorcin into their higher homologues, the same consisting in subjecting them while in a suitable still to the action of the corresponding fatty alcohols in the presence of chloride of zinc or similar metallic salts producing condensation, all substantially as specified.

252,783. SUGAR CENTRIFUGAL MACHINE. S. MORRIS LILLIS, Philadelphia, Pa. Filed Mar. 18, 1880. (Model.)

Claim.—1. The combination, in a centrifugal machine, of molds formed radially in the basket of the machine by radial partitions with a central hopper mounted on the axle of the machine and revolving with it and communicating with the various molds, substantially as specified.

2. The combination, in a sugar centrifugal machine, of molds supported horizontally and radially around the axis of the machine, bearings located around the circumference of the machine, in which the outer extremities of the molds rest, the said bearings supporting the thrust of the molds due to the centrifugal force, and having passages through them through which the strups may flow into an encircling receptacle, and a central hopper mounted on the axle of the machine and revolving with it and communicating with the various molds, substantially as specified.

3. In a centrifugal machine, an annular basket consisting of an annular hollow shell supported on the axle by suitable radial supports, and whose outer wall consists of a sieve or straining medium, in combination with a central hopper having radial tubes or passages leading into the annular basket and making liquor and air tight junctures with the shell of the same, the hopper and the radial passages affording means of introducing a liquid or semi-fluid fill mass into the basket while the machine is in motion, substantially as specified.

4. In a centrifugal machine having its basket divided into molds by suitable vertical partitions, the construction of the top or bottom plates of the molds so that they may be opened or removed to allow of the emptying of the molds, substantially as specified.

5. The combination, in a sugar centrifugal machine containing a series of fixed or removable radial molds, of a central hopper mounted on the axle and revolving with it, receptacles for receiving the washing-liquor, formed one in front of the sugar in each mold, and spouts leading from the central hopper to the receptacles, substantially as specified.

6. The combination, in a sugar centrifugal machine, of a basket to hold the material to be drained or filtered, a chamber or chambers surrounding the basket and revolving with it, into which the liquid flows from the basket, and discharging-pipes through which the liquid flows from the chamber or chambers into an encircling trough while the machine is in motion, substantially as specified.

7. The combination, in a sugar centrifugal machine, of molds arranged radially in the machine or formed radially in the basket of the same, strap-receptacles arranged around the periphery of the machine and revolving with it, into which the strups may flow from the molds, and tubes leading from the receptacles and communicating through a tube in the axle of the machine with a pipe or conduit leading from a vacuum-inducing apparatus, substantially as specified.

8. In a centrifugal machine, the combination, with the chamber or chambers surrounding and revolving with the basket of the machine and communicating with a suitable vacuum-inducing apparatus, of discharge-pipes curved so that the liquid in the curves will, while the machine is revolving, form air-traps and prevent the flow of any air through the said pipes into the chambers to destroy the vacuum or partial vacuum induced therein, substantially as specified.

9. The combination, in a centrifugal machine, of a basket arranged to be tightly closed toward the axis, and an axial tube communicating with the basket, and through the bearing of the axle with means for affording a supply of hot or dry air, substantially as specified.

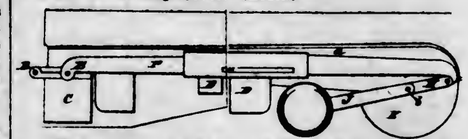
10. In a centrifugal machine, the combination of an annular basket or body, axial tubes communicating through the bearings of the axle with means for affording supplies of liquid or gaseous substances, and radiating tubes connecting the axial tubes with the annular basket or body of the machine, the axial and radiating tubes serving to conduct the liquid or gaseous substances into the annular basket or body while the machine is in motion, substantially as specified.

11. In a centrifugal machine having its basket or radial molds arranged to be tightly closed toward the center or axle of the machine, and having a central hopper or reservoir mounted on the axle of the machine and revolving with it, and communicating with the interior of the basket or of the radial molds by means of radiating tubes, in combination with the tubes, cones, or spray-plates closing the mouths of the tubes projecting into the interior of the basket or molds, by which any liquid poured into the central hopper or reservoir while the machine is in motion will be sprayed over the face of the sugar in the basket or molds, substantially as specified.

12. In a sugar centrifugal machine having its basket divided into molds by radial partitions, and having the bottom plate of each mold arranged as a door which may be opened for the removal of the contents of the mold, the parallel vertical partitions *d* in each mold, attached alternately to the top plate of the mold and to the under plate or door of the same, the partitions operating to form the sugar run into the machine and drained therein into slabs, and to thoroughly loosen the said slabs on the opening of the door, substantially as specified.

13. In a sugar centrifugal machine in which liquoring is to be practiced, a series of radial molds having their top and bottom plates inclined toward each other proceeding from the center of the machine, so that the thickness of the molds will be less the greater the distance from the center, and thoroughness in liquoring thereby be facilitated, substantially as specified.

14. In molds formed or arranged in the basket of a centrifugal machine in which liquoring is to be practiced, and having the plates forming the top and bottom of the same inclined toward each other proceeding from the axis to facilitate thoroughness in liquoring, vertical and parallel plates, substantially as described, for forming the sugar run into the molds and drained in the same into slabs, the vertical arrangement of the plates, instead of a horizontal arrangement, being for the purpose of avoiding the formation of the thin wedge-shaped pieces of sugar which would be formed were the plates horizontal in consequence of the inclination of the top and bottom plates of the molds toward each other.



15. The combination, in a centrifugal machine, of horizontal and radial molds having their mouths toward the axis provided with means whereby they may be tightly closed, and an axial tube communicating with the various molds, and also through the bearings of the axle with means for affording supplies of liquid or gaseous substances, substantially as specified.

16. The combination, in a centrifugal machine, of annular or radial receptacles for holding the matter to be subjected to the centrifugal force, and arranged to be tightly closed toward the axis, a central hopper communicating with the receptacles by suitable passages, a sleeve-cap on the axle of the machine, by which the mouth of the central hopper may be closed, and an axial tube communicating with the receptacles, and through the bearings of the axle with means of affording a supply of a gaseous reagent, substantially as specified.

17. In a centrifugal machine, the combination of annular or radial receptacles for holding the matter to be subjected to the action of the centrifugal force, and having axial communications with means for affording supplies of liquid or gaseous reagents, and chambers surrounding the receptacles, into which flow the liquids separated from the contents of the latter by the centrifugal force, the said chambers having axial communications with an exhausting or vacuum-inducing apparatus, substantially as specified.

18. In a centrifugal machine, the combination, with annular or radial receptacles for holding the matter to be subjected to the action of the centrifugal force, and arranged to be tightly closed toward the axis of the machine, of a central hopper having radial pipes leading to the receptacles and arranged so that its mouth may be closed air-tight, an axial tube communicating with the receptacles, and through the bearings of the axle with means for affording supplies of gaseous reagents, air-tight chambers surrounding the receptacles, and into which flow the liquids separated from the contents of the latter by the centrifugal force, and an axial tube communicating with the said chambers, and through the bearings of the axle with pipes leading from a vacuum-inducing apparatus, the combination operating to effect the flow of a gaseous reagent through the contents of the receptacles, substantially as specified.

252,784. SHUTTER-WORKER. THOMAS H. LUPTON, Winchester, Va. Filed Aug. 1, 1881. (Model.)

Claim.—1. The combination, with the shutter C and hinge B, having a pin, E, on the section which is secured to the shutter, of the bar F, pivoted to the said hinge and provided with a central pin, G, the longitudinally-slotted plate H in engagement with pin G, the arm H, pivoted to the inner end of bar F, and the crank-lever J, connected to said arm and adapted to engage with lug *e* on the upper face of the casing K, substantially as shown and described.

2. In combination with the bar F and shutter C, the casing K, adapted for being secured over the recess *a* inside the sash, and supporting the crank-lever J and arm H by means of a plate secured to its bottom, and covered by a segmental cap having lugs *e*, with which the lever is adapted to engage, substantially as shown and described.

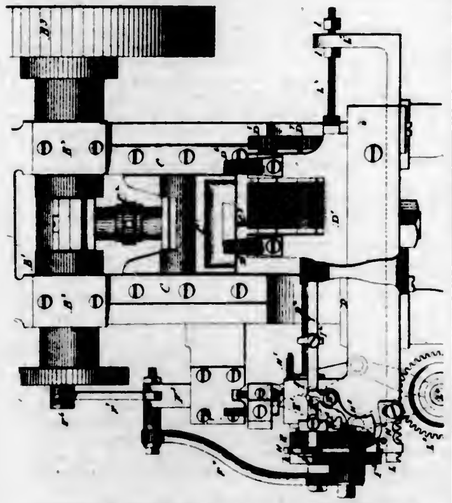
252,785. DENTAL ARTICULATOR. LOUIS HANKER and JOHN W. HANKER, Villisca, Iowa. Filed Oct. 18, 1881. (No model.)

Claim.—1. The combination of adjustable jaw-plates *c c*, slotted saddles, adjustable arm *f*, and pivoted wire *m*, substantially as shown and described, for gaging the lines of opposites and occlusion.

2. The pivoted arms *h h'*, arm *f*, slides *i i'*, and screws *l l'*, combined with the biting-gage A, substantially as shown and described, for indicating variations of the jaws from their correct position, as specified.

3. The biting-gage A, having saddles *d*, adjustable on plates *c*, for the purpose of preventing the patient's jaw from extending out too far, as described.

4. The combination, with the arm *f*, of the clamping-collar *g* and arms *h h'*, to indicate any deviation of the lower jaw, as described.



5. The combination, with the arms *h h'* on rod *f*, of the slides *i i'* and the adjustable screws *l l'*, to ascertain and correct any deviation of the lower jaw, as described.

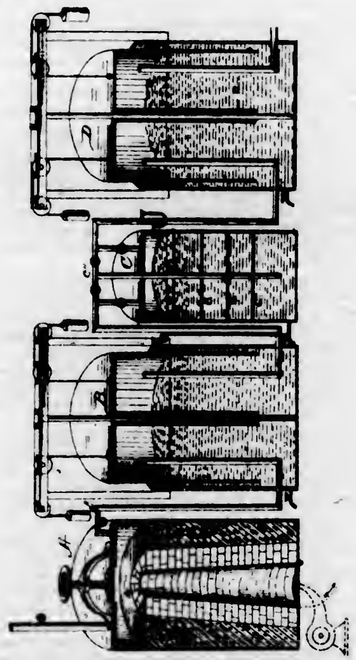
6. The combination, with the rod *f*, of the cross-bar *m*, the collar *s*, carrying pointer *n'*, and the collar *g*, having scale to indicate any variation caused by the turning of the biting-gage in the mouth, as described.

7. The wire *m* and the gage A, combined with an arm, *f*, made adjustable in the gage to bring the wire in line with the parting of the lips, as and for the purpose specified.

8. The duplicating-gage consisting of bar *o*, rod *p*, and pivoted wire *q*, for use with the original gage, substantially as shown and described.

252,786. FEEDING DEVICE FOR PUNCHING-MACHINES. FREDRICK MARGGRAFF, Waterbury, Conn. Filed July 30, 1881. (Model.)

Claim.—1. In a feeding mechanism, the combination of the rolls D^2 D^4, the ratchet F^6 in connection with said rolls, the pawl *f*, the saddle H, having a vertical movement with relation to said pawl and by such movement to engage or disengage said pawl from said ratchet, the cam-lever H', arranged upon a rock-shaft, a horizontal sliding bar with trips I' I^1 thereon, one of which, at each extreme horizontal movement of said bar, turns the said rock-shaft to present an arm, H^5, extending from said rock-shaft or the stud thereon in the path of the reciprocating dog H', whereby said dog imparts to said rock-shaft a rotative movement to depress the saddle on which the pawl rides and permit the pawl to engage the said ratchet until said dog, on its return, escapes from said arm H^5 and permits the return of the rock-shaft, substantially as described.



2. In a feeding mechanism, the combination of the rolls D^2 D^4, the ratchet F^6, in connection with said rolls, the pawl *f*, the saddle H, having a vertical movement with relation to said pawl and by such movement to engage or disengage said pawl from said ratchet, the cam-lever H', arranged upon a rock-shaft, a horizontal sliding bar with trips I' I^1 thereon, one of which, at each extreme horizontal movement of said bar, turns the said rock-shaft to present an arm, H^5, extending from said rock-shaft or the stud thereon in the path of the reciprocating dog H', whereby said dog imparts to said rock-shaft a rotative movement to depress the saddle on which the pawl rides and permit the pawl to engage the said ratchet until said dog, on its return, escapes from said arm H^5 and permits the return of the rock-shaft, and mechanism, substantially such as described, to impart a transverse movement to said rolls, substantially as described.

3. In a feeding mechanism, the combination of the longitudinal sliding bar I and a shaft for imparting longitudinal movement thereto, reverse ratchets L^4 L' on the said shaft, their respective pawls *n n'*, hung upon vibrating levers P P', and mechanism, substantially such as described, to impart vibratory movement to said levers, the rock-shaft R^3 having a rotative movement imparted to it, first in one direction and then in the opposite, by trips on said bar I, the said rock-shaft being provided with a lever, R^4, one arm of which engages a tripping device between said arm and said pawls to throw them alternately out or into engagement with their respective ratchets, the other arm being inclined upon its two sides, and a vertically-reciprocating dog, R^5, operating upon said inclined sides of the said lever to give to said lever the rocking motion required to so operate the said pawls, substantially as described.

4. In a feeding mechanism, the combination of the longitudinal sliding bar I, and a shaft for imparting longitudinal movement thereto, reverse ratchets L^4 L' on the said shaft, their respective pawls *n n'*, hung upon vibrating levers P P', and mechanism, substantially such as described, to impart vibratory movement to said levers, the rock-shaft R^3 having a rotative movement imparted to it, first in one direction and then in the opposite, by trips on said bar I, the said rock-shaft being provided with a lever, R^4, one arm of which engages a tripping device between said arm and said pawls to throw them alternately out of or into engagement with their respective ratchets, the other arm being inclined upon its two sides, and a vertically-reciprocating dog, R^5, operating upon said inclined sides of the said lever to give to said lever the rocking motion required to so operate the said pawls, with mechanism for imparting a longitudinal or forward feed, substantially as described.

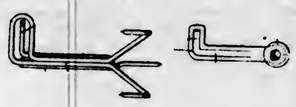
252,787. PREPARING GAS FOR PRESERVING FOOD. EDWIN R. MCCALL, Lockport, N. Y. Filed Dec. 24, 1881. (No model.)

Brief.—The products of combustion are drawn into the first reservoir by suction, and then are repeatedly passed through a purifier containing milk of lime or like liquid by alternately causing pressure and exhaust on the storage and receiving tanks. By this method but one washer is necessary to clear the product to the desired extent.

Claim.—1. The furnace A, in combination with receiving and exhaust gasometer B and purifier C, provided with perforated diaphragms *c* and central inlet-pipe, as specified.

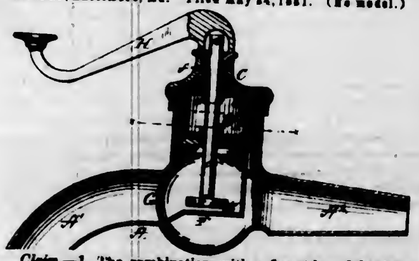
2. The combination consisting of gasometers B D with purifier C, located between the two, the latter serving for repeated passage of the gas and its efficient purification, as set forth.

3. The combination of furnace A, gasometer B, and purifier C, having the central dip-pipe and diaphragms stated, with gasometer D, in the order and for the purposes hereinbefore set forth.



252,788. STEAM-BOILER. THOMAS MCDONOUGH, Montclair, N. J. Filed Oct. 10, 1881. (No model.)

Claim.—1. The herein-described method of absorbing furnace-heat, consisting in injecting water against the roof of a boiler and conducting the portions that do not fall directly to the bottom of the same by sloping gutters at the sides thereof, as set forth.



2. In a steam-boiler, the boiler A, provided with the interior sloping gutters, B, and the external spiral flanges, C, combined and operating substantially as and for the purposes specified.

252,789. FALSE-CUFF HOLDER. GEO. A. HOLMTIER, Stamford, Conn. Filed May 7, 1881. (No model.)

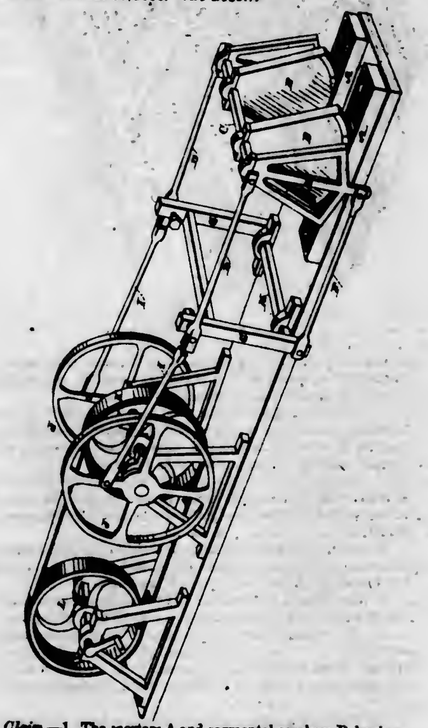
Claim.—As an improved contrivance for holding in place a false shirt-cuff or wristband, a cuff-holder composed of a main or body portion adapted to be either permanently or temporarily secured to the inner portion of the coat-sleeve, and a clamping device arranged transversely to said main portion of the contrivance and adapted to grasp with a yielding pressure the outer overlapping edge of the cuff, all substantially as set forth.

252,790. SELF-CLOSING VALVE FOR FAUCETS. JOSEPH E. MOONEY, Baltimore, Md. Filed May 24, 1881. (No model.)

Claim.—1. The combination, with a faucet-barrel having a formed chamber above the valve-seat and an induction-passage partially surrounding the said chamber, of a valve-rod with a piston-head closed by the liquid-pressure applied above the piston-head, substantially as described.

2. The combination, with the faucet-barrel having a valve-seat, cylinder, and induction-passage leading into the cylinder, of the self-closing valve consisting of the piston-rod, valve, piston-head, and pivoted lever, substantially as described.

252,791. BED-LOUNGE. JOS. L. NEWTON, Weymouth, Mass., assignor to Samuel Graves, same place. Filed Oct. 26, 1881. (No model.)



Claim.—1. In the extension of a bed-lounge or sofa-bed, the combination, with a leg adapted to be swung from a horizontal to a vertical position in said extension, of a cross-piece or beam next the leg, provided with an opening, H, of shape to fit and hold the same in a vertical position, said leg being adapted to be slipped horizontally into said opening, all substantially as and for the purpose set forth.

2. In the extension of a bed-lounge or sofa-bed, the swinging legs F F, provided with the connecting-bar I, adapted by the motion of one leg to impart corresponding motion to the other, substantially as and for the purpose described.

3. In combination with the leg F and pin E, secured to or bearing in the cross-pieces D'' D', the cross-piece D'', provided with the opening H, of shape to fit and hold said leg in a vertical position, and means for retaining the leg in said opening, substantially as and for the purpose specified.

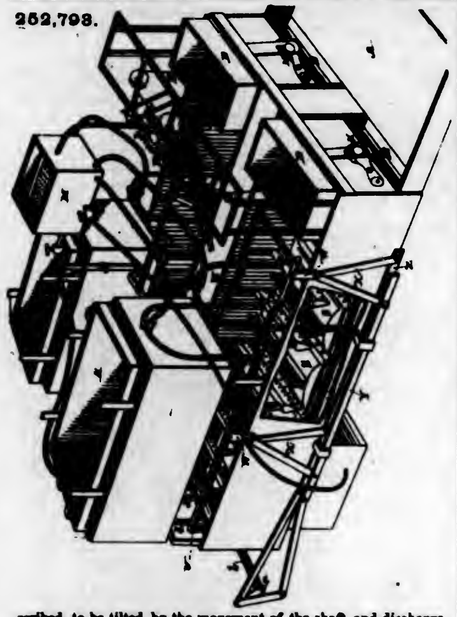
252,792. QUARTZ-CRUSHER. ALLEN OLIVER, Forest Hill, Cal. Filed June 28, 1881. (No model.)

Claim.—1. The mortars A and segmental crushers B, having the curved peripheries reciprocating in said mortars, in combination with the rocker-arms E and G and the parallel rods D and F, substantially as and for the purpose herein described.

2. The mortars A, reciprocating crushers B, having the curved faces moving upon the mortars, the rocker-arms G E, and the parallel driving and check-rods D F, as shown, in combination with the case inclosing the mortars and the slides K, perforated to allow the rods to pass, substantially as herein described.

252,793. AMALGAMATOR AND CONCENTRATOR. ALLEN OLIVER, Forest Hill, Cal. Filed June 27, 1881. (No model.)

Claim.—1. The sluices B B, connected with the main or supply sluice A, in combination with gates C, rope E, and pulley G, substantially as described.



2. The boxes D, provided with the gates C, in combination with the rope E, the pulley G, and guides, substantially as set forth.

3. The sluices B, in combination with the suspended water-boxes D and automatic gates N, substantially as and for the purpose specified.

4. The boxes D, provided with the gates C, and suspended as shown, in combination with the detent or ratchet wheel H, the lever I, carrying the pawl, the floats K, and tripping-arms J, all constructed, arranged, and operated as set forth.

5. The oscillating shaft carrying the pulley G and the ratchet-wheel H, in combination with the double nozzle L, secured as de-

252,793.

scribed, to be tilted by the movement of the shaft and discharge alternately into spouts leading to the two sluices B, and the supply-tank M, substantially as described.

6. The sluices B, having the amalgamated plates P, in combination with the supplemental bottoms Q, and the water-discharging pipes R, arranged beneath the supplemental bottoms Q, substantially as and for the purpose herein described.

7. The sluices B, provided with the amalgamated plates and the water-pipes R, in combination with the supplemental bottoms having transverse depressions, perforated as shown, for the purpose set forth.

8. The curved transverse plates S, extending across the sluices and having their edges turned at right angles to clamp the brushes T, substantially as and for the purpose described.

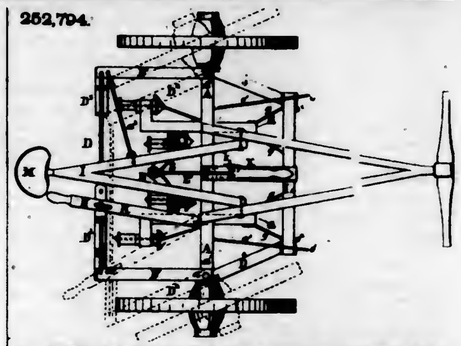
9. The sluice B, in combination with the upwardly-projecting soap-root brushes T, arranged transverse the sluice, as set forth.

10. The sluices B, the water-pipes U, and the wedge-shaped perforated tubes V, arranged transverse the sluice, in combination with the series of reciprocating levers W, X, X', and Z, to give the water-pipes a rising and falling motion, substantially as described.

11. The flexible rifle h, rolling upon the cylinder c within the case c, and extending across and fastened to the bottom of the sluice, in combination with the sluice B, for the purpose set forth.

12. The tanks m, having floats K, and tank M, in combination with the arms d and cases c, said arms connecting the floats to the cases, and sluices B, all constructed, arranged, and operated as described.

13. The case c, contained cylinder c, provided with pinions f, and flexible rifle h, in combination with the vertical racks g, the whole constructed, arranged, and operated as set forth.



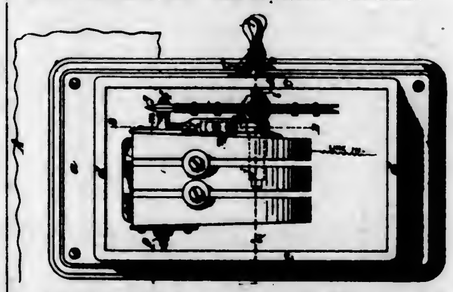
252,794. WHEEL-CULTIVATOR. THEODORE A. PALM, White House, Pa. Filed Aug. 28, 1881. (Model.)

Brief.—A hinged shovel and yielding spring. Wheel-spindles having vertical parts swiveled and braced from the upper and lower portions and adapted to be operated either by hand or foot, slotted beam-hangers allowing either beam to rise over obstructions when the lever is locked.

Claim.—1. In a wheel-cultivator, the combination, with the cross-beam A, having hinges or ears, of the swiveled wheel parts a, the upper and lower brace-bars, D' D², the cross-bar D, having foot-rests D², and the lever H, substantially as and for the purpose described.

2. The combination of the drag-bars G, with bifurcated straps g, and adjustable brackets F l, with the slotted yoke-bars E, elbow-lever E', and hook K, substantially as and for the purpose described.

252,794.



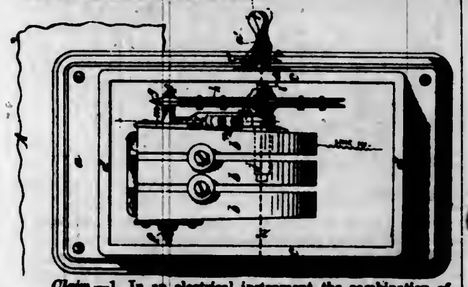
3. The shovel-blades B, having central ears, b, hinged to the standard-brackets, in combination with standards C, tension-rods c, and springs c', substantially as and for the purpose described.

252,795. METHOD OF CLOSING THE SEAMS OF SHEET-METAL CANS. GEORGE H. PERKINS, Philadelphia, Pa. Filed Nov. 10, 1880. (No specimens.)

Claim.—The method of closing the head-seams of sheet-metal cans herein before set forth, which consists in first subjecting the heads in place upon the body to the action of sliding or squeezing dies, and in then subjecting the squeezed heads to the action of seaming-rolls, substantially as and for the purposes specified.

252,796. LAWNING AND CLEANING CLAY. SIMON S. PHILLIPS, Perth Amboy, N. J. Filed Nov. 8, 1881. (No model.)

Claim.—1. The strainer D, mounted on a suitable open-ended framing capable of being revolved, in combination with means E for introducing the fluid to be strained, provisions I for receiving the strained fluid, and an internal receptacle or spout, G, arranged to receive the material which cannot pass through the strainer, substantially as herein specified.



2. The driving-shaft K and wheel K', in combination with the tilting frame A a, and with the revolving strainer D, mounted on a suitable frame, C' C² C², with provisions for supplying and taking away the fluid and provisions G for receiving the material which cannot pass the strainer, all arranged for joint operation substantially as herein specified.

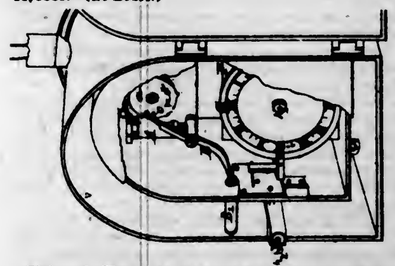
3. The means H for supplying water to the upper side of the strainer D, so as to move through the same in the opposite direction to that of the straining, in combination with provisions for straining in another part of the revolution, and with a spout, G, for taking away the retained material, as herein specified.

4. The method herein described of heaving and cleaning clay, consisting in projecting the slip in a stream against a strainer in an inclined position, so that the action of the stream urges the coarser particles along on the surface of strainer and keeps the acting part of the latter clear, substantially as herein specified.

252,797. ELECTRIC SIGNALING APPARATUS. HENRY PICKFORD and HARRY T. GREGORY, Chelsea, Mass. Filed July 27, 1881. (Model.)

Brief.—A contact-finger consisting of a coiled spring is attached to the crank-arm of the machine, and normally rests in contact with a disk surrounding the shaft to which the crank is attached. Turning the crank raises the contact-finger and breaks the short circuit around the machine.

Claim.—1. In an electrical instrument, the combination of the support a of arbor f, formed with the enclosed extension l, and the sleeve-like bearing j of arbor i, formed with the cylindrical extension k, to be seated, adjusted, and locked in socket l, whereby the driving-disk h on arbor i can be adjusted both linearly and in plane relatively to disk g on arbor f, substantially as specified.



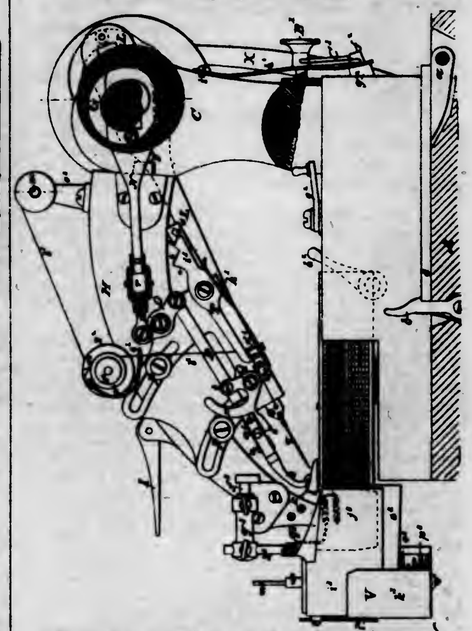
2. In an electrical instrument, the combination of hollow crank-arm y, with its handle x, the internal arm, t, the coiled spring v, the short arm s', and the contact-finger projecting therefrom, all substantially as specified.

3. In an electrical instrument, and in combination with its electric circuits, a crank-arm constructed and arranged to be rocked, rotated, or vibrated by the force exerted upon its wrist-pin or handle, and a contact-finger projecting from such crank-arm and arranged to be thereby vibrated to make and break contact, substantially as specified.

4. In an electrical instrument, and in combination with its electric circuits, and actuating-crank constructed and arranged to rock, rotate, or vibrate, and an elastic yielding contact-finger arranged to make and break contact by the action of such crank, substantially as specified.

5. In an electrical instrument, a contact finger or point composed of the securing-screw b', suitably secured and supported, and the coiled wire spring s', mounted upon and held in position by the engagement of its coils with the threads of said screw, substantially as specified.

252,798. AUTOMATIC TIME-RECORDER FOR TELEGRAPHIC SIGNAL-BOXES. HENRY W. PEPE, Elizabeth, N. J. Filed July 21, 1881. (No model.)



Claim.—1. The combination, substantially as herein before set forth, of a mechanism for transmitting electric signals, a movable cover or guard inclosing or protecting said mechanism, a register-ing device or mechanism, and devices, substantially as described, connected to the cover or guard and to the registering mechanism, whereby said registering mechanism is controlled.

2. The combination, substantially as herein before set forth, of a mechanism for transmitting electric signals, a movable cover or guard inclosing the same, a tablet, a time-train for imparting a uniform progressive movement to said tablet, a marking device, and devices, substantially as described, for automatically producing a record upon said tablet when said cover or guard is removed from the signaling mechanism.

3. The combination, substantially as herein before set forth, of a mechanism for transmitting electric signals, a movable cover or guard inclosing or protecting said mechanism, a yielding slide a spring which is compressed by said slide when said cover or guard is in its normal position, a lever provided at one end with a marking device, and a hook or detent which engages with the opposite end of said lever during the advance movement of said slide when the latter is actuated by the recoil of the spring.

252,799. OVERSTITCHING-MACHINE. JEAN E. RICHARD, New York, N. Y. Filed Apr. 6, 1881. (Model.)

Claim.—1. An overstitching-machine having its presser-foot rigidly fixed with reference to the path of the needle, and a feed-wheel arranged to be adjusted to and from the presser-foot, substantially as and for the purposes set forth.

2. An overstitching-machine having an arm which bears the stitch-forming mechanism and the presser-foot, arranged to swing or turn radially in a vertical plane on the main or cam shaft independently of the feeding mechanism, and having the feeding mechanism arranged in the non-moving bed upon which the said swinging arm is mounted, substantially as and for the purposes set forth.

3. The combination, with the arm of the machine bearing the presser-foot, of the adjustable plate bearing the stitch-forming mechanism, arranged to be adjusted on the arm, substantially corresponding to a circle described from a point coincident with the junction of the vertical and horizontal portions of the right-angular presser-foot, whereby the angle of the path in which the needle plays may be varied with respect to the bed of the machine, substantially as and for the purposes set forth.

4. The combination, with the arm bearing the stitch-forming mechanism and the presser-foot fixed rigidly thereto, of the feed-wheel having both a vertical and horizontal adjustment, substantially as set forth.

5. In an overstitching-machine adapted for stitching in hat-sweats, a sweat-holder, V, having a central guide-stem, m', a sleeve which slips over said stem and has a disk secured to its lower end, a spring under said disk to elastically support it, and an inclosing

case or cup with an outlet for the end of the strip, all arranged substantially as shown, whereby the sweat-strip which is wound on the sleeve may be properly fed to the needle, substantially as set forth.

6. The combination, to form a looper mechanism for an over-stitching-machine, of a cam, G, rod N, lever O, bar l^1, lever Q, bearing cam-arms s and s, the looper pivoted to the bar l^1 and having a shank, v, the projection s' on the said shank, and the spring w, all arranged to operate substantially as set forth.

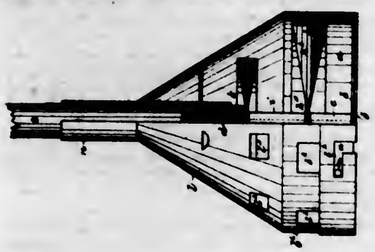
7. The combination of the reciprocating needle-bar provided with a projection or pin, j', the take-up lever T, provided with a cam, f', and a retaining-spring, arranged to press against the take-up lever and bring it back to its normal position, the pin on the needle-bar being arranged to engage the cam on one side in making its back-stroke, and thus move the take-up in one direction, and to engage the cam on the opposite side in making its forward stroke and move the take-up in the opposite direction, all substantially as and for the purposes set forth.

8. The combination, to form a mechanism for giving the feed-wheel an intermittent rotary motion, of the said wheel, the expanding ring, the toggle or link q', the lever n', having an arm, p', the rod Y, the lever X, and the eccentric W, all constructed and arranged to operate substantially as set forth.

9. The combination, with the feed-wheel, the expanding ring, and the mechanism for expanding it, of the rod Y, lever X, eccentric W, stem s', lug t', spring u', and nut v', forming a mechanism whereby the length of the stitch is regulated, all arranged substantially as set forth.

10. The combination of the feed-wheel mounted rotatively on the lever-arm A', the said arm mounted on movable bearings y' and provided with a stop for a cam, d^3, to impinge against, the said cam arranged to move the arm A' longitudinally, and the spring j^3, all constructed and arranged to operate substantially as set forth.

11. The combination of the feed-wheel mounted rotatively on a lever-arm, A', the said arm mounted in grooves in the faces of revolving disks y', a cam arranged to move the lever-arm A' endwise, the spring j^3 on the stem f^3, the tubular collar g^3, the abutting spring-plate h^3, provided with an adjusting-screw to increase the pressure on the plate h^3, and the spring C', all arranged to operate substantially as set forth.

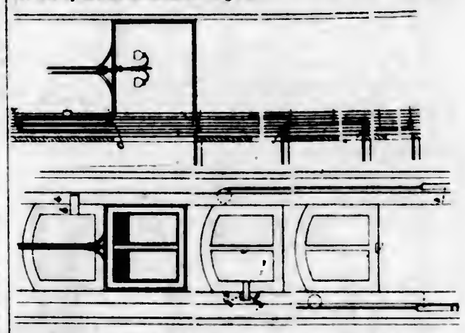


12 The combination, with the radially-swinging arm H and the bearing-post C, of the bolt g, arranged to shoot into a recess in the post when the arm is down, the lever I, to draw the bolt when the arm is lifted, a suitable connecting-rod to connect the lever and bolt, and a suitable spring to keep the bolt pressed normally up to the post, substantially as and for the purposes set forth.

13. The spool-holder comprising a stem with a button at its free extremity, a split tubular sleeve or collar on the stem to receive the spool, a spring to keep the sleeve pressed up to the button on the stem, and a disk on the stem interposed between the spring and a disk on the split sleeve, and a soft washer interposed between said disks, all combined and arranged to operate substantially as set forth.

14. The tension device comprising a stem, a^3, fixed disks b^3 and g^3, tied together by a bar and having notches c^3, a sleeve, e^3, coned as described, its one end turning in a recess in the disk b^3 and the other bearing a flange, x^3, the hook or projection on the sleeve to engage the bight of the thread, the nut n^3, and the spring l^3, all combined and arranged to operate substantially as set forth.

15. The holder V for the sweat-strip c', provided with an outlet-passage, f^3, having an elastic tension device to impinge upon the strip as it passes out, the tip of the said tension device being arranged to incline upward, so as to prevent the strip from working down, substantially as set forth.



252,800. AGITATOR OR EGG-BEATER. OTIS W. RICHARDSON, Mill Grove, Ky. Filed Dec. 26, 1881. (No model.)

Claim.—The combination, with the perforated cone l, provided with the perforated base-flange l', having angular recesses l' and tube n at its apex for the reception of the handle e, of the annulus a, provided with the pins m, and cross-bars b, supporting the step c, and agitators h k, adapted to revolve in opposite directions, substantially as described, and for the purpose set forth.

252,801. ELEVATOR. HENRY ROBERTS, Hartford, Conn. Filed Nov. 15, 1881. (No model.)

Brief.—The elevator has projections, which raise an upper set and push down a lower set of doors sliding in vertical grooves. The upper set of doors descend by their own weight and the lower set rise by means of counter-weights.

Claim.—1. In elevators, the combination, with the elevator shaft or well having vertical doorways and the elevator-cage, of two sets of vertical doors, one above and one below the cage, the doors above the cage being raised thereby and dropping by their own weight, while those below the cage are pushed down thereby and raised by counter-weights, and stops for arresting the doors of each set in succession, substantially as set forth.

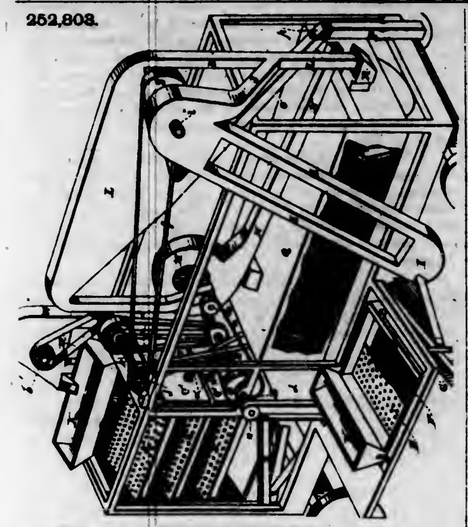
2. In elevators, the elevator-cage having projections, in combination with the two sets of doors sliding in vertical ways and raised and pushed down respectively by the projections on the cage, substantially as set forth.

252,802. SEED-PLANTER. JAMES W. ROBERTSON, Hardin, assignor of one-half to George Alexander Marshall, Sidney, Ohio. Filed June 23, 1881. (No model.)

Claim.—The combination, in a check-row planter, of the main frame a and the supplementary frame c, hinged directly to the axle of the main frame by curved bars k, and having a number of rollers adapted to support the main frame above the ground, substantially as shown and described

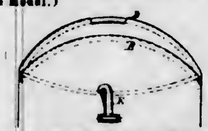
---

252,803. GRAIN SEPARATOR AND CLEANER. DEXTER SALISBURY, Williams, Cal. Filed July 5, 1881. (No model.)



Claim.—1. In a grain cleaner and separator, the combination of the vibrating screens E and F, carriers G and H, elevator I, suction-spout L, said spout having a deep chamber above and an exit-spout, O, suction and blast-fan M, and spout N, arranged substantially as and for the purpose herein described.

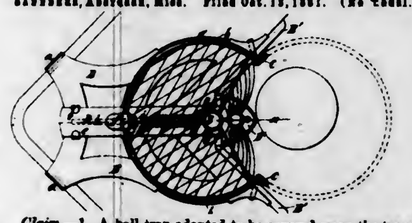
2. The combination of the elevator I, suction-spout L, fan M, and rotating inclined screen S, and an exit-spout, U, arranged substantially as and for the purpose herein described.



3. The combination of the elevator I, suction-spout L, fan M, inclined rotating screen S, the exterior radial blades, T, the box or casing Q, and the exit-spout V, substantially as and for the purpose herein described.

4. The combination of the rotating inclined screen S, having exit-spout V, the elevator W, hopper X, and series of vibrating oppositely-inclined or zigzag screens Y, having bottom plates, v, and carriers E and A', arranged and used substantially as and for the purpose herein set forth.

252,803.



252,804. BAG-FASTENER. TIMBROOK SANFORD, Brooklyn, assignor to Bradley, Kurtz & Co., New York, N. Y. Filed Nov. 7, 1881. (No model.)

Claim.—In combination with a bag, the fastener herein described, consisting of the bails B D, connected together at their ends so as to be capable of a hinge-like movement, one bail having a less pitch than the other, and the hook or catch adapted to secure the larger bail when the bails are closed, substantially as set forth.

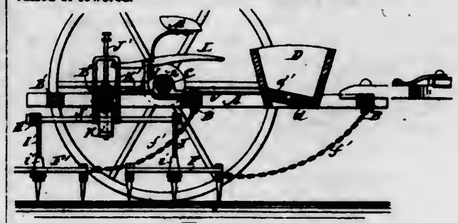
252,805. BALL-TRAP FOR BILLIARD-TABLES. FRANK SAUNDERS, Aberdeen, Miss. Filed Oct. 18, 1881. (No model.)

Claim.—1. A ball-trap adapted to be secured upon the top of the rail of a billiard-table and to descend upon or cover and catch or entrap the balls when they come within its range, substantially as specified.

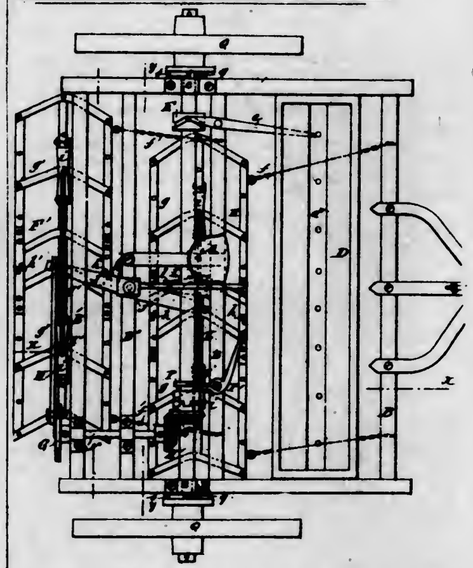
2. A swinging or pivoted ball-trap adapted to be secured upon the rail of a billiard-table, and composed of a rim and an elastic or yielding web within said rim, and a catch for holding the trap set, substantially as specified.

3. A swinging or pivoted ball-trap adapted to be secured upon the rail of a billiard-table, and a catch for holding it set, adapted to be released by the impact of the balls, substantially as specified.

4. The combination of a swinging or pivoted ball-trap, a base-plate therefor, adapted to be secured to the rail of a billiard-table, a sliding tongue having a projecting head, against which the balls may strike, and a catch upon said tongue for holding the trap set, substantially as specified.



5. The combination of the base-plate B, the trap C, pivoted thereto, the springs d, the tongue D, having a head, D', and the catch f upon said tongue, substantially as specified.



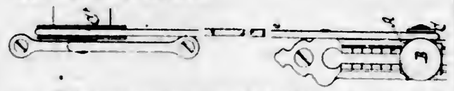
6. The combination of a swinging or pivoted ball-trap, a base-plate therefor, adapted to be secured upon the rail of a billiard-table a sliding tongue carrying a catch for holding the trap set and adapted to be moved inward by the impact of the balls, and a catch for holding said tongue against forward movement after the trap is released, substantially as specified.

7. The combination of the base-plate B, the pivoted trap C, the tongue D, with its head D', the catch f upon said tongue, and the spring h, with its projection or lug i and shoulder k, substantially as specified.

252,806. SULKY-HARROW AND SEED-SOWER COMBINED. ABRAHAM C. SCARR, Marybarough Township, Ontario, Canada. Filed Sept. 28, 1881. (No model.)

Brief.—The harrows are each formed in two centrally-hinged sections, connected by bows and yokes, and an oscillating bar connecting the yokes is adapted, by suitable operating mechanism, to give to the harrows an oscillating or reciprocating motion. By means of a vertical guide-rod, lever, and loop the harrows may be raised or lowered.

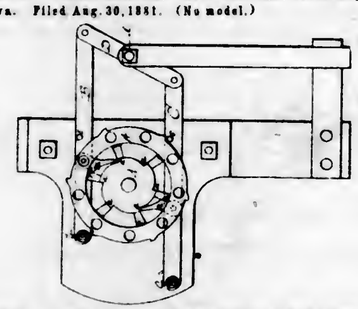
Claim.—1. The combination, with the frame and the harrows F F', of the yokes I I', the oscillating bar J, the vertical rod J', the loop or yoke K', and means for oscillating said bar, substantially as and for the purpose set forth.



2. The harrows F F', formed of the sections g g and g' g', provided with the bows i i and i' i', in combination with the yokes I I', pivoted bar J, and means for oscillating said bar upon its pivot, substantially as and for the purpose set forth.

3. The combination, with the frame and the harrows F F', formed of the sections g g g' g', and provided with the bows i i', of the yokes I I', the pivoted bar J, the connecting-rod H, crank-wheel G, shaft N, and the pinions H' G', substantially as and for the purpose set forth.

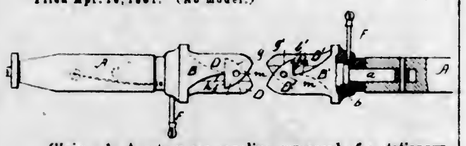
4. The combination, with the frame, the harrows F F', and the yokes I I', of the pivoted bar J, the vertical rod J', the loop or yoke K', and the lever L, substantially as and for the purpose set forth.



252,807. CURTAIN-CORD TIGHTENER. CHARLES SCHWARZOLD, Brooklyn, N. Y. Filed July 23, 1881. (No model.)

Brief.—The axes of the thumb-button and cord-pulley are at right angles with each other.

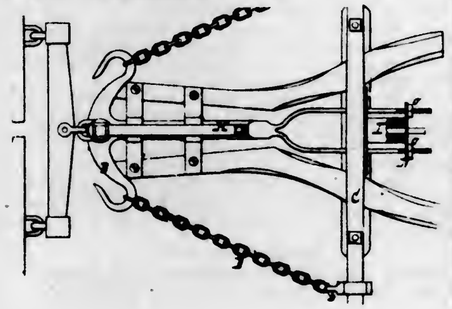
Claim.—The combination, substantially as hereinbefore set forth, of the locking-slide, constructed with the thumb-button and the pulley, having their axes substantially at right angles to each other, and the slotted guide-bracket, for the purpose specified.



252,808. CORN-PLANTER. LEVI SCOFIELD, Cedar Rapids, Iowa. Filed Aug. 30, 1881. (No model.)

Claim.—1. The combination of the rotary seed-plate with the two pivoted bars B C and their pawls, said pawls and the points of applying the motive power being arranged substantially as described, whereby the movements of the pawls are equalized, in the manner herein set forth.

2. The combination of the rotary seed-plate with the two pivoted bars B C, their pawls, and the two stops, the movements of the pawls and stops being equalized, substantially in the manner described.

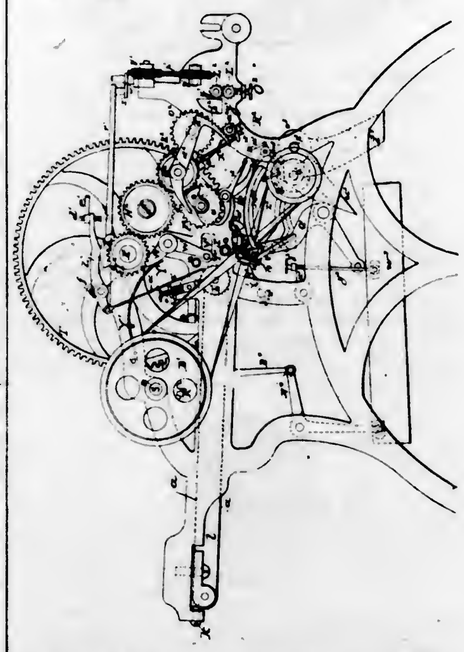


252,809. CAR-COUPLING. WILLIAM SCOTT, Malden, Mass. Filed Apr. 10, 1881. (No model.)

Claim.—1. A rotary car-coupling composed of a stationary draw-bar, A, and of a head, B, which is swiveled to the draw-bar and is provided with one or more cam-shaped hooks, D, in combination with a spring or weight, constructed and arranged together, to operate substantially as described.

2. A rotary car-coupling composed of a stationary draw-bar, A, and of a draw-head, B, which is swiveled to the draw-bar and is provided with one or more cam-shaped hooks, D, in combination with a bent spring, C, attached to the draw-head and draw-bar and protected on each side by flanges *a a'* of the draw-bar, all substantially as described.

252,810. DRAFT-EQUALIZER. JACOB SEBASTIAN, New York, N. Y. Filed Nov. 28, 1881. (No model.)



Claim.—1. In a draft-equalizer for vehicles, the combination, with the front axle having a spring supported at its rear side, of a horizontally-sliding draft-bar connected at its forward portion with the front axle and having its rear end extended directly through the said front axle and acting on the rear end portion of the spring, substantially as described, whereby the forward thrusts of the draft-bar are relieved by the spring and sustained by the front axle, as set forth.

2. In a draft-equalizer, the horizontally-sliding draft-bar having its rear end extended directly through the front axle of the vehicle, and provided at its forward end with lateral arms connected with the axle, in combination with a spring arranged directly in rear of the front axle and supported thereby and acting on the rearward extension of the draft-bar, substantially as and for the purpose described.

3. The combination, substantially as hereinbefore set forth, of the axle, the sliding draft-bar having its forward end connected to the axle by means of chains, and having its rear end bifurcated and arranged to extend through the axle, the tubular india-rubber spring fitted on a core projecting from the axle, and the cross-head, whereby the draft-bar acts on the spring in the manner specified.

252,811. CIGARETTE-MACHINE. EDGAR SIBA, Brooklyn, assignor to the Cowman Manufacturing Company, New York, N. Y. Filed July 18, 1881. (No model.) Patented in England Aug. 31, 1880.

Claim.—1. The trough a^3, consisting of the parts H I, pivoted together adjacent to their upper edge, the part H being secured between the arms L, and the part I being provided with a cord or chain, J, whereby, when the arms L are forced downward, carrying the part H, the cord J causes the lower portion of the part I to separate from the part H, substantially as set forth.

2. The mechanism for rolling the cigarette, consisting of the flexible apron, the two rollers, the oscillating bars supporting the carrier, toothed bar, and pinion-bearing for said rollers, the carrier and toothed bar being supplied with sheaves which travel over cam-surfaces on the ends of the table, substantially as specified.

3. In combination with the bars Q^3, carrying the carriers 16 and bar 17', wheels 17 and 22, and rollers 23 and 24, the bars 25, 26, 26', and 28, which are adapted to operate the bar 17', and roller 24 to form the pocket in the apron for the tobacco, substantially as specified.

4. In a cigarette-machine, the table M^3 and apron V^3, one or both ends of the latter being secured upon rods which are adjustable and have a spring-tension, whereby the apron is always kept taut, substantially as specified.

5. The rollers 23 and 24, mounted in a bearing having a pinion, 18, in combination with the bars Q^3, supporting the carrier 16 and toothed bar 17', the sheaves 17 and 22, and cams F N^3, substantially as set forth.

252,812. ORE-WASHER. SOLOMON P. SPRUNG, Baltimore, Md. Filed Nov. 15, 1881. (No model.)

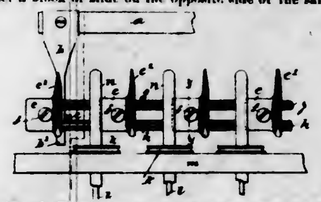
Claim.—1. In an ore-washer, an inclined trough having a water-supply at its head, a screw-conveyer mounted in the trough and arranged to carry the ore upward against the current, and one or more pipes opening upward near the bottom of the trough and communicating with the water-supply, as and for the purpose set forth.

2. In combination with the trough A and dam B, the conveyer *b*, spout *a*, and pipe *c*, as set forth.

3. In combination with the trough A, dam B, and conveyer, the pipe *c*, having a series of openings, *e e*, in the base of the trough, and the settling-tank C, as set forth.

4. In combination with the conveyer, troughs, and channels *d*, amalgamated as described, the conveyer B, spout *a*, pipes *c* and *a'*, and settling-tank C, all arranged and operating as set forth.

252,813. DRAFT-EQUALIZER. CHARLES L. SPENCER, Pittsfield, Ill. Filed Nov. 25, 1881. (No model.)



Claim.—1. A single-tree provided with the metallic straps secured to the back and face of the tree, and extending around the ends thereof, with formed eyes, as an improved article of manufacture.

2. The improved draft-equalizer consisting of the tongue, with the tongue-plate constructed as described, the double-tree, and the single-trees, provided with the end straps and the connections, substantially as described.

252,814. THREAD-GUARD FOR SPINNING-MACHINES. EDWARD S. STIMPSON, Hopedale, Mass., assignor to George Draper & Sons, same place. Filed Aug. 25, 1881. (No model.)

Brief.—Two parallel rods extend longitudinally along the frame of the machine and serve to support the thread-guards, which can be adjusted horizontally on said rods by means of suitable screws, which pass through a hole in the foot of the thread-guards and enter a block or slide on the opposite side of the said rods.

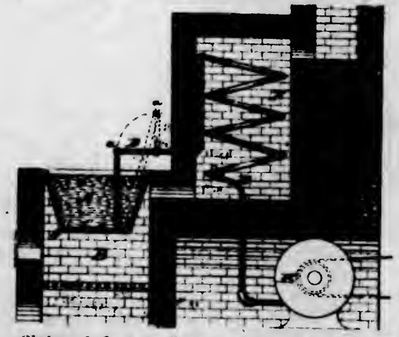
Claim.—1. The hangers adapted to be secured to the frame of the machine, and the two parallel rods or bars *g h*, combined with a series of guards having feet, and with blocks and screws to clamp and hold the said feet in adjusted position on the said rods or bars, substantially as described.

2. The guard *c'* and its laterally-projecting foot *e*, provided with a hole, and the block *d*, provided with a threaded hole, and the two rods *g h*, placed between them, combined with the screw *f*, inserted loosely through the foot and screwed into the block, substantially as described.

3. The hanger *b*, provided with the finger b^3, combined with the rods *g h*, block *d*, and its pin *e*, and with the guard and its foot and screw, all substantially as described.

252,815. DOMESTIC FRUIT-DRIER. JEROME B. SWEETLAND, Pontiac, Mich. Filed Oct. 26, 1880. Renewed Aug. 27, 1881. (No model.)

Claim.—1. In a fruit-drier, the base-section A, provided with the diaphragm C, having the deflecting-wings D, made larger than the openings C', substantially as and for the purpose set forth.

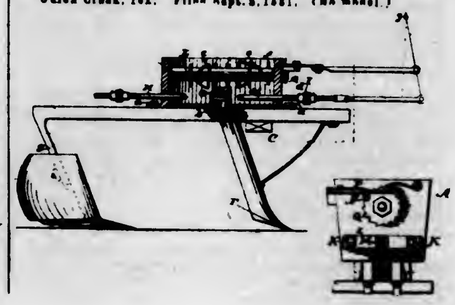


2. In a fruit-drier, the base-section A, having perforations B, and diaphragm C, having openings C' and wings D, in combination with the trays E H *a* and the cap F G, constructed and operating substantially as and for the purposes set forth.

3. In a fruit-drier, the tray E, having internal flange, *a*, in combination with the wire-gauze bottom H, and the securing-ring *b*, constructed and operating substantially as and for the purposes set forth.

252,816. ART OF DRAWING WIRE. CHARLES O. THOMPSON, Worcester, Mass., assignor to the Washburn & Moen Manufacturing Company, same place. Filed Sept. 2, 1881. (No specimens.)

Claim.—In the process of wire-drawing, preparing the wire to be drawn by coating or covering it with a solution of acetate of calcium, substantially as and for the purposes set forth.



252,817. APPARATUS FOR AND PROCESS OF OXIDIZING LEAD BULLION CONTAINING PRECIOUS METALS. JOHN TUNNICLIFF, Newark, N. J. Filed Apr. 13, 1881. (No model.)

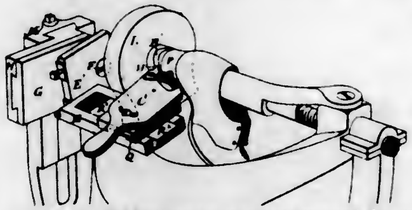
Claim.—1. In a cupellating apparatus, the combination of the pan A and furnace B with the pipe D, having joint *a*, and with the propelling apparatus E, all arranged to permit oxygen to be heated and forced into the lower part of said pan when the latter is filled with molten metal, substantially as described.

2. The process herein described of oxidizing all the lead contained in the mixtures of lead and precious metals by forcing into such mixtures, while they are in a molten condition, a current of superheated oxygen, and causing the same to ascend through the molten mixture, thereby producing oxide of lead that will float on top of the precious metal, substantially as described.

252,818. COTTON AND CORN PLANTER. JAMES M. TURLEY, Onion Creek, Tex. Filed Sept. 5, 1881. (No model.)

Claim.—1. The combination, with a seed-hopper, A, having a central discharge-opening, *b*, in its bottom, of the plungers H H, arranged in alignment with each other, and with a space between their inner ends, and reciprocating from one end to the center and from the center to the opposite end of the hopper alternately, substantially as described.

2. The combination, with a seed-hopper provided with a central discharge-opening, *b*, in its bottom, and a bridge, *c*, of the plungers H H, in alignment with each other, and provided with forked ends, with a space between them, and adapted to reciprocate from one end to the center and from the center to the opposite end of the hopper alternately, substantially as described.



3. The combination of horizontally-reciprocating plungers H, having forked ends, and arranged in alignment as specified, the rigid frame I K, whose side bars work in guides, a seed box or hopper placed horizontal, and mechanism for connecting the plunger-frame with a transporting-wheel for reciprocating the plungers, substantially as shown and described.

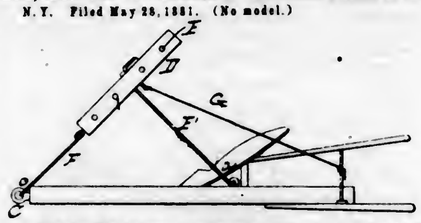
4. In combination with the parallel side bars, K, and straps I for connecting them, the plungers H and nuts applied thereto, in the manner described, for adjustment of the plungers, as specified.

5. The combination of the two reciprocating and aligned plungers H, the hopper A, having discharge-opening *b* and bridge *c*, and the shaft L, having two sets of arms, *e*, which are arranged on opposite sides of said opening and inclined in opposite directions, as shown and described, so that the seed is pushed toward the opening when the plungers advance in that direction.

6. The shaft L, having inclined arms *e*, and means for imparting intermittent rotation to it, in combination with the hopper having a bottom discharge-opening and seed-ejecting devices, substantially as shown and described.

252,819. HEEL-TRIMMING MACHINE. MERRILL A. TYLER, Rockland, and HERMAN D. STONE, Boston, Mass., assignors to the Tyler Manufacturing Company, Portland, Me. Filed Nov. 18, 1881. (No model.)

Claim.—1. In a heel-trimmer, the combination, with the rotary jack and the pivoted knife-stock-supporting table E, provided with rollers J, of the cam-groove K on the jack, receiving the rollers J, and the block G, adapted to slide in guides toward and from the axis of the jack, and supporting the pivot of the table, said grooved cam and sliding block moving the table positively, as set forth.

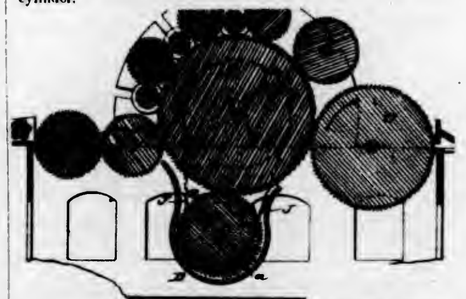


2. In a heel-trimmer, the combination of the rotary jack having the guide-groove R, curved laterally at R', the pivoted table or support E, guided by means, substantially as described, to give the trimming-knife its proper inclinations, and the knife-carrying stock C, supported by said table and adapted to be moved laterally thereon by the curve R' of the guide-groove, whereby the fullness or inclination of the heel at its rear portion is automatically increased, as set forth.

3. The combination of the jack having the curved guide-groove R, the pivoted table, guided by means, substantially as described, to give the trimming-knife its proper inclinations, the knife-carrying stock C, secured rigidly to a slide, Q, which is guided so as to move toward and from the axis of the jack, and a guide, R^3, supporting the slide Q, and guided to move in a line substantially parallel with the axis of the jack, the stock being thus allowed to move only in two directions, as set forth.

4. The combination of the jack, the pivoted table guided by means, substantially as described, to give the trimming-knife its proper inclinations, the guide R^2, guided on said table so as to move in a line substantially parallel with the axis of the jack, the slide Q, guided on the guide R^2 so as to move toward and from the axis of the jack, and the knife-carrying stock, pivoted to the slide Q, so that it can be turned thereon to vary its position, and provided with means for positively holding the stock upon the slide in any position to which it may be adjusted, as set forth.

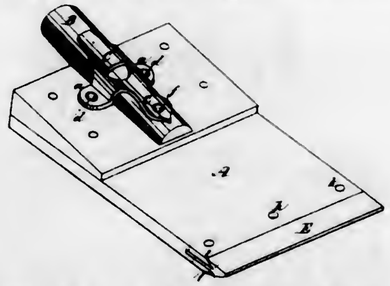
5. The combination of the jack, the fixed standard M, having vertical guides, the slide H, movable vertically in said guides, the slide G, movable toward and from the axis of the jack, and the knife-supporting table pivoted to the slide G, as set forth.



252,820. PLOW ATTACHMENT. REUBLAND UPDIKE, Hector, N. Y. Filed May 28, 1881. (No model.)

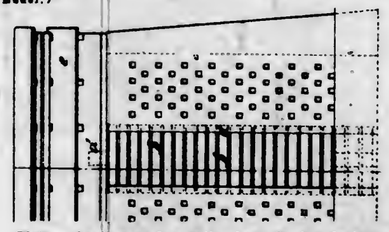
Claim.—The harrow attachment to a plow, consisting of the bar D, placed in V form with the beam, the forward connecting-rod F, the rigid arm E, hinged to the beam and having the shoulder or bearing *b*, and the cord G, whereby the harrow can be turned up and rest upon the plow-beam, substantially as specified.

252,821. CARDING-MACHINE. JNO. WALL, Amsterdam, N. Y. Filed Aug. 1, 1881. (No model.)



Brief.—A toothed cylinder located under the main cylinder of the carding-engine and revolving in a line parallel with the axis thereof is caused to perform the functions of a stripper by being driven at a higher rate of speed by means of a band passing from a band-wheel on the main cylinder to a smaller band-wheel on said stripper. The stripper is inclosed in a case or jacket, which receives or holds the extraneous matter removed from the main cylinder.

Claim.—1. As an improvement in carding-machines, the combination of the main cylinder A, cylinder or stripper B, arranged under the main cylinder and provided with metallic teeth *a*, and the case or jacket D, inclosing said cylinder B and forming a receptacle for the refuse matter, substantially as and for the purpose set forth.



2. As an improvement in carding-machines, the combination, with the main cylinder A, of the toothed cylinder B, arranged underneath the main cylinder, and suitable mechanism by which the latter is driven at a greater speed than the former, for the purpose set forth.

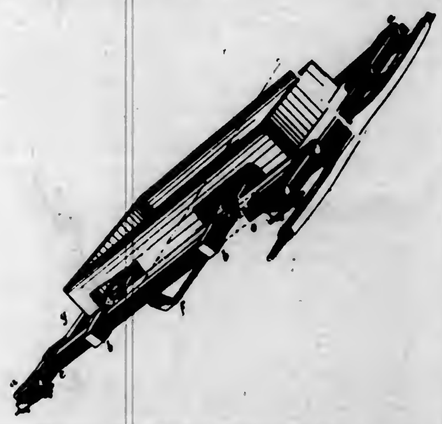
252,822. SNOW-SHOVEL. CHARLES A. WAY, North Charlestown, N. H. Filed Oct. 31, 1881. (Model.)

Claim.—In a snow-shovel, the combination, with the blade A and handle B, of the metallic clasp C, provided on its sides with flanges or ears *a*, secured in place by bolts *d d*, passing through said ears and the blade, and riveted upon the plate D, and the bolt *f*, passing through the end of the clasp, the thin portion of the chamfered end of the handle, and the blade A, and riveted on the triangular plate D, all constructed and arranged substantially in the manner and for the purpose set forth.

252,823. CORRODING-HOUSE FOR THE MANUFACTURE OF WHITE LEAD BY THE OLD DUTCH PROCESS. WILLIAM H. WURTENBILL, Philadelphia, Pa. Filed Sept. 20, 1881. (No model.)

Claim.—An improved corroding-house having sloping walls of masonry, provided with numerous perforations, and with vertical openings *a* in two opposite sides, extending from the floor to the roof, and having their inner sides rabbeted to receive the ends of the boards *b*, and provided with a central perforated ventilating-flue, *d*, substantially as herein shown and described.

252,824. WAGON BOLSTER-SPRING. JEROME W. WETMORE, Erie, Pa. Filed May 14, 1881. (No model.)



Claim.—1. The spring-bar *a*, when placed by the side of the bolster and supported in the middle and at each end without pivot-bearings, and connected by the arms F between the bearings with the bolster-board B, substantially as described.

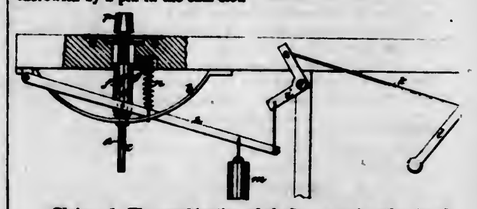
2. The spring-supports *c c*, with connecting-plate G, in combination with the spring *a*, substantially as described.

3. The spring-bar *a*, bearings *c c*, and arms F, in combination with the arms D and bolster-board B, substantially as described.

252,825. VEHICLE-SPRING. JEROME W. WETMORE, Erie, Pa. Filed May 14, 1881. (No model.)

Claim.—1. The vertical or oblique spring side bar, *c c*, when sustained in the middle and at each end without pivot-bearings, in combination with the arms *b b*, connecting it with the body of the vehicle, substantially as described.

2. The oblique or vertical spring side bar, *c c*, sustained in the middle and at each end without pivot-bearings, in combination with the horizontal spring-bar *g* and arms *b b*, constructed and arranged substantially as described.



252,826. HARVESTER. WILLIAM H. WHITELEY, Springfield, Ohio. Filed Sept. 10, 1881. (No model.)

Claim.—In an inclined elevator for harvesters, the rollers O O', provided with yielding journals, in combination with the customary aprons, *a a'*, and mechanism whereby said rollers are forced against the outer or returning portions of said aprons, substantially as and for the purpose specified.

252,827. SIGNAL FOR RAILWAY AND OTHER PURPOSES. OSCAR F. WILBUR and DAVID SAFFORD, Ashton, Ill., assignors to themselves and Nathan A. Petrie, same place. Filed Sept. 24, 1881. (No model.)

Brief.—The lantern rests on a detachable head upon the rotating shaft, said shaft being operated through weighted vibrating lever pivoted to a cam-slotted sleeve sliding thereon and connected therewith by a pin in the cam-slot.

Claim.—1. The combination of shaft *a*, carrying the signal devices, the operating-lever A, connected with the shaft, and devices, substantially as described, to turn the shaft without moving it endwise, substantially as shown and described.

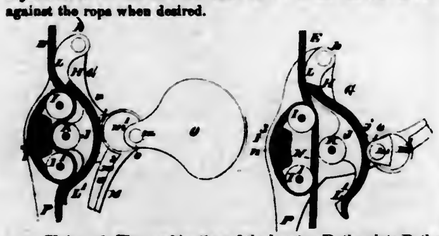
2. The combination of shaft *a*, carrying signaling device, the sleeve *c*, and the operating-lever A, substantially as shown and described.

3. The combination of shaft *a*, carrying signal devices, operating-lever A, crank-lever *i*, link *h*, and hand-lever *l*, substantially as shown and described, for operation as set forth.

4. The removable head *p*, formed to carry a lantern, in combination with the shaft *a* and head *c*, substantially as shown and described.

5. The sleeve *c*, provided with a slot, *f*, and fitted for movement by lever A, combined with shaft *a*, having pin *g*, substantially as shown and described, for the purpose of turning and locking the shaft, as specified.

252,828. LIFE-PRESERVING GARMENT. CHESTER WILLIAMS, Capac, Mich. Filed July 19, 1880. (No model.)



Claim.—1. A life-preserver composed of a jacket or garment having a permanently-attached air-tube commencing and terminating at the opening of the garment and continuing upward over the shoulders in enlarged caliber and down the sleeves and encircling the wrists, and provided with means for inflating the same, substantially as shown and described.

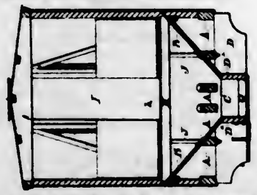
2. In a life-preserver, the combination of the jacket A and the continuous air-pipe B, terminating and commencing at the opening of the jacket at *a a*, and provided with or being of enlarged caliber at the shoulders, and having the pipe *c* and valve *f* located in one of its branches, as shown and described.

252,829. FIRE-ESCAPE. GEORGE L. WILLIAMS and HENRY RUDDLE, Edwardsville, Ill., assignors of one-third to James T. Cooper, same place. Filed May 21, 1881. (No model.)

Brief.—In the frame are journaled two sheaves, around which the rope passes. A brake pivoted to the upper end of the frame

is also provided with a roller-bearing. When closed a cam-lever pivoted to the outer side of the frame bears against the brake. An adjustable brake-shoe at the back of the frame can be set out against the rope when desired.

Claim.—1. The combination of the bearing D, the plate B, the screw C, having the shoulder *c*, the hook A, jointed to the plate B, the rope E, and the traveler G, substantially as described.



2. The traveler G, combining in its construction the frame H, the sheaves I I', the brake J, having the roller K, and the cam-lever M, substantially as described.

3. The combination of the frame H, the sheaves I I', the part P, the plate P', the shoe N, the screw *n*, the brake J, bearing K and lever M, substantially as described.

4. The combination of the frame H, sheaves I I', brake J, roller K, bearing L, and lever M, substantially as described.

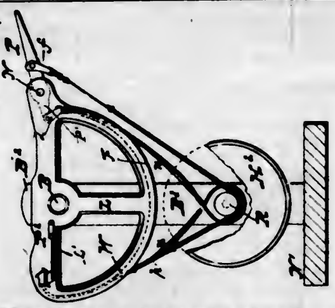
5. The traveler G, having fixed or movable bearings at I I', the brake J, pivoted at A, and having a fixed or movable bearing at K, the cam-lever M, and the plate O, substantially as described

252,830. CAR. THOMAS L. WILSON, Port Hope, Ontario, Canada, assignor of one-half to Eugene Harmon Davis, Toronto, Canada. Filed Nov. 15, 1881. (No model.)

Claim.—1. In a car having hoppers constructed in its bottom, a series of transverse joists, H, permanently secured over the top of the hoppers, in combination with the longitudinally-arranged bars A, fixed to the joists H, so as to form a permanent flooring capable of carrying ordinary merchandise without presenting any serious obstruction to the free passage of grain into the hoppers.

2. In a car having hoppers constructed in its bottom and a skeleton-frame permanently fixed over the top of the hoppers, a series of ferrules or sleeves, J, arranged between the transverse joists H and longitudinal timbers A, in combination with bolts K, passing through the said ferrule and through the joists H and timbers A, the said bolts being screwed and provided with nuts for drawing the timbers together, substantially as and for the purpose specified.

3. In a car having hoppers constructed in its bottom, the cross-timbers D, securely bolted to the longitudinal timbers A and braced together by the bolts E, in combination with the timbers D', the whole being arranged substantially as described, for the purpose of forming a suspension-frame for supporting the hoppers.



4. In a car, the sleeves J, provided with angular flanges at their lower ends, in combination with the joists H, timbers A, hopper-bottom B, and the bolts K, substantially as and for the purpose specified.

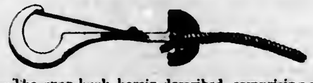
5. In a car provided with a hopper constructed substantially as described, the sliding door L and the guides M, bolted to the bottom of the timbers supporting the hopper, in combination with the lever N, rod O, and the apron Q, secured to the inner surface of the hopper-mouth, as and for the purpose specified.

6. In a car provided with a hopper and a sliding door moving in guideways, as described, the combination of an apron, Q, secured to the inner surface of the hopper-mouth, as and for the purpose specified.

252,831. DEVICE FOR CONVERTING MOTION. JAMES W. ANDERSON, Lancaster, Pa. Filed Aug. 17, 1881. (No model.)

Claim.—1. The appliance for converting reciprocatory rotary motion into rotary motion, consisting of a double-acting actuating-

lever, a vibrating frame or arc having on its peripheral extension the fulcrum for said lever, and tackle-belts connected and arranged to communicate the motion of said arc or frame to the driven pulley of a machine by alternate engagement of said belts, substantially as and for the purposes set forth.

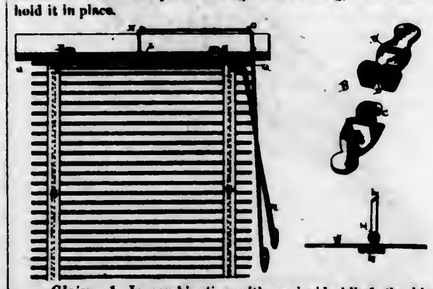


2. The oscillatory arc or frame L W, provided with belts *m n*, attached thereto at E' S', and to bits *d f* on lever P, which latter is pivoted at N to said frame, and operating substantially as and for the purpose set forth.

3. The sections L W L W' of the divided oscillatory arc or frame, pivoted upon each other at B on the upright B', and provided with the peripheral extensions O Q O' Q', in combination with belts *m n* and lever P D applied thereto, all arranged and operating substantially as set forth.

4. A tackle-belt, *m*, in combination with sheet-metal lining or re-enforcement *p* riveted or wired thereto, substantially as and for the purpose set forth.

5. The oscillatory-motion device composed of the vibratory arc L W, vibratory lever P, belts *m n*, in combination with a rotary machine having a fixed pulley, R, and a fly-wheel, H', or its equivalent, all operating conjointly, substantially as set forth.



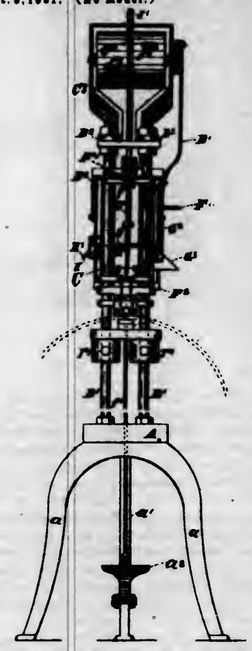
252,832. SNAP-HOOK. ADOLPH BURRD, Macon, Ga., assignor to Burrd Brothers, same place. Filed Nov. 7, 1881. (No model.)

Claim.—The snap-hook herein described, comprising a body or hook portion having branching arms and a head or base portion provided with a hemispherical cavity, and an opening at the bottom of said cavity adapted to receive a knotted rope and allow it to turn freely thereon, all substantially as herein set forth.

252,833. INSIDE WINDOW-BLIND. EDWARD W. BOWSLAUGH, Grimsby, Ontario, Canada. Filed Nov. 11, 1881. (No model.)

Brief.—The hinges by which the blind is secured to the window-casing are made in two parts, each part being provided with a slot, by which it can be adjusted while in position. The slats are fastened to the webbing by hooks, one end of which passes through the slat and the other passes through the webbing, and is bent to hold it in place.

Claim.—1. In combination with an inside blind, the hinge B, made in two parts, one of which is provided with the hook C and the other with the portion D, over which the hook catches, whereby the blind can be removed from the window without having to remove the screws from the hinges, substantially as shown.



2. In combination with an inside blind, the hinges B, provided with the hooks C and parts D, the parts of the hinges being

provided with slots for the screws to pass through, whereby the parts of the hinges can be adjusted into line with each other without having to remove the screws, substantially as described.

3. In an inside window-blind, the combination of a series of slats, F, provided with holes I near their ends, the webbing G, and the hooks H, which have an eye at one end for catching in the slat and a bend at the other end for catching against the outer side of the webbing, substantially as set forth.

4. The combination of the blind with hinges which are made in separable parts, and which can be detached without removing one of the screws, one of the parts being provided with a slot, so that it can be adjusted in position, substantially as specified.

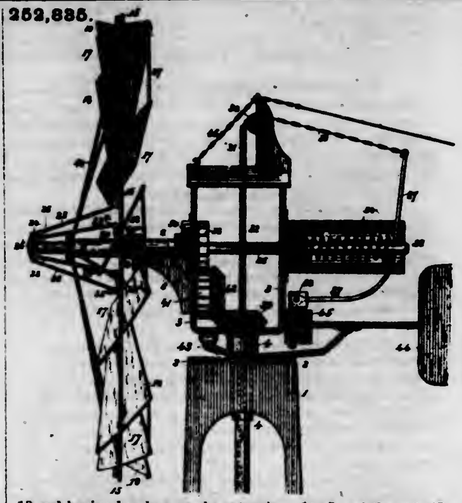
252,834. NAIL-DRIVING MACHINE. JOHN J. BUNN, Buffalo, N. Y., assignor of one-half to Edward M. Jewett, same place. Filed Oct. 3, 1881. (No model.)

Claim.—1. In a nail-driving machine, a separating nail-bar, G, having both a longitudinal and an oscillating movement, in combination with the arm G^3, pin F^4, inclined projecting piece G^3, spring H, and their operating mechanism, substantially as and for the purposes described.

2. The oscillating nail-box F^5 and inclined guideway C, in combination with the longitudinally movable and oscillating nail-separating bar G and the separating-bar G', with their operating mechanism, substantially as specified.

3. The inclined guideway C, in combination with the vertical rods B', end piece, B^2, nail-receiving jaws J J, and spring *g*, for the purposes described.

4. The parts $K' K^2$, provided with the opening K, in combination with the nail-guiding jaws L L and springs *r r*, for the purposes described.



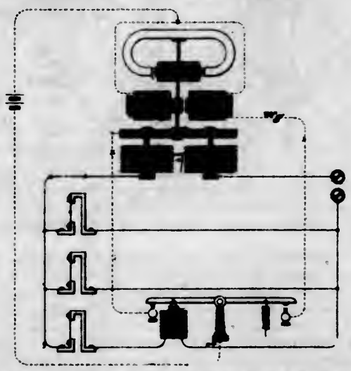
5. The combination of the nail-driving bar F and its operating connections D^2, F^3, *f*, and a^3 with the vertically-adjustable anvil N, for the purposes specified.

6. The inclined guideway C, provided with the end piece, B^2, adapted to move up and down on the rods B', in combination with the part K' and the bolts T, for limiting the vertical movement of the guideway C, as set forth.

252,835. WINDMILL. BLANCHARD CHAMBERLAIN, Bellefontaine, Ohio, assignor to John H. Wilson, same place. Filed Oct. 18, 1881. (No model.)

Claim.—1. The combination of hub 8, having the flange 9, the radial arms 11, extending therefrom, concentric rings 13 14 15, radial shafts 16, carrying sails 17 and having bearings on the inner ring, 13, and outer ring, 15, intermediate shafts, 19, carrying sails

252,835.



18 and having bearings on the outer rings, 14 15, and the rods 37, connecting the sails 17 and 18, as set forth.

2. The combination of the hub 8, having flange 9, the radial arms 11, extending therefrom, three concentric rings, 13 14 15, radial shafts 16, formed with crank-arms 20 and wrists 21, rotary collar 24, rods 23, connecting the wrists with the collar, presser-rod 26, having fixed collars 25, short shafts 19, sails 17 and 18, and the rods 37, connecting said sails, as set forth.

3. In combination with the feathering sails, connecting-rods, and rotary collar, the horizontal presser-rod 26, having slots 26* and collars 25 25 and 36, lever 27, having fulcrum 28 and passing through said slot, the spring 34, located on the presser-rod between the lever and collar 37, governor-rod 31, and chain 29, working over pulley 30 and connecting the lever to the governor-rod, as set forth.

4. The combination of the revolving mill-head 3 4, pawl 43, secured to the housing, the rack 2, hinged vane 44, and tripping device 47, operating substantially as and for the purpose set forth.

252,836. ELECTRIC LIGHTING SYSTEM. MOSES G. FARMER, Newport, R. I. Filed June 7, 1881. (No model.)

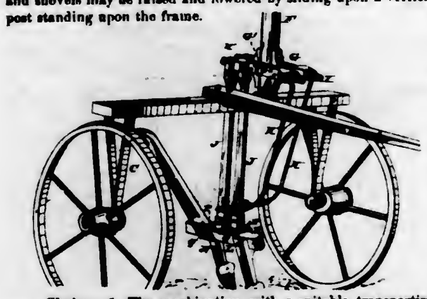
Claim.—1. In an incandescent electric lighting system, the method hereinbefore described of uninterruptedly controlling the strength of current of a main line of continuous conductors by and correlatively with incidental variations of strength in the same current traversing a continuous branch circuit.

2. In an incandescent electric lighting system, the method hereinbefore described of varying the strength of current of a main line of continuous conductors by dynamic effects produced by variations of strength in the same current traversing a continuous branch circuit.

3. In an incandescent electric lighting system, the method hereinbefore described of automatically controlling the strength of

current traversing a main line of continuous conductors by and correlatively with incidental variations of strength in the same current traversing continuous branch circuits in which the lights are included.

4. The combination, substantially as set forth, of a generator of electricity, separate branches or derived circuits uniting the poles or main conductors thereof, mechanism for varying the strength of the current flowing through said conductors, means for controlling the current-varying mechanism included in one of the branches and actuated by the current flowing therein, and an electric lamp or lamps included in each of the other branches.



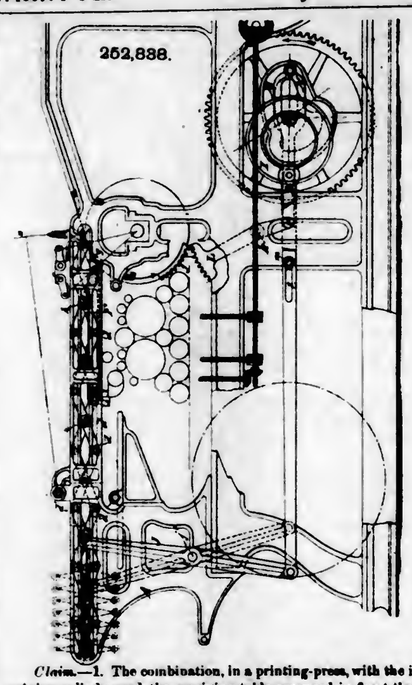
5. The combination, substantially as hereinbefore set forth, of a generator of electricity, two or more separate branches or derived circuits connecting the poles or main conductors of said generator, mechanism for regulating the strength of the electric current in the main and branch circuits included in one of said branch circuits and actuated by variations in the current traversing the same, and one or more electric lamps included in the remaining branch or branches.

6. The combination, substantially as hereinbefore set forth, of a generator of electricity, two or more separate branches or derived circuits connecting the poles or main conductors of said generator, mechanism for regulating the strength of the electric current in the main and branch circuits, an electro-magnetic helix included in one of said branch circuits for controlling said regulator, and one or more electric lamps included in the remaining branch or branches.

7. The combination, substantially as hereinbefore set forth, of a generator of electricity, two or more separate branches or derived circuits connecting the poles or main conductors of said generator, one or more electric lamps included in each of said branches, an adjustable rheostat included in that portion of the circuit of the generator common to all the lamps, and mechanism, substantially such as described, whereby the resistance of said rheostat is diminished as the joint resistance of the whole number of lamps is increased, and the reverse.

252,837. CULTIVATOR. ALEXANDER GUMP, Fletcher, Ohio, assignor of one-half to Jacob Gump, same place. Filed Oct. 20, 1881. (No model.)

Brief.—The cultivator-beams are hinged upon suspending-bars, so as to swing laterally. The frame that suspends the beams and shovels may be raised and lowered by sliding upon a vertical post standing upon the frame.



Claim.—1. The combination, with a suitable transporting-frame, of the vertically-adjustable frame G, having brackets H, the rods J, hinged upon said brackets, and the cultivator-beam hinged between the lower ends of said rods, substantially as set forth.

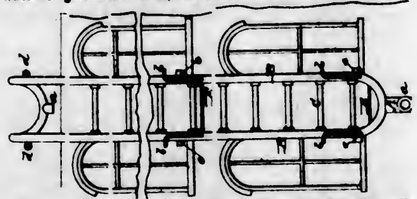
2. The combination of the frame G, having brackets H J, the arms J, hinged upon brackets H, the rods or braces K, hinged upon brackets I and connected to arms J, and the cultivator-beam hinged between the lower ends of arms J, substantially as set forth.

3. The combination of the frame-beam B, having upright F, the sliding frame G, having brackets H I, the arms J, the braces K, and the cultivator hinged between the lower ends of the arms J, substantially as herein described, for the purpose shown and specified.

252,838. PRINTING-PRESS. JOHN HENRY, Jersey City, N. J., assignor to Calvert E. Cottrell, New York, N. Y. Filed July 30, 1881. (No model.)

Brief.—The delivery gripper-bar and gripers are supported on ways above the bed, and are caused to reciprocate on said ways by lazy-tongs mechanism operated from the main shaft, so as to take the sheet from the front of the impression-cylinder and deliver it face upward on the receiving-table. The guideways are hinged to frame, so that they may be turned up.

Claim.—1. The combination, in a printing-press, with the impression-cylinder and the receiving-table arranged in front thereof, of stationary ways between said cylinder and table and delivery-gripers arranged in front of the cylinder, supported and guided by said ways, and operating in their movements both toward and from the cylinder entirely independent of the bed, substantially as herein described.



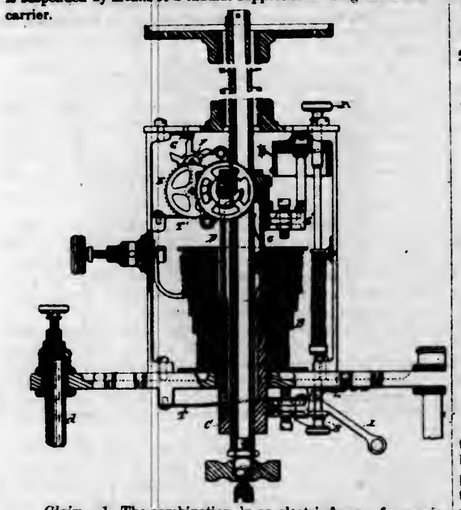
2. The delivery-griper guiding-ways hinged to the press-frame, substantially as herein described, whereby they are capable of being turned up or over, as and for the purpose herein set forth.

3. The combination, substantially as herein described, with the delivery-gripers, of carriers composed of lazy-tongs attached to fixed studs or pins on the press-frame, and means, substantially as herein described, of operating the said lazy-tongs.

4. The combination, with the frame of the press, provided with sliding bearings and with vertical guiding-faces *s s*, of the bed Q and the guide-rollers S S and their screw-threaded yokes and nuts, providing for their adjustment, substantially as and for the purpose herein described.

252,839. FIRE-ESCAPE. GEO. W. LEVI, Louisville, Ky., assignor of one-half to M. J. Duffy and Louis Kostal, same place. Filed Oct. 24, 1881. (No model.)

Brief.—A ladder of tubing provided with foot and hand rails, by which to gain access to it, and hose and tackle attachments.



Claim.—1. In a fire-escape ladder, the combination of branch pipes B B, cross-pipes C C, hose-connections *a a*, platform E E, and stand-pipe A, all in the manner and for the purpose set forth.

2. The combination, in a fire-escape ladder, of the branch pipes B B, having tackle attachments *d d*, and platforms E E, with railings *b b*, substantially as and for the purpose set forth.

3. The within-described fire-escape ladder, consisting of the branch pipes B B, cross-pipes C C, stand-pipe A, platforms E E, and tackle attachments *d d*, all substantially as and for the purpose set forth.

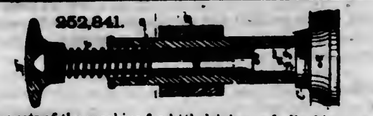
252,840. ELECTRIC LAMP. HIRAM S. MAXIM, Brooklyn, assignor, by mesne assignments, to the United States Electric Lighting Company, New York, N. Y. Filed Nov. 27, 1879. Patented in England Apr. 21, 1880.

Brief.—The carbon-carrier is controlled by a train of gears mounted upon a hollow core, through which the carrier passes. A fixed detent is employed in connection with the train. The lamp is suspended by means of a tubular support containing the carbon-carrier.

Claim.—1. The combination, in an electric lamp, of a gravitating carbon-carrier, with an axial magnet having a hollow core surrounding the carbon-carrier, a train of gearing mounted upon said core and controlling the descent of the carbon-carrier and a fixed detent into engagement with which the gearing is brought by the movement of the magnet-core, substantially as described.

2. The combination, in an electric lamp, of a movable magnet-core surrounding a gravitating carbon-carrier and bearing-gearing for controlling its descent, with flat springs supporting said core and holding it in place laterally, substantially as described.

3. The combination, in an electric lamp, of the magnet B with the movable core C and the springs T T', suspending said core free from frictional contact with the stationary part of the lamp, substantially as described.

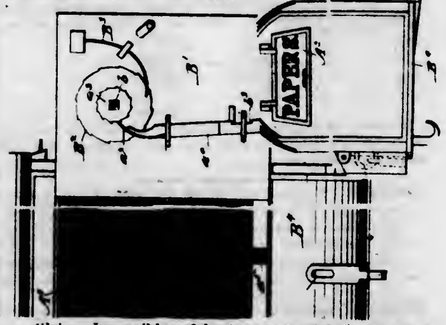


4. The combination, in an electric lamp, of a spindle and rack carrying one of the carbons, with a train of gearing, and a stationary detent, the said train of gearing being suspended on springs, substantially as described, and for the purposes set forth.

5. The combination, in an electric lamp, of a movable magnet-core hung on springs and carrying the carbon feeding and regulating devices, with the hook L for locking the same, substantially as described, and for the purposes set forth.

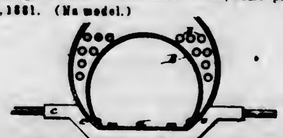
6. In an electric lamp, the combination, with the upper and lower carbons, of a sectional frame, one portion carrying the upper carbon, the other portion carrying the lower carbon, and the globe, the two sections being adjustable in the direction of the length of the carbons, so as to lengthen or shorten the lamp-frame, substantially as set forth.

7. The combination, with the upper-carbon carrier, its feeding mechanism and supporting-frame, of a tubular support attached to and adapted to sustain the lamp from above, extending above the case or frame in line with the carbon-carrier, so as to receive and inclose the latter.



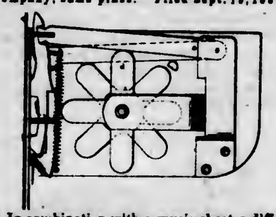
252,841. MACHINE FOR INSERTING AND CLINCHING STAPLES. GEO. W. MCGILL, New York, N. Y. Filed Dec. 10, 1881. (No model.) Patented in England Feb. 25, 1879, in Germany Mar. 15, 1879, in France Sept. 13, 1879, in Belgium Jan. 30, 1880, and in Austria-Hungary May 5, 1880.

Claim.—1. The combination of the anvil C, the guiding-collar B', and the removable and replaceable case D, containing the driving-plunger E, all constructed and arranged substantially as described.



2. The base-plate A, anvil C, guiding-collar B', and the removable and replaceable case containing the driving-plunger, all so constructed that said case may be used in combination with the other parts of the machine for both driving and clinching a staple, or may be withdrawn from the collar B' and used as a separate tool for driving a staple without clinching it, substantially as described.

252,842. STREET LETTER-BOX. TERRY MCLAUGHLIN, Chicago, Ill., assignor of one-half to Josiah J. Myers, same place. Filed Mar. 18, 1881. (No model.)



Claim.—In a mail-box of the character hereinbefore described, the combination, with the door B' and the bottom flap, B⁴, both being secured to box proper by one and the same lock, of the dial-plate B³, the ratchet-wheel a^3, the spring-lock B⁵, the pawl a^5, and the vertical lever a^4, all constructed, arranged, and operating substantially as and for the purpose set forth.

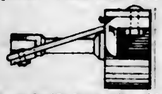
252,843. STEAM-BOILER. WILLIAM R. NICHOLS, Oswego, N. Y., assignor to the Ames Iron Works, same place. Filed Oct. 18, 1881. (No model.)

Claim.—The main boiler-shell A, having the straight bottom *a*, formed of a continuation of said shell, and the fire-shell B, of segmental form in cross-section, joined at its longitudinal edges to the interior of the main shell at or near the edges of the straight bottom portion thereof, all constructed and combined substantially in the manner specified and shown.

252,844. MECHANICAL MUSICAL INSTRUMENT. HENRY B. NORRIS and LUCIEN A. HART, Ithaca, N. Y., assignors to the Autophone Company, same place. Filed Sept. 19, 1881. (No model.)

Claim.—1. In combination with a music-sheet, a differential-feeding mechanism for mechanical musical instruments, the same consisting of a series of feeding hooks or arms arranged in different planes, and constructed to operate directly upon said music-sheet, substantially as before set forth.

2. A differential feeding mechanism for mechanical musical instruments, mounted at the transverse center of such instrument, substantially as before set forth.



3. The combination, substantially as before set forth, of the cams mounted side by side on a single shaft, the rock-levers, one opposite each cam, and operated thereby, the pawls secured one to each rock-lever and the springs.

4. The combination, substantially as before set forth, of the feeding-pawls provided with springs, the cams (one for each pawl) for moving the pawls one at a time in one direction, and the music-sheet provided at its center with feed-holes.

5. The combination, substantially as before set forth, of the feeding-pawls provided with springs, the cams (one for each pawl) for moving the pawls one at a time in one direction, and the music-sheet provided at its center with two or more rows of feed-holes.

6. A perforated music-sheet having a series of longitudinal rows of feed-holes along the center of the sheet, arranged as described, and having note-holes on each side thereof, substantially as before set forth.

252,845. FLAT-SEAM KNIFE FOR USE IN SOLDERING CANS. ROBERT NEIL, Wilmington, Del., assignor of one-half to J. Muir Clark, London, England. Filed Sept. 12, 1881. (No model.)

Claim.—A flat-seam knife for use in soldering cans, consisting of the sole-plate, the lever, the blade, and adjustable guide, substantially as set forth.

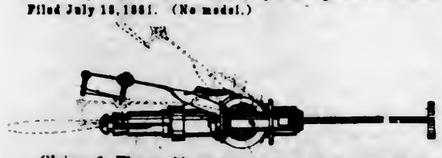
252,846. PREPARATION OF CHINOLINE. WILHELM PICKHARDT, New York, and HERMANN EBERMANN, Brooklyn, assignors to said Pickhardt and Adolf Kuttroff, New York, N. Y. Filed Dec. 8, 1881. (Specimens.)

Claim.—As a new article of manufacture, the citrate of chinoline herein described and having the characteristics above set forth.

252,847. PREPARATION OF CHINOLINE. WILHELM PICKHARDT, New York, and HERMANN EBERMANN, Brooklyn, assignors to said Pickhardt and Adolf Kuttroff, New York, N. Y. Filed Dec. 8, 1881. (Specimens.)

Claim.—As a new article of manufacture, the sulphate of chinoline herein described and having the characteristics above stated.

252,848. ELECTRICAL GAS-BURNER. JEROME REDDING, Malden, assignor to himself and Harvey Redding, Everett, Mass. Filed Aug. 13, 1881. (Model.)



Claim.—1. As an article of manufacture, an insulating section for gas-burners, having a yielding socket, substantially such as herein described, adapted to receive and permit the removal of a common lava tip, and electrodes secured to said section outside of the socket, as set forth.

2. The combination of the insulating section having a yielding socket adapted to receive and permit the removal of a common lava tip, and electrodes secured to said section outside of the socket by a water-proof cement, substantially such as described, in which said electrodes are embedded, substantially as and for the purpose described.

3. The improved molded insulating section or tube for a gas-burner, having slots or grooves made on its inner surface at its upper end for the reception of the electrodes and the cement or material whereby said electrodes are secured, as set forth.

252,849. ELECTRIC GAS-LIGHTING. JEROME REDDING, Malden, assignor to himself and Harvey Redding, Everett, Mass. Filed July 18, 1881. (No model.)

Claim.—1. The combination of a gas-burner, a contact-arm supported by and insulated from the burner and connected with one pole of a battery, a movable metallic arm connected with the opposite pole of the battery and provided with a piece of platinum one end of which is in metallic connection with said arm and the other supported by an insulated contact-arm thereon, and means for moving the pivoted arm to close the circuit through the platinum and cause the latter to ignite the gas by catalytic action, as set forth.

2. The combination of a gas-burner, a contact-arm supported by and insulated from the burner and connected with one pole of a battery, a pivoted metallic arm connected with the opposite pole of the battery and provided with a piece of platinum one end of which is in metallic connection with said arm and the other supported by an insulated contact-arm thereon, and means for simultaneously turning on the gas and vibrating the pivoted arm to bring its insulated contact-arm into contact with the fixed arm of the burner and thereby close the circuit through the platinum, the latter being at the same time moved into the gas issuing from the burner and caused to ignite the same by catalytic action, as set forth.

3. The combination of a gas-burner, a gas-cock therefor arrested in its open and closed positions by stops, the platinum-carrying arm pivoted to turn independently of the cock, and a spring connecting the arm and cock, said spring causing the arm and cock to move together until the latter is arrested in its open position, then permitting the arm to be additionally moved until the circuit is closed through the platinum and the gas is ignited thereby, and finally withdrawing the platinum automatically from the flame without moving the cock, as set forth.

4. The combination of the burner having the fixed contact-arm, the vibrating arm moving with the gas-cock and provided with a pinion, M, a vertical shaft, N, journaled in an arm projecting from the burner and provided with a pinion, N, meshing with the pinion M, and a downwardly-extending rod or handle adapted to be grasped by the operator, as set forth.

5. The combination of the burner having the fixed contact-arm, the vibrating platinum-carrying arm moving with the gas-cock and provided with a pinion, M, a vertical shaft, N, journaled in an arm projecting from the burner and provided with a pinion, N, meshing with the pinion M, and a pendent rod or handle connected to said shaft, so as to swing freely in all directions, as set forth.

6. In an electric gas-lighting apparatus, an elongated strip of platinum standing substantially parallel with and projecting slightly into the flat side of the flame, whereby the platinum is presented to the best advantage to the gas and catalytic action is promoted, as set forth.

7. In an electric gas-lighting apparatus, a slip of platinum adapted to be heated by electricity, made wider at one end than at the other, and located so that its wider end only will project into the space occupied by the flame, as set forth.

252,850. COMBINED STAIR-CARPET FASTENER AND STAIR-ROD SECURER. CHARLES D. STONE, Brooklyn, N. Y. Filed Nov. 25, 1881. (No model.)

Brief.—The device may be provided with an eye to secure the stair-rod or may be constructed without an eye. In the latter case it serves only to fasten the carpet in place; in the former to hold the stair-rod as well as to fasten the carpet in place.

Claim.—1. The stair-carpet fastener consisting of bracket A, formed of a wire doubled together and having screw-holes *a a*, thence turned over and brought back to overhang the shank, substantially as set forth.

2. In a stair-carpet fastener and stair-rod fixture, an arm which extends inwardly to overhang the carpet, and thence outwardly, forming a socket or eye to receive a stair-rod, as and for the purpose set forth.

3. The stair-carpet fastener and stair-rod fixture consisting of bracket A, formed of a wire doubled together and having screw-holes *a a*, thence turned over and brought back to overhang the shank, and terminating in an eye, A', substantially as set forth.

252,851. CURTAIN-FIXTURE. HENRY S. WING, Ashtabula, Ohio, assignor to Jennie A. Wing, same place. Filed Oct. 11, 1881. (No model.)

Brief.—The friction-disk, which bears against the bracket, is secured to a screw-threaded shank, which passes into the roller. A spiral spring surrounds the shank within a socket in the end of the roller.

Claim.—1. In a curtain-fixture, the combination, with the roller and the screw-threaded shank, of the bracket through which the shank extends, a spring, D, and disk E, the latter being secured to the end of the shank and adapted to bear against the outer side of the bracket, substantially as set forth.

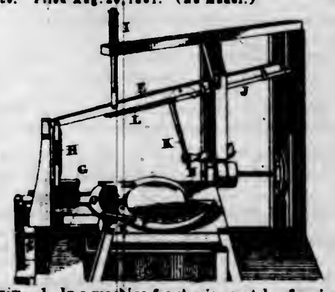
2. In a curtain-fixture, the combination, with the roller having the socket *c*, of the screw-threaded shank F, disk E, secured thereto, the bracket A, and spring D, surrounding said shank within its socket, said disk E being adapted to have frictional engagement with the disk B of the bracket, substantially as set forth.

252,852. ANIMAL-TRAP. FRANK WINSLOW, Hiawatha, Kans. Filed Nov. 18, 1881. (No model.)

Claim.—1. In an animal-trap, the combination, with a box, of a transverse shaft supporting a series of weighted platforms, and suitable stop devices for engaging said platforms, substantially as described.

2. In an animal-trap, the combination, with a box, of a transverse shaft supporting a series of tilting platforms, and swinging leaves provided with catches or stops adapted to engage with said platforms, substantially as described.

3. In an animal-trap, the combination, with the box having its rear side projecting above the other side and ends of the box, and provided with a transverse cleat, leaves hinged to said cleat, and each having two stops, one of which is beveled, of a series of tilting platforms pivoted upon a transverse shaft, and recessed and provided with rollers and weights, substantially as described.



4. In an animal-trap, the combination, with the box having the partition and transverse shaft, of a series of tilting platforms pivoted on said shaft and provided with weights, substantially as described.

5. In an animal-trap, the combination, with the box, transverse shaft, and swinging leaf having the catches, as described, of a pair of tilting platforms, recessed as described, and provided with rollers and supported upon said shaft, as set forth.

6. In an animal-trap, the combination, with the box and tilting platforms, of the removable trough or passage H, having its lower side open and secured to the box by end cleats, *h*, as set forth.

7. In an animal-trap, the combination, with the box, of the removable top section, G, and removable passage H, having the end cleats, *h*, and interior transverse strip, I, substantially as described.

252,853. MACHINE FOR BENDING AND SHAPING METAL ARTICLES. AUGUSTUS E. WOODYATT, Guelph, Ontario, Canada, assignor to the Guelph Carriage Goods Company, same place. Filed Aug. 20, 1881. (No model.)

Claim.—1. In a machine for shaping metal, a forming-block made in the form it is desired to produce the article and supported on a table having a slot through its top around and corresponding with the shape of the block, in combination with a compressing bar or bars arranged to compress against the forming-block the metal to be shaped, and a tank containing tempering-fluid placed below the table to receive the plates falling through the slot the instant they have been compressed into the required shape.

2. In a machine for forming metal, having a forming-block supported on a table with a slotted passage-way cut through its top, so as to permit the article compressed against the block to fall through the table, the compressing-bars P, pivoted on the table N, and connected to the cross-head Q by the links R, in combination with the wedge-shaped block G, arranged to operate the cross-head, as described, and having an indentation on its edge at a point which will permit the cross-head to spring back when the article has been compressed against the forming-block, thereby releasing from the pressure of the compressing-bars the article, which will then fall through the slotted passage-way in the table into the oil-tank below.

3. In a machine for shaping metal, having a compressing arm or arms operated in connection with a forming-block, a wedge-shaped block arranged to operate the compressing-bars and connected to the pivoted lever E by the rod H, in combination with the sliding plate J, connected to the lever and provided with a spring, L, and hand-lever K, for moving the plate J, so as to come in contact with the moving cross-head C, by which the lever E is tilted, so as to impart a downward movement to the block G, substantially as and for the purpose specified.

252,854. HARVESTING-MACHINE. CHAS. H. YOUNG, Derry, Pa. Filed Sept. 24, 1881. (No model.)

Claim.—1. In a harvesting-machine in which the main frame is raised or lowered by means of pinions on the axle working in curved rack-standards on the frame, the combination, with the axle, of the worm-wheel fast thereon, and the worm or screw on the tumbling shaft for actuating the same, and the shaft and pinions, substantially as described.

2. In a harvesting-machine in which the main frame is raised and lowered by means of pinions on the axle working in curved rack-standards on the frame, the jointed or tumbling worm-shaft for actuating said pinions through a worm-wheel on the axle, in combination with the sheave on the fixed portion of the shaft, and the cord or chain connecting it with the grain-wheel lever for operating the same, and raising or lowering the outer end of the platform simultaneously with the raising or lowering of the main frame, substantially as described.

252,855. RAILWAY-CAR. WILLIAM P. PREWITT, Hilton, Ky., assignor to himself and Caleb W. Bell, same place. Filed Dec. 7, 1881. (No model.)

Claim.—1. The combination, with a railroad-car, of two sliding or retracting supports surrounded by spiral springs, to which are secured cross-supports, thus adapting said supports to close up or open out, substantially as and for the purpose described.

2. The combination, with a railroad-car, of the rods B B, surrounded by spiral springs *b b*, and rods or connections *a a*, all substantially as and for the purpose set forth.

3. The combination, with a railroad-car, of rods B B, springs *b b*, connections *a a*, and chain *c*, all arranged to operate substantially as and for the purpose set forth.

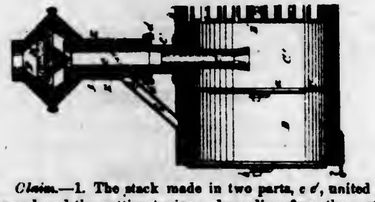
252,856. COMB. VINCENT W. WILDER, Leominster, Mass., assignor to Wilder, Paton & Metcalf, same place. Filed Oct. 22, 1881. (No model.)

Claim.—1. The combination, with the frame-piece A, having upwardly-inclined extremities *a*, of an arched wire springing from said extremities, and united with said frame-piece only at its two extremities *a*, and having beads or other ornaments strung thereon in close contact with each other, substantially as and for the purpose described.

2. The combination, with the frame-piece, of a wire connected only at each extremity to an end of said frame-piece, and curved above it, and having beads or other ornaments strung thereon in close contact with each other, so as to form an arch, substantially as described.

3. A comb for ladies' head-wear, comprising a frame-piece or base, a beaded wire covered over said frame-piece or base and attached to it, and one or more beaded wires filling the space between said curved wire and said frame-piece or base, substantially as described.

252,857. INSULATOR FOR TELEGRAPH-WIRES. CHARLES L. GOSS, New York, N. Y., assignor of one-fourth to John D. Townsend, same place. Filed May 10, 1881. (No model.)



Claim.—1. The telegraph-wire A, having series of insulating-rings B B strung directly upon it, the said rings being separated from and not in contact with each other on the wire, and made of non-conducting material, substantially as herein shown and described.

2. The nested or massed telegraph-wires A A, each having insulating-rings B B strung upon it, said rings being arranged on the several wires so as to break joints, thereby allowing less than the length of the radius of one ring to intervene between the wires with which said rings are respectively in contact, substantially as specified.

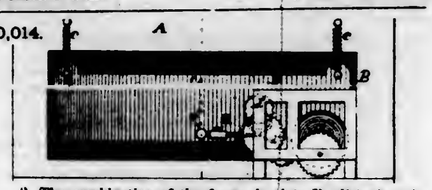
3. The nested or massed telegraph-wires, each having insulating rings or beads strung directly upon it, said rings being arranged upon the several wires so as to break joints, thereby allowing less than the radius of one ring to intervene between the wires with which said rings are respectively in contact, and an insulating substance which fills the remaining spaces between the wires when placed in a pipe or box, whereby the wires are insulated and protected from moisture, substantially as herein shown and described.

REISSUES.

10,013. SMOKE-STACK AND SPARK-ARRESTER. WILLIAM F. COSGROVE, Jersey City, N. J., assignor to himself and ERNEST F. JENNINGS, same place; said Cosgrove and Jennings assignors, by mesne assignments, to the J. K. Taylor Company, Concord, N. H. Filed Dec. 5, 1881. Original No. 218,937, dated Aug. 26, 1879.

Claim.—1. The stack made in two parts, *c c'*, united at the flange *d*, and the petticoat-pipe *e*, depending from the part *c'*, in combination with the jacket E, mounted on the flange *d*, and supporting in its head the arresting and deflecting devices, for the purpose set forth.

2. The chamber D, formed as an integral extension of the boiler-shell A, but distinct from the smoke-arch C', and arranged to receive the sparks, dust, and cinders deflected downward in the stack, substantially as set forth.



3. The chambers C' D of the boiler A, separated by the solid or impervious partition C, and arranged with relation to the smoke-stack, deflectors, and conveying-tube, substantially as set forth.

4. The boiler A, having forward of the smoke-arch C' a chamber, D, the cylindrical walls of which are coincident or integral with the boiler-shell, in combination with suitable means of arresting the cinders and sparks carried upward by the draft, and an oblique pipe to convey them to said chamber, substantially as set forth.

10,014. SIGN. EMIL GRAE, Toledo, Ohio, assignor, by mesne assignments, to John Tremlett and Alexander S. Hann, St. Louis, Mo. Filed Dec. 22, 1881. Original No. 230,268, dated July 20, 1880.

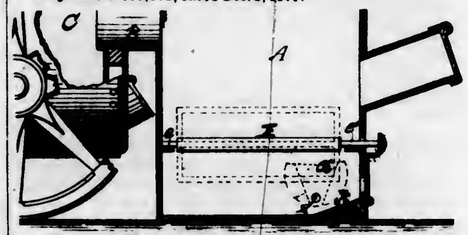
Claim.—1. In a sign, a plate having open letters supported by a suitable frame, in combination with a moving or vibrating brilliant disk or plate, substantially as and for the purpose set forth.

10,014.

2. The combination of the frame A, plate B, glistening vibrating plate or disk C, springs *e*, and clock-work mechanism D, all made substantially as and for the purpose set forth.

10,015. WINDOW-SHADE. HANNAH B. S. NORMAN, St. Louis, Mo. Filed Dec. 9, 1881. Original No. 247,394, dated Sept. 20, 1881.

Brief.—Ornamented paper or other thin material is applied to one or both sides of translucent portions of the web, the designs on both sides registering.



Claim.—1. A window-shade the body of which is a continuous web, A, and having mounted thereupon and upon one or both sides of the web, as desired, the translucent ornamented paper C, said web at the point or points where the ornamented paper is attached being translucent, substantially as described.

2. A window-shade any part of which having mounted thereupon and upon one or both sides of said part, as desired, ornamented paper or other thin, flexible, translucent material, said web at the point or points where the paper is attached being translucent.

3. A window-shade having ornamented paper or other thin, flexible, translucent material upon both sides thereof, the designs on said papers registering.

10,016. FIRE-BOX ATTACHMENT FOR FARM-ENGINE BOILERS. HARRISON GILLETT, Lake City, Minn., assignor of one-half to James H. Gillett, same place. Filed Oct. 8, 1881. Original No. 232,270, dated Dec. 2, 1879.

Claim.—1. The inclosed box provided with a flue leading from its upper portion and adapted for connection with a boiler-furnace, and having at a suitable level a horizontal series of wide rotatable grate-bars provided with projecting handle or handles, and outwardly-projecting feed-chute leading into the box above the grate-bars and a water-chamber below said grate-bars, substantially as described.

2. The fire-box A, having flue B, rotatable grate-bars E, water-chamber F, and a suitable fuel-feed opening, substantially as described.

3. In a fire-box, the combination, with the water-chamber below the grate-bars, of the water-pocket G, having near its bottom an opening leading into said water-chamber, substantially as described.

4. In a fire-box, the water-chamber below the grate-bars, having arranged within it an incline, *h*, leading from the bottom thereof to the doorway, substantially as and for the purpose set forth.

5. A portable straw-burning detachable fire-box having a grate and provided with an opening or door through which the straw may be fed, and having an opening or flue for applying the same to a farm-engine boiler for the purpose of generating steam, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of Illinois.

EDGARTON *et al.* v. THE FURST & BRADLEY MANUFACTURING COMPANY *et al.*

Decided July 19, 1881.

1. RULE OF COMITY.

When the record is substantially the same as that in a prior case the rule of comity prevails and the findings of the court will be followed; but when the defenses and proofs are not the same the rule does not apply.

2. DISCLAIMER—ADMISSION OF COMMON USE AMOUNTS TO.

The statement in an original specification that certain described parts or combinations of parts "are in quite common use" amounts to a disclaimer, and is a statement of fact which prevents the reclaiming of such parts by a reissue.

3. MECHANICAL TERMS—CERTAIN NOT SYNONYMOUS.

In a limited state of the art "mounted on" is not the same as "suspended from."

4. COMBINATIONS—PARTS DISCONNECTED AND INOPERATIVE DO NOT CONSTITUTE VALID.

Parts wholly disconnected from each other and from the machine, and which are inoperative for any purpose as enumerated in the combination claimed, do not constitute a valid combination.

5. SAME—CERTAIN COMBINATIONS VOID FOR UNCERTAINTY.

A combination claim naming two independent sets of devices used for producing different operations or results, and containing the words "or either, in relation to each other" and to another part not affected by either of them, is void for uncertainty.

6. REISSUE PATENT NO. 2,994 DECLARED VOID.

Whitcomb's Reissue Patent No. 2,994, for an improvement in horse hay-rakes, is void, because the improvement claimed had been in public use for more than two years prior to the original application for a patent.

Mr. Thomas H. Dodge for the complainants.

Messrs. West & Bond for the defendants.

BLODGETT, *D. J.*:

These two suits are for infringement of letters patent issued on the 5th day of October, 1858, to George Whitcomb, for an improvement in horse hay-rakes. The patent was reissued June 16, 1868, in two parts, as Reissues Nos. 2,994 and 2,995, and on the 5th of October, 1872, was extended for a further term of seven years.

The first suit is brought by the owners of the original term and the second by the owners of the extended term.

The defenses set up are, first, the invalidity of the reissued claims involved in this suit; second, that the devices covered by the reissued patent were in public use, with the knowledge or consent of the patentee, for more than two years prior to his application for this patent, and also that they were publicly known and used by others for more than that time; third, that the improvements in question are anticipated by the older art; and, fourth, that the defendants do not infringe.

The patent in question has reference to what are known as wire-tooth horse hay-rakes, and the claims of the patent alleged to be infringed by the defendants are the second and fourth of Reissue No. 2,994, which are as follows:

2. The combination and relative arrangement of the hinged rake-head with the supporting-axle and carrying-wheels, substantially as shown and described, whereby the head is supported above the rear upper edge of the axle, as shown, and the lower ends of the teeth, when gathering the hay, occupy positions in rear of the tread of the wheels and forward of a vertical plane on a line with the rear edge of the wheels, substantially as shown in the accompanying drawings.

4. The arrangement of the rake-head E and foot-treadles H J and G K, or either, in relation to each other and the axle B, substantially as and for the purposes set forth.

In his specifications, forming part of the original patent, the patentee inserted a disclaimer, as follows:

I do not claim the wire teeth F, attached to the head E, as shown for such device mounted on wheels is in quite common use.

This disclaimer is wholly omitted from the reissued patent, and the only claim in the original patent was—

The arrangement of the treadle J K, lever I, rake-head E, arms G K, bar F, joint C, and adjustable rope L, substantially as and for the purposes set forth.

This patent was before the United States Circuit Court of Massachusetts in June, 1872, in the case of *Brown* v. *Whittemore et al.*, (5 Fish., 524,) Mr. Justice Clifford and Judge Lowell presiding, and the two claims now in question were sustained under the facts in that case, and it was again before the same court, Judge Lowell presiding, in December, 1879, in the case of *Edgarton et al.* v. *Beck et al.*, and the fourth claim sustained under the facts in that case.

In the first of these cases the court said:

The record does not contain a copy of the original patent, and there is no evidence of what changes, if any, are found in the reissue. In the absence of such evidence we must, of course, assume that the action of the Patent Office was well warranted by the facts, and that the reissued patent is open to only such objections as might have been raised to the original patent.

In *Brown* v. *Whittemore* the second point made in this case seems to have been urged, and the court said:

Upon a very careful examination of the evidence we are of opinion that the combinations of the second and fourth claims were not only invented by Whitcomb, but that they had not been publicly used or sold with his consent before the time in question. * * * And though the evidence is not all on one side, yet the preponderance of it is that the combination of the treadle for raising the rake-head with the other devices was not fully discovered and used before June, 1856.

In *Edgarton et al.* v. *Beck* the contest seems to have been mainly over the questions of novelty and infringement; but the proofs in *Brown* v. *Whittemore* on the question of prior use and sale with the consent of the patentee and in *Edgarton* v. *Beck* on the question of novelty do not seem to have been the same as in the cases now before the court, and the original patent is before this court, which was not before the court in the Whittemore case. Of course, if the testimony in these cases was substantially the same as that in the cases heretofore decided by the learned judges in the Massachusetts circuit court, I should feel wholly bound by

their decisions and the construction of the patent given by them; but as it is evident from the inspection of this record that I have a different combination of facts to deal with from what has been heretofore presented, I must consider these cases in the light of their own evidence.

The first objection to the second claim is that it comes within the disclaimer of the original patent:

I do not claim the wire teeth F, attached to the head E as shown, for such a device mounted on wheels is in quite common use.

What is it that Whitcomb here disclaims? My own construction is that it is the rake-head E, mounted on wheels, as described in his specification and shown in his drawing, and this rake-head and mode of mounting it is described in his original specifications in the following language:

The back end of the shafts or thills C C extend a trifle back of the axle B, and to the back end of the thills, beyond the back part of the axle, a rake-head, E, is connected by joints or hinges C, the hinges being at the under side of the rake-head, as shown clearly in Fig. 1, so that the head may work thereon as a fulcrum.

Figure 1 in the drawing of the original patent and in the reissued patent shows the rake-head made of a square stick of timber with an eyebolt passing through from corner to corner, which, with an eyebolt or staple passing through the end of the thill, makes the joint or hinge by which the rake-head is attached to the carriage. By this arrangement the teeth hang nearly in a line with the periphery of the wheel, the points coming to the ground just back of the tread of the wheel. Naturally enough the curved rake-teeth will hang or move somewhat in the line of the periphery of the wheel, and they will hang just back of the tread of the wheel.

If I am right in my construction of this disclaimer, there can be no doubt that the second claim of the reissue is for the very thing which Whitcomb disclaimed and said was in common use in his original specification. He brings this case clearly within the principle laid down by the Supreme Court of the United States in *Leggett* v. *Avery*, (101 U. S., 259; 17 O. G., 445:)

We think it was a manifest error of the Commissioner in the reissue to allow to the patentee a claim for an invention different from that which was described in the surrendered letters, and which he had thus expressly disclaimed. The pretense that "an error had arisen by inadvertence, accident, or mistake" within the meaning of the patent law was too bald for consideration. The very question of the validity of these claims had just been considered and decided with the acquiescence and the express disclaimer of the patentee. If in any case where an applicant for letters patent, in order to obtain the issue thereof, disclaims a particular invention or acquiesces in the rejection of a claim thereto, a reissue containing such claim is valid, (which we greatly doubt,) it certainly cannot be sustained in this case.

Then, again, they say on the same page:

As before remarked, we consider it extremely doubtful whether reissued letters can be sustained in any case where they contain claims that have once been formally disclaimed by the patentee or rejected with his acquiescence, and he has consented to such rejection in order to obtain his letters patent. Under such circumstances the rejection of the claim can in no just sense be regarded as a matter of inadvertance or mistake. Even though it was such, the applicant should seem to be estopped from setting it up as an application for a reissue.

So, too, in the bottle-stopper case lately before Judge Shipman, *Putnam* v. *Tinkham*, (4 Federal R., 411,) the learned judge says:

The claim is as follows:

"The internally-located bottle-stopper B, provided with a hinged or jointed handle or bail, C, composed of two elastic legs or branches, and an eye or finger loop, as and for the purposes set forth."

He virtually disclaims rigid handles, and says that his invention is designed to avoid such a method of construction. It is useless to say that by a rigid handle he merely meant a bail without spring action, for the entire paragraph shows that he also meant a handle so jointed or hinged to the stopper that it could be turned away from the mouth of the bottle. He intended to point out that his handle or bail was both hinged to the stopper and had elastic legs. The reissue covers a device in which the bail is attached to the stopper in any manner.

The hinged construction is briefly alluded to as one which accomplishes a certain result.

In the original patent the patentee informed the public, with precision and after deliberation, that his invention was an improvement upon a rigid handle, and limited himself to a hinged or jointed handle.

It has now become important for the plaintiff to possess himself of the territory which his assignor attempted to occupy but abandoned, and the ownership of which he virtually disclaimed.

A comparison of the two patents shows that the case is clearly within the principles which have been recently and frequently announced by the Supreme Court as applicable to reissues. The reissue is void because it is on its face for a different invention from that which was embraced in the original patent. (*Russell* v. *Dodge*, 93 U. S., 460; *Railway Company* v. *Sayles*, 97 U. S., 554; *Powder Company* v. *Powder Works*, 98 U. S., 126; *Leggett* v. *Avery*, 17 O. G., 445.)

These authorities seem to fully meet this case, and I can put no other construction upon them than that this claim is void by reason of the original disclaimer. This patentee had no right, after having stated positively to the world and to the Patent Office that he did not claim the idea of mounting the rake-head upon the top of the carriage, by a reissue to claim this as an element of invention by himself. But if there is room for doubt as to the soundness of this position, I am also clear that the defendants do not infringe this claim. The claim is for the combination, &c., whereby the head is supported above the rear upper edge of the axle, as shown. The defendants' rake-head is suspended behind or in the rear of the axle by brackets hung, so to speak, behind the axle, instead of being supported above the axle.

In *Edgarton* v. *Beck*, Judge Lowell says:

The difficulty with the second claim of the reissue as applied to this case is that the patentee has seen fit for some reason to describe his rake-head as supported above the upper edge of the axle, and the defendant's rake-head is on a line with the axle. It may be that this limitation was unnecessary, but it is found in the second claim, and I do not feel at liberty to disregard it.

The inspection of the two models before me shows that the distinction taken by Judge Lowell was mechanically and technically correct. The specification and drawing described the particular manner and place where and how the patentee Whitcomb supported his rake-head upon the carriage. Judge Lowell sees fit to confine him to that special method of so supporting his rake-head. The defendants do not literally support their rake-head upon the axle at all, but by means of the brackets they suspend or hang it in the rear of the axle, so that a different function or mode of operation is accomplished by defendants' rake-head from what is accomplished by the Whitcomb rake-head. The Whitcomb rake-head having for its point of motion the place of attachment to the thills by its hinge, necessarily made it more difficult to keep the teeth upon or near the ground while gathering the load, while by the peculiar manner in which defendants' rake-head is suspended its whole weight aids in holding it down in working position. Probably the testimony before Judge Lowell in this case showed that Whitcomb must from the state of the art be confined to the specific device—that is, the special place where and mode by which he supported his rake-head on the carrying-wheels, because the proof in this case shows that Randal Pratt had mounted his rake-head over or on the axle long before Whitcomb entered the field, and that Whitcomb himself and Banks and Craft had, as early as 1853, 1854, and 1855, made rake-heads with the heads mounted on or over the axle and behind the axle.

Randal Pratt, in his patent granted in 1855, says:

Over the main axle and secured to it by studs or posts is a rod or axle, marked *c c*, extending the whole length between the wheels, to which the teeth of the rake are attached by any form of movable joint, so that each may move up and down independent of the rest. This rod also forms the center of motion of the apparatus for raising and depressing the teeth, to be hereinafter described.

An inspection of Pratt's patent shows his rake-head supported over the axle in substantially the same way—not, of course, attached by just the same kind of joint or hinge, but mounted over the axle so that the teeth fall outward and backward almost in the line of the wheels, and come to the ground just back of the tread of the wheels—that is, there may be in the practical full-sized rakes a few inches difference, but not enough to make a distinction or difference in the principle or mode of operation of the two devices in that regard. The same principle and mode of operation, but differently worked out, are found in Delano's patent of 1849, Martz's patent of February, 1856, and in Grant's English patent of 1847.

As to the fourth claim, it is urged by the defendants that this claim is void for uncertainty, because it does not describe an operative mechanism. It is for the—

Arrangement of the rake-head E and foot-treadles H J and G K, or either in relation to each other, and the axle B, substantially as and for the purposes set forth.

This claim does not connect the treadles with the rake-head nor the axle, nor show how these treadles are operative parts of the machine.

The description of these in the reissued patent is as follows:

To the upper end of bar or arm F are hinged or pivoted the rear ends of the arms G and H. The front end of arm G is pivoted or hinged to the hand-lever I, which in this instance is slotted out to receive the lever G, as shown at *d*, while its lower end is hinged or pivoted to the front ends of the braces *a' a'*, as shown at *e*. The lower end of arm H is hinged or pivoted to the rear and lower end of the foot-treadle J, the front end of which treadle J being hinged or pivoted to the angle-braces *a' a'*, as shown at *f*.

Another foot-treadle, K, is hinged or pivoted to the angle-braces *a' a'*, as shown at *g*, and the rear inner part of the foot-treadle K is connected to the front part or end of arm G by a link or rod, A.

Here is a description of two separate treadles operating independently of each other. Their functions are different, and no part of one forms any part of another. The words "or either" would seem to indicate that it was the purpose of this patentee to claim that if any person used both or one of these treadles he thereby infringed upon this claim—that is, if a rake is made with the treadle H J for the purpose of unloading the rake, and an entirely different device from the treadle G K for holding the rake-teeth down while gathering the hay, this claim is thereby infringed—that is to say, the true construction of this claim contended for by complainants is that the words "or either" covers the use of either of these treadles for the purpose of performing the function they respectively fulfill in complainants' rake. If this is the construction of this claim, then the words "in relation to each other" must be disregarded, as these are words which show combination or a joint or common function in the parts described. I think that you must reject the words "in relation to each other," as applicable to these treadles, or else the two treadles are to be treated as independent organisms, each one of which is covered by this claim. It seems to me that as a combination of parts this claim must be held void for uncertainty, as I have already said, because it does not show whether the patentee intended to cover by this claim the two treadles working in combination with each other for their different purposes, or whether he intended to cover each one as a separate device, so as to be able to punish any infringer who used both or only one. In other words, it seems to me he attempts here to cover not only the combination of these treadles with the axle, but each separate element of his combination, and this, I think, cannot

be allowed; but even if I am wrong in this construction, still it seems to me that this claim must be held inoperative, because it shows no useful result which can be produced by this mechanism alone. He does not show that these treadles are to operate in combination with the bar or standard F' so as to work the rake-head either to unload or hold it down while gathering the hay. As claimed, these treadles are simply two sticks, as was said upon the argument, which are not connected with any part of the mechanism. It is true that the words "as shown" refer us to the specifications and drawings of the patent; but when we examine these specifications and drawings we find that these treadles do not reach any operative combination or connection with the axle except through the rake-head, and it is so obvious that it needs no argument that the treadles and axle alone would not rake hay or perform any other effective work, so that a claim of the treadles and axle gives us no operative mechanism. But without being hypercritical as to the language of this or either of these claims, I find from the proof that both these treadles were used and sold with Whitcomb's consent more than two years before the patent was applied for. These treadles are both shown in the three full-sized rakes in evidence in this case. These rakes were, I am satisfied, made and sold as early as 1855. The only substantial difference between these rakes and the patent is the mode of hinging the rake-head to the axle or carriage.

In the full-sized rakes shown in evidence the rake-head is fastened to the carriage by clasps, which allow the rake-head to revolve within the clasps upon its own axis. This rake-head is attached to the carriage-frame by the joint C, so that the lower corner of the rake-head is made the center of motion, a difference which may have some mechanical value, but is only a specific difference.

These treadles which I am now considering were in use in the old rakes in 1854 and 1855. This evidence shows that Whitcomb began to make rakes as early or earlier than 1851. In 1852 he applied for a patent on the form of rake which he then claimed to have invented, which application was rejected. In this application he shows a horse-rake with wire teeth, and the teeth attached directly to the axle of the carriage and operated by a mechanism something like a "reach," as it was called, or the bar H and the lever I. In 1853 he adopted a separate rake-head, which, of course, he or some one mounted on or attached to the carriage. This separate rake-head, in order to be operative or of any use to the mechanism, must be in some way attached to the carriage. Some mode of unloading was also necessary to the operation of this machine. As all these rakes were intended to allow the driver to ride, some kind of treadle or lever operated by the feet as well as the hands was almost a necessity, and was indispensable to the practical operation of this rake by one man. The whole organism shows that it was intended that the driver should ride upon the carriage and that he should operate the rake from his position on the driver's seat. There must therefore be embodied in the mechanism in some form levers and treadles which would enable the driver to operate the rake to hold the teeth down while gathering the hay and raise the rake-head when loaded. I therefore come to the conclusion that treadles and levers were early adopted

in the progress of the development of this rake, and that substantially the treadles which are shown in the Whitcomb patent were in use for much more than two years prior to the application for this patent.

The testimony on the part of the defendants shows clearly, as evidenced by the recollection of witnesses, that such treadles were used; but from the very nature of the invention and its progress step by step it seems to me that one of the most natural devices that the mind of the constructor would be directed to in making a practical riding hay-rake would be the method of operating the rake from the driver's seat, and they could hardly have attempted to make a device for that purpose without the adoption of treadles. This view seems also to be so fully in harmony with the recollections of the witnesses who have testified as to the development of the finally perfected rake that I consider it confirmatory of the testimony of those witnesses.

Whitcomb first began to make rakes at Glenville, Connecticut. He moved to Brundage's Corners, which were only a couple of miles from Glenville, in 1853, and there had his factory until the fall of 1855, when he moved to Port Chester, these places being all within a very few miles of each other. This locality seems to have been one in which the manufacture of this class of horse-rakes had its first inception. A number of persons besides Whitcomb were engaged in the same line of manufacture. It is true that they may have followed Whitcomb. He may have been the inventor of the rake-head E, as shown in his patent, and he may have been the first person to support it upon a carriage. He may have been the inventor of the treadles in question. The only question is, did he apply for a patent before these parts of his rake became common property, and my conclusion from the proof is that Whitcomb did not make his application for a patent until more than two years after this rake-head and these treadles had come into public use with his consent. The full-sized rakes that are put in evidence in this case show satisfactorily that these devices, these treadles and levers, were adopted and in use and were part of these original rakes at the time they were made and put upon the market, and that they were actually made and sold as early as the haying season of 1854. This certainly fully sustains the conclusion to which I have arrived as to the use of these treadles in those rakes. It is claimed on the part of the complainant that the old rakes have been altered over; that new treadles have been put into them, but there is nothing in the appearance of the mechanisms or of the treadles as they stand now before the court to show that there has been any change. All the parts seem to be of an age—they all bear the same marks of exposure. There is no evidence of any cutting or change by substituting the treadles they now have for other devices. Indeed, the whole appearance of these old rakes satisfies me that they now show their parts as they were originally constructed. I have therefore come finally and firmly to the conclusion that these treadles were old and common property at the time this patent was issued. Perhaps, as I have already said, they were Mr. Whitcomb's invention. He seems to have been the leading genius in that locality in reference to this class of farming implements, and it is likely and probable that these improvements were his, but he abandoned them to the public. He allowed his neighbors to use them. They were public property and sold on the market long before the expiration of two years prior to the application for this patent, and they were not mere experimental uses. These rakes were made and sold in the market for use in the fields, not merely for the purpose of seeing whether they would work or not.

So that from all these considerations I come to the conclusion that the claims of this patent involved in this suit must be held to be void, and this bill must be dismissed for want of equity.

U.S. Circuit Court—Southern District of New York.

ADAMS *et al.* v. HOWARD *et al.*

Decided October 24, 1881.

1. PLEADINGS—CANNOT DEMUR AND ANSWER TO WHOLE BILL.
   By Rule 32 in equity a defendant may demur to the whole bill, and may demur to a part of the bill and answer as to the residue; but there is nothing that allows him to demur to the whole bill and at the same time to answer the whole bill, especially where the answer sets up everything that is in the demurrer. Putting in such an answer is a waiver of such demurrer.
2. CIRCUMSTANCES EXCUSE FAILURE TO GO AHEAD.
   Failure on part of complainant to set down demurrer for argument or to take testimony within three months after filing replication not ground for dismissing bill if sufficiently explained.

Mr. F. H. Betts for the plaintiffs.
Mr. J. A. Whitney for the defendants.

BLATCHFORD, *J.*:

The defendant Morse has demurred to the whole bill, and has put in an answer to the whole bill. The suit is one for the infringement of a patent. The grounds of demurrer set forth in the demurrer are all of them also set forth in the answer. They relate solely to the title set forth in the bill to the patent and to the allegations in the bill respecting infringement. A replication to the answer has been filed. The plaintiffs now move for an order either that the defendant elect between his demurrer and his answer or that the demurrer be set down for argument. By Rule 32 in equity a defendant may demur to the whole bill, and may demur to a part of the bill and answer as to the residue; but there is nothing that allows him to demur to the whole bill and at the same time to answer the whole bill, especially where the answer sets up everything that is in the demurrer. Putting in such an answer is a waiver of such a demurrer. The defendant must elect between his demurrer and his answer; and to guard against misunderstanding, if he should elect his demurrer and it should be overruled on argument, he would be held probably to have waived what ordinarily and otherwise would be, under Rule 34, his right to answer. The defendant moves to dismiss the bill. The ground of the motion is not specified in the notice of motion. From the affidavit made in support of the motion one ground would seem to be that the plaintiffs did not, under Rule 38, set down the demurrer for argument within the time required, and that they did not take any testimony within three months after the replication was filed. I think the plaintiffs sufficiently excuse the omissions. The demurrer ought to be disposed of before any testimony is taken.

The motion is denied.

WOOSTER v. CLARK *et al.*

Decided August 29, 1881.

TESTIMONY TAKEN AFTER TIME.
Rule 69 is imperative that no testimony taken after time shall be allowed to be read at the hearing.

BLATCHFORD, *J.*:

The motion to strike out the testimony taken on the part of the defendants must be granted. Rule 69 is imperative that no testimony taken after time shall be allowed to be read at the hearing. The plaintiff duly objected on the record to the taking of what was taken, on the ground that it was taken after time and such objection has never been waived. Moreover, the defendants after that specially moved for time to take proofs, and the motion was denied.

The proof of the sale of the binder is sufficient. It is plain that it infringes claims 2, 4, and 5. The granting of the reissue to the plaintiff is sufficient proof of his title to sue.

There must be a decree for the plaintiff.

"The words 'LA FLOR DE MORALES.'"

9,062.—SOAP.—*Jas. B. Williams & Co.*, Glastonbury, Conn. Application filed January 3, 1882.
"The symbol of a brush."

9,063.—SEWING COTTON AND THREAD.—*Jonas Brook & Brothers*, Meltham Mills, near Huddersfield, county of York, England. Application filed October 5, 1881.
"The word 'LONDON,' when arranged between the numbers '1851' and '1862,' and the word 'PARIS' between the numbers '1855' and '1867.'"

9,064.—MILK COOLERS.—*Albert R. Brown*, Guilford, N. Y. Application filed December 28, 1881.
"The word 'ARCTIC.'"

9,065.—REFINED CARBON OILS, LUBRICATING-OILS, AND ALL OTHER GOODS REFINED, DISTILLED, MADE, OR COMPOUNDED FROM CRUDE PETROLEUM.—*The Cleveland Refining Company*, Cleveland, Ohio. Application filed December 5, 1881.
"A picture-diamond with facets cut, with words in or around it, or both."

9,066.—CIGARS AND CIGARETTES, CHEROOTS, SMOKING AND CHEWING TOBACCO, AND SNUFF.—*Louis C. Frey*, Cincinnati, Ohio. Application filed December 27, 1881.
"The word 'ROXY.'"

9,067.—CIGARS, CIGARETTES, CHEROOTS, SMOKING AND CHEWING TOBACCO, AND SNUFF.—*Louis C. Frey*, Cincinnati, Ohio. Application filed December 27, 1881.
"The word 'GATH.'"

9,068.—CIGARETTES.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The representations of the tobacco-leaves and the cigarettes and the word 'NATIVE.'"

9,069.—CIGARS, CIGARETTES, CHEROOTS, AND PLUG, SMOKING, AND CHEWING TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The word 'MIDDY.'"

9,070.—CIGARS, CHEROOTS, CIGARETTES, AND SMOKING-TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The figures and character '½ & ½.'"

9,071.—CIGARS, CHEROOTS, AND CIGARETTES.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The word 'CAPORAL.'"

9,072.—CIGARS, CIGARETTES, CHEROOTS, AND PLUG, SMOKING, AND CHEWING TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The word 'VETERAN.'"

9,073.—CIGARS, CHEROOTS, CIGARETTES, AND SMOKING-TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The figures expressing the number ½."

9,074.—CIGARS, CIGARETTES, CHEROOTS, AND SMOKING-TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The word 'DRAGOON.'"

9,075.—CIGARS, CIGARETTES, CHEROOTS, AND PLUG, SMOKING, AND CHEWING TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The symbol of an equipped soldier."

9,076.—CIGARS, CHEROOTS, CIGARETTES, AND SMOKING-TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"The words 'TRIPLE ALLIANCE.'"

9,077.—MACHINE-OILS.—*William McBain*, Toronto, Ontario, Canada. Application filed December 12, 1881.
"The word 'CASTORINE.'"

9,078.—PERFUMERY AND FLORIDA-WATER.—*Teodoro Münch*, Hamburg, Germany. Application filed November 10, 1881.
"The monogram of the letters 'T M.'"

LABELS.

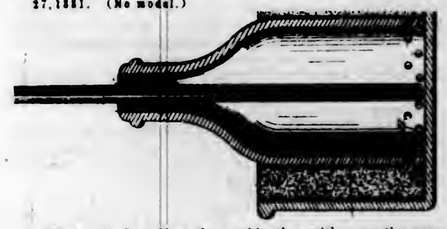
2,603.—Title: "CRANE'S LADIES NOTE PAPER AND ENVELOPES."—*Z. Crane, Jr., & Brother*, Dalton, Mass. Application filed January 5, 1882.

2,604.—Title: "CRANE'S LADIES NOTE PAPER AND ENVELOPES, GRECIAN ANTIQUE."—*Z. Crane, Jr., & Brother*, Dalton, Mass. Application filed January 5, 1882.

2,605.—Title: "DOCTOR HENLEY'S OREGON KIDNEY TEA."—*Hodge, Davis & Co.*, Portland, Oreg. Application filed December 15, 1881.

2,606.—Title: "DR. WARE'S ENGLISH HEARTBURN LOZENGERS."—*F. W. K. Nye & Co.*, Milton, Mass. Application filed January 10, 1882.

2,607.—Title: "DR. GRAY'S LOTION."—*Horatio Smith* and *Henry T. Goold*, Boston, Mass. Application filed December 30, 1881.

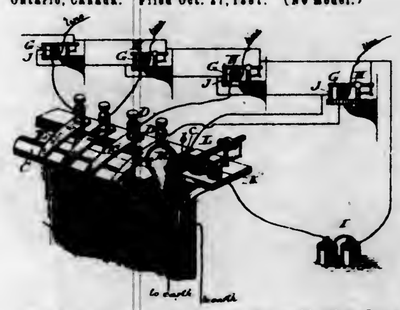


2,608.—Title: "THE GREAT MOUNTAIN SAGE REMEDY, COUGH SYRUP."—*R. C. Schroeder & Co.*, Raton, N. Mex. Ter. Application filed January 3, 1882.

2,609.—Title: "THE GREAT MOUNTAIN SAGE REMEDY, ANTI-BILIOUS PILLS."—*R. C. Schroeder & Co.*, Raton, N. Mex. Ter. Application filed January 3, 1882.

PATENTS

GRANTED JAN. 31, 1882.



252,858. FILTER. JOHN C. ADSIT, Olean, N. Y. Filed Aug. 27, 1881. (No model.)

Claim.—1. In a filter, the combination, with an earthenware vessel having an open top, of a bottomless jug of less diameter than the open vessel, and adapted to be placed within the latter to form an annular space to receive filtering material, and a pump-pipe extending through said jug, substantially as set forth.

2. In a filter, the combination, with an open-top earthenware vessel, of a bottomless jug provided with perforations surrounding the lower end, filtering material packed between the jug and outer vessel, and a pump-pipe extending through the jug and held therein in a water-tight manner, substantially as set forth.

252,859. LIGHTNING-ARRESTER. THOMAS ANDARS, Ottawa, Ontario, Canada. Filed Oct. 27, 1881. (No model.)

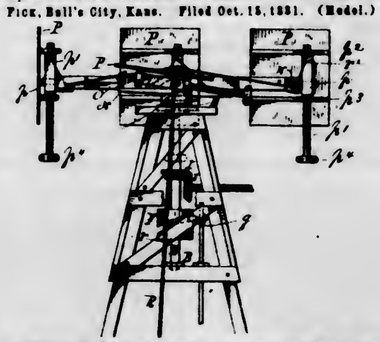
Claim.—1. In a lightning-arrester, the combination of a series of electric conducting-lines, a body in electric connection with the earth, an intermediate body adapted to make and break connection between the line or lines and the earth-connected body, and an electro-magnet adapted and arranged to control the intermediate connection, and thereby to automatically ground all the lines of the series upon the overcharging of one of said lines.

2. In a lightning-arrester, the combination of an electric conducting line or lines, a body in electric connection with the earth, an intermediate movable body adapted to make or break connection between the line or lines and the earth-connected body, and provided with a weight or spring to effect its movement, and a detent controlled by an electro-magnet and arranged to hold the movable body in position to interrupt connection with the earth until the magnet is caused by an excessive charge of electricity in the line to withdraw the detent and permit the release of the weight or spring.

3. The combination, substantially as described, of one or more electric conducting-lines, each having an electro-magnet in its circuit, an earth-connected body, a detent arranged to hold said body normally out of electric connection with the line or lines, an electro-magnet placed in an open local circuit and arranged to withdraw the detent when in action, and one or more circuit-closers arranged to be actuated by the armatures of the line electro-magnets when the lines are overcharged, whereby the local circuit is closed and the detent caused to be withdrawn.

4. In combination with a grounding-switch, a series of electric conducting-lines, and an electro-magnet and armature controlling said switch and adapted and arranged to be thrown into action by each or any of said lines when they become overcharged with electricity.

5. The combination, substantially as shown and described, of the cylinder C, provided with the gravitating-arm M, insulated on a portion of its surface and in electric connection with the earth, fingers E, bearing upon said cylinder and connected with electric conducting-lines, electro-magnets G, introduced into said lines, armatures I and contact-points J, arranged in an open local circuit containing an electro-magnet, K, and armature L, arranged to engage the gravitating-arm M until withdrawn by the electro-magnet K, as and for the purpose set forth.



6. In a lightning-arrester, the combination of an earth-connected cylinder insulated throughout its entire length on one side, and a series of fingers connected with the respective lines to be protected and bearing upon said cylinder, substantially as shown, whereby all the lines may be simultaneously insulated or grounded by partially rotating the cylinder.

7. In a lightning-arrester, the combination of an earth-connected rotary cylinder provided with a thin insulating layer on one side, and a series of fingers connected with the lines to be protected and arranged to bear upon the cylinder, whereby the lines may be automatically or manually grounded, as set forth.

8. In a lightning-arrester, an earth-connected cylinder insulated on one side and provided with a threaded shaft, said shaft passing through a correspondingly-threaded bracket, whereby the rotation of the shaft is caused to move the cylinder endwise under the finger or fingers bearing thereon, and thus to bring an unused portion of the insulated surface under the finger or fingers.

9. In a lightning-arrester, the combination of two or more electric conductors in independent electric circuits and an earth-connected body adapted and arranged to be moved into or out of contact with all of the conductors simultaneously, substantially as shown and described.

252,860. WIND-ENGINE. JOSIAH W. ARTHURS and JOHN C. FICK, Bull's City, Kans. Filed Oct. 15, 1881. (Model.)

Claim.—1. In a wind-engine, the combination of arms and counterbalanced vane-shafts supported and operating upon horizontal pivots at the outer ends of said arms, with vanes pivotally

attached to said vane-shafts, substantially as shown and described.

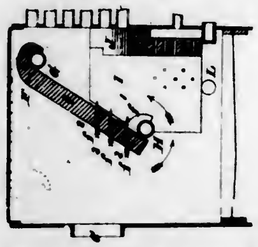
2. The combination of the main shaft, the arms, swinging counterbalanced vanes, projecting rods, pivotally attached vane-shafts, and knife-edge bearing-plates, substantially as shown and described.

3. The combination of the vanes P, provided with the bearings p' p'', and the vane-shafts p', pivotally attached to their arms and carrying the counter-balances p^4, substantially as shown and described.

4. The combination of the vanes P and shafts p' with the arms L, provided with the knife-edge bearing-plates O and rods N, substantially as shown and described.

5. The combination of the arms L, pivotally attached swinging counterbalanced vane-shafts p', vanes P, pivotally attached to said vane-shafts, and cords S, substantially as shown and described.

252,861. BED AND FOOT WARMER. ERASTUS P. BRIGHAM, St. Paul, Minn. Filed Nov. 23, 1881. (No model.)

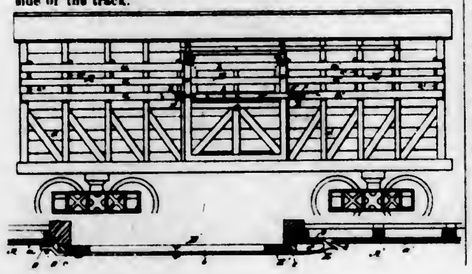


Claim.—1. A bed and foot warmer provided with neck B, in combination with screw-cap stopper F and handle D, substantially as described.

2. In a bed and foot warmer, a neck adapted to receive a screw-cap stopper, in combination with said stopper, and with a handle adapted to slide over both the stopper and the neck, substantially as described.

252,862. LOCOMOTIVE-FURNACE. THOMAS A. BUCKLAND, St. Louis, Mo. Filed May 25, 1881. (No model.)

Brief.—The diaphragm is hinged, by which means it can be raised up and down when desired to have access to the flues.



Claim.—1. The combination of the furnace A, hooked and adjustable diaphragm F, support G, and support H, substantially as described.

2. The combination of the furnace A, the sections *f f f*, spaced apart, as described, and forming a removable diaphragm, having a shoulder, *f'*, and the water-tubes G H, substantially as described.

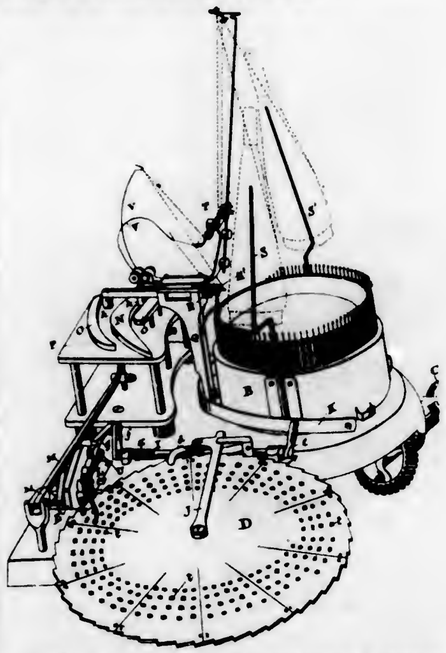
3. The combination of the diaphragm F, constructed, arranged, and extended as described, and the tiling I I and J, substantially as described.

252,863. STOCK-CAR. JOHN S. BUTTERFIELD, Chicago, Ill. Filed June 1, 1881. (No model.)

Brief.—The upper portion of the sliding door has a swinging portion carrying a rod which engages at one end a staple on a swinging set of slats and at the other end has a hook which engages a swinging set of slats. The upper swinging portion of the door may form a top to a trough, with inclosed sides and back, located at one side of the track.

Claim.—1. In combination with the stationary lifting doors A and A' and the similarly-lifting door B of the slide C, the bolts D and e and the staples D' and e', applied to the several parts, as shown and described, and for the purposes set forth.

2. As a means of engaging the lifting door B of the slide C with the lifting door A', over which the slide runs, the hooked head or catch E *e* and the staple *e'*, applied to the respective parts, and operating substantially as set forth.



3. The outwardly and inwardly movable catch E *e*, applied to the lifting door B of the slide C, combined with the lifting door A', having the slot *s* and staple *e*, substantially as described, and for the purposes specified.

4. The combination, with the door A', having a slot, *s*, and staple *e'*, the door B of the slide C, provided with a movable part, E, provided with the bolt *e*, and with a spring whereby the bolt is borne inward, so as to pass beneath the staple, substantially as set forth.

5. In combination with the outwardly and inwardly swinging door of the car, the external trough, T, having the rack or guard G, whereby the trough, rack, and door may together constitute an inclosure over the door-opening, substantially as described.

252,864. KNITTING-MACHINE. JNO. BUCHILD, Georgetown, Ontario, assignor to Edward Roper Carson Clarkson, Toronto, Canada. Filed Jan. 8, 1881. (No model.)

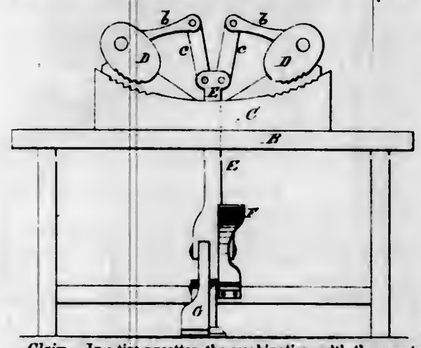
Brief.—The machine is provided with a rotating pattern-plate which is connected by mechanism to a series of cams arranged to operate sliding yarn-carriers, by which the invention is adapted to produce automatically various patterns of work.

Claim.—1. The combination of the cam-cylinder B, standard Q, and sliding yarn-carriers R with the vertically-moving cams N O for operating said carriers, cam K on the cylinder B, and connecting mechanism, substantially as described, between the cam K and cams N O, as and for the purpose specified.

2. The standard Q, cam-cylinder B, cam K on said cylinder, sliding yarn-carriers R, vertically-moving cams N O, and connecting mechanism, substantially as described, between the cam K and the cams N O, in combination with the bobbin-carriers S, attached to and revolving with the cylinder B, and the guides T, secured to the standard Q, as and for the purpose specified.

3. The cam-cylinder B, cam K on said cylinder, standard Q, sliding yarn-carriers R, and cams N O, in combination with the rods M, cams L', and connecting mechanism, substantially as described, between the cam K and the cams L', as and for the purpose specified.

4. The cam-cylinder B, cam K on said cylinder, rock-shaft I, spring *x*, cranks *e f* on said rock-shaft, and pawl *g*, in combination with the cams L' and the ratchet-wheel L for operating said cams L', substantially as described.

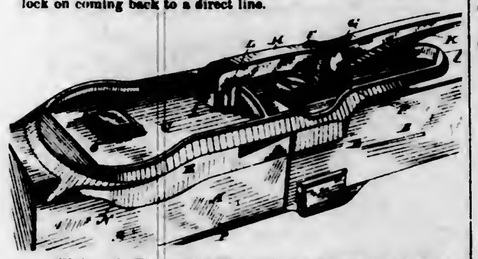


5. The combination of the cam-cylinder B, cam K on said cylinder, rock-shaft I, spring *x*, crank *e f*, and cam-block *b* on said rock-shaft, lever J, pawls *d g*, ratchet-wheel L, and pattern-plate D, substantially as and for the purpose specified.

6. The cam-cylinder B, cam K on said cylinder, rock-shaft I, and crank *e* and cam-block *b* on said rock-shaft, in combination with the lever J, pawl *d*, and the pattern-plate D, substantially as and for the purpose specified.

7. The pattern-plate D and slide G, in combination with positive mechanism, substantially as described, for intermittently operating said pattern-plate, substantially as specified.

8. The perforated pattern-plate D, provided with a spiral series of perforations for receiving removable pins, and with a scroll, E, on its under side, and with a peripheral series of ratchet-teeth, in combination with the slide G and mechanism, substantially as described, for giving the pattern-plate an intermittent rotary and lateral movement, substantially as specified.

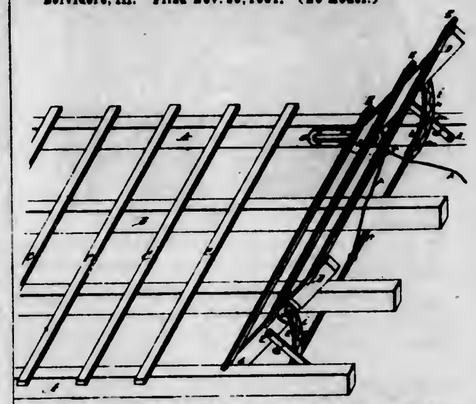


252,865. MACHINE FOR UPSETTING TIRES. FRED SUMNER CARR, West Newbury, Mass. Filed July 9, 1881. (No model.)

Claim.—In a tire-upsetter, the combination, with the serrated bed C and cams D, of the arms *b*, link *c*, bar E, and treadles F G, constructed and arranged to operate substantially as and for the purpose set forth.

252,866. JOINTED PLOW-TONGUE. WILLIAM L. CASADAY, South Bend, Ind. Filed Nov. 15, 1881. (No model.)

Brief.—The sulky-tongue, when unlocked, may swing around in turning, the joint-plates being so constructed as to automatically lock on coming back to a direct line.

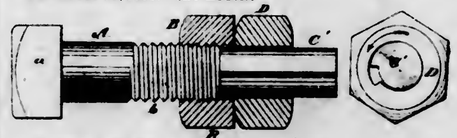


Claim.—1. The combination, with the two sections A B of a plow-tongue, of the metal plates C P, for securing said sections together, the plate E, provided with the beveled portions Q and slot J, and spring-dog H, substantially as set forth.

2. The combination, with the plow-tongue sections A B, placed end to end, and metal plates C P, for connecting said sections, of the plate E, provided with the arc-shaped slot T and pin or stud T', for limiting the movement of the pivoted tongue-section, substantially as set forth.

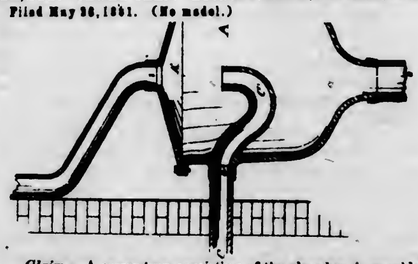
3. The combination, with the plow-tongue sections A B, placed end to end, and plates C P, for securing said sections together, of the plate E, provided with slot J, the dog H, and the guide-flanges L L, formed on plate C, and adapted to relieve the dog of lateral strain, substantially as set forth.

252,867. SPRING BED-BOTTOM. ELIAS A. CLEAVELAND, Belvidere, Ill. Filed Nov. 28, 1881. (No model.)



Claim.—1. In an invalid-bed, the combination, with the horizontal rails, of a head portion, the side bars of which are provided with studs, the slotted plates secured to the inner sides of the horizontal rails, adapted to receive said studs, and braces and adjusting devices, substantially as set forth.

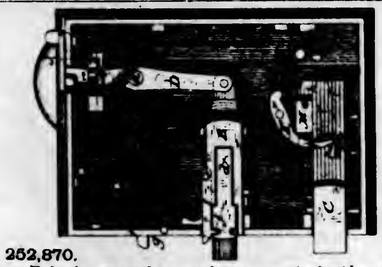
2. In an invalid-bed, the combination, with the base A, of the head-bars D, slotted supporting-pieces *a*, braces *d*, having studs *m*, and the pivoted slotted ratchet-bars *i*, substantially as set forth.



3. The combination, with the spiral springs, connected by rings and diagonal spiral springs, of a border or selvage wire surrounding and connecting the upper outer portion of the springs by means of a loop-connection of the end portion of wire from which the spring is formed, substantially as set forth.

252,868. NUT-LOCK. CHARLES H. DENISON, New York, N. Y. Filed June 13, 1881. (No model.)

Claim.—The bolt A, having the screw-threads *b* and cam-shaped or eccentric shank C', in combination with the nut B and the jam-nut D, having the cam-like or eccentric bore or interior corresponding in shape to the cross-section of the shank C' of the bolt, the said parts being combined and arranged for joint use and operation substantially as and for the purpose herein set forth.



252,869. SEWER-TRAP. ARTHUR J. EDWIN, Cleveland, Ohio. Filed May 16, 1881. (No model.)

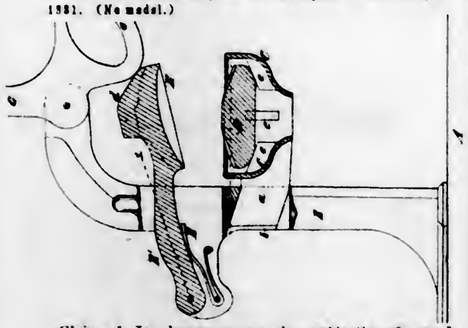
Claim.—A sewer-trap consisting of the chamber A, provided with the trap C', having an inlet at the side of the chamber, an outlet at the bottom of the chamber, and short pipe-sections at the side and bottom to connect with the inlet and discharge pipes, the several parts being cast in a single piece, in combination with the cover A', provided with a gas-outlet, *b*, substantially as set forth.

252,870. LATCH AND LOCK. ORLANDO EWERS, De Soto, Wis. Filed May 12, 1881. (Model.)

Claim.—1. In combination with the latch-operating devices, the fixed arm F, provided with a knob-like head, and the pivoted

252,870.

arm E, having one end arranged to operate the latch mechanism and the opposite end seated in a recess in one side of the before-mentioned head.



2. In combination with the reversible latch end *d*, the bolt B, the dog *c*, having one end provided with journals seated in the hook-shaped notches of the latch-bolt, and the spring I, applied as shown, whereby it is caused to serve the threefold purpose of throwing the latch, maintaining the connection between the dog and latch, and keeping the dog normally in a locked position.

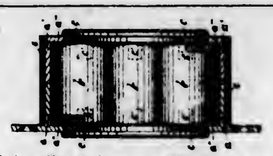
3. In combination with the recessed latch-bolt B, the reversible nose *d*, the dog *c*, and the pivoted locking device *g*, arranged to engage over the nose of the dog, as shown.

4. The lock-bolt provided with the lateral stud *m*, the upright shoulders *h* and *i*, adapted to be acted upon by the key for throwing the bolt, and the pivoted dog K, having its lower end arranged to engage behind the stud *m*, to prevent the retraction of the bolt, substantially as described.

5. In combination with the key-body, the sliding bar *r*, mounted thereon, and the two obliquely-slotted transversely-sliding bits *p p'*, as described and shown.

252,871. LEMON-SQUEEZER. JOHN FANNING, Brooklyn, N.Y., assignor, by direct and mesne assignments, to James Hanford and Josephine P. Fanning, both of same place. Filed May 11, 1881. (No model.)

Claim.—1. In a lemon-squeezer, the combination of a standard, a bed, a presser and means for operating it, a concentrator supporting said bed, and a tongue and recess with which the concentrator and standard are provided, and which have their tops inclined upward toward the back of the standard, whereby said concentrator is detachably connected to the standard, substantially as specified.



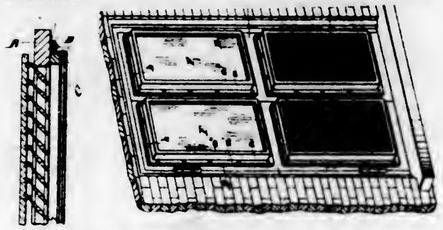
2. In a lemon-squeezer, the combination of a base-piece, the standard B, erected thereon and overhanging the latter at the upper end, the concentrator C, supported by said standard, the bed D, the presser E, provided with the arm E', extending through the standard and pivoted between lugs extending rearwardly from the latter, and provided with the cam *d*, the lever G, pivoted to the upper end of the standard and provided with the cam *e*, and the spring H, arranged between said rearwardly-extending lugs and acting on the under side of the arm E', substantially as specified.

252,872. ANTI-FRICTIONAL BEARING. THOS. R. FERRALL, Boston, Mass. Filed Dec. 3, 1881. (No model.)

Claim.—1. In anti-frictional bearings, the shells *a a'' a' a'''* and the rollers *b b*, in combination with the regulators *c c* and their radial intermediate projections, *c'' c'' c''*, adapted to serve as stops for the said regulators against the inside of the flanges *a'' a'''*, as herein shown and described.

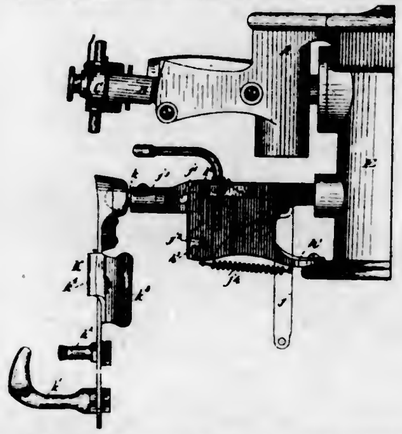
2. In anti-frictional bearings, the shells *a a'' a' a'''*, the rollers

252,872.



b b, with their cylindrical recesses *b' b'*, the regulators *c c*, with cylindrical projections *c' c'*, and radial intermediate projections, *c'' c''*, as and for the purpose set forth.

3. The herein-described method of making anti-frictional bearings, consisting in casting the shells *a a'* with solid ends *a'' a'''*, inserting therein the rollers and regulators, then casting around the abutting shells *a a'* the metal ring *e*, and finally boring out or removing the central parts of the ends *a'' a'''* for the insertion and reception of the shaft *d*, as and for the purpose set forth.

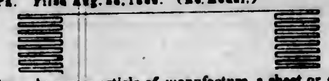


252,873. WINDOW-BLIND. JOHN D. FERRIS, Chicago, Ill. Filed Oct. 17, 1881. (No model.)

Brief.—Applies to the outside of an ordinary blind a sheet of glass or netting clamped between two removable frames secured to the blind.

Claim.—The combination, with a window-blind, of the removable frames B and C and a screen of glass or other material, the removable frames and screen being arranged on the outside of the blind, the frame C being within the frame B, and the screen being between the said frames, substantially as and for the purposes specified.

252,874. SOLE-EDGE-BURNISHING MACHINE. GEORGE A. FULLERTON, Boston, Mass. Filed Nov. 21, 1881. (No model.)



Claim.—1. The improved jack above described, consisting of the sole-plate K, swiveling stem *k*, edge-rest *k'*, and handle *k''*, as set forth.

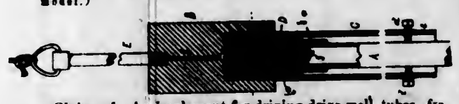
2. In a sole-edge-burnishing machine, the jack-carrier above described, consisting of the lever J, adapted to support the jack-swivel *k*, in combination with standard H, substantially as and for the purposes set forth.

3. The combination of the jack K, jack-carrier J, and standard H with a burnishing-machine, the carrier J being operated, as described, to hold the jack, with the edge of the sole, against the burnishing-tool in burnishing around the toe, and to be got out of the way in burnishing the side edges, as set forth.

252,875. FRINGED FABRIC. SYLVESTER GARRETT, Philadelphia, Pa. Filed Aug. 26, 1880. (No model.)

Claim.—As a new article of manufacture, a sheet or section of paper, leather, or textile fabric having upon one or more of its edges a fringe consisting of a series of parallel-sided strips or shreds, separated one from the other by similarly-shaped notches or slots formed by the complete removal of the intervening material of the fabric, substantially as set forth.

252,876. TOBACCO-PIPE. ISAAC W. GILES, South Abington, Mass. Filed Mar. 11, 1881. (No model.)

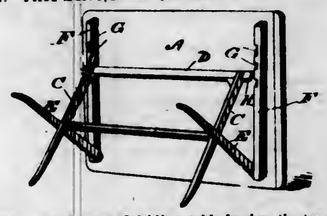


Claim.—As an improved article of manufacture, a bowl for tobacco-pipes, made of two or more thicknesses of hard-calendered paper, and having one end closed by an inserted wooden plug, the end of which within the bowl and the interior of the bowl are coated with fire-proof material, the bowl and said plug being perforated to receive the pipe-stem, substantially as described.

252,877. PAPER MATRIX FOR STEREOTYPING. BENJAMIN B. HOUTSON, Louisville, Ky. Filed Apr. 16, 1881. (No specimens.)

Claim.—Matrices for stereotyping, made of charred or carbonized paper, substantially as described, and for the purpose set forth.

252,878. IMPLEMENT FOR DRIVING DRIVE-WELL TUBES. MATTHIAS ITIN, St. Paul, Minn. Filed Oct. 3, 1881. (No model.)

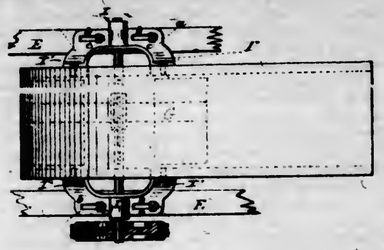


Claim.—1. An implement for driving drive-well tubes, &c., consisting of a hammer, B, guide-tube C, and cushion D, substantially as set forth.

2. The combination and arrangement of the head B, cushion D, tube C, and set-screws *d' d*, and tube A, substantially as set forth.

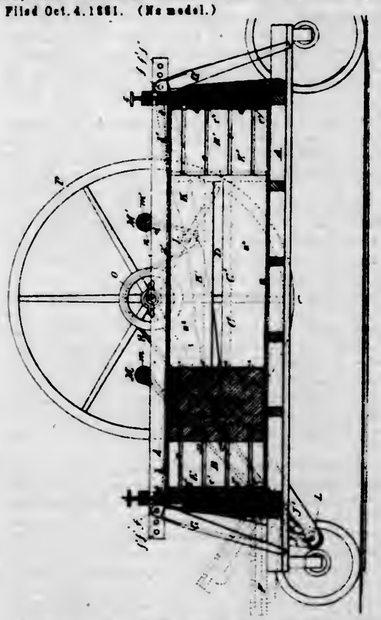
3. The combination and arrangement of the head B, cushion D, and cap *b*, all provided with the perforations *g* and the tubes C, A, and E, substantially as set forth.

252,879. FOLDING TABLE. NICHOLAS JENGLAMAS, Grand Rapids, Mich., assignor to himself and John F. Holman, same place. Filed Mar. 8, 1881. (No model.)



Claim.—An improved folding table having the top A, with the rails F F, having grooves G and legs E E pivoted to them, and the legs C C, cross-pivoted to said legs E E, and connected together by cross-rails D engaging with said grooves G, substantially as set forth and described.

252,880. METHOD OF ATTACHING BUTTONS. SCOTT D. JORDAN, Cape Elizabeth, Me. Filed June 11, 1881. (Model.)



Claim.—That improvement in the art of setting buttons on shoes or other articles consisting in interlocking the shank of each successive button, after it has been inserted in the stock, with the shank of the preceding one until the last one, which is further secured by stitching or other suitable fastening, substantially as and for the purpose set forth.

252,881. CORN-SHELLER. LEONARD KISSNER and JESSE P. OUTCALT, Lancaster, Ohio; said Kissner assignor to said Outcalt. Filed July 6, 1881. (No model.)

Claim.—The combination, with the fan-casing and supporting rails E, of the brackets I', detachably secured to said casing, having slot-and-bolt connection to said rails, and provided with journal boxes I, the fan-shaft, the rubber-faced pulley on said shaft, and the wheel B, having its periphery arranged to impart motion to said pulley, the whole constructed and operated as specified.

252,882. BALING-PRESS. JOHN LA DOW, Albany, N. Y. Filed Oct. 4, 1881. (No model.)

Claim.—1. In a baling-press, the combination, with a case having a pressing-chamber in its middle section and baling-chambers in its end portions, and a platen adapted to be moved through the entire length of said middle section, of mechanism for operating said platen alternately in opposite directions toward and from said end baling-chambers, as and for the purposes set forth.

2. In a baling-press, the combination, with a case having a pressing-chamber in its middle section and baling-chambers in its end portions, and a platen adapted to be moved through the entire length of said middle section, of toggle-levers and mechanism operating with the same, whereby said platen will be moved alternately toward each baling-chamber and from the same, in the manner set forth.

3. In a baling-press, the combination, with a case having a pressing-chamber in its middle section and baling-chambers in its end sections, and a platen adapted to be moved alternately toward said baling-chambers, of duplicate toggle-levers arranged at each side of said press-case and having a pivotal connection with said platen, whereby one pair of said toggle-levers will be adapted to move the platen in one direction toward one of said end baling-chambers and the other pair of said toggle-levers will move said

platen in an opposite direction toward the opposite end baling-chamber, as and for the purpose set forth.

4. The combination, with a horizontal pressing-case and a platen adapted to be moved in a horizontal plane in the same, of toggle-levers J J', (or K K',) having one of their limbs pivoted to said platen and the other limb to a fulcrum situated at an end of said pressing-case, whereby the said toggle-levers when straightened in line will crowd said platen to the full distance of its length of movement, and when broken from a straight line will draw said platen to a distance back, substantially as set forth.

5. In a horizontal baling-press having a pressing-case in which a baling-chamber is situated at each end, and a pressing-chamber provided with a platen is situated between said baling-chambers, duplex toggle-levers which have their neighboring ends pivoted to said platen and their outer ends pivoted to, or near to, the ends of said pressing-case, whereby each of said toggle-levers is made to counterbalance the other and each alternately operate said platen, substantially as set forth.

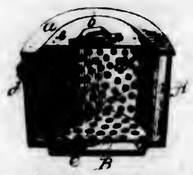
6. In a baling-press, the combination, with the press-case, platen moving in said case, and toggle-levers J J', (or K K',) having one end pivoted to said platen and the opposite end pivoted to the end of said press, of windlass-pulley O, rope R, coiled about said pulley, and cleat m, (or m',) whereby said cleat will be made to sustain one-half of the resistance and said rope operate the said toggle-levers to progressively move said platen, as set forth.

7. In a baling-press, the combination, with the pressing-case and platen adapted to be moved within the same, toggle-levers J J', (or K K',) having one end pivoted to said platen and the opposite end pivoted to pivot-pin *f*, of the series of holes *f' f'*, adapted to receive said pivot-pin, whereby larger or smaller bales may be made, at the will of the operator, by a simple adjustment of said pivot-pin, in the manner set forth.

8. In a horizontal baling-press, the combination, with a press-case having a pressing-chamber and a platen adapted to be moved by mechanism, as described, in said chamber, and baling-chambers situated at each end of the press-case and communicating with said pressing-chamber, of door F, (or F',) pivoted to the lower sill, so as to be adapted to be folded from a vertical and closing position to a horizontal one, whereby said doors, when held vertical, will operate to form opposing walls to the thrust of the platen, and when folded down will form a platform from which hay will be fed into said press-case, substantially as set forth.

9. In a horizontal baling-press, the combination, with the parallel side walls of the press-chamber, of the expansible side walls of the baling-chamber and door F, (or F',) provided at its marginal side edges with tongues *v v* and grooves *x x*, whereby the inner surfaces of said expansible side walls will be held in planes coincident with the planes of the inner parallel surfaces of the said press-chamber walls when said door is in a closed position, and adapted to be expanded outward at their outer ends when the said door is opened from said baling-chamber, substantially as and for the purpose set forth.

10. In a horizontal baling-press, the combination, with the parallel top and bottom walls of the press-chamber, of the expansible top wall of the baling-chamber, door F, (or F',) having its upper end supporting said baling-chamber top wall in a horizontal plane coincident with the horizontal plane of the press-chamber top wall, and mechanism *s*, reacting against the support of the outer end of said expansible top wall, whereby the plane of the surface of said adjustable top wall will be held coincident with the plane of the surface of the top wall of the press-chamber while a bale is being pressed and its outer end be inclined upward when the bale is being removed, substantially as and for the purpose set forth.

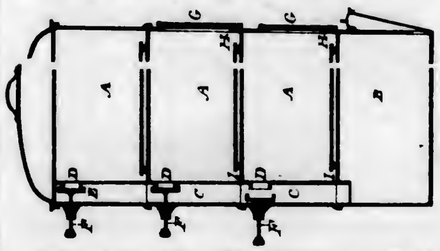


11. In a baling-press, the combination, with the press-case, platen adapted to be moved in said case, windlass-pulleys O, having ropes R coiled about the same as a contributing power to move said platen, of the windlass-wheel P, fixed to revolve with pulleys O, and draft-rope coiled about the same, all for operation as set forth.

12. The combination, with a windlass-pulley having a coiled rope about its periphery, with its ends running from the same for attachment with reacting devices or mechanism m, (or m',) of wheel P and pin *l*, adapted to hold said wheel with said windlass-pulley, substantially as and for the purpose set forth.

13. Mechanism for moving a platen, consisting of the combination of the following devices, viz: duplicate toggle-levers, windlass-pulley, and windlass-rope coiled about said pulley, with its end portions connected with said duplicate toggle-levers at the hinge of their respective arms and its extremities attached to cleats m m', or fixed pieces, all for operation substantially as set forth.

14. Mechanism for moving a platen, consisting of the combination of the following-described elements, viz: duplicate toggle-levers, windlass-pulleys, windlass-ropes coiled about said pulleys, with their end portions connected with said duplicate toggle-levers at the hinge-connections of their respective arms and their extremities secured to fixed pieces, a windlass-wheel loosely mounted on the windlass-pulley shaft and provided with mechanism by which it will be locked with or unlocked from the windlass-pulley, and draft-rope coiled about said wheel, all for operation substantially as set forth.

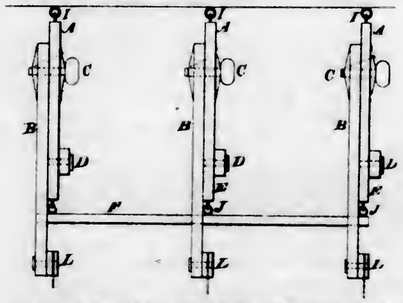


252,883. FOOD-STRAINER. GEORGE LINDNER, Canandaigua, N. Y., and JOHN DORSCH, Milwaukee, Wis. Filed Oct. 15, 1881. (No model.)

Claim.—1. The combination of the receptacle B, having perforations *e* and loops *d d*, with cover *a*, provided with hooks *c c*, substantially as set forth.

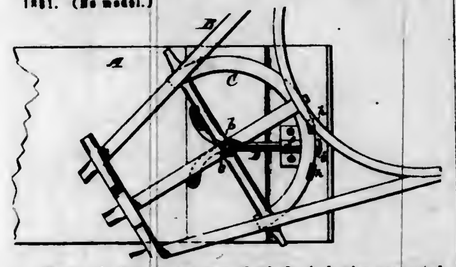
2. The combination of the strainer B, loops *d d*, hooks *c c*, cover *a*, and kettle A, all substantially as and for the purpose specified.

252,884. STEAM COOKING APPARATUS. JOHN H. LINNEY, San Francisco, Cal. Filed Oct. 18, 1881. (No model.)



Claim.—1. In a steam cooking apparatus composed of the sections A, fitted one above another, and supported above a boiler, B, and having one or more pipes, C, extending to the upper section, with openings D, valves E, and stems F, as shown, the small holes I at the floor-level to carry off the water of condensation, substantially as herein described.

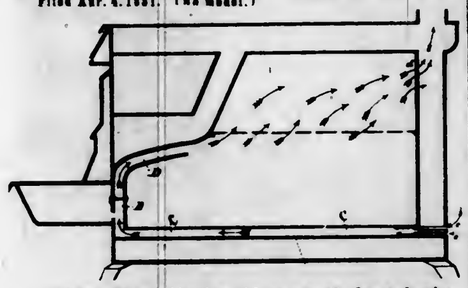
2. In a steam cooking apparatus, the independent chambers or sections A, supported upon the boiler B, and having the steam-pipes, valves, and the side doors, G, as shown, said doors having the guards H, to prevent the escape of the moisture, substantially as herein described.



3. In a steam cooking apparatus, the independent chambers or sections A, supported upon the boiler B, and having the steam-pipes and valves, as shown, in combination with the doors G, whereby the intermediate sections may be opened without disturbing those above, substantially as herein described.

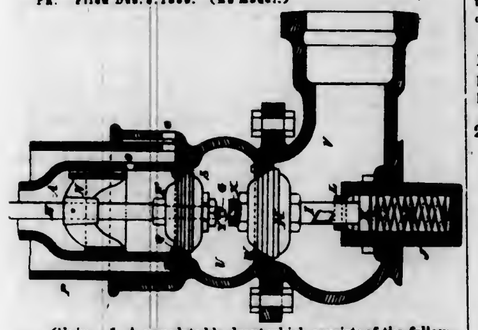
252,885. FLY-FAN. ALVIN LLOYD, Allerton, Iowa. Filed July 18, 1881. (No model.)

Claim.—In fly-brushes, the single frames composed of the hanger-supports A A and the supports B B, arranged to be longitudinally adjusted thereon and be held obliquely to them by means of screw-bolts O C, in combination with the two-part clamping-bar L and one or more rods, F, for connecting two or more of the single frames, to have a uniform oscillating movement, as and for the purpose specified and shown.



252,886. RUNNING-GEAR FOR VEHICLES. MORGAN A. LOGAN and FRANCIS M. WRIGHT, Lathrop, Mo. Filed Nov. 26, 1881. (No model.)

Claim.—1. In a wagon-gear, the body A, having connected thereto the horizontal rod D and lug *c*, in combination with the king-bolt *b*, fifth-wheel D, and segmental bearing-plate E, substantially as and for the purpose set forth.



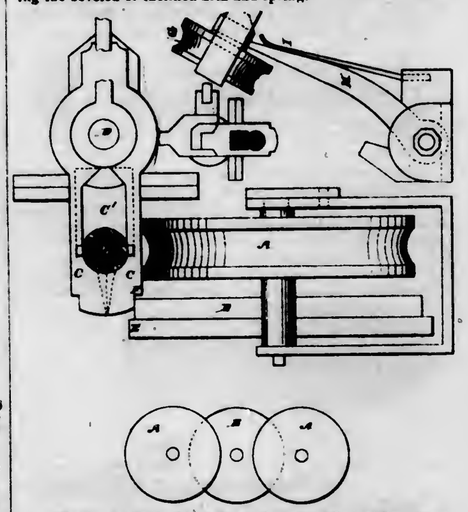
2. In a wagon-gear, the body A, having connected thereto the rod D, yoke *f*, and lug *c*, and the bearing-plate E, having eye *g*, through which the rod passes, in combination with the frame B, fifth-wheel C, and king-bolt *b*, having head *d*, all constructed and arranged to operate substantially as and for the purpose specified.

252,887. DOMESTIC OVEN. JAS. A. MARSH, Cleveland, Ohio. Filed Apr. 4, 1881. (No model.)

Claim.—The combination, with an oven, of a flue or chamber, C, located beneath the oven and communicating with the outer air, and flue D, communicating at its lower end with the forward portion of the flue or chamber C, said flue being constructed and arranged to discharge heated air into the oven at a point above its base, substantially as set forth.

252,888. HYDRANT. SAMUEL R. C. MATHEWS, Philadelphia, Pa. Filed Dec. 6, 1880. (No model.)

Claim.—1 A completed hydrant which consists of the following parts in combination: the chambers V and U, supplemental valve H, piston-rod I, cap L, spring-chamber J, spring M, valve-rod E, provided on the top with a screw-thread, ring-valve N, stock A, provided with waste-orifice O and stuffing-box T, cap B, sleeve C, and retaining-cap D, all constructed substantially as and for the purpose specified.



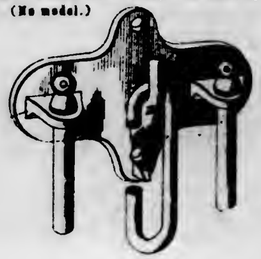
2. In a hydrant, the combination of the chambers V and U, valve H, rod I, and spring M with seat W, valve F, seat Q, stock A, and brass ring R, substantially as and for the purpose specified.

3. In a hydrant, the combination of chambers V and U, valves H and F, and their seats with rod I, spring M, nut X, with its recess or centering-hole Y, pin G on valve F, a waste-valve, stock A, with waste-orifice O and stuffing-box T, cap B, sleeve C, and frost-jacket P.

4. The supplemental valve H, in combination with rod I, working in a cylinder, J, entirely closed at the top and inclosing the spring M, for the purpose of closing the supplemental valve against its seat and protecting the spring and point of contact with the rod, substantially as shown and described.

252,889. CABLE-RAILWAY. WILLIAM MCCALL, San Francisco, Cal. Filed June 16, 1881. (No model.)

Brief.—Consists of a double series of overlapping sheaves placed one above the other and alternating. The gripe has vertically-moving jaws having shoulders to guide the downward movement, and a vertical guide-sheave journaled in a swinging arm having the beveled or inclined arm and spring.



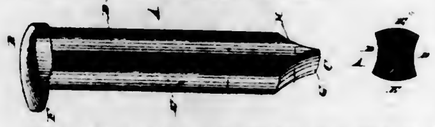
Claim.—1. In a cable-railway, the means for guiding the cable and the gripe around curves, consisting of the double series of sheaves A B, placed one above the other and alternating and overlapping, substantially as herein described.

2. The superposed overlapping sheaves A B, the lower ones projecting beyond the upper, as shown, in combination with the gripe having vertically-moving jaws and the shoulders F to guide the downward movement of the lower jaw when the gripe is opened, substantially as herein described.

3. The vertical guide-sheave G, journaled in the swinging arm H, and having the beveled or inclined arm K, by which the approaching gripe may move it back, substantially as and for the purpose herein described.

252,890. PIN AND LINK CARRYING DEVICE FOR RAILWAY-CARS. PATRICK MCGUIRE, Louisville, Ky. Filed Nov. 22, 1881. (No model.)

Claim.—A plate of metal the outer surface of which is provided with projections adapted to receive and carry coupling links and pins for coupling together railroad-cars, it being used in connection with such cars in any convenient locality, as and for the purpose set forth.



252,891. MANUFACTURE AND COMPOSITION OF FLOOR OIL-CLOTHS. DAVID N. HELVIN, New Springville, N.Y. Filed Sept. 24, 1881. (No specimens.)

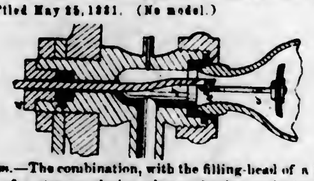
Claim.—1. The production of a floor oil-cloth by rolling onto canvas or spreading into sheets a composition composed of cork or other analogous organic substance and a gummy substance or cement, produced in the manner above specified.

2. The mixture of gum-copal or other analogous gums with boiled linseed-oil and an ocherous pigment, and spreading of the same on sheets, either by flooding, dipping, or with a trowel, after thickening the mixture to the consistency of mortar and drying the same by heat, for the purpose above specified.

3. Mixing the composition of gums, boiled linseed-oil, and pigment, after being dried, as described, with common rosin and pulverized cork, for the purpose of producing a floor oil-cloth, substantially as described.

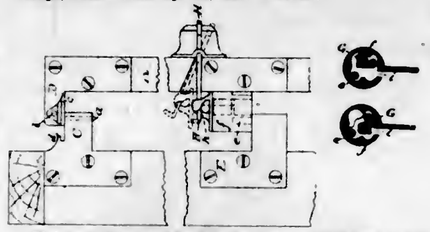
252,892. RAILROAD-SPIKE. JAMES HENRY MORGAN, Brookwick, Mo. Filed Sept. 24, 1881. (No model.)

Claim.—The herein-described improved spike, consisting of the head B and body A, having parallel fluted sides D H D H and convex sides E E, the lower ends of which are chamfered to form the sharp-edged point C, as herein described, for the purpose set forth.



252,893. MITTEN AND THE ART OF KNITTING THE SAME. JOHN NELSON, Rockford, Ill. Filed Oct. 6, 1880. (No model.)

Claim.—1. The improved method of knitting mittens, consisting in commencing the knitten at or near the point at which the narrowing of the end portion is commenced, and by a back-and-forth knitting process and narrowing to produce one side and widening to produce the other side, then knitting the straight portion, then dropping a number of the needles, retaining only a sufficient number to produce the thumb, and by a back-and-forth knitting process produce the straight part of one side of the thumb, then narrowing and then widening to produce the opposite side of the rounded or tapered end of the thumb, and then knitting the straight portion of the other side of the thumb, then narrowing to contract that part of the mitten adjacent to the wristlet, and then knitting the wristlet, substantially as set forth.

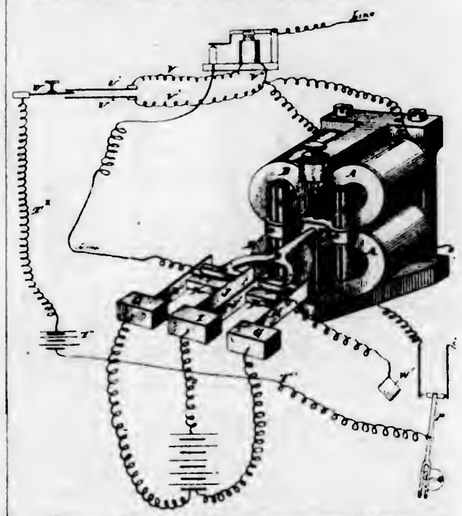


2. As a new article of manufacture, the herein-described mitten, formed of a knit fabric, and made complete, except at the sides of the thumb, which are closed by seams, substantially as set forth.

252,894. BOTTLING-MACHINE. RICHARD OTTO, Chicago Ill. Filed May 25, 1881. (No model.)

Claim.—The combination, with the filling-head of a bottling-machine, of a stopper-closing plunger having on its lower end a pivoted dog, adapted to operate substantially as and for the purposes specified.

252,895. AWNING-BLIND HINGE. KENDRIL P. PIRACH, Cambridge, Mass. Filed Apr. 30, 1881. (Model.)



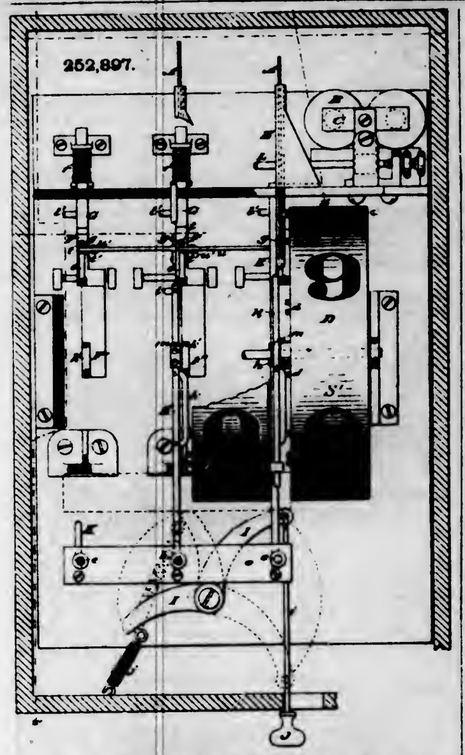
Claim.—1. The tumbler A *g* G, in combination with socket portion *f*, having slot *i* and pintle *e*, substantially as described.

2. The lever H, in combination with the cam-loop *h*, tumbler G, and the parts *e f*, substantially as described.

3. The pivoted and rotating journal *a*, constructed with the latch *c*, in combination with the part C, constructed with the projection *d* and part D, substantially as described.

252,896. SELF-ADJUSTING RELAY FOR PRINTING-TELEGRAPHS. SAMUEL M. PLUSH and WILLIAM P. PHELPS, Philadelphia, Pa. Filed Feb. 14, 1881. (No model.)

Claim.—1. In a transmitting telegraphic mechanism, a self-adjusting relay, in combination with the main circuit, the latter being controlled by said relay, which is composed of two pairs of magnets, with a suitable armature attachment, in combination with an initial mechanism for alternating the electric current from one pair of magnets to the other, connected substantially as and for the purposes described.



2. A simple spring-relay, S, in combination with the self-adjusting relay, so connected that it can be operated at will without opening or disturbing the self-adjusting relay, and operated by the same local battery, T, as the self-adjusting relay, substantially as described.

3. The combination of the self-adjusting relay and a pole-changing mechanism, connected as described, whereby any number of relays can be added and any number of circuits operated by an initial mechanism, P, with a single local battery, T, substantially as described.

252,897. ELECTRICAL VISUAL INDICATOR. CHESTER H. POND, New York, N. Y., assignor to the Pond Electric Signal Company, same place. Filed Nov. 19, 1880. Renewed Dec. 19, 1881. (No model.)

Brief.—Improvement on Letters Patent No 232,415 so that only one electro-magnet is required to operate all the systems. Each indicating-wheel automatically locks itself and throws the succeeding wheel under the influence of the electro-magnet when the required number is reached in the series to be transmitted

252,897.

Claim.—1. In a visual indicator, the combination of intermittently-moving stop *b*, electro-magnetic mechanism for controlling its intermittent movements, wheel D, pins *d d* thereon, pinion *h*, connected therewith, and toothed weight H, meshing with said pinion, and thereby imparting to the wheel D a normal tendency to rotate, substantially as set forth.

2. In a visual indicator, the combination of stop *b*, an electro-magnetic escapement for controlling its movement, wheel D, pins *d d*, pinion *h*, and toothed weight H, meshing therewith, with a restoring device consisting of an upwardly-moving part, K, provided with a shoulder or arm, *e*, adapted to engage said weight and lift it to its normal position, substantially as set forth.

3. In a visual indicator comprising a rack, A, wheel D, weight H, and connection between said wheel and weight, whereby the dropping of the latter causes the rotation of said wheel, the combination, with said parts, of a restoring mechanism consisting of a sliding rod, K, bearing shoulder *m*, adapted to take under and lift rack A, lever I, adapted when pulled to take under and lift said rod, and means actuated by said movement of said lever for lifting said weight and effecting thereby the return revolution of the wheel, substantially as set forth.

4. In a visual indicator employing a non-intermittently-rotating wheel, D, and mechanism for releasing and stopping it, the combination of said wheel with a friction-brake, F, adapted to press against the surface thereof, of mechanism adapted, when released, to press said brake forcibly against said wheel, and of means for releasing said mechanism by the stoppage of the wheel, substantially as set forth.

5. In a visual indicator, the combination of the wheel D, means for releasing it, means for rotating it, and means for stopping it, leaver F, bearing the friction-brake F, drop G, inclined or wedging surface *f*, and means for releasing said drop by the stoppage of the wheel, substantially as set forth.

6. In a visual indicator, the combination of an intermittently-moving rack, A, the wheel D, the rod *g*, the lever F, bearing the friction-brake F, and the drop G, substantially as set forth.

7. The combination, with the wheel D, of the lever F, bearing the friction-brake F, the drop G, having cam-surface *q* and toe *p*, which normally rests on lever F, and thereby upholds the drop, and means for releasing said drop by pressing back the lever F until it no longer upholds said toe, substantially as set forth.

8. In a visual indicator, one indicating system consisting of a non-intermittently-moving part, so arranged relatively to a series of characters that the extent of its movement from its normal position determines which of said characters is displayed, an intermittently-moving part the number of whose advances determines the extent of movement of the first-named part, and an escapement whose operation controls the movement of said intermittently-moving part, in combination with a second like indicating system, with one electro-magnet adapted to operate the escapement of either system and normally in operative connection with that of the first system only, and with means, actuated automatically by the stoppage of the movement of the non-intermittently-moving part of the first system, for bringing said magnet into operative connection with the escapement of the second system, substantially as and for the purposes set forth.

9. In a visual indicator, an indicating system consisting of a non-intermittently-moving part, D, tending to move in one direction, but normally restrained from moving, mechanism for releasing it and for stopping it after it has traveled a greater or less distance, and an escapement, E, for controlling said stopping mechanism and determining the point in its travel at which the moving part is stopped, in combination with a second like system, with one electro-magnet, B, whose armature is normally in operative connection with the escapement of the first system only, whereby its vibrations operate said escapement, and with mechanical means, in connection with said stopping mechanism of the first system, whereby the stoppage of the part D thereof establishes an operative connection between the armature of said magnet and the escapement of the second system, that the subsequent vibrations of said armature shall effect the operation of the second system, substantially as set forth.

10. In a visual indicator, an indicating system consisting of an escapement, E, an intermittent stop, *b*, and a non-intermittently-moving part, D, bearing a series of pins, *d d*, in combination with a second like system, with one electro-magnet for operating the escapement of either system, the same being normally in operative connection with the first system only, and with means for automatically bringing said magnet into operative connection with the second system upon the completion of the operation of the first, substantially as set forth.

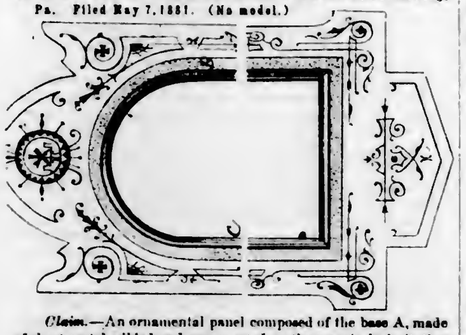
11. In a visual indicator, an indicating system consisting of a pallet, *c*, rack A, having teeth *a a*, intermittent stop *b*, and non-intermittently-moving part D, having a series of pins, *d d*, in combination with a second like system, with means for vibrating the pallets of both systems simultaneously, with means for holding the rack of the second system up out of engagement with its pallet during the operation of the first system, and with means for automatically dropping it onto said pallet upon the completion of the operation of the first system, substantially as set forth.

12. In a visual indicator, an indicating system consisting of a pallet, *c*, rack A, having teeth *a a*, intermittent stop *b*, and non-intermittently-moving part D, having a series of pins, *d d*, in combination with a second like system, with means for simultaneously vibrating the pallets of the two systems, with a detent, *t*, arranged to normally uphold the rack of the second system out of connection with its pallet, and with means for withdrawing said detent and dropping the said rack onto its pallet upon the completion of the operation of the first system, substantially as set forth.

13. In a visual indicator, an indicating system consisting of a pallet, *c*, rack A, having teeth *a a*, intermittent stop *b*, and non-intermittently-moving part D, with a second like system whose rack A has a shoulder, *s*, with means for simultaneously vibrating the pallets of both systems, with a detent, *t*, for engaging said shoulder *s*, with an arm, *u*, for withdrawing said detent, and with means for moving said arm by the stoppage of the part D of the first system, substantially as set forth.

14. In a visual indicator, the combination of an indicating system consisting of a pallet, *c*, rack A, having teeth *a a*, stop *b*, and wheel D, bearing pins *d d*, with a second like system, with means for vibrating both pallets simultaneously, with a rod, *g*, in connection with the rack A of the first system, with an arm, *v*, moved by said rod, and with a detent, *t*, moved by said arm, and normally engaging a shoulder, *s*, on the rack A of the second system, substantially as set forth.

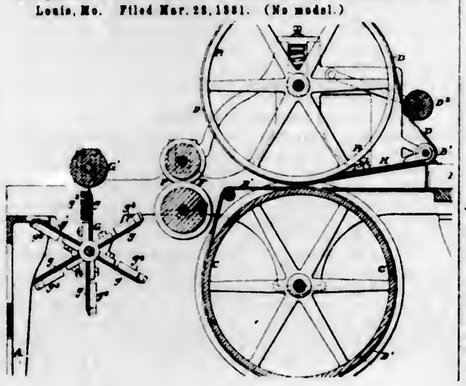
15. The combination of two electrically-actuated indicator systems, each adapted to advance one character for each break or closure of their actuating-circuit, the first system only being in operative connection with said circuit, with means for bringing the second system into connection therewith upon the completion of the operation of the first system, and with mechanical means for preventing the act of effecting this connection from prematurely



starting the second system in case the circuit at the time said connection is made is in the condition (either open or closed) prearranged to effect the starting thereof, without withholding the circuit from the magnet which actuates said second system, substantially as set forth.

16. The combination of two indicator systems, both operated by the same electro-magnet, and each adapted to advance one character for each closure and break of the actuating-circuit, and the first system only normally in operative connection with the magnet, with means for automatically establishing an operative connection between the second system and said magnet upon the completion of the operation of the first system, and with mechanical means for preventing the act of establishing such connection from prematurely starting the second system, substantially as set forth.

17. In a visual indicator, an indicating system consisting of a character-displaying mechanism whose movement is controlled by a pallet, *e*, and rack A, having teeth *a a*, in combination with a second like system whose rack A is formed with an additional tooth, *a'*, and is normally sustained with said tooth above its pallet, with means for vibrating said pallets, and with means for dropping the said rack into connection with its pallet upon the completion of the operation of the first system, substantially as set forth.

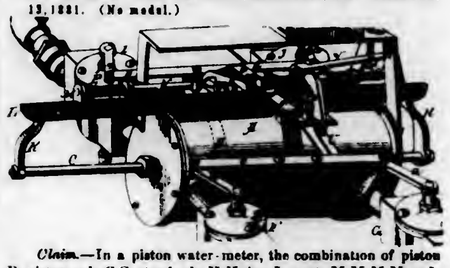


18. In a visual indicator, a non-intermittently-moving part, D, having pins *d d*, in combination with an intermittently-moving part, A, bearing a stop, *b*, and having a projection, *r*, which normally bears against a fixed shoulder and confines the part A laterally, but which, when said part has passed out of its normal position, passes beyond said shoulder and leaves the part A free to be moved laterally by the contact of either of the pins *d* with its stop *b*, substantially as set forth.

252,898. PICTURE-FRAME. SILAS W. POULTON, Harrisburg, Pa. Filed May 7, 1881. (No model.)

Claim.—An ornamental panel composed of the base A, made of sheet metal, gilded and ornamented on the margin in imitation of a picture-frame, with the mat B, having a rough-gilt raised margin within the ornamental margin of the base A and a tapering and grooved edge panel, C, extending over the entire surface of the mat B, within the rough margin of the same, constructed, arranged, and combined as herein described, and for the purpose set forth.

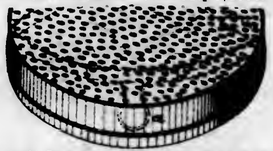
252,899. PLUG-TOBACCO MACHINE. JOHN RAMMING, St. Louis, Mo. Filed Mar. 28, 1881. (No model.)



Claim.—1. In a plug-tobacco machine, the upper pressing-roll, B, made vertically adjustable, in combination with the non-adjustable driving-pulley B', tightener-pulley D^2, and carrying and driving belt D, all arranged substantially as described, and for the purpose set forth.

2. The combination, in a plug-tobacco machine, of the pivoted inclined bearing-plate H, arranged forward of the rolls B C, and operating, as described, with the belt D, pulley B', and rolls B C, all substantially as described, and for the purpose set forth.

3. The combination, in a plug-tobacco machine, of the inclined plate H, having friction-roller *h*, with the drum B, pulley B', and endless belt or carrier D, as described, and for the purpose set forth.



4. In a plug-tobacco machine, the combination of the rotary head G and radial cutters *g*, provided with spring-followers g^1, all arranged as herein described, and for the purpose set forth.

252,900. DEVICE FOR OPERATING THE VALVES OF PISTON-METERS. PETER RUSSELL, Milwaukee, Wis. Filed June 13, 1881. (No model.)

Claim.—In a piston water-meter, the combination of piston B, piston-rods C C, standards K K, bar L, posts M M M M, rods N N', springs P P, angular bars R, oscillating catches O O, springs U U, cross-bars *e e*, bars *b* and *d*, levers *a a* and *c c*, and cut-off valves F, G, I, and J, all substantially as and for the purpose set forth.

252,901. APPARATUS FOR FORMING HAT-MAP BATS. JAS R. RUSSELL, Boston, Mass. Filed July 1, 1881. (No model.)

Claim.—1. The combination of the flanged plates *b d* with the foraminous former, substantially as described.

2. The combination of the flanged plates *b d* and foraminous plate *f*, substantially as and for the purpose described.

3. The combination of the flanged plates *b d*, plate *f*, and handle *g*, substantially as described.

4. A jigger having a foraminous face-plate and a back plate provided with openings, whereby the air may escape from below the face-plate, substantially as described.

252,902. DEVICE FOR ATTACHING ROLLER-COLTERS TO PLOWS. HANS H. SATER, Dubuque, Iowa. Filed Sept. 19, 1881. (No model.)

Claim.—1. The arm or bracket A, provided with serrations *f f*, recess I, and slot G, in combination with the colter-stem B, eyebolt D, and seat C, having serrations *g g'* and shoulder *i*, whereby said seat C is prevented from dropping down when the bolt D is loosened, substantially as shown and described.

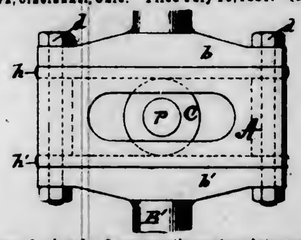
2. The plow-beam F, combined with an arm or bracket, A, provided with the extended bearing-face C', projection C^2, with rib C^3, and the flanges *a* and *a'*, substantially as shown and described.

3. The plow-beam F, combined with an arm or bracket, A, having the bearing-face C', projection C^2, and lugs *a* and *a'*, in combination with the strap-bolt B, substantially as shown and described.

252,903. REAMER. ANDREW SAUERBREI, Yonkers, N.Y. Filed May 9, 1881. (Model.)

Claim.—1. In a reaming-implement, the combination of the cylindrical body A, constructed with the cavity *g* and the seat *b*, the adjustable key B, having a cutting-edge, *f*, and an actuating-screw, C, arranged to adjust the key B, all substantially as and for the purpose herein set forth.

2. In a reaming-implement, the combination of the hardened steel body A, of cylindrical form, and constructed with a cavity, *g*, a seat, *b*, and key B, having a cutting-edge, *f*, and an actuating-screw, C, working through a solid nut or bearing, *m*, to adjust the key B, all substantially as and for the purpose herein set forth.



3. In a reaming-implement, the cylindrical body A, constructed with the parts $a' b' c'$ of diminished diameter, and the tapered portions $a' b' c'$, and having the inclined dovetailed seat *b*, the adjustable key B, having a cutting-edge, *f*, the aforesaid body being cut away at one side of the said key B, and the parts being constructed and combined substantially as and for the purpose herein set forth

252,904. HEATING-STOVE. ALBERT L. SAVAGE, Ashtabula, Ohio. Filed Sept. 5, 1881. (Model.)

Claim.—The stove-base A, cast with the air-chamber or tube B, with its upper end covered by a plate, *a*, arranged in an inwardly-inclined position in the ash-pit under the overhanging flange of the grate-support C', and having perforations *a'*, in combination with the removable tube B', having perforations or apertures near its lower end, substantially as and for the purpose set forth.

252,905. YOKE FOR CONVERTING MOTION. MICHAEL SCHULTZ, Cincinnati, Ohio. Filed July 16, 1881. (No model.)

Claim.—1. A yoke for converting rotary into reciprocatory motion in steam-pumps and other machinery, in which a box or open block, A, extending the full length of the yoke, is interposed between the parallel faces of the cross-heads and held by the connecting-bolts securing the cross-heads, substantially as set forth.

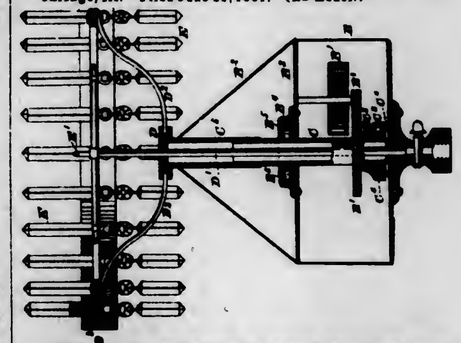
2. In combination with the members *b b'* of a yoke, the box A, constructed as described, having thickened end walls, through which pass the retaining-bolts, and side walls, longitudinally perforated for the play of the crank-pin, substantially as set forth.

3. The members *b b'* of the yoke, in combination with the box A, bolts *d d*, and facing-plates *h h'*, as and for the purpose set forth.

4. The members *b b'* of the yoke, in combination with the open box A and the roller C, substantially as specified.

252,906. TRACING-TABLE. MATHAS BOLT, Weisport, Pa. Filed Dec. 14, 1881. (No model.)

Claim.—1. The combination, with the box or case A, having glass top D, opening I, and door F, of the lamp G, substantially as and for the purpose set forth.



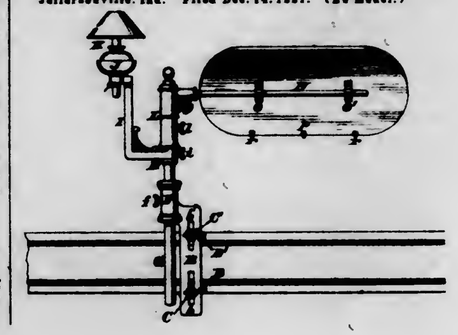
2. The combination of the box or case A, having a removable glass top, D, opening I, studs O, and door F, with the lamp G and the shade L, having notched flange M, substantially as and for the purpose set forth.

3. The combination of the box or case A, having a glass top, D, and slanting or diagonal sides J, with the lamp G and the mirrors or reflectors K, substantially as and for the purpose set forth.

4. The box or table A, having a glass top, D, and graduated sides, in combination with the lamp G, substantially as set forth.

5. The herein-described tracing-table, consisting of the box or case A, having a glass top, D, opening I, studs O, door F, and graduated sides, in combination with the lamp G, mirrors or reflectors K, and shade L, having notched flange M, substantially as and for the purpose shown and specified.

252,907. REVOLVING PRISMATIC SHADE. WM. H. STAATS, Chicago, Ill. Filed June 20, 1881. (No model.)



Claim.—1. A revolving shade composed of party and various colored prisms or prisms and pendants E, revolved by any suitable mechanism and combined with a gas-burner or other light-giving device, substantially as described.

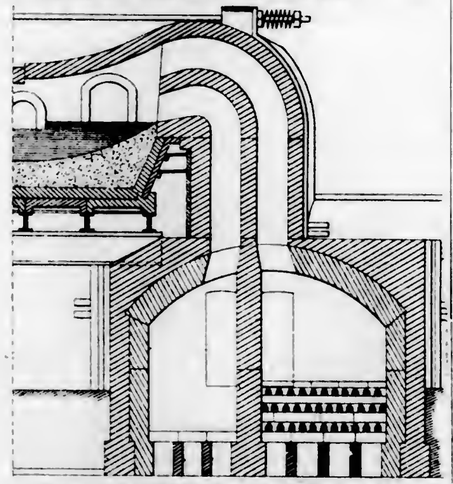
2. The combination, in a party-colored revolving shade, of the ring D^2, for carrying the prisms or pendants, arms for connecting it to the driving-shaft, a sectional driving-shaft, C C^2, its supporting wheels or rollers B^2 and C^2, and the driving mechanism, the parts being arranged for joint operation substantially as set forth, and for the purpose described.

3. The combination of the drum or case B, having upon its upper surface a conical reflecting-surface, B^2, the sectional driving-shaft C C^2, and mechanism for driving the same, substantially in the manner and for the purpose set forth.

4. The combination of the ring D^2 and the party-colored glass prisms E, the parts being constructed as described and arranged to be operated by mechanism substantially as described.

252,908. TABLE ATTACHMENT FOR BEDS. ROBT. L. STOKES, Jeffersonville, Ind. Filed Dec. 14, 1881. (No model.)

Claim.—1. The combination, in a table attachment for beds, of slotted plate B *b b'*, screws D D', and keepers E E', said plate being provided with a socket, F, that supports the standard of said attachment, as herein described.

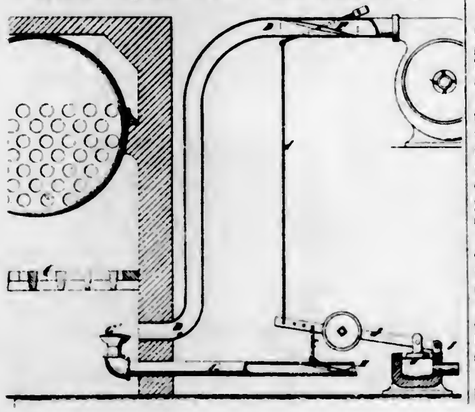


2. The combination, in a table attachment for beds, of the round rod or bracket N, bearings O O', thumb-screw o, and table P, which latter is attached to said bearings, as herein described.

3. The combination, in a table attachment for beds, of a swivel-arm, I, provided at its free end with a lamp-holder, said arm being applied to the same standard that supports the table-bracket, as herein described.

4. The combination, in a table attachment for beds, of standard G, support H, swivel-arm I, socket L, bracket N, and table P, the free end of said arm being provided with a lamp-holder, as herein described.

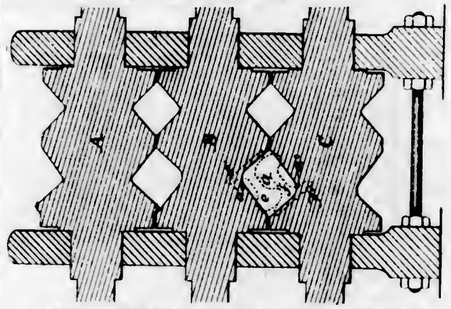
5. The combination, in a table attachment for beds, of slotted plate B *b b'*, washers C *c C' c'*, thumb-screws D D', and keepers E E', as herein described.



252,909. REGENERATIVE FURNACE. WILLIAM SWINDELL, Allegheny, Pa. Filed Nov. 26, 1880. (No model.)

Claim.—1. A regenerator having its checker-work formed of bricks, having an inclined wedge-shaped or pointed upper surface, substantially as and for the purpose specified.

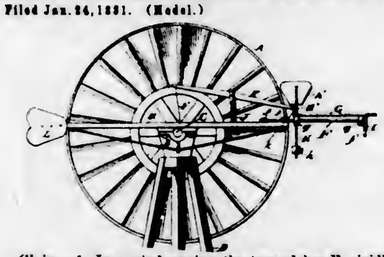
2. A regenerator-brick having a sharp ridge-comb on its upper edge and notches for receiving the transverse courses, substantially as and for the purpose described.



252,910. APPARATUS FOR BURNING COAL-SLACK. CHAS. TAYLOR, New York, assignor to Henry L. Van Syckel and Chas. G. Till, Brooklyn, N. Y. Filed June 2, 1880. (No model.)

Claim.—1. The combination, with a steam-boiler furnace, of pipes for introducing air and spraying water below the grate, valves in said pipes for controlling the passage of air and water through them, and a pressure-regulator for simultaneously opening and closing said valves, whereby the supply of air and water is automatically and uniformly regulated, substantially as specified.

2. The combination, with steam-boiler furnace, of the pipes D and G, for supplying air and water thereto, valves F and H, contained in said pipes, and the pressure-regulator I and connections between said regulator and valves for simultaneously opening and closing the latter, substantially as specified.



252,911. ROLLING-MILL. JAMES THOMAS, Laramie City, Wyo. Filed Sept. 12, 1881. (No model.)

Claim.—1. The improvement in the art of utilizing old rails, which consists in placing side by side, without any inner or outer filling-pieces, two railroad-rails, the flange of one overlapping the head of the other, with the interstices open, as described, and operating upon them together at one heat, substantially as set forth.

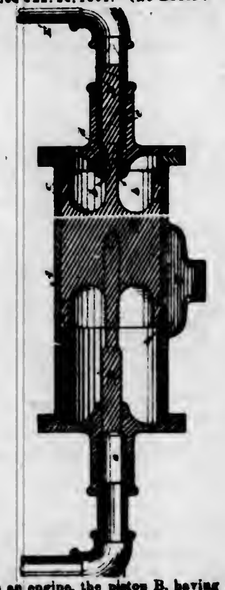
2. A three-high rolling-mill having the first groove, *a*, formed between the bottom and middle roll approximately square, with its angles *a'* and *a*[2] filled and rounded, as described, and the second groove, *b*, formed between the top and middle roll, its sides being made equal, or approximately so, by the projecting rib *b*[2] of the top roll, A, substantially as and for the purposes specified.

252,912. WIND-ENGINE. ALEXANDER THOMSON, Ames, Iowa. Filed Jan. 24, 1881. (Model.)

Claim.—1. In a wind-engine, the trussed bar E, rigidly attached to the revolving head B, and provided with the main or governor vane G, pivoted to one end thereof, and small counter-balance-vane L, rigidly attached to the other end, substantially as described.

2. In a wind-engine, a main or governor vane, G, pivoted to the outwardly-extending arm F, and provided upon its under side with a projecting arm, H, and adjustable weight h, whereby it retains normally a horizontal position, in combination with an upwardly-projecting arm, H', having a vane, h', attached thereto, and operating to present the face of the vane G to the wind when the pressure upon the vane overbalances the adjustable weight, substantially as described.

3. In a wind-engine, the limiting-stop *f'* of the arm F, in combination with the stop I upon the under side of the vane G, whereby the latter is limited to a quarter-turn upon its axis, substantially as described.



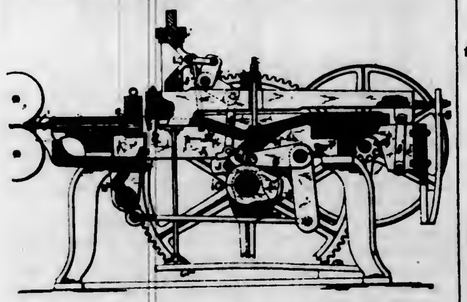
4. In a wind-engine, the bar E, provided with the standard J, lever K, and cords or chains *k* and *k'*, whereby the vane G may be kept from the horizontal plane, and whereby it may be revolved, substantially as described.

5. In a wind-engine, the pivoted main vane G, provided with projecting arm H, having weight h, and arm H', having vane h',

in combination with the bar E and revolving head B, substantially as and for the purpose set forth.

6. The combination of the vane G, provided with projecting arms H and H', weight h, small vane h', and stops I *f'*, and pivoted to the projecting arm F of the bar E, with the standard J, lever K, and cords *k k'*, substantially as described.

252,913. DIRECT-ACTING ENGINE. ALEXANDER THOMSON, Ames, Iowa. Filed Jan. 28, 1881. (No model.)

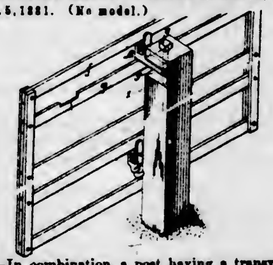


Claim.—1. In an engine, the piston B, having steam-chambers *b*, in combination with valves D D', working in the recesses *c*, arranged in the cylinder-heads, substantially as shown and described.

2. In an engine, the piston B, having steam-chambers *b*, in combination with the cylinder A, provided with slots G for the passage of the pins F, substantially as shown and specified.

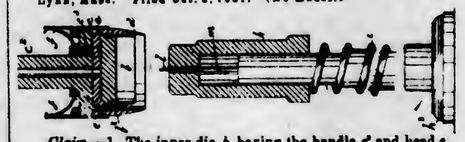
3. In an engine constructed substantially as shown, the forked connecting-rod provided with stub ends having removable lining-pieces *h* inserted in them, substantially as and for the purpose specified.

4. An engine consisting of a cylinder, A, piston B, provided with steam-chambers *b*, and elongated valves D D', moving in recessed heads, and the forked connecting-rod H, all constructed and arranged as shown and described.



252,914. MACHINE FOR FORMING BOLT-BLANKS FROM COLD RODS OF METAL. WM. E. WARD, Port Chester, N. Y. Filed Apr. 4, 1881. (No model.)

Claim.—1. The combination, substantially as before set forth, of the rod-guide, the stationary griping-jaws which gripe the end of a rod and hold the same during the heading operation, a die-block containing two or more matrices for progressively forming and finishing a bolt-head, and the mechanism, substantially as described, for changing the planes of elevation of said matrices to enable them to act successively in upsetting, shaping, and finishing the end of a metal rod to form a bolt-head prior to cutting the headed portion from the rod.

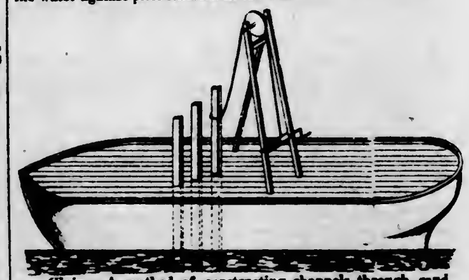


2. The combination, substantially as before set forth, of the stationary griping-jaws, the ram or header provided with a series of head-forming dies, the mechanism, substantially as described, for changing the header to different planes of elevation for bringing such head-forming dies successively into alignment with the griping-jaws, suitable feeding devices for advancing the header-rod intermittingly, and movable shears for cutting off the headed bolt-blank, the whole combined by suitable connecting mechanisms.

252,915. HANGING GATES. WILLIAM R. WHITE, Meeds, Ill. Filed Feb. 5, 1881. (No model.)

Claim.—In combination, a post having a transverse corner slot, a bracket, A, having an arm, *a*, fitting in and guided by the said slot, a pivot-pin fitting sockets in the post, a roller turning between fingers of the bracket, and a gate supported on the roller, all as set forth.

252,916. HEEL-FORMING APPARATUS. FRANK A. WIGGIN, Lynn, Mass. Filed Oct. 6, 1881. (No model.)

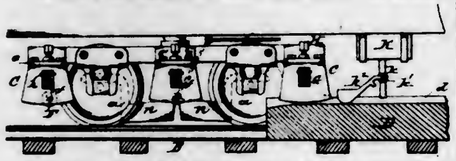


Claim.—1. The inner die, *b*, having the handle *c'* and head *c*, combined with the outer and larger die, *d*, detachably connected therewith, whereby both dies are made movable with the handle to place the dies on the leather to cut heel-lifts of different sizes, substantially as described.

2. The inner die, *b*, and external die, *d*, combined with catches to hold the two dies together, substantially as described.

3. The nail-holder composed of the post, the driver *m*, and the surrounding spring-supported sleeve, provided with a hole to receive and steady the nail, the end of which is supported by or made to rest on the driver, combined with the inner die, *b*, and the outer die, *d*, and means to hold the two dies together, and a handle common to both dies to jam the lifts held within the dies by friction down upon the nail set up in the sleeve, substantially as described.

252,917. CONSTRUCTING CHANNELS THROUGH SAND BARS IN HARBORS. DANIEL W. WILLIAMS, New Orleans, La. Filed Oct. 18, 1881. (No model.)



Brief.—Channels formed through sand bars by the action of the water against piles inserted in the bar.

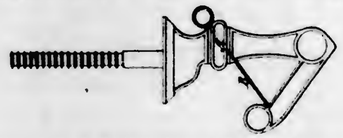
Claim.—A method of constructing channels through sand bars in harbors, rivers, bays, &c., by the insertion of planks or piles into such bars along and across the place through which it is de-

sired to construct a channel in such a manner that the action of the water upon and around such planks or piles will remove and wash away the sand of which such bars are composed, and thus form a channel through the same.

252,918. RUNNING-GEAR FOR RAILWAY-CARS. BERRET C. WILSON, Philadelphia, Pa. Filed June 20, 1881. (No model.)

Claim.—1. A railroad-car provided with double running-gear consisting of wheels and glides, the latter being provided with mechanism, substantially as shown and described, whereby the friction between the glides and their rails may be varied, substantially as set forth.

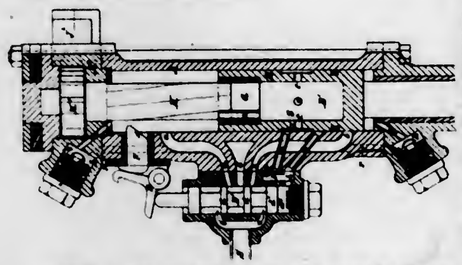
2. A railroad-car provided with wheels and glides, in combination with a wheel or wheels arranged upon the axle for relieving the friction between the glides and the rails, substantially as shown and described.



3. A glide for railroad-cars, provided with a friction-roller and means for protruding the periphery of said roller beyond the lower or riding surface of the glide, substantially as shown and described.

4. In combination with a car, the cross-bars E, pivoted thereto or to its trucks, and the glides C C, pivotally secured to said cross-bar, whereby said glides are capable of a lateral oscillating movement, substantially as set forth.

5. In combination with a car provided with wheels and glides, the oil-tank K and mechanism between said tank and glide-rail, whereby the glide-rails are automatically lubricated, substantially as shown and described.

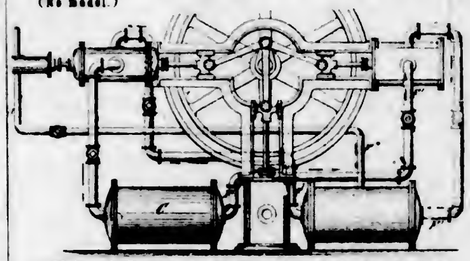


6. The glides C C, formed with recess c^2, and opening c', in combination with roller F, pivoted to bar f, spring G, and screw H, substantially as shown and described.

252,919. HANGER FOR CHANDELIERS. GEORGE W. WOODWARD, New York, N. Y. Filed Mar. 16, 1881. (No model.)

Claim.—As an improved article of manufacture, a chandelier suspension-hook having a hole, A, through its stem and a removable pin, B, fitted therein acting as a positive stop to prevent the chandelier from being lifted off the hook, substantially as shown and described

252,920. ROCK-DRILL. JOHN F. ALLEN, New York, N. Y. Filed June 11, 1881. (No model.)

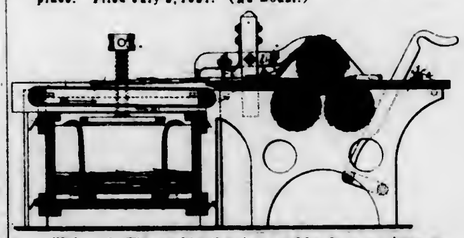


Claim.—1. In a rock-drill provided with a ribbed or feathered rod, H, working in a corresponding nut, G, firmly attached to the piston B, the holes or passages p through the solid part of said nut or piston, in combination with the cavity B', substantially in the manner and for the purpose specified.

2. In a rock-drill provided with a piston or balance slide-valve, the combination of the passages p and t and recess g in the piston B and the passages m and n, connected with the lower part of the valve-chamber, arranged to operate substantially in the manner and for the purpose described.

3. In combination with the cylinder of a rock-drill, the chambers L L, with plugs N N, provided with annular recesses r, and with passages o, closed by a self-acting valve, g, and passages r r and w, communicating with the regular port-passages a and b and with the upper and lower end of the cylinder, respectively, the whole being arranged to operate substantially in the manner and for the purpose herein set forth and described.

252,921. PROCESS OF AND APPARATUS FOR DYNAMIC COOLING. LEICESTER ALLEN, New York, N. Y., assignor to Henry T. Brown, Trustee, same place. Filed May 25, 1881. (No model.)



Claim.—1. In a process for dynamic cooling, wherein air or other gas is first compressed, then cooled, then expanding to perform outer work, the mode of increasing the cooling effect of a stated bulk or volume of air or other gas, which consists in condensing the gas to and maintaining it above a stated limit materially higher than the normal atmospheric pressure, substantially as and for the purpose set forth.

2. In a process for dynamic cooling, wherein air or other gas is first compressed, then cooled, and then expanded in the performance of outer work, the mode of beginning and ending the cycle at a stated pressure materially above the normal atmospheric pressure, substantially as herein described.

3. In a dynamic cooling apparatus in which air or other gas is first compressed, then cooled, then expanded in the performance of outer work in a closed cycle to compress air above and expand it again to a minimum limit of pressure materially higher than the normal atmospheric pressure, substantially as herein described, the combination, with a steam-engine or other prime motor, air-engine, air-compressor, and intermediate coolers, of an auxiliary pump for taking air from the exterior atmosphere and injecting it into the system in sufficient quantities to compensate for leakages, substantially as herein described and specified

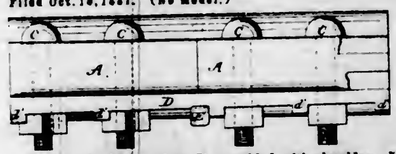
252,922. FODDER-PRESS. FRANK H. BACON, Plainfield, N. J., assignor to himself, Joseph Fowler, and Carman Perse, same place. Filed July 8, 1881. (No model.)

Claim.—1. The combination, in a machine for preparing cornstalks or similar material, of a table for receiving the stalks, three rollers for crushing the stalks, a cutter and mechanism for actuating the same automatically, and a press-box and means for pressing and baling the stalks, substantially as set forth.

2. The combination, in a machine for preparing cornstalks or similar material, of a feed-table, crushing-rollers, a cutter actuated automatically for separating the stalks into lengths, endless belts and cross-bars for supporting the advancing ends of the stalks, a press-box for receiving the stalks, and pressing mechanism, substantially as set forth.

252,923. SHOULDER-REST FOR VIOLINS. FRANCIS L. BACKER, New York, N. Y. Filed May 27, 1881. (No model.)

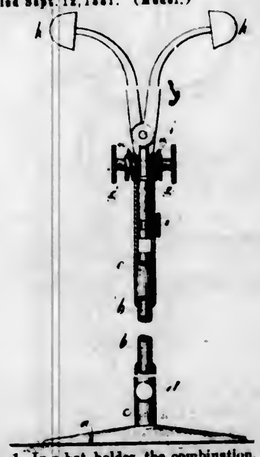
Claim.—1. A shoulder-rest for violins, composed of a stay having a cushion at the lower end, a U-shaped upper part, and a spring cushioning device connected to the latter, whereby the shoulder-rest may be attached to the body of the violin, substantially as and for the purpose set forth.



2. In a shoulder-rest for violins, a spring-stay, A, having a U-shaped upper portion and a curved lower part, substantially as described.

3. A shoulder-rest for violins, composed of a metallic spring-stay having a cushion at the lower end, of an upper U-shaped portion provided with means for attaching it to the violin, and of a chin plate or rest secured to the upper end of the stay, substantially as set forth.

4. In a shoulder-rest for violins, the combination, with a metallic spring-stay having an upper U-shaped portion and a curved lower portion, of a chin-plate secured to the upper end, and of an outer face plate or extension, by which the stay is protected against perspiration, substantially as specified.

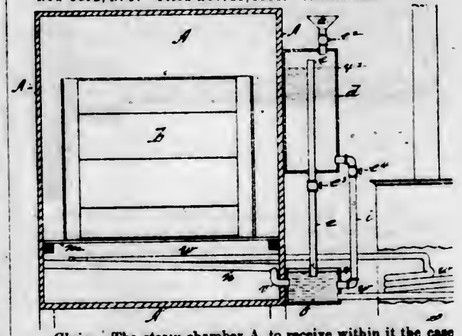


5. In a shoulder-rest for violins, the combination, with a spring-stay, A, having a U-shaped upper portion, of an elastic cushion, a, attached to the inside of one of the shoulders thereof, to secure the same tightly to the body of the violin, substantially as set forth.

252,924. NUT-LOCK. LOUIS D. BEST, Canal Dover, Ohio. Filed Oct. 18, 1881. (No model.)

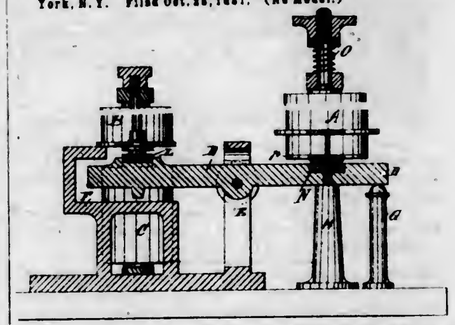
Claim.—A sliding plate, D, provided with shoulders d' and V-shaped notches d^2, and wedge-shaped bearing between the shoulders d', substantially as and for the purposes set forth.

252,925. HAT-HOLDER. SARAH E. BROWNING, Worcester, Mass. Filed Sept. 12, 1881. (Model.)



Claim.—1. In a hat-holder, the combination, with the supporting-column, of two arms extending upwardly and terminating with pads, a stock to which the lower ends of the arms are connected, and mechanism, substantially as specified, for spreading or contracting such arms and holding them, as set forth.

2. In a hat-holder, the arms e f, provided with pads at their outer ends, and the stock g', to which the arms are pivoted, in combination with the screws n, having right and left hand threads, substantially as specified.



3. The combination, with the base a and rod b, of the tubular standard c, clamping-screw d, pivoted arms e f, adjusting-screws n, stock g', and shank g, the latter entering the upper end of the tube c, as and for the purposes set forth.

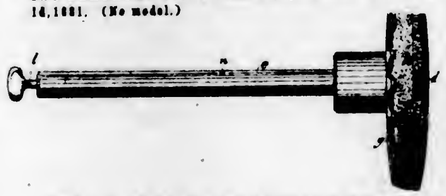
252,926. APPARATUS FOR CURING TOBACCO. EDWIN A. BURDICK, Springfield, Mass., assignor to Charles S. Phillips, New York, N. Y. Filed Nov. 21, 1881. (No model.)

Claim.—The steam-chamber A, to receive within it the case b of tobacco, and having the inclined floor n and the drain-pipe v, leading from the latter through the side of said chamber, the water-receptacle o, located outside of said chamber, the pipe-coil w, passing from said receptacle through a suitable stove and thence into chamber A over said inclined floor n, and having perforations therein for the escape of steam therefrom into said chamber, and the reservoir d, connected with the water-supply of said receptacle by pipes, whereby the lowering of the water in the latter admits air into said reservoir and allows water to flow therefrom, all combined and operating substantially as set forth.

252,927. RELAY AND SOUNDER. CHARLES G. BURKE, New York, N. Y. Filed Oct. 26, 1881. (No model.)

Claim.—1. In a relay or sounder, the combination of electro-magnet A, with its coils d and e, electro-magnet B, electro-magnet C, armature-lever D, armatures L and N, trunnion E, stops F and G, supporting-frames H and I, adjustment O, binding-posts a a' a^1 a^2 a^3 a^4 a^5 a^6, switch b and b', battery S, with its closed circuit R, and battery W, with its closed circuit T, substantially as described, and for the purposes set forth.

2. In a relay or sounder, the combination of electro-magnets A, B, and C, double-armed lever D with armatures L and N, support E, stops F and G, magnet-supports H and I, battery S, and closed circuit R, substantially as described, and for the purpose set forth.



3. In a relay or sounder, the combination of coil d in electro-magnet A, electro-magnet B, armatures L and N, lever D, and its support E, stops F and G, magnet-supports H and I, adjustment O, battery W, and closed circuit T, substantially as described, and for the purpose set forth.

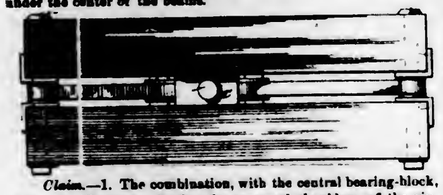
4. In a relay or sounder, the combination of electro-magnet C, coil d in electro-magnet A, electro-magnet B, armatures L and N, lever D, stops F and G, magnet-supports H and I, battery S, and its closed circuit R, substantially as described, and for the purpose set forth.

5. In a relay or sounder, the combination of electro-magnet A with its coils d and e, and electro-magnet C, both attracting

armature-lever D from opposite sides of such lever, for the purpose of moving such lever in one direction only, the other or reverse motion of such lever resulting from the force of retractor B, in further combination with such magnets and lever, substantially as described, and for the purpose set forth.

252,928. MACHINE FOR SHAVING AND WHITENING LEATHER. JOHN G. BUSSELL, Lynn, Mass. Filed Dec. 14, 1881. (No model.)

Claim.—1. The abrading-disk *d*, molded and set to form, with a depressed center, and the swelled line from such center to the retiring or backward-turned periphery, substantially as specified.



2. The combination of the elastic or cushioning disk *h*, the molded abrading-disk *d*, and a device to secure said abrading-disk in position by engagement with the depressed center thereof, substantially as specified.

3. The combination of disks *d* and *h*, the flanged sleeve *f*, secured in shaft *e*, and the broad-headed pin *j*, secured in said sleeve, substantially as specified.

4. The combination of the flanged sleeve *f*, the pins *i i*, the broad-headed pin *j*, and disks *d h*, substantially as specified.

252,929. BEAM-TRUSS. THOS. W. CARTER, New Orleans, La. Filed Nov. 5, 1881. (No model.)

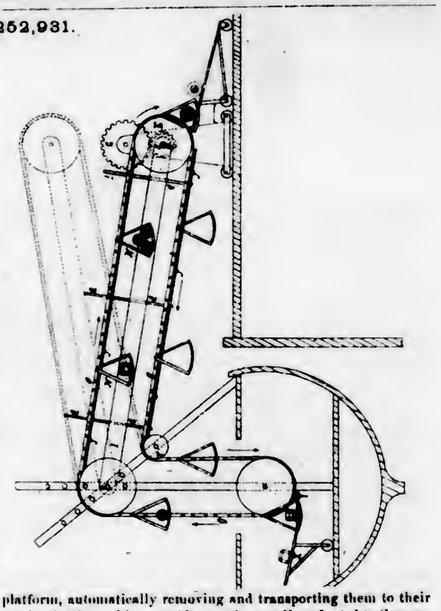
Brief.—Sprung or warped beams are trued through brace or truss rods secured to said beams and links, upon which rests a screw-bolt carrying an adjusting-nut and an upper bearing-block under the center of the beams.

Claim.—1. The combination, with the central bearing-block, nut, and pillar-screw, having the concaved shoulders, of the pivoted semicircularly-shouldered plates or levers and the articulated braces, substantially as and for the purpose set forth.

2. The combination, with the central bearing-block, nut, and pillar-screw, of the pivoted plates or levers and the articulated braces, substantially as and for the purpose set forth.

252,930. ENVELOPE-OPENER. WILLIAM A. DE CAINDRY, Washington, D. C., assignor of one-half to William H. Pearce, same place. Filed Nov. 4, 1881. (No model.)

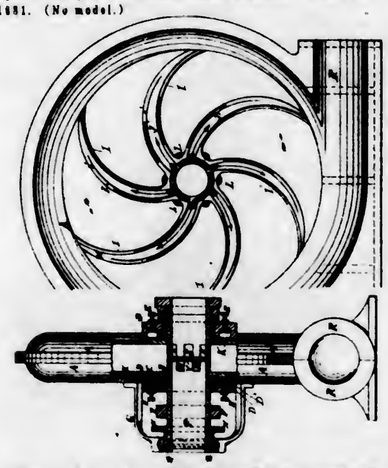
Claim.—An envelope-opener provided with an elastic blade having a recessed cutting-edge and a dull point, substantially as shown and described.



252,931. ENDLESS PACKAGE CARRIER OR ELEVATOR. OLIVER H. EATON, New York, N. Y. Filed Oct. 31, 1881. (No model.)

Claim.—1. An endless traveling carrier or elevator, preferably portable and adjustable, composed of parallel endless chains or ropes, traveling upon properly-located pulleys and bearing suspended between such chains or ropes, one or more carriers or cradles adapted to take up, carry, and deposit loads.

2. A movable carrying-cradle self-adjusting to the perpendicular and having two sides, with means of suspension at their tops, and at and between their bottoms a connecting-bar, from which project laterally teeth or fingers suited to support a load and to permit the passage between of corresponding stationary sets of teeth or fingers in the taking up and depositing of the loads.



3. A method of removing and transporting loads, substantially as hereinbefore set forth, by placing the loads on a suitable

252,931.

platform, automatically removing and transporting them to their destination by and in movable carrying-cradles adapted to the purpose, and moved by and between parallel endless chains or ropes traveling on properly-located pulleys, and automatically delivering such loads at their destination without dumping or otherwise disturbing or injuring them, all continuously.

252,932. CONDENSER. THOMAS ELCOATE, Newcastle-upon-Tyne, County of Northumberland, England. Filed Oct. 11, 1881. (No model.)

Claim.—1. As a new article of manufacture, a condensing apparatus in which the steam is let into the hollow vanes of a centrifugal pump rotating at a high velocity.

2. The process of condensing steam, consisting in delivering the same into a centrifugal machine through which water is passed at the same time, substantially as described and shown.

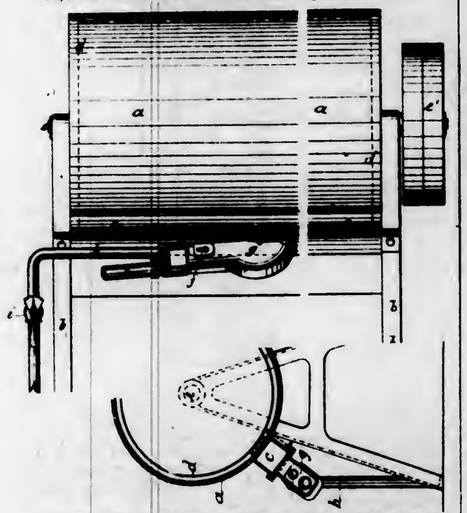
3. A condenser consisting of revolving arms or conductors provided at the center with separate steam and water admissions.

4. A condenser consisting of a series of revolving arms or conductors provided with a central inlet, and passages within said arms provided with a separate inlet, whereby the steam and the condensing medium may be introduced and passed separately through the apparatus.

5. In a rotary condenser, the combination of two series of radiating arms or conductors, one within the other, with a space between, and inlets whereby the steam and the condensing medium may be admitted separately to the respective passages.

6. The combination of the tubular transversely-divided shaft having the two series of ports or openings, the side plates, K, and the intermediate plates, I and J.

7. In a rotary condenser, the steam-chambers J, with openings at their ends farthest from the center for the escape of air and water, exposed to a current of condensing-water flowing past them, and thus causing an induced current outward on the principle of a Sprengel pump.



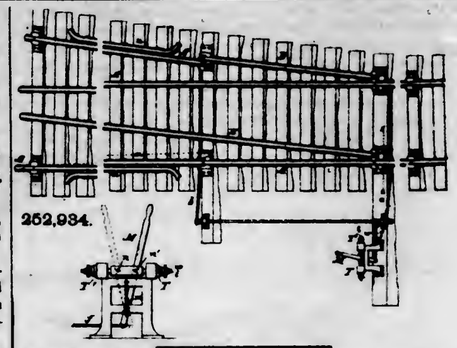
8. In a rotary condenser, the combination of a tubular shaft, tubular arms, and independent passages for the passage of the steam and the condensing medium into the arms.

9. In a rotary condenser, the combination of radiating steam-conducting arms and passages lying contiguous to said arms and extending outward beyond the same, whereby the escaping steam is subjected to the frictional action of the outward-flowing condensing medium.

10. In a rotary condenser, the combination of the casing, the rotary side plates, I, and the packing-rings C, as shown.

11. In a rotary condenser, the combination of radiating steam and water passages, lying contiguous to each other, a tubular shaft divided transversely, ports leading from one end of the shaft into the steam-passage, and ports leading from the opposite end of the shaft into the water-passage, or both water and steam passages.

252,933. COFFEE-ROASTING APPARATUS. HENRY FAULDS, Stockport, County of Lancaster, England. Filed June 13, 1881. (No model.) Patented in England Sept. 3, 1879.



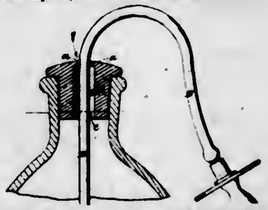
Claim.—The combination of the revolving cylinder *b*, outer casing, *a*, burner-chamber *c*, valved mixing-chamber *g*, valved pipe *h*, and air-pump, for the purpose specified.

252,934. RAILROAD-SWITCH. TIMOTHY H. FERRELL, Syracuse, N. Y. Filed Apr. 18, 1881. (No model.)

Brief.—Movable sections of main and side track are operated to shift the switch, through passing wheel-flanges of trains traveling from the direction of the siding, on either main or siding line. The operating hand-lever moves in a slotted rod having a spring at each end, whereby the switch-rails are returned to normal position after having been operated by a passing train.

Claim.—1. In an automatic switch, the combination of the main switch-rails, arranged to move opposite stationary sections of the main track, siding-rails, movable rail-sections arranged in the main and siding tracks, and appliances, substantially as described, whereby the main rails are set by the movement of the said movable sections by the cars, as specified.

2. The combination, with the switch-stand and rails, of the lever M, bar extending through helical springs T T', and provided with a slotted block having openings *n n'* and detachable pin *m*, substantially as set forth.

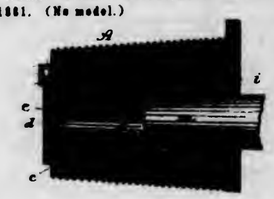


252,934.

252,935. CORSET. MARY E. FIELD, New Haven, Conn. Filed Sept. 3, 1881. (Model.)

Claim.—In a corset, the combination of the body A B, the yoke C, of the form shown, having laced shoulder-straps, and the bosom-pieces G, each consisting of two pieces of thin porous material united by a central vertical seam gathered at the sides and evenly secured at the top and bottom, all constructed and arranged substantially as herein described, for the purpose set forth.

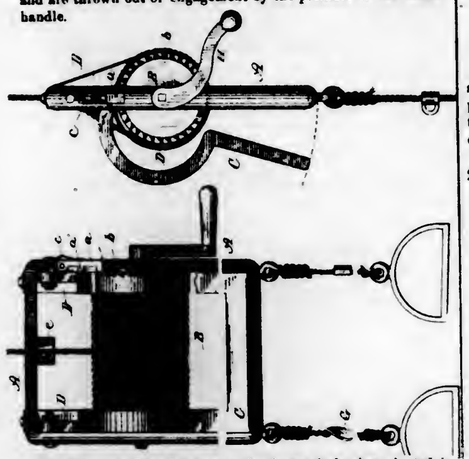
252,936. NURSING-BOTTLE. SIMON W. FRANCE, Brooklyn, N. Y. Filed Apr. 1, 1880. (No model.)



Claim.—1. A stopple, A, for nursing-bottles, in which the hole *b* is enlarged nearly throughout its entire length, and has a short contracted portion, forming a seat, *a*, in which a flexible tube may fit tightly, and acts as a valve by expansion to prevent spilling and by contraction to admit air directly to and through the central hole, *b*, without separate lateral vents, substantially as hereinbefore set forth.

2. The combination, with a flexible tube, of a stopple having but a single hole for its passage and without additional vent-openings, which hole is contracted for a portion of its length to fit the tube and enlarged throughout the rest of its length to admit the air on both sides of the contraction, substantially as described.

3. The bridge C, in combination with the nursing-pipe B and with the stopple A, having the enlarged central hole, *b*, and the contraction *a*, substantially as and for the purpose set forth.

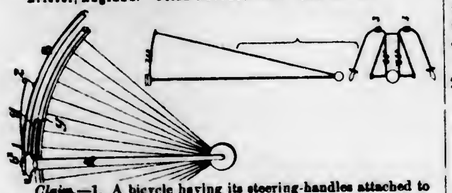


252,937. BUNG. HIRAM F. GAIBBS, Rouse's Point, N. Y. Filed Aug. 26, 1881. (No model.)

Claim.—The bung A, provided with a faucet-hole, *b*, in combination with the hinged valve *d*, bushing *c*, and valve-operating screw *i*, substantially as shown.

252,938. FIRE-ESCAPE. HIRAM F. GAIDER, Rouse's Point, N. Y. Filed Aug. 23, 1881. (No model.)

Brief.—The brake-handle curves around the cylinder and has attached to it one end of the brake-spring, the other end being attached to the frame. Pawls with beveled lugs are pivoted in slots in the frame and engage with ratchets on the end of the cylinder and are thrown out of engagement by the pressure of the brake-handle.



Claim.—1. In a fire-escape, the frame A, having pivoted in elongated slots in its sides the pawls *a*, provided with lugs *a'* and retained in position by the spring *c*, in combination with the cylinder B, having formed around its ends the ratchets *b*, and with the brake-handle C, substantially as set forth.

2. The brake-handle C, curved around the cylinder, as shown, and pivoted to the upper and inner sides of the frame A, operating in combination with the spring D, one end of which is secured to the brake-handle at a point between its pivotal attachment to the frame and the top of the cylinder, and having its other end carried around the cylinder and secured to the top of the frame, as shown.

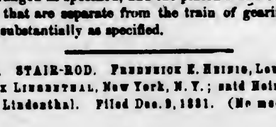
3. In a fire-escape, the safety stopping device herein described, consisting of the pawls *a*, pivoted in slots in the sides of the frame A, and provided with beveled lugs *a'*, against which operates the brake-handle, as described, said pawls being retained in position by the spring *c* and engaging with suitable ratchets, *b*, formed in the ends of the cylinder B, substantially as set forth.

252,939. BICYCLE. THOMAS T. HARRISON, Bristol, County of Bristol, England. Filed Nov. 25, 1881. (No model.)

Claim.—1. A bicycle having its steering-handles attached to the front fork and curved so as to pass beneath the legs of the rider, as set forth.

2. In combination with the front fork of a bicycle, a pair of steering-handles curved to the rear, so as to pass behind and beneath the legs of the rider, and attached to the fork by braces *h*, as described.

3. In combination with the front fork having casing *a'* and a half-seat for the balls *c*, the backbone provided with a pivot, *b'*, having corresponding half-seat, as set forth.



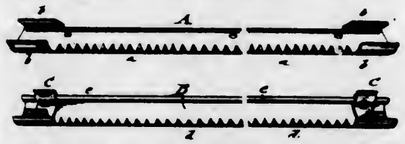
4. In combination with a bicycle, a slotted saddle-plate, P', having depression *a*, containing an inflatable bag or cushion, as set forth.

5. In combination with a bicycle, a saddle-plate extended backward, as at P', to constitute a valise-cover and cantle, as set forth.

6. In combination with the front fork having casing *a'*, the cone *a*², cap-piece *b*², balls *c*, and pivot *b'*, attached to the backbone, as set forth.

7. In combination with the pivot *b'* and its bearing in the top of the front fork, the inclosing convex bell and cover *d*, as set forth.

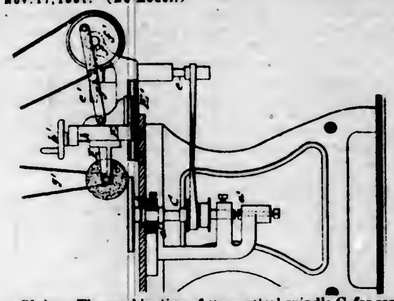
252,940. WARDROBE-HOOK. RANDOLPH HAYDEN, Haddam, Conn. Filed Dec. 14, 1881. (No model.)



Claim.—A wardrobe-hook composed of the upwardly-inclined socket A, provided with the conical opening D E, and the wooden pin B, provided with the straight tenon larger than the socket on the shoulder F, the tenon being forced or driven into the conical opening of the socket, substantially as specified.

252,941. WATCH. ALBERT HERBERLE, Ueberlingen, Baden, Germany. Filed June 23, 1881. (No model.) Patented in Germany July 27, 1880.

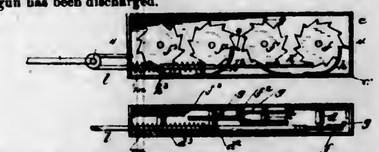
Claim.—In a watch-movement, the combination, with the barrel *a*, of the wheels *c e*, of the same size, and the pinions *b d f*, and the escapement-wheel *g*, receiving motion from such train of wheels, arranged as specified, and the pinion *x* and connections to the hands, that are separate from the train of gearing to the escapement, substantially as specified.



252,942. STAIR-ROD. FRIEDRICH E. HEINIG, Louisville, Ky., and MAX LINDENTHAL, New York, N. Y.; said Heinig assignor to said Lindenthal. Filed Dec. 9, 1881. (No model.)

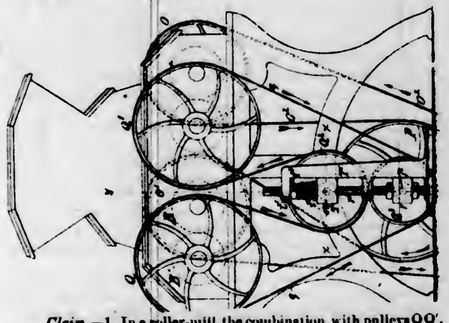
Claim.—1. The combination of a stair-rod or top plate and of a fixed base-plate with retaining devices connecting them at the ends, one or both of said plates being provided with retaining-teeth along the edges for holding the carpet, substantially as set forth.

2. The combination of a base-plate, A, having upwardly-projecting teeth *a* and retaining end flanges, *b b*, with a top plate, B, having downwardly-extending teeth *d* and spring-clasps C at the ends, by which the top plate may be sprung into the flanges of the base-plate, substantially as set forth.



252,943. MACHINE FOR GRINDING THE LAPS OF POLISHING-MACHINES. ANTHONY HERBERLE, New York, N. Y. Filed Nov. 17, 1881. (No model.)

Claim.—The combination of the vertical spindle C, for carrying the lap to be ground off, the vertical shaft *e*, means for connecting said shafts, gear *e'*, worm *e*², shaft *f*, having crank-disk *f'*, carriage E, crank-rod *f*², vertically-adjustable bracket-supports F, a shaft supported thereby, and the emery-wheel on said shaft, all substantially as described.

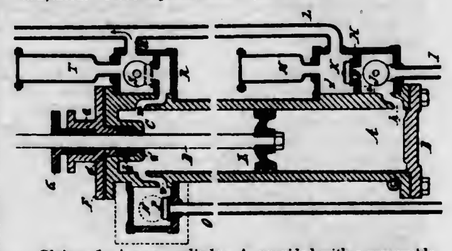


252,944. REGISTER FOR GUNS. JAMES HOLAHAN, Ansonia, Conn. Filed July 15, 1881. (No model.)

Brief.—Registering device to record the number of times a gun has been discharged.

Claim.—The attachment herein described, consisting of casing *c*, vertical shafts *d d' d*² *d*³, ratchet-wheels *f f' f*² *f*³, lugs *g*, for engaging the teeth of said wheels, springs *h h' h*² *h*³, to prevent the backward rotation of said wheels, rods *i* and *l*, and spiral spring *m*, in combination with a gun-lock, substantially as and for the purpose set forth.

252,945. ROLLER-MILL. NOAH W. HOLT, Buffalo, N. Y. Filed Nov. 21, 1881. (No model.)



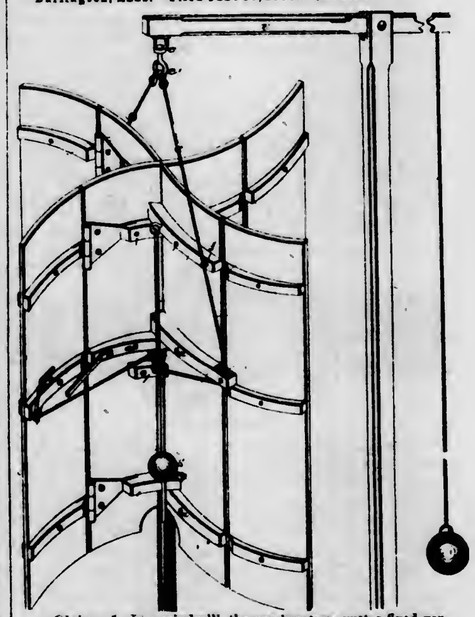
Claim.—1. In a roller-mill, the combination, with pulleys Q Q', a driving-pulley, Q², and an endless driving-belt, *g*, of a friction-pulley, Q³, which is partially surrounded by the driving-belt *g*, whereby the latter is pressed against the driving-pulley Q², substantially as set forth.

2. The combination, with two fast rollers provided with pulleys O O' and two slow rollers provided with pulleys Q Q', of the main driving-belt O², pulleys J' and Q², mounted on a counter-shaft, *p*, secondary driving-belt *q*, friction-pulley Q³, and mechanism whereby the pulley Q³ and the belt *g* surrounding it are pressed against the pulley Q², substantially as set forth.

3. The combination, with the pulleys Q Q', driving-pulley Q², and endless driving-belt *g*, of the friction-pulley Q³, movable bearing T S, suitable support therefor, and spring *t*², whereby the friction-pulley Q³ is pressed against the driving-pulley Q², substantially as set forth.

4. The combination, with the pulleys Q Q', driving-pulley Q², and endless driving-belt *g*, of the friction-pulley Q³, which is partially surrounded by the belt *g*, and whereby the latter is pressed against the pulley Q³, adjustable bearing *r*, adjustable carrier T, provided with bearing S, spring *t*², screw-bolt *r'*, suitable support therefor, and adjusting-nut *t*³, substantially as set forth.

252,946. PUMP. THOMAS H. JOHNS and ROBERT GAGE, Jackson, Mich. Filed Sept. 14, 1881. (No model.)



Claim.—1. A pump-cylinder, A, provided with a removable head, B, upon one end, the opposite head being cast with and forming an integral part of said cylinder, and provided with the inwardly-projecting stuffing-box C, and ports *k m n*, in combination with the valve-chambers H R N, secured to the outside of said cylinder, substantially as set forth.

2. A stuffing-box for pump-rods, consisting of the box C, bushing *a'*, and packing *b*, in combination with the follower F, provided with the bushing *d* and packing *e*, and the outer follower, *i*, substantially as and for the purpose specified.

3. In a double-acting pump, and in combination with the cylinder A thereof, the valve-chambers H, N, and R, provided with the valves J, K, P, and S, air-chambers M and T, and pipes I, O, L, and U, constructed, arranged, and operating substantially in the manner and for the purposes described.

252,947. WINDMILL. ALFRED W. JOHNS and ALLEN R. SMITH, Burlington, Kans. Filed June 30, 1881. (Model.)

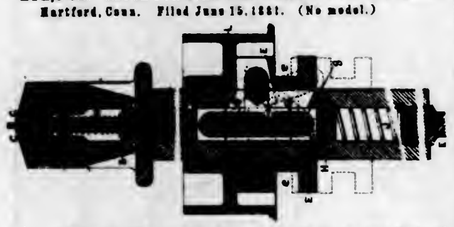
Claim.—1. In a windmill, the combination, with a fixed vertical shaft having a socket in its upper end and a collar secured to its body, of a wheel having a pivot-bolt adapted to rest in the socket and a disk adapted to bear against the collar, substantially as set forth.

2. In a windmill, the combination, with a fixed vertical shaft having a socket or bearing in its upper end and a rigid collar se-

cured to its body, of a wheel having rigid and pivotal vanes or fans secured to suitable arms, a pivot-bolt adapted to bear in the socket, and a disk to encircle the rigid collar, substantially as set forth.

3. In a windmill, the combination, with a shaft rigidly secured to a tower or derrick, the said shaft having a socket in its upper end and a collar rigidly secured to its body portion, of a wheel having curved rigid and hinged vanes or fans secured to suitable arms, a pivot-bolt on which the weight of the wheel rests, a disk adapted to encircle the collar and steady the machine, and means for automatically regulating the speed of the wheel, substantially as set forth.

4. In a horizontal windmill, the combination, with three sets of radial arms adapted to receive and retain four or more rigid vanes, the upper set having the governor-rods pivotally secured thereto, the middle set being provided with two rollers on the convex surface of the vanes, through which chains adapted to close the wheel pass, four springs on the concave surface, against which the hinged vanes abut, and a pivot-bolt on which the weight of the wheel rests, and the lower set having a central perforation through which the supporting-shaft passes, and a disk surrounding the said perforation to take up the wear, of hinged vanes pivoted to the said rigid vanes and connected to the governor-rods in pairs by suitable chains, substantially as set forth.



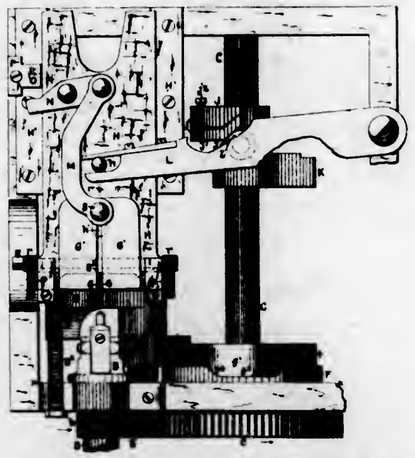
5. The combination, with rigid and pivoted vanes, the rigid vanes being secured in radial arms and the hinged vanes being secured to the said rigid vanes, of governor-rods having adjustable weights secured thereto, each governor-rod being connected to and adapted to operate two hinged vanes, and springs secured to said arms, against which the said hinged vanes are adapted to abut, substantially as set forth.

6. The combination, with rigid and hinged vanes, the said rigid vanes being secured in three sets of radial arms, and the hinged vanes being provided with braces on their concave and convex surfaces, and an arm running below and parallel to the lower arm of the middle set, between which two pulleys are secured, of governor-rods provided with adjustable weights, each rod having two chains secured thereto, one chain adapted to pass around one pulley and through one vane to the vane preceding and the other chain adapted to pass around the pulley and return to the hinged vane nearest to the governor-rod, substantially as set forth.

7. The combination, with rigid and hinged vanes secured together by suitable hinges, of governor-rods having chains secured thereto, which latter are connected to the said hinged vanes through the intervention of suitable springs, substantially as set forth.

8. The combination, with a standard having a lever pivoted thereto, one end of the said lever resting over the wind-wheel and provided with a bail and swiveled ring and the opposite end provided with a hand-rope, of a wind-wheel having rigid and hinged vanes, governor-rods and suitable chains for controlling the speed of the machine, and chains and rods for connecting the said governor-rods to the said swiveled ring, substantially as set forth.

252,948. CHUCK FOR SCREW-MACHINES. HORACE K. JONES, Hartford, Conn. Filed June 15, 1881. (No model.)



Claim.—1. The combination, substantially as described, of lever-acting jaws adapted to hold a screw-blank, a sliding wedge-block or equivalent means for causing the jaws to close upon the blank, a toggle-jointed lever for giving a to-and-fro movement to said block, and a link pivoted at one end to the knuckle of the toggle-lever and at the other end to a sliding sleeve on the jaw-spindle, whereby a powerful gripe can be given to the blanks by a small movement of the sliding sleeve, as specified.

2. The combination, substantially as described, of clamping-jaws, a sliding wedge-block or equivalent means for causing the jaws to close upon and gripe the blank, and a supplemental sliding block carried upon the wedge-block and operated by the movement thereof to clamp against the head of the blank after the closing of the jaws, whereby a positive pressure is applied to the head of the screw-blank to clamp it in the jaws.

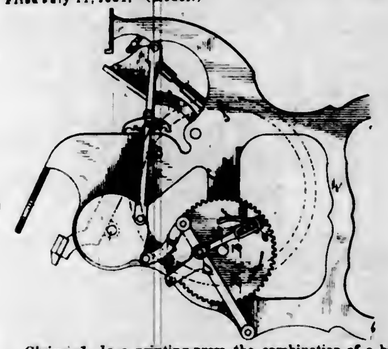
3. The combination, substantially as described, of clamping-jaws, a sliding wedge-block or equivalent means for causing the jaws to close upon the blank, suitable mechanism for working the said wedge-block, a yielding seat, H J, for the same, and a supplemental sliding block, M, operated by the movement of the wedge-block, whereby a direct but yielding pressure can be exerted on the head of the blank to clamp it in the jaws.

4. The combination, substantially as specified, of the lever-acting clamping-jaws, the sliding wedge-block for closing said jaws, and the spring-acting supplemental sliding block mounted in and moving with said wedge-block, whereby said supplemental block serves, with the jaws as a clamping device, as an ejector of the finished screw, and also to open the jaws for the reception of a blank.

252,949. METAL-SCREW MACHINE. HORACE K. JONES, Hartford, assignor to the Russell & Erwin Manufacturing Company, New Britain, Conn. Filed June 20, 1881. (Model.)

Claim.—1. The combination, substantially as hereinbefore described, with a revolving jaw-spindle for holding screw-blanks and threading-dies which move to and from said jaws in alignment with the spindle-axis, of the vibrating centering and pointing tool, and the mechanism, substantially as described, for placing said tool into and away from the plane of the axis of the jaw-spindle and for advancing and retiring said tool in said plane, as set forth.

2. The combination of a revolving jaw-spindle adapted to hold a blank, a pointing-tool, as described, a cam for depressing said tool and moving it rearwardly, and a spring or equivalent for lifting said tool into alignment with the axis of the jaw-spindle and bringing said tool into engagement with the blank and causing the tool to point the blank under a yielding pressure, substantially as set forth.



3. The combination, substantially as described, of a sliding carriage having a pair of threading-dies pivoted thereto, but capable of a longitudinal movement independently of the movement of the carriage, and mechanism, substantially as described, for giving a rearward movement to the carriage just before the threading of the blank is completed, so as to enable the threading-dies to open and be clear of the threaded blank.

4. The combination, substantially as described, of a sliding carriage having a pair of threading-dies pivoted thereto, but capable of a longitudinal movement independently of the movement of the carriage, suitable mechanism for giving a rearward movement to both the carriage and the threading-dies, and means, as described, for causing the threading-dies to be moved independently of the carriage, so that they may be closed and locked preparatory to the ensuing advancing movement of the carriage to thread the succeeding blank.

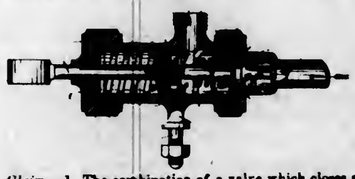
5. The combination of a sliding carriage, H, a pair of die-holders, G G', pivoted thereto, but capable of an independent longitudinal movement thereon, the said holders having a portion, g', of their sides flat, and a portion, g^2, recessed and inclined, and adjustable locking-screws P P', substantially as described.

6. In an open-die screw-threading machine, the combination, with the longitudinally-reciprocating die-holders having wedge-shaped or inclined sides, of right and left hand adjusting-screws, which are advanced and retired for contact with the sides of the die-holders, thereby gaging the approach of said dies toward each other, and a toothed pinion-shaft engaging with toothed heads upon said adjusting-screws for rotating them simultaneously, substantially as set forth.

252,950. PRINTING-PRESS. JOHN M. JONES, Palmyra, N. Y. Filed July 11, 1881. (Model.)

Claim.—1. In a printing-press, the combination of a bed, a vibrating platen, a pivoted arm connected with said platen, a rotating wheel provided with a crank-pin, and a pitman connected with the pivoted arm and slotted to receive the crank-pin and to permit a limited movement of the pin longitudinally of said slot, substantially as and for the purpose set forth.

2. In combination with a continuously-rotating wheel provided with a crank-pin, and with a cam having a part of its bearing-face concentric with the wheel, a pivoted arm provided with a roller to rest upon said cam, and having attached to it a pitman, the lower end of which is slotted to receive and to permit a limited play of the pin.



3. In combination with the vibrating arm J, connected with the platen, the cam e, constructed as described, whereby it is caused to effect a gradual fall and rise of the arm, and to hold the same at rest for a period between the fall and rise.

4. In a printing-press, the combination of a continuously-rotating wheel provided with a crank-pin, and with a cam the middle portion of which is concentric with the wheel, while the end portions curve outward therefrom, a pivoted arm connected with the platen and provided with a roller to travel upon the cam, and a pitman connected with the pivoted arm and slotted to receive and to permit a limited play of the crank-pin.

5. In a printing-press, the combination of a pivoted arm connected with the platen, a continuously-rotating wheel provided with a crank-pin, a pitman connected with the vibrating arm and slotted to receive the crank-pin and to permit a limited play thereof, and a cam, *f*, formed upon or secured to the wheel and adapted to start the pitman forward, substantially as described.

6. The herein-described press, consisting of a bed, a vibrating platen, links or bars connecting the platen with disks secured upon a rock-shaft, a vibrating arm connected with one of said disks and provided with a roller, a continuously-rotating wheel provided with a cam, e, and pin M, and a pitman connected with the vibrating arm and slotted to receive and to permit a limited play of the pin, substantially as set forth.

252,951. VALVE FOR WATER-PIPES. WILLIAM KAISER, Wilkes-Barré, Pa. Filed July 13, 1881. (No model.)

Claim.—1. The combination of a valve which closes against the flow of the liquid, means to hold the valve normally to its seat, except when the pressure of liquid is on, and an independently-movable stem, which abuts against the valve and is adapted to hold it rigidly to its seat, as set forth.

2. The combination of a valve which closes against the flow of the liquid, means to hold the valve normally to its seat, except when the pressure of liquid is on, an independently-movable stem, which abuts against the valve, and means to exert sufficient pressure to close the valve to its seat against the flow of water, as set forth.

3. In a water-closet or urinal, the combination of a water-supply valve and a check-valve detached therefrom, which closes to its seat against the flow of water and is opened solely by the current when the supply-valve is opened, whereby, if there is no current in the main supply-pipe, the check-valve will remain closed upon opening the supply-valve and prevent back-flow into the main pipe of soiled water or filth, as set forth.

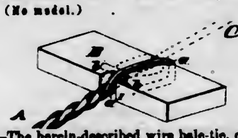
252,952. PILLOW-SHAM HOLDER. JOSEPH J. KELSEY, Detroit, Mich. Filed Oct. 12, 1881. (No model.)

Claim.—1. In a pillow-sham holder, the adjustable spring-bows applied upon the two-part holding-rod, and provided with the flexible adjusting-cord, substantially as and for the purposes set forth.

2. The herein-described holding-rod of a pillow-sham holder, the same being made in two parts, each part slotted, as explained, and each part provided with a set-screw passing through the slot in the other part, the whole combined and arranged substantially as shown and described.

3. In combination with the turning-rod of a pillow-sham holder, the flexible tapes or strips secured thereon, to which strips the pillow-shams may be pinned, substantially in the manner and for the purposes set forth.

4. The rod A, hinged upon brackets B, which latter are provided with holding-springs, substantially as explained, so that when the rod is turned up the shams will be held in elevated position, substantially as shown and described.



5. The combination of the brackets, the holding-rod hinged thereon, and the adjustable spring-bows, substantially as shown and described.

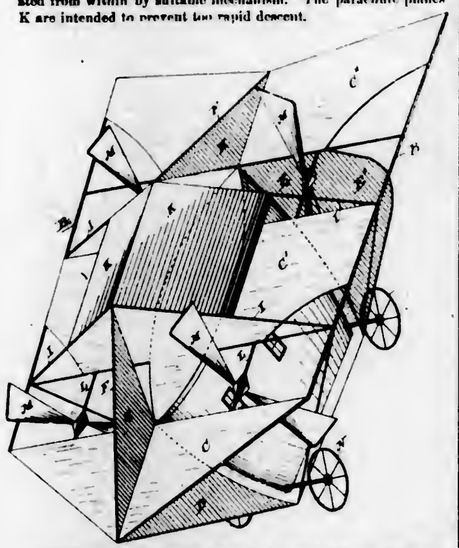
6. The combination of the brackets, the two-part adjustable holding-rod hinged thereto and turning thereon, the adjustable spring-bows, and the flexible strips or tapes for holding the shams, substantially as shown and described.

7. In combination with the turning-rod of a pillow-sham holder, the spring-bows applied thereon, said bows being joined at the ends by an adjusting-cord, and provided with a central supporting-piece, substantially as shown and described.

8. The herein-described improved pillow-sham holder, composed of the adjustable rod hinged upon the side brackets, the spring-bows connected with said rod and provided with adjusting cords, the flexible strips upon the rod for attachment of the shams, and the brackets provided with springs to operate against suitable stops on the rod, the whole arranged and combined to operate substantially as and for the purposes herein set forth.

252,953. BALE-TIE. WILLIAM H. KING, St. Louis, Mo., assignor of one-half to Thos. W. Pitch, same place. Filed Aug. 26, 1881. (No model.)

Claim.—The herein-described wire bale-tie, consisting of the looped end A, the cross-piece B, and the end C, said cross-piece having the shoulders *b b*, and being held rigidly in the loop *a*, and said end being, when the tie is formed, carried around the neck of the loop, the cross-piece, and main portion of the wire, substantially as described.



252,954. FURNITURE-CASTER. WLADYSLAW T. KOSINSKI, Brooklyn, N. Y. Filed Aug. 7, 1880. (No model.)

Claim.—In combination with the supports of an article of furniture, the cap D' and hood C', secured to the cylinders D and C, the said cylinders being slotted or split at their extremities and adapted to spring and bind upon the supports, substantially as specified.

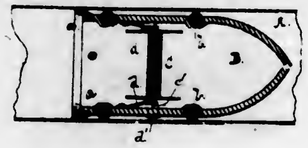
252,955. AIR-SHIP. WILLIAM G. KRUDER, St. Louis, Mo. Filed Jan. 5, 1882. (No model.)

Brief.—The vessel A, having light flexible planes extending horizontally and vertically on all sides, governed from within by means of ropes, is propelled by flexible wheels or propellers operated from within by suitable mechanism. The parachute planes K are intended to prevent too rapid descent.

Claim.—1. An air-ship having an extended frame, B, having sectional horizontal planes C C' C'', in combination with vertical adjustable planes at bow and stern, and a central brace, F, provided with flexible inclined planes to act as a parachute, all substantially as shown and specified.

2. An air-ship having an extended frame, B, provided with horizontal planes C C' C'', vertical planes D E, a longitudinal brace extending over the entire vessel, to which the parachute planes K are attached, and two or more propellers, arranged substantially as and for the purpose set forth.

3. An air-ship having an extended frame, B, provided with horizontal planes C C' C'', in combination with vertical planes D E, brace F, vertical adjustable planes G H, and propellers M, all arranged substantially as specified.



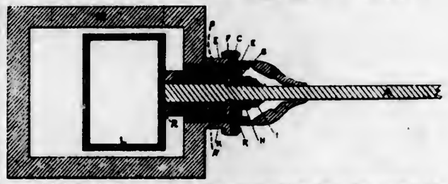
4. An air-ship having an extended frame, B, horizontal planes C C' C'', vertical planes D E, longitudinal brace F, parachute planes K, made extensible, and four (more or less) propellers, all arranged for operation substantially as described.

5. An air-ship having an extended frame, B, horizontal planes C C' C'', vertical planes D E, brace F, vertical planes G H, parachute planes K, propellers M, and suitable driving mechanism, all substantially as shown and specified.

6. An air-ship having an extended frame, B, horizontal adjustable planes C C' C'', vertical planes D E, brace F, vertical planes G H, parachute planes K, propellers M, and the wheels N, as and for the purpose herein set forth.

252,956. LAYING SUBTERRANEAN CONDUCTORS. HENRY E. LEARN, Baltimore, Md. Filed Nov. 10, 1881. (No model.)

Brief.—A projectile having rollers is adapted to fit air-tight in a tube, and is provided with an expanding-flange and a reel for a pilot-wire.



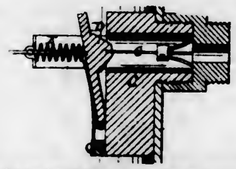
Claim.—1. In a device for laying conductors under ground, a projectile adapted to fit substantially air-tight in the tube, and provided with a reel for the pilot-wire, as set forth.

2. The projectile B, having rollers *b* and expanding-flange *g*, in combination with the reel C and wire *c*.

3. In combination with the pipe A and receiver E, connected therewith, the projectile B and wire *c*, as set forth.

252,957. PACKING VALVE-STEMS FOR STEAM AND OTHER ENGINES. ABRAM N. MATTHEWS, Norwood, Mass., assignor to the Matthews Steam Spring Packing Company, Nashua, N. H., and Boston, Mass. Filed July 20, 1881. (No model.)

Claim.—1. The combination, in packing for valve-stems, of the stem A, a detachable thimble, D, nearly filling the cylinder and abutting against the yoke at end B and against the riding-ring at end P, the latter serving the purpose of the usual follower, and the packing rings K E, all constructed and arranged to operate in the cylindrical projection of the steam-chest N in the manner shown and described.



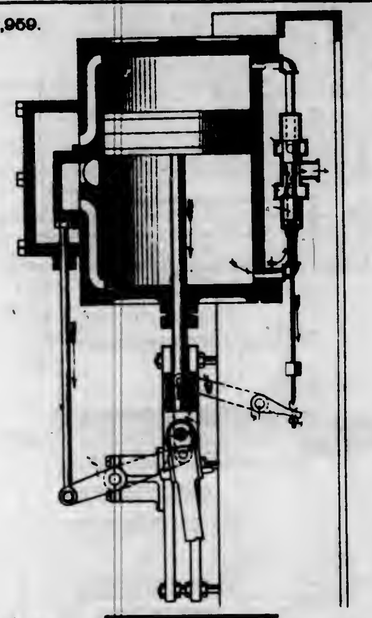
2. The combination, with the steam-chest provided with the cylindrical projection N, of the guide-thimble D, one end of which forms the follower, the other end projecting into and beyond the walls of said chest, thereby lessening the resistance of the steam-pressure, a riding-ring, F, provided with the usual follower, by which a double recess is formed between said follower and thimble for the reception of the packing-rings, and the valve-stem and gland, all arranged to operate as shown and described.

3. The combination, with the steam-chest and the cylindrical projection N, of a detachable cylindrical cover or dust-cap, B, one end fitting with steam-tight joint on the cylindrical projection N at C and the other end split in several places and provided with a thread and nut, enabling the stem to be firmly held from operating as necessity may require, an oil-cup on the upper side passing through the cylindrical cover B, and a waste or water pipe on the under side of the cylindrical cover, all arranged to operate as shown and described.

4. The combination, in valve-stem or piston-rod packing, of the working-cylinder C, thimble D, and the metallic packing, constructed and arranged to operate in the manner shown and described.

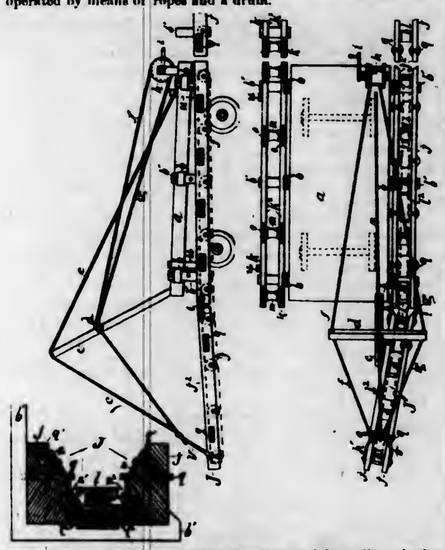
5. The combination, in valve-stem or piston-rod packing, of the cylinder C, thimble D, and the metallic packing, said cylinder having on its outer end a screw for the reception of the dust cap, and its inner edge adapted to fit the gland of a stuffing-box in the manner shown and described.

252,958. ATTACHMENT TO STEAM-BOILERS. PATRICK F. MCDONNELL, Clarksburg, W. Va. Filed Sept. 30, 1881. (No model.)



Claim.—As an improvement in steam-boilers the valve D, provided with one or more springs for closing the same, and being held permanently open by means of rod G, which is liable to be released in case of accident, substantially as set forth.

252,959. CYLINDER DRAIN-COCK. JOHN B. MOONEY, Cincinnati, Ohio, assignor to Edward P. Bradford and Thornhill E. Mooney, both of same place. Filed Aug. 15, 1881. (No model.)



Claim.—The combination of the moving parts of the cylinder drain-cocks with a moving part of the engine, substantially as described, whereby the opening and closing movements of the said cocks are coincident with the opening and closing of the exhaust of the engine, as set forth.

252,959.

252,960. MACHINERY FOR LAYING RAILWAY-TRACKS. DAILY S. MOORE, Chicago, Ill., assignor of two-thirds to Francis T. Sherman and Rhea J. Marsh, both of same place. Filed Nov. 22, 1881. (No model.)

Brief.—Cars are provided with ways having rollers and parallel endless chains connected by bars and a roller provided with spurs. At the forward end is a vertically-adjustable and laterally-swinging frame supported by struts provided with a cross-bar and operated by means of ropes and a drum.

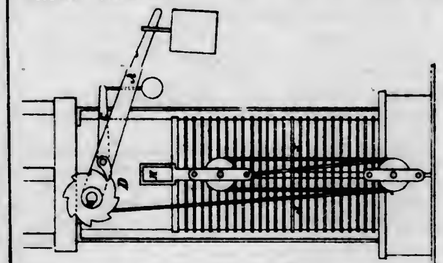
Claim.—1. The vertically-adjustable and laterally-swinging frame or ways J and strut e, provided with cross-bar *d*, in combination with the drum *h* and ropes *f* and *g*, arranged to operate substantially as described.

2. The rails *j*, provided with rollers *g*, in combination with the plates *s*, provided with rollers F, roller *l*, and stops *s'* and *s''*, substantially as specified.

3. The adjustable frame k^2, provided with box *n*, carrying rollers r, and concave roller *m*, in combination with the adjustable hanger *b'*, substantially as specified.

4. The adjustable hanger *b'*, frame k^2, provided with box *n*, carrying rollers *r*, and concave roller *m*, in combination with the strap *o*, substantially as and for the purpose specified.

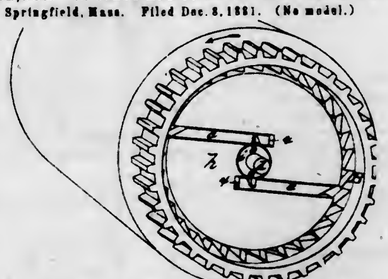
5. The adjustable hanger *b'*, frame k^2, provided with stakes *n*, box *n*, carrying rollers *r*, and concave roller *m*, in combination with the straps *o*, substantially as specified.



6. The beveled rails *j*, provided with rollers *g*, in combination with the plates *s*, provided with rollers F and *l*, and stops *s'* and s^2, substantially as and for the purpose specified.

7. In combination with a series of cars, *a*, provided with ways k^2 and j^2, having rollers *m* and *l*, the parallel endless chains F^2, provided with bars f^2, roller *l*, provided with spurs F^2, and pulleys a^2 a^4, shaft B, drum d^2, clutch d^3, rope d^4, and claw d^5, all constructed and arranged to operate substantially as specified.

8. In combination with a series of cars, *a*, provided with frames or ways k^2 and j^2, having rollers *m* and *l*, parallel endless chains F^2, provided with bars f^2, roller *l*, provided with spurs F^2, pulleys a^2 a^4, and shaft B, the horizontally and vertically adjustable swinging-frame J, provided with rollers *l*, constructed and arranged to operate substantially as specified.



9. A flat car provided on its sides with vertically-adjustable ways provided with rollers, in combination with ways extending beyond the front of the car, said ways together provided with an endless carrier and the car with apparatus for operating said carrier and projecting ways, substantially as specified.

252,961. PRESS. ROBERT NEILL, Chicago, Ill. Filed Apr. 1, 1881. (No model.)

Claim.—The combination of the adjustable weighted lever A, pawl C, ratchet-wheel D, drums E, pulley-blocks F, and ropes, substantially as herein shown and described, and for the purpose specified.

252,962. RATCHET-AND-PAWL DEVICE. JOS. S. O'BRIEN, Springfield, Mass. Filed Dec. 8, 1881. (No model.)

Claim.—The within-described improved ratchet-and-pawl device, consisting of the shaft *d*, having the pins *o o* therein, the pawls *c c*, notched to receive said pins, the disk *h*, grooved to receive said pawls in the face thereof, and the ratchet-ring B, all combined and operating substantially as set forth.

252,963. TEA-KETTLE. HENRY L. PALMER, Brooklyn, N. Y. Filed Nov. 2, 1881. (No model.)

Claim.—1. In a tea-kettle, the ear A, extending from the breast down upon the shell of the kettle, the same being arranged to be riveted or otherwise secured to the breast and shell, and to sustain the hinged handle, substantially as shown and described.

2. In a tea-kettle, the shell made flaring toward its top, and

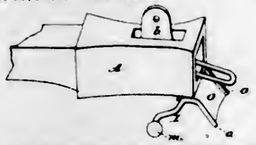
252,963.

provided with a projecting seat for the spout formed of the material of the shell, said shell being constructed, substantially as described, so that another shell of similar construction may be nested with it and fitted for the attachment of a breast, substantially as and for the purposes set forth.

3. In combination with a shell of a tea-kettle, a sleeve for attachment of the spout formed of the material of the shell and the surrounding gutter for the reception of the solder, substantially as shown and described.

4. The tea-kettle shell, the projecting sleeve for holding the spout, made continuous with the material of the shell and the spout, combined and arranged substantially as shown and described.

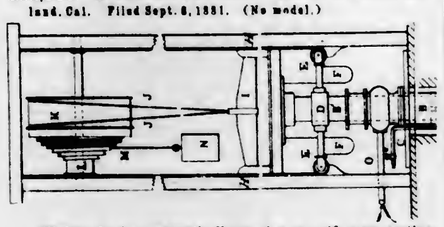
5. The tea-kettle shell having the bottom secured thereon, and having a seat for the spout formed of the material of the shell and a seat for the breast, the shell being constructed to be united with spout, breast, and handle, substantially as shown and described.



6. The herein-described partly-finished tea-kettle, composed of a shell having inclined walls and an attached bottom, a separate breast-piece, handle, and spout, all constructed to be subsequently united, substantially as shown and described.

7. The herein-described tea-kettle, in which the shell is provided with an extra coating of metal at the region of the joint with the copper bottom for the purpose of preventing corrosion, substantially as and for the purposes set forth.

252,964. ART OF PRODUCING PHOTOGRAPHIC NEGATIVES. ABEL PECK, Newburg, N. Y. Filed Feb. 17, 1881. (No specimens.)

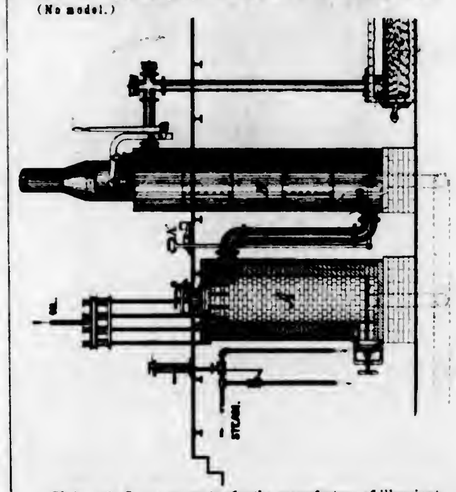


Claim.—In the art of producing film negatives, the herein-described process of submerging a properly-prepared glass negative, coated side uppermost, in a shallow dish or pan of water and floating upon the water a sheet of gelatine or its equivalent until it becomes saturated, sinks, and adheres to the glass plate, after which it is dried under pressure and finally removed from the glass plate, substantially as set forth.

252,965. CAR-COUPLING. SOLON A. PERRY, Beloit, Kans. Filed June 10, 1881. (No model.)

Claim.—In a car-coupling, the draw-head A, having the upper recess, *a*, inclined, as shown, the rear groove, *c*, and lower concave, *g*, in combination with the pivoted guide-plate O, having flanged *o*, and weighted lever I *m*, and the coupling-pin *b*, having cam-projection *d* and beveled or rounded point *g'*, substantially as specified.

252,966. HYDRAULIC ELEVATOR. GEORGE L. PIERCE, Oakland, Cal. Filed Sept. 6, 1881. (No model.)



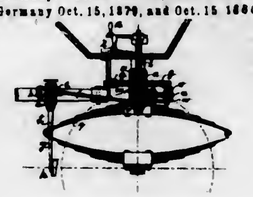
Claim.—1. An automatically-varying or self-compensating counterpoise, in combination with a hydraulic elevator having a platform or cage resting upon, secured to, and operated by a vertical ram.

2. A hydraulic elevator having a platform or cage resting upon, secured to, and operated by a vertical ram, in combination with the ropes T J, drum K, fusee L, ropes M, and weight N, substantially as and for the purpose described.

3. A hydraulic elevator having a platform or cage resting on, secured to, and operated by a vertical ram, in combination with a device for blowing out sediment from the cylinder containing the ram.

4. The ram B, operated by hydraulic pressure, in combination with the guide D and lines F F, substantially as and for the purpose specified.

252,967. APPARATUS FOR THE MANUFACTURE OF GAS. JAMES S. PIERSON, Plainfield, N. J., assignor to American Gas Fuel and Light Company, New York, N. Y. Filed Mar. 5, 1881. (No model.)

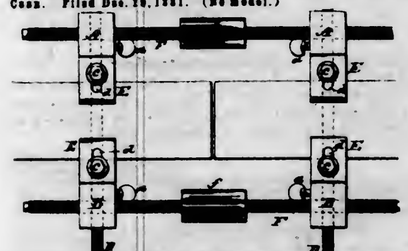


Claim.—1. In an apparatus for the manufacture of illuminating or heating gas, the combination, with the superheater, of a valve-seat that is slightly bell-mouthed, a flat valve to rest upon such seat and close the superheater, a lever for lifting and moving the valve, a swiveled pivot for the lever, and the brackets for supporting the valve when the superheater is uncovered, substantially as set forth.

2. In an apparatus for manufacturing illuminating or heating gas, the combination, with the generator, of the frame *i*, permanently connected to the same, the removable frame *l*, lugs in the corners of the respective parts, and bolts *m*, the door *n*, secured by hinges *o* to the frame *l*, and having a projection, *p*, and the swinging yoke *q*, pivoted to the back frame, *i*, and the clamping-screw *r*, as set forth.

3. In an apparatus for the manufacture of illuminating and heating gas, the combination, with the generator or superheater and the air and steam valves, of a rod and handle for operating the valves and the clamping device for the rod, constructed and operating substantially as and for the purposes set forth.

4. In an apparatus for the manufacture of illuminating and heating gas, an oil or naphtha valve supply vessel composed of the case *a'*, base *b'*, bolted together, and provided with the glass cylinders *c'*, and cocks or valves *g'*, and inlet and outlet pipes, the whole constructed and operating substantially in the manner and for the purposes set forth.



252,968. HORSE-DETACHER. AUGUST PLÖNZAY, Lippehne, Prussia, Germany. Filed Oct. 11, 1881. (No model.) Patented in Germany Oct. 15, 1879, and Oct. 15 1880.

Claim.—1. For detaching runaway horses from the carriage the described hooks *b*, set free by drawing back the slide *c* by means of a combination of devices comprising the crank *h*, or its equivalent, shaft *l*, bevel-gearing *r s*, screw *u*, cross-head *v*, bell-crank lever *w*, and connecting-rods *f*, arranged and working as shown and described.

2. The brake-shoes *h*, attached to the forked lever *y i*, and connected by the bar *g* to the bell-crank lever *w*, and actuated by the movement of the crank *h*, or its equivalent, in combination with trace-detaching mechanism connected to said crank *h*, substantially as shown and described.

252,969. BELT-TIGHTENER. JOSEPH PEARCE, New Haven, Conn. Filed Dec. 20, 1881. (No model.)

Claim.—1. In a belt-tightener, the combination, with the blocks A B, carrying stationary and movable jaws *b* K, of the rods D and right-and-left-handed screw-rods F, said rods passing through the blocks at right angles to each other, and constructed to operate substantially as and for the purpose set forth.

2. In a belt-tightener, the combination, with the right-and-left-screw-threaded rods F and rods D, of the blocks A B, formed with jaws *b*, and carrying the adjustable and reversible jaws E, having offset *g*, substantially as and for the purpose specified.

3. In a belt-tightener, the combination, with the lower jaw, *b*, of the upper jaw, E, constructed substantially as shown and described, and for the purpose set forth.

252,970. ROLLER-SKATE. GEORGE H. PRICE and GEORGE W SMITH, Philadelphia, Pa. Filed Nov. 10, 1881. (No model.)

Claim.—1. In a roller-skate, the combination of the frame A, carrying the parallel plates or projections C', provided with parallel oblique slots C', open on the bottom, spring G, perpendicularly arranged above the axle, hub D, axle E, loose sleeves F, and wheels or rollers B, substantially as and for the purpose specified.

2. In a roller-skate, the plate C, having projections C', arranged parallel to each other, and provided with parallel slots C', arranged obliquely thereon and open on the bottom, said plate being further provided with an aperture, C', to support the rubber-spring cushion, substantially as shown.

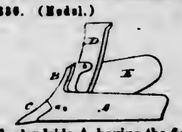
3. In a roller-skate, the combination of the frame A, plates C, having projections C', furnished with oblique parallel slots C', open on the bottom, spring G, hub D, axle E, rollers B, and band H, substantially as and for the purpose specified.

4. In a roller-skate, the combination of the frame A, plates C, having projections C', furnished with oblique parallel slots C', open on the bottom, springs G, hub D, axle E, loose sleeves F, rollers B, and band H, substantially as and for the purpose specified.

252,971. BICYCLE-SADDLE. AUGUST RIETZELMAN, Milwaukee, Wis. Filed Oct. 25, 1881. (No model.)

Claim.—1. A bicycle-saddle having a frame of cast metal, to the rear end of which the rear portion of the seat is secured, and over the front end of which the tongue of the seat is drawn by a turn-buckle anchored in the lower portion of the frame, as set forth.

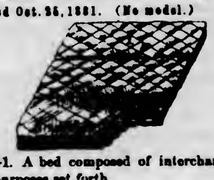
2. The seat having a tongue or strap, in combination with the frame having a groove, B', and a turn-buckle anchored in the frame, as set forth.



3. The combination of seat B, having strap *a*, frame having groove B', and anchor-plate F with a turn-buckle, *b c c'*, as set forth.

252,971.

4. The combination of frame A, having flange A', and the seat having plate *a* secured thereto, with a device for drawing the seat tight over the front of the frame, as set forth.

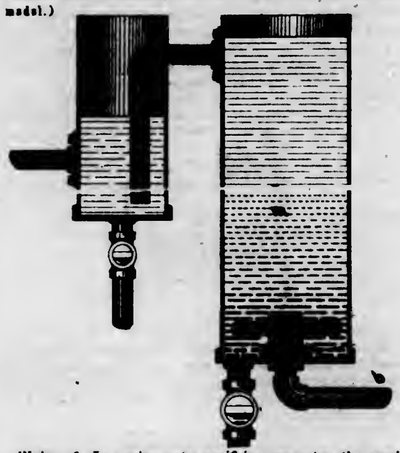


252,972. PLOW. NEWELL SANDERS, Chattanooga, Tenn. Filed Oct. 8, 1880. (Model.)

Claim.—1. The landside A, having the forward notch, *a*, and the upward extension, B, the latter having a sharp cutting-edge, and curved to be flush with the mold-board and share, and provided with the ear *b*, substantially as shown and described.

2. The landside A and colter-extension B, as described, formed in one piece, in combination with the mold-board E, share C, and standard D, substantially as shown and described.

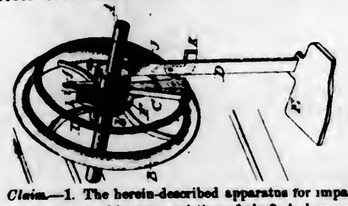
252,973. SPRING-MATTRESS. ADAM SCHERR, Milwaukee, Wis. Filed Oct. 26, 1881. (No model.)



Claim.—1. A bed composed of interchangeable sections, as and for the purposes set forth.

2. A bed composed of interchangeable sections of equal dimensions, as set forth.

3. The combination, in a spring-bed, of sections 1, 2, and 3, arranged as shown, and adapted to be interchanged in position at will, whereby the wear will be distributed equally upon all portions of the mattress.



252,974. APPARATUS FOR PURIFYING MINE-WATER. THOMAS SHAW, Philadelphia, Pa. Filed Nov. 15, 1881. (No model.)

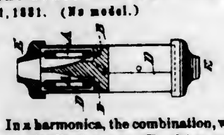
Claim.—1. In a mine-water-purifying apparatus, the combination of a vertical tank, an inlet-pipe communicating with the lower end, and an agitator arranged near the lower end, substantially as and for the purpose set forth.

2. In a mine-water-purifying apparatus, upright subsiding-tank, in combination with injecting-pipe *b*, entering the bottom of said tank, and provided with a device for admitting and circulating the water, substantially as set forth.

252,975. FRICTION-CLUTCH. JNO. SMITH, Horicon, Wis., assignor of one-half to John Little, same place. Filed Dec. 26, 1881. (No model.)

Claim.—1. The herein-described apparatus for imparting rotary motion to machinery, consisting of shaft A, loose wheel B, provided with hub or boss *b*, collar F, band G, lever H, slotted arm C, provided with hub *a*, strap D, and treadle or lever E

2. In combination with a loose wheel having a projecting hub or boss, a collar mounted upon said hub and provided with a flexible band, a lever pivoted to said collar and connected with one end of said band, and a swinging arm or block mounted upon the shaft and adapted to move said lever, substantially in the manner set forth.



3. In combination with the wheel A, band G, lever H, and arm C, a flexible band or strap, D, treadle or lever E, and spring F, substantially as set forth.

4. In combination with the friction-band G and lever H, spring I, coiled about a circular core, J, as shown, whereby the use of a long elastic spring is permitted.

5. In combination with the friction-band and its lever H, the arm or block C, the circular core or rod J, guide K, and spring I, coiled about core J, as shown and described.

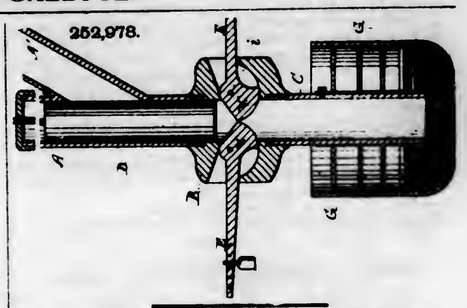
6. In combination with the wheel A and friction-band G, the lever H and eccentric pinions *h i*, the former mounted in slotted bearings and the latter provided with an arm, H', substantially as shown.

252,976. HARMONICA. OTTO SPARTEN, Gera, Germany. Filed June 21, 1881. (No model.)

Claim.—1. In a harmonica, the combination, with the wooden frame C, having longitudinal grooves B, of tongue-plates A, case D, and retaining mouth-piece E, constructed and arranged substantially as and for the purpose set forth.

2. As an improvement in harmonicas, the combination of a wooden frame or body, C, having longitudinal grooves B, tongue-plates A A, case D, made of one continuous piece of metal, and a mouth-piece, E, having a base-rim, *e*, substantially as described.

252,977. MECHANICAL MUSICAL INSTRUMENT. OTTO SPARTEN, Gera, Germany. Filed June 21, 1881. (No model.)



Claim.—In a mechanical musical instrument or melophone, the combination, with the wind-chest *m*, having openings *o* and intermediate narrower slots, *p*, of a supporting-rail C, spring-actuated levers D, having noses *d*, and bells F, substantially as and for the purpose set forth.

252,978. APPARATUS FOR AMALGAMATING ORES. CHAS. H. SWAIN, New York, N. Y. Filed Dec. 8, 1881. (No model.)

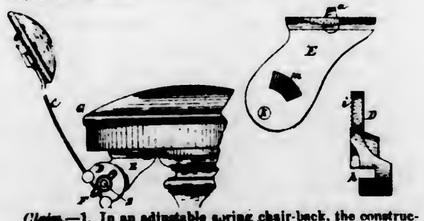
Claim.—In combination with vessel containing molten lead the cylinder A, feeding-hopper A', extension-cylinder C, piston-head D, valve-arms E, controlling-valves V, pivot-pin I, and annulus G, having radial distributing-arms H, substantially as described, and for the purposes set forth.

252,978.

252,979. ART OF SHARPENING FILES AND OTHER SIMILARLY-TOOTHED TOOLS. BENJAMIN C. TILGHMAN and JEREMIAH E. MATHEWSON, Philadelphia, Pa.; said Mathewson assignor to said Tilghman. Filed May 18, 1879.

Claim.—1. In the method of sharpening files described, the employment of one or more interior steam-jets, combined with an exterior supply of fluid mud or fine sand mixed with water, applied to the sharpening of files, substantially as described.

2. In an apparatus for producing a wide and thin sand-blast, one or more thin apertures in the same plane, or preferably a row of small holes having intervals between them for introducing the steam.



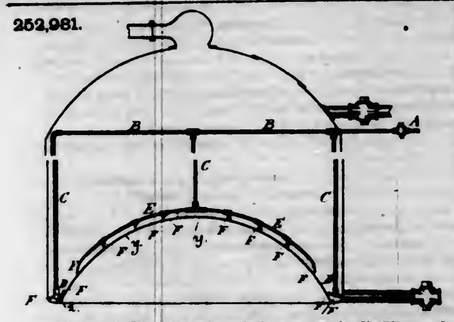
3. The improved method of sharpening the teeth of files, wherein the formation of grooves is avoided, by presenting the sand-blast at an acute angle sidewise to the longitudinal axis of the file, and at the same time at an acute angle to the horizontal plane of the teeth thereof, substantially as specified.

4. In sharpening files by the sand-blast, the method of sharpening two adjacent sides simultaneously, which consists in presenting the file to a thin sand-blast of a width greater than that of the file and at the angle, substantially as described.

5. A feeler to test the progress of the sharpening during the operation.

6. The combination of a conical mud-vessel with the suction-pipe of a sand-blast apparatus.

252,980. CHAIR-BACK. MAX TOCH and GEORGE H. HOWE, Chicago, Ill.; said Howe assignor to said Toch. Filed Apr. 11, 1881. (Model.)



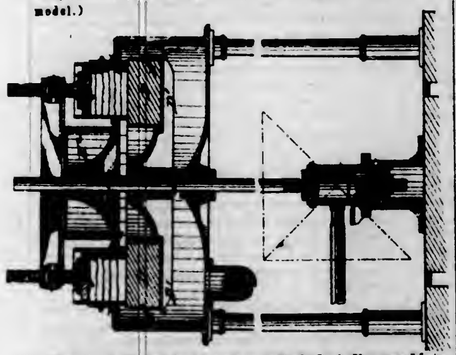
Claim.—1. In an adjustable spring chair-back, the construction hereinbefore shown, consisting of the arrangement, in combination, of the standard E, the bolt S, the clamping-plates D D, and the flat spring C, whereby the spring C is held by its edges and its flat side presented toward the direction of angular adjustment, substantially as shown, and for the purposes described.

2. In an adjustable chair-back, the combination of the spring C, the standard E, provided with the serrated sector *m*, the clamping-plates D D, provided with the grooves *h* and serrated sector *i*, the bolt S, and thumb-nut F, substantially as shown, and for the purposes described.

252,981. DISTILLATION OF COAL-TAR. GEO. C. TREWBY and HENRY W. FRESHA, Beckton, County of Essex, England. Filed Apr. 6, 1881. (No model.) Patented in England Sept. 9, 1879.

252,981.

Claim.—1. The within-described apparatus for distilling coal-tar, consisting of the main steam-pipe B, with its controlling-cock A, small branch pipes C, ring D, lesser branches E, and outlets or jets F, in conjunction with a suitable form of still-bottom, substantially as shown and described.



2. The still for distilling coal-tar, constructed with the outer surface of its bottom concave, and provided with a steam-pipe having the ring D and central pipe with branches E, this ring and the branches having numerous small outlet-pipes inclined respectively to the gutter and to the convex inner surface of the bottom of the still, for minutely subdividing the steam and causing it to strike the crown of the still-bottom and its gutter, as and for the purposes set forth.

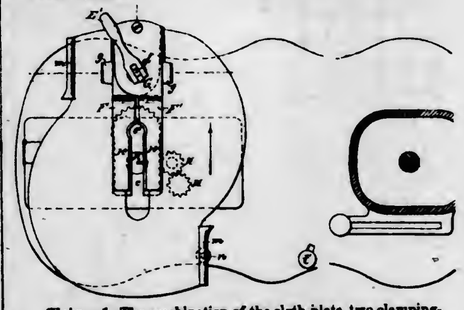
252,982. MANUFACTURE OF SOLUBLE ALUMINA. JAMES WEBSTER, Saltbull, County of Warwick, England. Filed July 25, 1881. (No specimens.) Patented in England June 14, 1881.

Claim.—1. The process of making soluble alumina, consisting in the following steps: first, roasting a mixture of aluminous material with carbonaceous matter; second, treating the compound with dilute acid and allowing it to give off sulphureted hydrogen; third, passing through the compound while heated a jet of steam and air to carry off sulphur and other substances; finally, boiling the residuum and drawing the liquid off after cooling, thus leaving the soluble alumina behind as a precipitate, substantially as set forth.

2. In a process for producing soluble alumina from the alum of commerce and carbonaceous matter, the following steps for reclaiming a by-product: first, treating the above compound with dilute hydrochloric acid; second, subjecting it under heat in a closed vessel to the action of a jet of steam and air, which will carry off the hydrochloric acid slightly tainted by sulphur and ferric sulphide; and, finally, condensing this vapor into liquid form for use in the manufacture of colors and for other purposes.

252,983. MANUFACTURE OF WOOD PULP. GUSTAV WERNER, Taisnach, Bavaria, Germany. Filed Sept. 19, 1881. (No model.)

Claim.—1. The method herein described of grinding wood into pulp, which consists in feeding the pieces of wood vertically downward upon the top surface of a horizontally-revolving grindstone and holding them in such a manner thereon that the fibers form an acute angle of inclination to the direction of motion of the grindstone, substantially as set forth.



2. The combination, with a horizontally-revolving grindstone, of an inclosing casing having circular top openings, of vertical receiving-boxes having disk-shaped flanges guided in seats of the openings, and of mechanism whereby the wood in the receiving-boxes is pressed down upon the stone, said boxes and the feed mechanism being adapted to be axially set at any angle toward the direction of motion of the grindstone, substantially as specified.

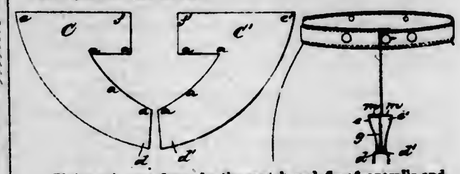
3. In an apparatus for grinding wood into pulp, a grindstone composed of a number of jointed sections, in combination with a ring-shaped supporting-frame having an exterior retaining-flange substantially as set forth.

4. In an apparatus for grinding wood into pulp, the combination of the fixed exterior casing having circular top openings, vertical receiving-boxes having exterior disk-shaped flanges guided in seats of the top openings, a horizontally-revolving grindstone below the boxes, and means for adjusting the same vertically toward the lower end of the receiving-boxes, substantially as specified.

5. In an apparatus for making wood pulp, the combination of the fixed receiving-boxes with a revolving grindstone and with means for adjusting the same vertically toward the lower end of the revolving boxes, substantially as specified.

252,984. BUTTON-HOLE SEWING-MACHINE. WILLIAM W. ABBOTT, Philadelphia, Pa., assignor to the National Sewing Machine Company, (Limited,) same place. Filed Sept. 27, 1881. (Model.)

Claim.—1. The combination of the cloth-plate, two clamping-arms, F F', pivoted to the said plate, the pin *d*, a sleeve, G, adapted to the pin and having projections for acting on the arms, with the cam-lever E', pivoted to the said pin and constructed for operating on the arms, substantially as set forth.



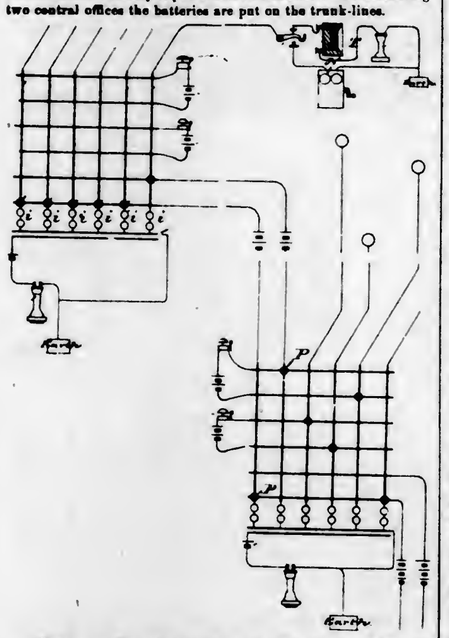
2. The combination of the cloth-plate having at its opposite edges straight parallel grooves *m m'*, open at both ends, the rack-plate, operating-gearing adapted to said plate, and a guide-pin, *n*, on the upper surface of the bed-plate or frame of the machine, all substantially as set forth.

3. The combination of the cloth-plate, its rack-plate, and a wheel gearing into the same, with a ratchet-wheel, mechanism for operating the same, and a spring-lever under the control of the operator for imparting friction to the ratchet-wheel, substantially as and for the purpose set forth.

4. The combination of the spindle J', carrying the wheel M, the ratchet-wheel K, the vibrating plate J and its pawl, with the spring-lever P, adapted for acting on the pawl, all substantially as specified.

5. The combination of the slotted cloth-holding plate having a rack-plate with opposite straight sides and segmental end, the operating-pinion therefor, ratchet mechanism connected with said pinion, and a ratchet-operating lever having a shifting fulcrum, whereby the gage of the stitches can be altered in forming the eye of the button-hole, as set forth.

252,985. OVERALLS. CHARLES ABLER, Alameda, Cal. Filed Oct. 3, 1881. (No model.)



Claim.—A re-enforce for the crotch and fly of overalls and pants, consisting of the two counterpart pieces C C', formed with the coincident edges *a a*, the end portions, *d d'* and *e e'*, and the horizontal projecting ends *f f'*, said counterpart pieces being united

along the edges *a a* and attached to the garment with the horizontal end portions, *f f'*, lapping or extended over the opposite and adjacent inside faces, B B', of the fly in the manner described, and the parts *d d'* and *e e'*, respectively, overlapping the junction of the back seam, *b*, and leg-seams *c* and the crotch, as herein shown.

252,986. TELEPHONE-EXCHANGE APPARATUS. GEORGE LEE ANDREW, London, County of Middlesex, England, assignor to the American Bell Telephone Company, Boston, Mass. Filed Aug. 8, 1881. (No model.)

Brief.—The transmitters and receivers at subscribers' stations are placed in the main line. All the battery can by this expedient be located at the central office. To render the transmitters operative a battery is placed in a loop connecting each pair of cross-bars on the central-office switch-board, so that when any two lines are connected a battery is put in circuit therewith. In connecting two central offices the batteries are put on the trunk-lines.

Claim.—1. The combination, with a series of lines emanating from a central office, and variable-resistance telephones in said lines at the subscribers' stations, of switch devices for connecting said lines with each other, and batteries connected with the said devices, substantially as described, whereby, when any two lines are connected, they are so charged with a battery-current that the variations of the resistance of one line produce variations of the current in both lines, and conversations can be carried on between subscribers on said lines with the aid of receiving-instruments, as set forth.

2. In a telephone-exchange system, the combination, substantially as hereinbefore described, of a central station or stations, a series of main lines radiating therefrom and connecting with sub-stations, switching devices, as indicated, whereby any two lines may be connected together through one or more central stations, a main battery placed at the central office in a loop connected with the switching devices, so as to be interposed in the circuit of any two lines so connected, and a transmitting-telephone at each sub-station, having its variable resistance or tension regulator directly in the circuit of said main battery, when so interposed for the purpose of varying the strength of current on the main line.

3. In a telephone-exchange system, the combination of a central station, two or more subscribers' lines radiating therefrom and connected with sub-stations, switching devices whereby any two lines may be connected together, transmitting-telephones in the main line at sub-stations, and a main battery located at the central station and brought into action only when included in the compound circuit composed of two lines connected for conversation, for the purpose of furnishing battery-power for the transmitting-telephone at each sub-station.

4. In a telephone-exchange system, the combination of a main-line circuit extending between a central station and a sub-station, a main battery located at the central station and normally on open circuit, but adapted for inclusion in the main-line circuit, and a transmitting-telephone at a sub-station, provided with a variable-resistance piece or tension-changer connected directly in the main-line circuit, the said telephone arranged to become operative only when the battery is included in the main circuit, substantially as hereinbefore described.

5. In a telephone-exchange system, the combination of a series of main lines, a series of sub-stations located thereon, a vibrating call-bell connected normally in the main-line circuit at each sub-station, switching devices whereby any two lines may be connected together, a battery permanently connected to said switching devices and normally on open circuit, but interposed in the circuit of any two lines when connected one with another, and an electro-magnetic testing-instrument in the circuit of said battery, and adapted to give a signal, when connected in the main-line circuit, under the influence of the vibratory bell at the sub-station, substantially as and for the purpose specified.

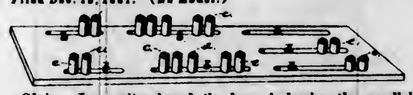
6. The combination, in a telephone-exchange system, of a main battery located at the central station and placed in the circuit of any two lines when connected together, and a direct-acting transmitter having its variable resistance included in the compound battery-circuit so constituted, as and for the purpose specified.

7. In a system of electrical communication, a series of trunk-lines extending between any two central stations, the said trunk-lines being connected at one terminal through an annunciator to earth and at the other terminal to one pole of a main battery, the other pole of said battery being attached to an insulated switch-bar constituting a normally-open circuit, adapted to be closed by the connection of a subscriber's line to said insulated switch-bar, substantially as described, and for the purpose specified.

8. The combination, in a telephonic circuit, of two main lines, switching devices arranged as indicated to connect the said lines together at a central point common to both, a main battery interposed in the compound circuit constituted by the said two lines, at the junction thereof, by means of said switching devices, and a battery-telephone having its variable resistance connected directly in said circuit, at the outer terminal of each line, as and for the purpose specified.

9. In a telephone-exchange system, the combination of a switch-board the vertical strips whereof are connected to the respective main lines and the horizontal strips in pairs to the poles of a main battery, and a series of main lines terminating in said switch-board through annunciators at an earth-plate common to the series, with a normally-open branch circuit, including a battery, *l*, and a telephone or telephones, and an electric switch attached to and actuated by each annunciator-magnet, and acting to transfer the main circuit from its normal direct connection with the ground-plate to the normally-open telephone branch, as described.

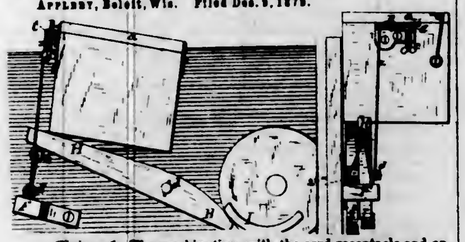
10. The combination, substantially as hereinbefore described, of two or more central stations, a series of subscribers' lines radiating therefrom and extending to sub-stations, connecting and switching devices whereby any two lines may be connected together, and a main-line battery to be included at the junction thereof and in the circuit so constituted, with a series of trunk-lines extending from one central station to another, and an auxiliary battery for each trunk-line, normally on open circuit, but in electrical communication with the trunk-line, and adapted to be brought into action by the connection of a subscriber's line to its connecting trunk-line.



11. In a telephone-exchange system, an electric switch-board having its vertical connecting-strips connected to incoming trunk-lines and subscribers' lines and a portion of its horizontal connecting-strips connected in pairs to the opposite poles of a main battery, the remaining portion of said horizontal strips being each one connected singly to one pole of an auxiliary battery, the other pole of which is permanently connected to an outgoing trunk-line, substantially as described.

12. In a telephone-exchange system, the combination, at a central station, of a subscriber's line-wire, a switch-strip serving as the open terminal of an auxiliary main battery, connecting devices for connecting the subscriber's line to the said switch-strip, a trunk-line permanently attached to the opposite pole of the said battery and extending to a distant central station, there terminating, after passing through an annunciator, in the earth, and at the said distant central station a normally-open branch circuit, including a battery and a telephone, and an automatic electric switch or circuit-changer, whereby, when the subscriber's line is connected to the switch-strip at the first central station and the circuit of the auxiliary battery is closed, the main-line circuit at the distant station is transferred to the normally-open branch, and the signal

is given and the oral communication is established independently of any positive action thereto by the connecting operator, substantially as described.

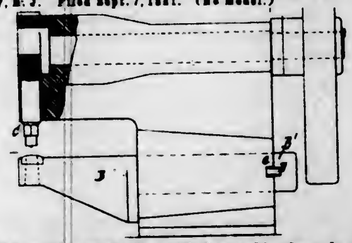


13. In a telephone-exchange system, the combination, with vibrating circuit-breaking bells at sub-stations, of a main battery at the central office in the circuit of the strips for connecting any two subscribers' lines, and in circuit with said battery an electro-magnetic testing-instrument adapted to vibrate when any two lines are connected by means of said connecting-strips under the influence of and in correspondence with the circuit-breaking bell at the sub-station, whereby the signal given at such sub-station by the inclusion of the battery in the circuit is automatically repeated at the central station, substantially as and for the purpose specified.

252,987. MITER-BOX. JAMES W. ANDUS, Mason City, Ills. Filed Dec. 15, 1881. (No model.)

Claim.—In a miter-board, the base A, having the parallel slots *b b* extending longitudinally thereof, in combination with the bolts *c*, having the nuts *d*, and the adjustable cylindrical posts *e*, substantially as specified.

252,988. TENSION DEVICE FOR GRAIN-BINDERS. JOHN F. APPLEBY, Beloit, Wis. Filed Dec. 9, 1879.



Claim.—1. The combination, with the cord-receptacle and an adjustable tension device composed of a stationary plate, B, and a yielding plate, C, of an eye or guide for giving direction to the draft of the cord designed to pass through said tension device, such that the draft of the cord will, in the event of the presence of a knot or bunch thereon, operate to instantly pull the plate C away from B, substantially as described.

2. In combination with the means for exerting a uniform tension on the cord as it is drawn from the source of supply, the auxiliary tension device or mechanism to create an increased tension at certain times, and regulated in its times of action automatically by the binder or harvester mechanism.

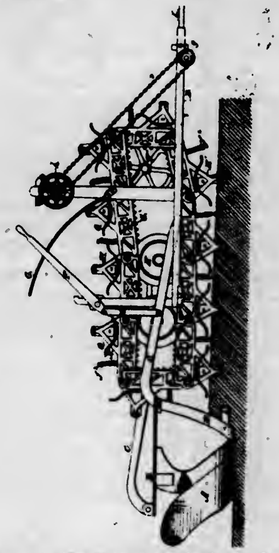
3. In a self-binder harvester, the automatic auxiliary tension mechanism, as described, to alternately create a tension on the cord and a slack therein, made in the process of applying the tension, substantially as and for the purpose set forth.

252,989. PUNCHING-MACHINE. WILLIAM C. BAAR, Jersey City, N. J. Filed Sept. 7, 1881. (No model.)

Claim.—The combination, with the machine-frame having a transverse opening or eye and side notches, *c c*, at the rear, of the nose or die-holder B, having its shank passed through said opening or eye, and the wedge D, extending through the shank and resting in the said notches, all substantially as and for the purpose described.

252,990. RETENTION-SPRING FOR UMBRELLAS. WILLIE H. BELKNAP, New York, N. Y. Filed Oct. 7, 1881. (No model.)

Brief.—A light metal case incloses the spring-acting catch.



Claim.—1. In a retention device for umbrellas and parasols, in combination, a narrow case having a slotted top, a catch projecting through the slot and adapted to turn at its rear end in the case, and a spring located under the catch, substantially as and for the purpose hereinbefore set forth.

2. In combination with a spring-acting catch, *b*, an inclosing case *a a' a² a³ a⁴* therefor made of a single piece of sheet metal cut and formed into a narrow box and provided with holding-spurs *a² a³*, substantially as hereinbefore set forth.

252,991. PLOW. BENJAMIN S. BENSON, Baltimore, Md. Filed Jan. 8, 1881. (No model.)

Brief.—An endless track with trucks on it takes the place of a sulky-frame and wheels, and is laid by the advance of the machine. The system of track, sprocket-wheels, and trucks are connected together and longitudinally pivoted to the frame, so that they may be tilted or inclined to bear against the land and counteract the side thrust of plows without landsides. The presser-foot are angular to conform to the land and side of furrow. The plow-share runs forward, contrary to the usual form, cutting the slice next the furrow first.

Claim.—1. A mold-board plow having its share or front cutting-edge inclined, as described, reversely to the general inclination of the mold-board, and extending forwardly from the plow-standard to the previous furrow, as and for the purpose set forth.

2. The combination, with a mold-board plow, of a detachable share, D, inclined reversely to the general inclination of the mold-board, as described, and attached to the front edge of the same, and extending forwardly to the landside of the previous furrow, and then up to a support, as described.

3. The combination, with one or more plows, of a passively-moving railway having presser-feet with an inwardly-projecting angle adapted to fit over the edge of the unplowed ground, and a flanged-wheel truck located within the traveling railway and attached to and supporting the plows, so as to cause the weight and lateral strain of the plows to be constantly sustained upon the railway, as described.

4. The combination of the plow-beam B, mold-board A, share D, and the two beams C C', connected to the beam B and jointed to a frame in front, as described.

5. The combination, with a mold-board plow having a share, D, slanted forward from the mold-board to the previous furrow, of a landside or gage, *l*, fixed to said share and adapted to bear against the wall of the previous furrow, as described.

6. The combination, with one or more plows, of a traveling railway and a flanged-wheel truck running within the same, con-

nected to the plow-frame by a pivotal joint, which permits the railway to rock sidewise, substantially as described.

7. The combination, with the tongue L, pivoted upon a vertical bolt, of a screw-shaft, *f*, extending through said tongue and bearing chain-wheel *g*, the chain *i*, and the chain-wheel *h*, located near the driver's seat, as described.

8. The truck H, having running wheels, with gear-wheels B', and flanged guides a^2 a^2, in combination with the endless chain A' A' and the jointed racks C^2, substantially as and for the purpose described.

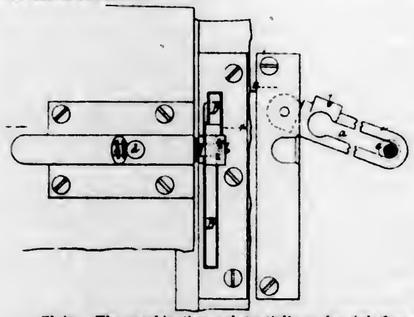
9. A traveling railway having feet with an angle in the same adapted to straddle or lap over the projecting edge of the previous furrow, substantially as described.

10. The cleat on the bottom of the foot, arranged longitudinally or in line with the draft, so constructed as to take hold in the ground to prevent the truck from slewing when the truck is not tilted over the wall left by the furrow, in combination with the railroad-track on the foot and the flanged truck-wheels.

252,992. SEWING-MACHINE NEEDLE. HELEN A. BLANCHARD, Philadelphia, Pa. Filed Nov. 5, 1880. (No model.)

Brief.—A hollow needle, which is adapted to carry a coil of thread, is filled with the same by winding it upon a flexible wire, inserting the wire and thread within the needle, and then withdrawing the wire.

Claim.—1. The combination of the coiled slotted tube A with the point at the front end and screw plug or cap at the rear end, substantially as described.



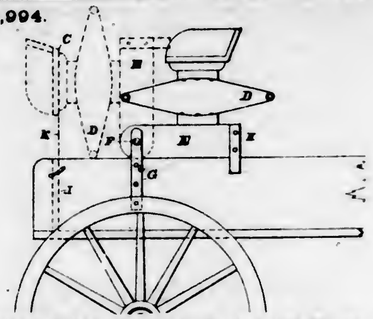
2. A bobbin for filling a hollow needle, consisting of a small flexible wire wound with thread, substantially as and for the purpose described.

3. The needle pointed at one end and provided with an eye for the delivery of the thread from the coil of thread within it, and with an abutment to retain the coil in position within the needle, substantially as described.

4. That improvement in the method of filling a hollow needle with a coil of thread which consists in winding the thread on a flexible core to form a bobbin, inserting the said bobbin in the hollow needle, and then withdrawing the flexible core, leaving the coil of thread therein, substantially as described.

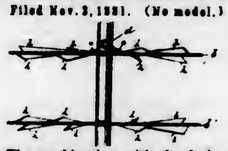
252,993. DOOR-CHECK. FRIEDRICH W. BOLDT and PETER C. A. VOGEL, Hamburg, Germany. Filed Sept. 14, 1881. (Model.) Patented in Germany Nov. 24, 1880, and June 3, 1881.

Brief.—The device consists of the combination of a locking-plate having a pear-shaped slotted check-bar, with a bevel-catch hinged therein, with a spring-bolt having a flanged head, said construction permitting the bolt to be withdrawn when the door is closed, but allowing the device to operate as a door-check when the bolt is undisturbed.



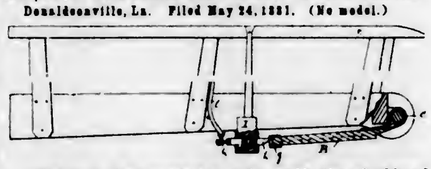
Claim.—The combination, substantially as hereinbefore described, of the locking-plate, the check-bar hinged therein, the pear-shaped slot in said check-bar, the incline formed on one edge of the check-bar, and the spring-bolt having a conical or beveled head.

252,994. WAGON-SEAT. SAMUEL BOWERS, Braddock, Pa. Filed Nov. 4, 1881. (No model.)



Claim.—In a movable seat for wagons or other vehicles, the

252,994.

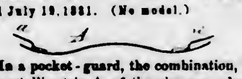


hinge-pieces E E, in combination with the springs D D and the pivots F F, attached to the wagon or box by the straps G G, substantially as described.

252,995. CHURN-DASHER. ROBERT S. BRIDGMAN, Charleston, Ark. Filed Nov. 3, 1881. (No model.)

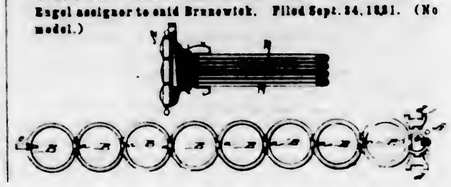
Claim.—The combination, with the dasher-shaft *a*, provided with the pawl *d*, pivoted thereto, of the dasher *b*, journaled on the shaft and constructed as set forth, and provided with the ratchet-plate *c*, whereby, when the pawl is raised, the dasher will be revolved in the reciprocatione of its shaft, and when the pawl is lowered the dasher will be locked in its upward movement to gather the batter, substantially as described.

252,996. TAIL-BOARD FOR WAGONS. LOUIS A. BRIGGIRR, Donaldsonville, La. Filed May 24, 1881. (No model.)



Claim.—1. In a wagon or cart, the combination of a hinged or pivoted tail-board and a spring-catch, for the purpose of retaining the tail-board in an open position under the said wagon or cart, substantially as described, and for the purpose stated.

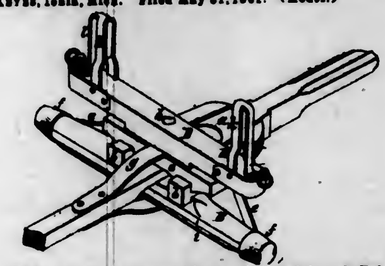
2. In a wagon or cart, the combination of a pivoted tail-board, a spring bolt-catch, and actuating-lever, arranged substantially as described, and for the purpose set forth.



3. In combination with the pivoted or hinged tail-board B, provided with socket *g* at its outer end and the spring-catch A to engage with the same, the axle I, formed with a recess or mortise, within which is located and operates the spring-catch, substantially as described.

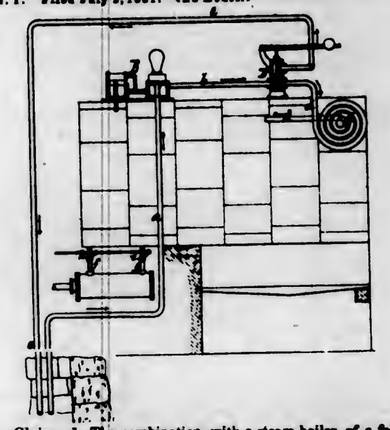
252,997. POCKET-GUARD. FREDERICK W. BROOKS, Sandusky, Ohio. Filed July 19, 1881. (No model.)

Claim.—In a pocket-guard, the combination, with the reversely-curved metallic strip A, of the pins *a a*, adapted to hold said strip in place, substantially as shown and described.



252,998. COMBINED FINGER-RING AND BRACELET. SIGMUND BRUNSWICK and JOHANNS ENGEL, New York, N. Y.; said Engel assignor to said Brunswick. Filed Sept. 24, 1881. (No model.)

Claim.—1. In a combined finger-ring and bracelet, the combination, with the ornamented hollow head A, of the series of hinged rings B, hinged to the said head, and the outer rings of the series provided with a spring-catch adapted to enter the hollow head, substantially as and for the purpose set forth.



2. In a combined finger-ring and bracelet, the combination, with the head A and the series of hinged rings B, of the recessed wings *d*, hinged to the opposite sides of the said head, substantially as and for the purpose set forth.

252,999. RUNNING-GEAR. DAVID BUCKLEW and WILLIAM KNUDS, Ionia, Mich. Filed May 31, 1881. (Model.)

Claim.—A gearing for vehicles, consisting of the axle B, having embedded in its sides steel plates *i*, extending the entire length of the axle, the ends thereof passing under the chains *j*, said axle having connected thereto the usual reach, tongue, and bolster, substantially as shown, and for the purpose set forth.

253,000. STEAM-GENERATOR. OSCAR F. BURTON, Brooklyn, N. Y. Filed July 9, 1881. (No model.)

Claim.—1. The combination, with a steam-boiler, of a feed-pipe connected thereto at or near its top, an overflow or waste pipe emanating from its top, and one or more discharge-pipes extending from its bottom part and connected to a steam-cylinder, substantially as shown and described.

2. The combination, substantially as hereinbefore described, of the steam-boiler, the feed-pump, the feed-pipe extending from the pump to the top of the boiler, the safety-valve inclosed in a chamber which connects below the valve with the feed-pipe and with the boiler, and the waste-pipe emanating from the valve-chamber above the valve.

3. The combination, substantially as hereinbefore described, of the steam-boiler, the feed-pump, the feed-pipe extending from the pump to the top of the boiler, the coil G, the safety-valve inclosed in a chamber which connects below the valve with the feed-pipe and with the boiler, and the waste-pipe emanating from the valve-chamber above the valve.

253,001. MACHINE FOR CREASING, BENDING, AND SHAPING CELLULOID COLLARS. EDGAR GARY, New York, N. Y. Filed July 14, 1880. (Model.)

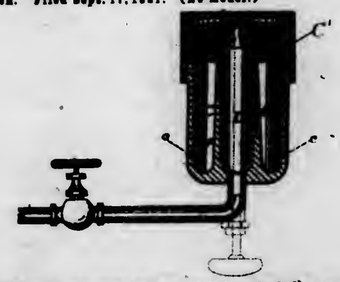
Claim.—1. The combination, in a machine for creasing, bending, or otherwise shaping celluloid collars or analogous articles, of the vertically-movable blade F, grooved along its lower edge to form the female die, with the stationary male die G, having a sharp

253,001.

upper edge coinciding with the groove in the upper die, and the gages L M, for adjusting and supporting the blank in position, one of said dies being made hollow to receive steam for heating it, substantially as described.

2. The combination, with the bed or base plate, of the crosshead operated by a treadle and arranged to slide between standards mounted upon the bed-plate, the upper male die, F, having a grooved lower edge and secured to the cross-head, the lower hollow male die, G, and the gages L M, respectively, provided with arms *l m*, for holding the blank horizontally between the dies, substantially as described.

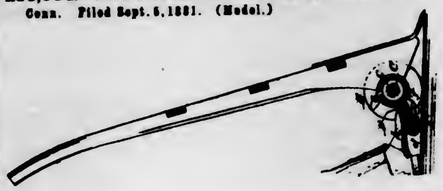
253,002. KNOT-TYING DEVICE FOR GRAIN-BINDERS. REUBEN CHAMBERLAIN and JOSIAH AUSTIN, East Liberty, Ohio. Filed May 3, 1881. (No model.)



Claim.—1. A knot-tying device consisting of a chambered rotary head having two oscillating segmental arms, which are crooked outwardly from each other, and an oscillating guide-lever, substantially as shown and described.

2. A knot-tying device consisting in a chambered rotary head, A, having segments B B, provided with curved arms *b b*, having intermeshing teeth, bars *c c*, rod *d*, spring *e*, and friction-roller *f*, in combination with the curved oscillating guide-lever *h*, substantially as shown and described.

3. A knot-tying device consisting in rotary head A, having oscillating lever *h*, and toothed segmental arms *b b*, in combination with suitable mechanism for operating the same, substantially as shown and described.



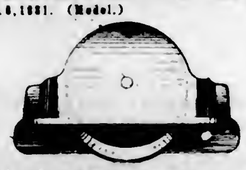
253,003. VAPOR-BURNER. JOHN FRANK CRUNCH, Albion, Mich. Filed Sept. 17, 1881. (No model.)

Claim.—1. A vapor-burner consisting of a hollow crown perforated with burning-jets, an inner central tube, one end of which is connected with the liquid-conduit, the other provided with a diminished orifice leading into the hollow crown, and a distributing-plate provided with a central aperture and fixed upon the top of said central tube, substantially as described.

2. The combination, with the outer chamber, C, inner chamber, D, and the distributing-plate E, having the central orifice *e* of the removable cap C', substantially as described.

253,004. HAND-TRUCK. GRENEN P. CLARK, Windsor Locks, Conn. Filed Sept. 5, 1881. (Model.)

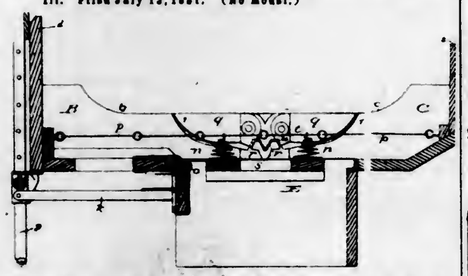
Claim.—1. The spring-actuated clamp or holder D, placed upon the shaft or axle C of the truck, and adapted to be pressed down to engage with the floor, as and for the purposes set forth.



2. The clamp or holder D, placed loosely upon the shaft or axle C, in combination with the spring *a*, substantially as and for the purposes set forth.

3. The collar *c*, formed with the stop *e*, in combination with the clamp D and the spring *a*, substantially as described.

4. The clamp D, provided with the rubber *d*, in combination with the collar *c* and spring *a*, substantially as described.



5. The clamp D, formed with the sleeves *d' d'* and provided with the rubber *d*, in combination with the collar *c* and the spring *a*, substantially as and for the purposes set forth.

253,005. SASH-CORD PULLEY. JNO. K. CLARK, Buffalo, N. Y. Filed Dec. 6, 1881. (Model.)

Claim.—A sash-cord guide composed of a casing cast in a single piece, with end projections or ears, and rearwardly-extending webs or flanges supporting said projections or ears, in combination with an axle or journal-pin supported by the side walls of the casing, and a pulley or sheave arranged on said axle or journal-pin, substantially as and for the purposes set forth.

253,006. WARDROBE-BEDSTEAD. MARK COLLINSON, Quincy, Ill. Filed July 13, 1881. (No model.)

Claim.—1. The combination of the central part, A, hinged parts B C, flexible bed-support, attached as described, and supplemental supporting-frame E, suspended within the walls of the part A, as set forth.

2. The combination of a central part, A, hinged parts B C, having their sides cut away at 1 1, and the pieces *q*, pivoted to swing in the places of the sides and to fill the spaces, whether the parts B C are raised or lowered, substantially as described.

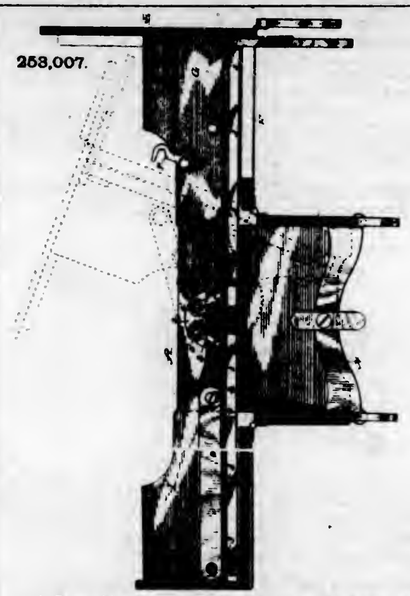
3. In combination with the hinged part B, the piece *f*, bars *g g*, pivoted guides *h h*, and stop-pin H, substantially as described.

4. The combination of the piece *f*, bars *g*, hinged guides *h*, and hinged bars *k k*, substantially as described.

5. In combination with the extended ends *a* and the prolongations *s*, the pivoted pieces *q*, and interlocking catches, as described.

6. In combination with the ends *a* and prolongations *s*, the castings F, pivoted pieces *q*, provided with catches, as described, and the stop-flanges *r*, substantially as described.

7. In combination, a central part, A, hinged part B, connecting-bars *k k*, hinged guides *h h*, and stop adapted to arrest and support the part B in inclined position by insertion of said stop-bolt in any of the series of holes, substantially as described.

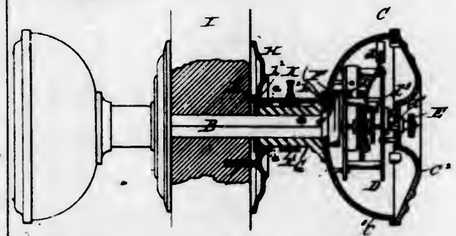


253,007. CRADLE-BED. MARK COLLINSON, Quincy, Ill. Filed Nov. 9, 1881. (No model.)

Claim.—1. The combination, in a folding bed, of the central or base section, the hinged head and foot sections, the fixed stop-block, and the fastening latch or hook and pins.

2. In a folding bed or cradle, the combination of the central, head, and foot sections, hinged together as described, and the folding rockers attached to the base-section.

3. In combination with the base-section A, the hinged rocker and the strip or brace M.



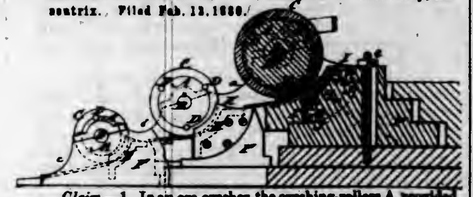
253,007.

4. In combination with the base-section A, the hinged rockers, the strip or brace S, and the pivoted button 12.

5. In combination, the central section, A, and pivoted head and foot sections with the stay rod and pin on the head-section, whereby said head-section is held in an inclined position.

253,008. DOOR-KNOB ALARM. WILLIAM F. CORE, Ivy Mills, Pa. Filed Oct. 28, 1881. (Model.)

Claim.—1. The combination, with a door-knob, of a clock-work mechanism for producing an alarm, such mechanism being located within the knob and adapted and designed to be started when the knob-spindle is turned and to continue ringing after such spindle has come to a state of rest, substantially as shown and described.



2. The combination, with a door-knob and clock-work located within the same and designed and adapted to produce an alarm, of means, substantially as described, whereby the actuating devices can be set and be started when the knob-spindle is turned and locked to be inactive when such spindle is turned, the alarm mechanism comprising spring-gearing, which will continue in operation after said knob-spindle has been turned and come to a state of rest, substantially as shown and described.

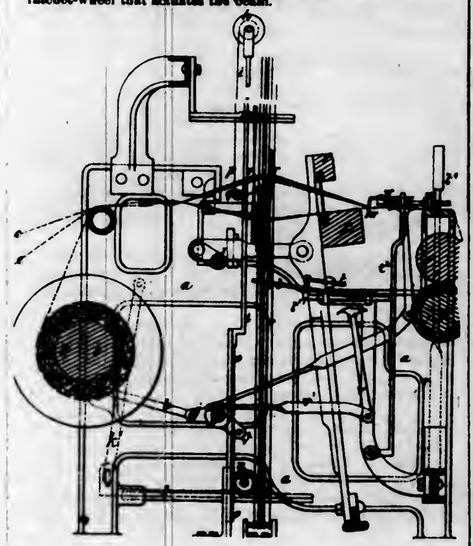
3. The combination, with the escutcheon H, knob C, internal clock-work gearing, D, and spindle B, of sleeve G, slide K, stop *d*', and detent F, said parts being constructed and arranged for operation substantially as shown and described, whereby in one position of said slide the parts will be set to start an alarm when the knob-spindle is turned and in the other position such spindle may be turned and the alarm remain inactive.

4. In combination with knob C, made in two sections, C' C", the slide K, extended through said knob and forming a support for the movable section C", substantially as shown and described.

5. In combination with slide K, the pivoted locking-lever K', substantially as shown and described.

253,009. ORE-CRUSHER. JOHN H. COURTENAY, (deceased,) Cornwall-on-the-Hudson, N. Y.; Margaret J. Courtenay, Executrix. Filed Feb. 13, 1880.

Claim.—1. In an ore-crusher, the crushing-rollers A, provided with the detachable tires C and the central annular space, *d*, between the said tires, substantially as and for the purpose set forth.



2. In an ore-crusher, the combination, with the crushing-rollers A, provided with the steel tires C, and the annular space *d* between the said tires, of the adjustable abutment F, provided with the central web, E, and the removable dies H, substantially as and for the purpose set forth.

3. In an ore-crusher, the combination, with crushing-rollers A, provided with annular space *d*, of the adjustable abutment F, provided with the web E, the side plates, K, and the removable dies H, substantially as and for the purpose set forth.

4. In an ore-crusher, the combination, with the crushing-wheels and the abutments, of the dies H, formed curved at the middle and straight at the ends, and provided with means for detachably securing said dies to the abutments, substantially as described, whereby the dies, when worn, may be reversed, as set forth.

253,010. LOOM. CHRISTOPHER CROSS, Manchester, County of Lancaster, England. Filed May 17, 1880. (No model.) Patented in England Mar. 9, 1880.

Brief.—Ornamental borders are woven upon fabrics by causing the regular weft to lap around an additional or lap-weft, placed at each selvage, and draw the same into the shed. The rod supporting the lap-weft bobbin is reciprocated at each pick to draw off the maximum quantity of lap-weft used, which is kept at the proper tension by a counterpoise resting on a weighted lever and pressing upward against the thread. On the breakage of the thread the hooked end of the lever descends, and is engaged by a vibrating hammer, which moves forward the slide carrying the lever, and through intermediate levers releases the shipper-handle and stops the loom. When beginning to weave an ornamental heading across the fabric the weighting of the warp-beam is increased and the speed of taking up decreased. A slotted handle, moved by hand, operates a lever connected with a sliding bar, having a wedge acting upon the weight-lever, and a cam having elevations and depressions that control the action of the take-up pawl is at the same time thrown into operation, and through connections throws the pawl alternately into and out of engagement with the ratchet-wheel that actuates the beam.

Claim.—1. The combination of a bobbin carrying a lap-weft thread, and mechanism for imparting a reciprocating motion to said bobbin, with a balanced counterpoise adapted to press on said lap-weft to insure its positive delivery, substantially as described.

2. The combination of a bobbin for the lap-weft, a rod carrying said bobbin, and mechanism for imparting a reciprocating motion to the said rod, with the frame, a counterpoise, *s*, and balanced or weighted lever *t*, adapted to act on said counterpoise, substantially as set forth.

3. The combination of a frame, counterpoise *s*, adapted to bear on the lap-weft thread, a sliding carriage, and a weighted lever, *t*, pivoted thereto and having a hooked end, with a vibrating lever, *v*, belt-shifting mechanism, and devices, substantially as described, whereby, on the breakage of a thread, said lever *v* will cause the operation of the belt-shifting mechanism, as specified.

4. The combination of the take-up beam, gear-wheels, ratchet, and catch 2, and devices for reciprocating the catch, cam *y*, levers connecting it with the catch, and mechanism for rotating the cam, with let-off beam, friction device therefor, a hand-lever and levers connecting the latter with the friction device, and the mechanism for operating the cam, substantially as described, whereby the friction may be applied to the let-off beam by the same movement which throws the cam-operating devices into gear, as set forth.

253,011. COMBINED CANE, CIGAR-CASE, PIPE-BOWL, &c. DANIEL CROWLEY, Boston, Mass. Filed Dec. 24, 1880. (No model.)

Claim.—1. A series of reversible and interchangeable tubular boxes, *e f g*, screwed or otherwise held together, and then held within a hollow cane to the head B or to the tip I, substantially as set forth.

2. The pipe-stem opening *n* in the cane-head B, substantially as described and shown.

3. The combination, in a cane-head, of a pipe-bowl and stem, constructed and arranged substantially as described, whereby the cane, with its head, can be used as a pipe without removing the head, as set forth.

4. The removable tip I, in combination with one or more tubular boxes, *e f g*, and cane A, all so arranged as to hold the said boxes securely in place and admit of the insertion and removal of the boxes at the lower end of the cane, substantially as specified.

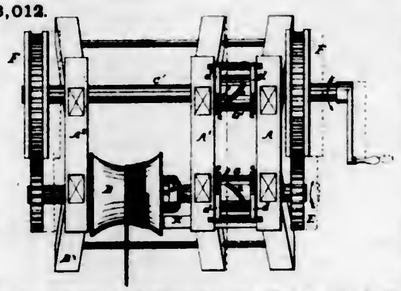
5. In combination with cane-head B, the removable cover C, made to serve as a cap to the same, or bottom piece to the cane-head, when the same is detached for use as a pipe, substantially as described.

6. In combination with a cane provided with partitions and compartments, as described, one or more pieces of sponge for the purpose of protecting the contents of the compartments, substantially as set forth.

7. One or more adjustable and removable partitions, I, in combination with a hollow cane, substantially as and for the purpose set forth.

8. A coiled tube, T, adapted to be fitted within a cane, and for use as a stem in connection with the pipe S or a cigar, substantially as specified.

9. A cane-head having a hole through it, in combination with a cap secured to the bottom of the cane-head to form a pipe-bowl, substantially as specified.



10. A cane-handle having combined compartments *f f'* S', for tobacco, matches, and pipe, substantially as set forth.

11. In combination with a cane provided with partitions and compartments, as described, one or more paper-cases, for the purpose of protecting the contents of the compartments, substantially as set forth.

253,012. DREDGE-WINDER. SUMNER W. DANA, Crisfield, Md. Filed June 29, 1881. (No model.)

Claim.—1. The sleeve G, having diagonal slots *e* in the same, and ratchet-teeth *c c* at each end of said sleeve, in combination with the two pawls *d d*, the frames A A', holding the sleeve against longitudinal movement, and the sliding shaft bearing a clutch and passing through the sleeve, and having a pin, *f*, passing through the slots *e*, substantially as shown and described.

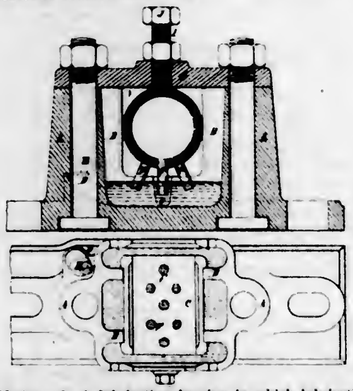
253,012.

2. The combination of the two longitudinally-adjustable shafts connected at their opposite ends by gear-wheels E F, one of which has projecting and the other indented teeth, the two sleeves G G', having slots *f* and ratchet-teeth *e e* at each end, the pawls *d d*, the frames A A' A², the clutch *b*, and the winding-drum D, as shown and described.

253,013. ORNAMENTAL CHAIN. SALOMON DAVIDSON, New York, N. Y. Filed Nov. 28, 1881. (No model.)

Brief.—A cap is applied to the end of the link and retained in place by a shoulder on the cap.

Claim.—1. In ornamental chains, the caps or bands *d*, formed with internal shoulders, combined with the end rings, *a a'*, and connecting loop or rings *b* of the links, substantially as shown and described.

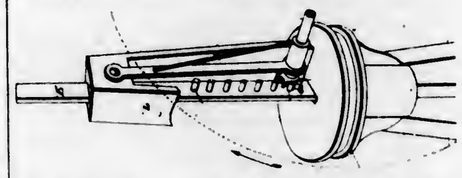


2. The combination of the shouldered cap or band *d* with the link *a a' b* and sleeve *c*, substantially as shown and described.

253,014. NURSING-BOTTLE. EDMUND O. DAY, London, England. Filed Dec. 7, 1881. (No model.) Patented in England Oct. 28, 1880.

Claim.—As an improved article of manufacture, the herein-described stopper for feeding-bottles, formed in a single piece with the flexible feeding-tube *c*, to the outer end of which the nipple is attached, as and for the purpose described.

253,015. SELF-LUBRICATING BEARING FOR AXLES. PAUL DECAUVILLE, Paris, France. Filed Dec. 16, 1881. (No model.) Patented in France Feb. 15, 1880.



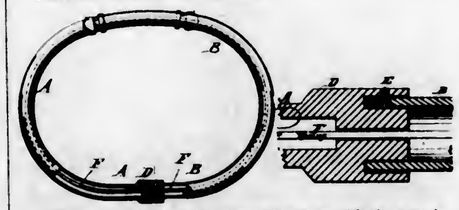
Claim.—1. A lubricating-bearing in which lubrication is effected by capillary attraction and by suction caused by a vacuum through pieces of cane or reed dipping in oil placed below the axle to be lubricated, as and for the purposes set forth.

2. In a lubricating-bearing, the combination of the axle-box A, serving as an oil-reservoir, the brasses C C', the ribs B, and the apertures O with the cup D, receiving the oil, and the pieces of cane or reed F, the lower ends of which dip in the oil, while their upper ends are flush with the lower surface of the axle to be lubricated, substantially as described with reference to Figs. 1, 2, 3, and for the purposes set forth.

3. In a lubricating-bearing chiefly designed for vehicles, the upper part, A, of the axle-box, bolted on the frame of the vehicle and receiving the lower part, B, serving as an oil-reservoir, in combination with the upper brass, C, and the pieces of cane or reed F in contact with the journal at the points *x y*, the whole arranged and working as described in reference to Figs. 4 and 5, and for the purpose set forth.

4. In a lubricating-bearing for vertical shafts, the combination, with the brasses B, the pieces of cane C, and the oil-cup D, of a collar or ring, E, having the form of a truncated cone, and fixed on the shaft A, as described in reference to Fig. 6, and for the purposes set forth.

253,016. WINDMILL FOR PUMPING. LEMI B. DENTON, Grand Rapids, Mich., assignor of one-half to Arthur J. Holt, same place. Filed May 19, 1881. (No model.)

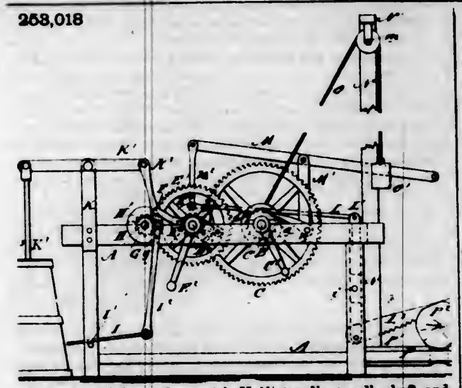


Claim.—1. In a windmill, the combination, with the wind-wheel shaft having a pinion attached thereto, of a rod having a series of pins secured thereto, the parts being arranged so that the pinion will engage with the opposite sides of the pins, and thereby convert the rotary motion of the wheel-shaft into a reciprocating motion of the rod, substantially as set forth.

2. In a windmill, the combination, with the wind-wheel shaft having a pinion secured thereto, of a rod provided with a series of removable pins arranged in a vertical line, the parts being arranged so that when the pinion engages with one side of the series of pins the rod will be raised, and when it engages with the opposite side the rod will be depressed, substantially as set forth.

3. In a windmill, the combination, with the windmill-shaft provided with a pinion and supported at one end by a vibrating link, of a pump-rod provided with a series of pins, with which said pinion engages and operates to impart a reciprocatory movement to the rod, substantially as set forth.

253,017. BRACELET. JOHN V. DIEFENTHALER, Newark, N. J. Filed Nov. 18, 1881. (No model.)



Claim.—1. In a bracelet, the combination, with the part A, provided with the coupling D, of the part B, provided with the semi-annular groove *a*, and the pin E, substantially as and for the purpose set forth.

2. In a bracelet, the combination, with the tubular part A, provided with the coupling D, the tubular part B, provided with the semi-annular groove *a*, and the pin E, of the spring F, having its ends resting against the outer ends of the bracelet, substantially as and for the purpose set forth.

253,018. MOTIVE POWER. EDGAR H. DRAKE, Newfield, N. Y. Filed July 25, 1881. (No model.)

Claim.—1. A motive-power mechanism constructed substantially as herein shown and described, consisting of shaft B, carrying cog-wheel, ratchet-wheel, and crank C C' C², sliding shaft D, carrying pinion, cog-wheel, crank, and eccentric F E' F' F², shaft

253,018

G, carrying pinion and eccentric H H', treadle, treadle-shaft, and pitman I I' I², standard, walking-beam, and pitman K K' K², connecting-rod and lever L L', and standard, walking-beam, and pitman M' M M², all in combination, supported on frame A, and operated as set forth, whereby the machine may be simultaneously used for churning and sawing, and may be driven either by treadle or hand-cranks at fast or slow speed, as desired.

2. In a motive-power mechanism, the combination, with the frame A and shaft B and cog-wheel C, of the standard N, provided with pulleys *m m*, rope O, and weights O', substantially as herein shown and described, whereby the mechanism may be operated by said weights, as set forth.

3. In a motive-power mechanism, the combination, with the shaft D, carrying cog-wheel, crank, and eccentric E' F' E², of the shaft G, carrying pinion and eccentric H H', and treadle, treadle-shaft, and pitman I I' I², substantially as herein shown and described, whereby the power may be applied through either crank or treadle, as set forth.

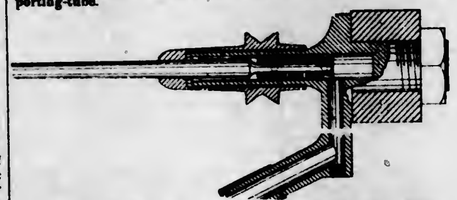
253,019. SPINDLE-BEARING. GEORGE DRAPER, Hopedale, Mass. Filed July 29, 1881. (No model.)

Claim.—1. The tubular support *d* and the sectional lateral or side spindle-bearing and spindle, combined with the elastic or yielding packing for the said lateral sectional bearing, the packing being interposed between the tubular support and sectional lateral bearing, substantially as described.

2. The spindle and tubular support, combined with the sectional bearing therefor, movable step, and elastic or yielding packing between the said sectional lateral bearing and tubular support, substantially as described.

253,020. PACKING FOR SPINDLE-BEARINGS. WILLIAM F. DRAPER, Hopedale, Mass. Filed Aug. 5, 1881. (No model.)

Brief.—The sectional bearing is surrounded by an elastic packing having an enlarged strand extending spirally through the same.

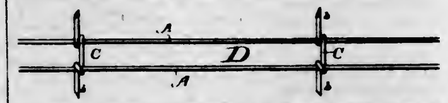


Claim.—1. The improved elastic packing composed of a braided fabric having an enlarged strand, *g*, extended helically through it, substantially as described.

2. The tube or support *a* and the lateral or side bearing, composed of sections *c*, combined with and connected together by means of the elastic packing, having an enlarged forcing-strand, *d*, extended helically therethrough, to operate substantially as and for the purpose described.

253,021. SPINDLE AND BOLSTER FOR SPINNING-MACHINES. WILLIAM F. DRAPER, Hopedale, Mass. Filed June 21, 1881. (No model.)

Brief.—The reduced pintle of the spindle is inclosed by a yielding bolster placed within a fixed supporting-tube. The sleeve-whirl has an annular extension below the whirl, which, by coming in contact with the exterior of the supporting-tube, prevents the spindle from being unduly deflected from a vertical position. The top of the pintle, groove of the whirl, and top of the bolster, which may be rounded and enlarged to fit the interior of the supporting-tube, are all located in substantially the same plane, whereby the strain of the band on the spindle is resisted by the enlarged head of the bolster, which is supported laterally by the fixed supporting-tube.



Claim.—1. The sleeve-whirl spindle provided with a sleeve-like extension, *b'*, below the band-groove of the whirl, combined with the yielding bolster and its support, the top of the bolster being located substantially in the line of the band-groove of the whirl, whereby the sleeve-like extension below the grooved whirl guards the pintle of the spindle against the effect of strain, tending to deflect the spindle from the vertical, as set forth.

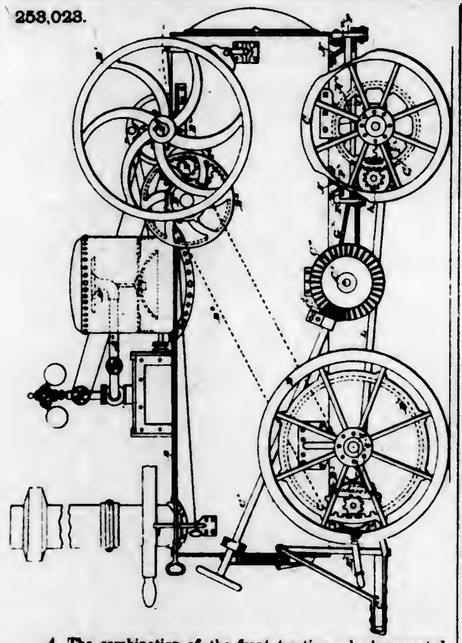
2. The sleeve-whirl spindle having a pintle of smaller diameter than the butt of the spindle-blade, combined with a yielding bolster and supporting-tube, substantially as described, the band-receiving groove of the whirl, the top of the reduced part of the spindle or pintle, and the top of the bolster being all located in substantially the same plane, as set forth.

3. The sleeve-whirl spindle, the upwardly-extended tube *a*, and the oil-supply reservoir extended above the plane of the top of the bolster, combined with the bolster shorter than the said supporting-tube, leaving above the bolster a chamber for the reception of oil, substantially as described.

253,022. BARBED FENCE-WIRE STRAND. ABRAM ELLWOOD, Sycamore, Ill. Filed Aug. 30, 1881. (No model.)

Claim.—1. The parallel wires A A, being about three-fourths of an inch apart, projecting points or barbs *b b*, and bar C, forming the strand D, substantially as and for the purposes described.

2. As a new article of manufacture, two parallel wires substantially three-fourths of an inch apart, held together and apart, and formed into a strand by interlocking staples or barbs, substantially as and for the purposes described.



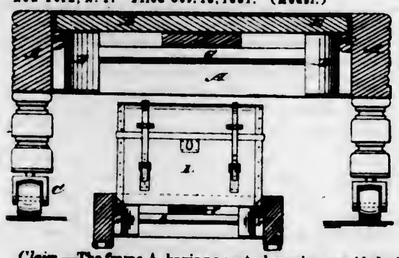
253,023. TRACTION-ENGINE. JOHN H. ELWARD, Stillwater, Minn. Filed Sept. 19, 1881. (No model.)

Claim.—1. The combination of the following elements, namely: a boiler, an engine thereon, a rear truck, a driving mechanism mounted on said truck for moving the rear wheels, a front truck movable relatively to the boiler and engine, a driving mechanism on said front truck for moving the front wheels, and an automatically-extensible power-transmitting mechanism connecting the driving mechanism on the rear truck with the driving mechanism on the front truck, substantially as set forth.

2. The combination of the following elements, namely: the rear truck, a driving mechanism on said truck for moving the rear wheels, a front truck, a driving mechanism mounted thereon for moving the front wheels, the sprocket-wheels L² and L³, arranged to approach and recede from each other, the sprocket-chain L, and devices, substantially as set forth, for expanding the chain.

3. The combination of the rear truck, the counter-shaft D' on said truck, the wheels on said shaft engaging directly with the rear traction-wheels, the compensating-gear on said shaft, the front truck, the counter-shaft H on the front truck, the wheels on said shaft H, which engage directly with the front traction-wheels, the compensating-gear on said shaft H, the short counter-shaft I, the bevel-gearing on the rear truck, the bevel-gearing on the front truck, and the flexible power-transmitting devices between the trucks, substantially as set forth.

253,023.

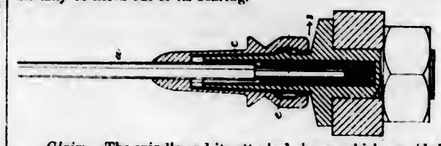


4. The combination of the front traction-wheels mounted loosely, the front counter-shaft, H, engaging directly with said wheels, the compensating-gear on said shaft, the rear traction-wheels mounted loosely, the counter-shaft D', engaging directly therewith, the compensating-gear on said shaft D', and the extensible power-transmitting mechanism between said shafts H and D', substantially as set forth.

5. The combination, with the driving mechanism which moves the rear traction-wheels and the chain L, of the counter-shaft H, engaging with the front traction-wheels, the compensating-gear on said counter-shaft H, and the shaft I, mounted upon the front truck, and arranged, as set forth, to receive the power from the chain L and impart it to the compensating-gear on the shaft H, substantially as set forth.

6. In a traction-engine, the combination of a driving mechanism for the rear wheels, a driving mechanism for the front wheels, a power-transmitting mechanism, a frame-work for supporting upon the front wheels the mechanism which drives them, the pivotal bearing of the boiler resting upon said frame-work, and the arms P P', arranged to loosely connect said frame-work to the boiler, substantially as set forth.

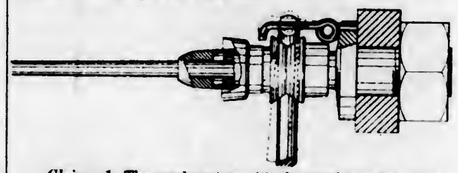
7. The combination of the frames N n, attached to the boiler, the frame O O', supported upon the front wheels, the mechanism for driving said wheels, and the angle-arms P P', arranged to rest upon flange n, substantially as described.



253,024. PORTABLE TRUNK-RACK. WILLIAM H. ERTELL, New York, N. Y. Filed Oct. 15, 1881. (Model.)

Claim.—The frame A, having a central opening provided with corner brackets, D, longitudinal strips E, and transverse piece F, and adapted to receive a trunk or center piece, substantially as shown and described, whereby the said frame is adapted to be used either as a trunk-rack or table, as set forth.

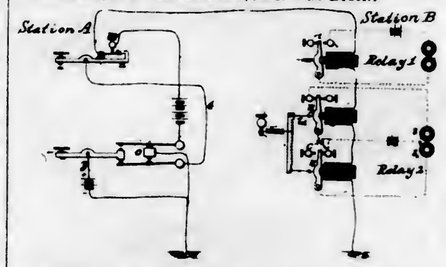
253,025. SPINDLE FOR SPINNING-FRAMES. RIMMON C. FAY, Milford, assignor to George Draper & Sons, Hopedale, Mass. Filed July 29, 1881. (No model.)



Brief.—The bolster-bearing for the spindle is surrounded by an elastic packing, and the supporting-tube is provided with a catch that engages a shoulder within the whirl-sleeve to prevent the spindle from rising when the bobbin is doffed. When the spindle is tipped backward in doffing the shoulder is carried under the catch and cannot rise; but by tipping the spindle in the opposite direction the shoulder will be carried out beyond the catch and the spindle may be lifted out of its bearing.

Claim.—The spindle and its attached sleeve-whirl, provided with the shoulder 2, combined with the bolster, the elastic packing external to the said bolster, and the bolster-supporting tube e, provided with the catch 3, to co-operate with the shoulder 2 of the sleeve-whirl, as described, and for the purposes set forth.

253,026. DEVICE FOR RETAINING SPINNING-SPINDLES IN AND ASSISTING IN REMOVING THEM FROM THEIR SOCKETS. RIMMON C. FAY, Milford, assignor to the Hopedale Machine Company, Hopedale, Mass. Filed July 25, 1881. (No model.)

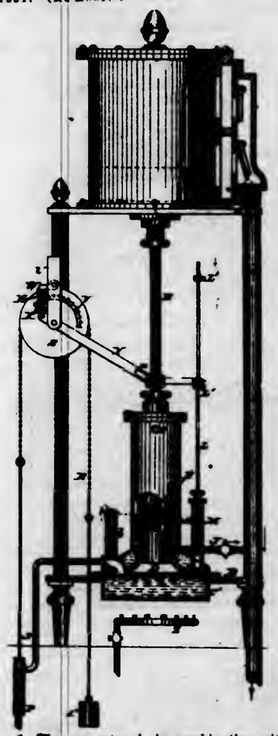


Brief.—The spindle is held in position by means of a spring, which, when said spindle is to be raised, is pushed back out of engagement with the whirl by a handled bar or rod bent at its end and slotted to fit the said spring, the band at the same time being removed from the groove of the whirl.

Claim.—1. The combination, with the whirl-spindle, of the retaining-spring, which may be sprung back away from above the whirl when it is desired to raise the whirl, as and for the purpose set forth.

2. The spindle, its whirl, and the tubular support and retaining-spring attached to the tubular support, combined with the slotted key to engage and operate the retaining-spring and throw off the band, substantially as described.

253,027. QUADRUPLEX TELEGRAPH. STEPHEN D. FIELD, New York, N. Y. Filed Nov. 25, 1881. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of two independent electro-magnets included in the same circuit, two armatures and armature-levers actuated by the respective electro-magnets, an equalizing-bar having its extremities attached one to each of said armature-levers, and an adjustable retractor acting upon said equalizing-bar.

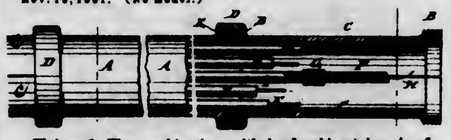
2. The combination, substantially as hereinbefore set forth, of two independent electro-magnets included in the same circuit, two armatures and armature-levers actuated by the respective electro-magnets, an equalizing-bar having its extremities attached one to each of said armature-levers, an adjustable retractor acting upon said equalizing-bar, a receiving-instrument actuated by a differential magnet, a local battery, two branch circuits from said battery, each including one coil of said differential magnet, and means, substantially such as described, for closing a circuit through one or through both of said branches, according to the position of said armatures.

3. The combination, substantially as hereinbefore set forth, of two independent electro-magnets, each provided with an armature and armature-lever, one of said levers constituting a yielding contact-stop for the other, an equalizing-bar having its ends connected one with each of said levers, and an adjustable retractor acting upon said equalizing-bar.

4. The combination, substantially as hereinbefore set forth, of two electro-magnets, two armatures mounted upon pivoted levers, an equalizing-bar having its respective ends mechanically connected with said levers, a retractor attached to said equalizing-bar, a device for regulating the tension of said retractor, and means, substantially as described, for varying the point of attachment of the retractor to the equalizing-bar.

253,028. GAS-MACHINE. REUEN W. FLOWER, Jr., and EDWARD C. BURGESS, Philadelphia, Pa., assignors to the United States Automatic Gas Machine Company, of New Jersey. Filed Apr. 14, 1881. (No model.)

Claim.—1. The generator A, in combination with the valve M and pipe J, and the connected piston-rod E and valve-stem L, substantially as and for the purpose set forth.



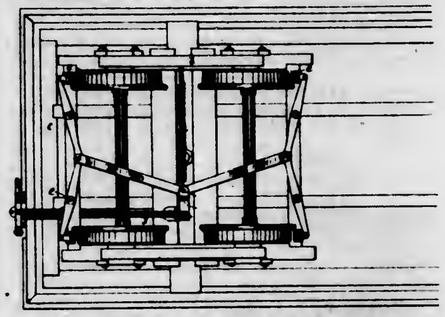
2. The generator with its piston-rod and a connected arm, in combination with the pump mechanism consisting of the pump-rod, chain, pulley, pawl and ratchet, and weight, said weight operating reversely to said piston-rod of the generator in turning said pulley, substantially as and for the purpose set forth.

3. The pulley, pump-rod, and weight in combination with the ratchet V, pawl W, rising-and-falling pin X, and mechanism for operating said pin, substantially as and for the purpose set forth.

4. The generator and air-pump, in combination with a communicating hollow piston-rod, substantially as and for the purpose set forth.

5. The gas-generator and an air-pump, in combination with a pipe communicating with the air-chest of said pump and the exhaust or discharge pipe of the generator, substantially as and for the purpose set forth.

253,029. INSULATOR AND PROTECTOR FOR UNDERGROUND LINES. WILLIAM A. FRENCH, Camden, N. J. Filed Nov. 19, 1881. (No model.)



Claim.—1. The combination, with hard-rubber tubes A, of the interior soft-rubber tubes, F, connected by short hard-rubber couplings G, as and for the purpose specified.

2. In a telegraph-wire insulator and protector, the combination of the series of exterior hard-rubber tubes, A, having collars E, and connected by hard-rubber tubes C, made in halves, and provided with collars B, and the coupling-bands D, substantially as herein shown and described, whereby the wires will be securely insulated and effectually protected, as set forth.

253,030. BOARD OR TABLET FOR ARTISTS' USE. SAMUEL J. PERKINS, New York, N. Y. Filed July 28, 1881. (Specimens.)

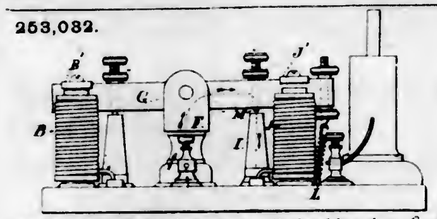
Claim.—As an improved article of manufacture, a stiff or rigid tablet or board for artists' use, provided with a prepared surface of oil-paint applied directly to the face of the tablet or board, and impressed with a woven fabric to produce an imitation grain resembling canvas or similar textile fabric, substantially as described.

253,031. CAR-BRAKE. GEORGE W. FRIEL, Rockland, Mass. Filed June 25, 1881. (No model.)

Claim.—1. The pivoted brake-levers provided with brake-shoes at one end and the toggle-jointed thrust-bars, connected with the other ends thereof, combined with the actuating spring or weight to draw the said thrust-bars into line and apply the brakes, substantially as described.

2. The pivoted brake-levers provided with brake-shoes at one end thereof, and the toggle-jointed thrust-bars connected with the other ends of the said levers, combined with the actuating-lever and connecting mechanism between it and the said thrust-bars, substantially as and for the purpose set forth.

3. The toggle-jointed thrust-bars and actuating-spring, combined with the cranked rock-shaft connected with the joint of the said bars, and the link and handled lever to operate the said shaft, substantially as described.



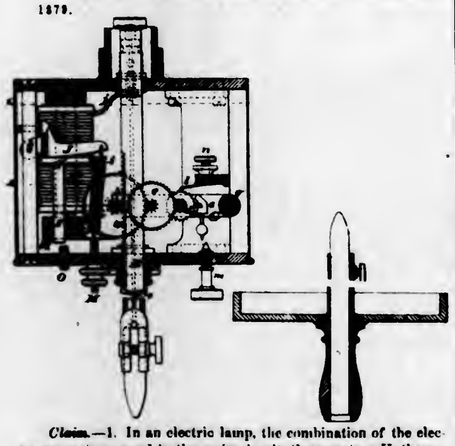
4. The brake-levers and toggle-jointed thrust-bars and their actuating-spring, combined with the actuating-lever and connecting mechanism between it and the said bars, and the locking device therefor, substantially as described.

5. The brake-shoes and their operating mechanism and actuator therefor, combined with the actuating-lever, arranged, as described, to act in opposition to the said actuator, and the locking device with its tripping-projection located, as set forth, to be tripped by the operator in passing, whereby the actuator is permitted to automatically apply the brakes, substantially as described.

253,032. ELECTRIC LIGHTING APPARATUS. SARAH L. FULLER, New York, N. Y., Administratrix of JIM BILLINGS Fuller, deceased, assignor to the Fuller Electrical Company, same place. Filed Jan. 5, 1880.

Claim.—1. In an electric lighting apparatus wherein two or more electric lamps or light-regulators are placed in a single electric circuit, the combination of the electro-magnet B, placed in the

253,082.



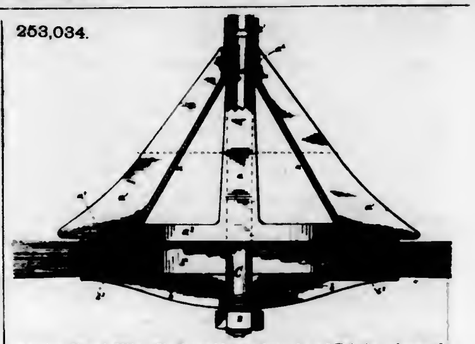
main circuit, with the electro-magnet J, placed in a short circuit around the lamp, the two magnets having a common armature-lever, G, in connection with the fine-wire resistance-coil O, substantially as specified, and arranged to partially shunt the electric current from the lamp to which it is attached and hold the shunt-circuit closed.

2. In combination with an electric lamp or light-regulator which forms one of several in the same electric circuit, each of which is provided with a short-circuiting device, an electro-magnet in the main circuit, and electro-magnet in the short circuit, with a resistance-coil or conductor of comparatively high resistance, dividing the current at the part of the circuit where the lamp is located, all so connected electrically that any too great resistance at the lamp or light-regulator will cause the electric current to operate the magnets without entirely breaking the circuit, thereby shunting the current from the lamp in time to prevent the other lamps in the circuit from being extinguished, substantially as described and shown.

3. In an electric lighting apparatus or shunting device, the combination of the movable armature J' of the shunt-magnet J and the movable armature B with the contact M, the attraction of the magnet J upon the armature operating to close said contact and the release of the armature of the magnet B also operating by the spring L to close said contact.

253,083. ELECTRIC LAMP. SARAH L. FULLER, New York, N.Y., Administratrix of Jim Billings Fuller, deceased, assignor to the Fuller Electrical Company, same place. Filed Dec. 18, 1879.

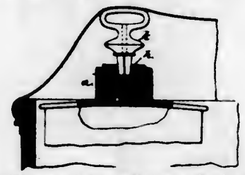
Claim.—1. In an electric lamp, the combination of the electro-magnet arranged in the main circuit, the armature H, the upright and table I I', the curved compensating-lever J, the adjustable tension-spring *i*, and the adjusting-screw O, all arranged substantially as shown, for the purpose of regulating the movement of the armature.



2. The combination of the electro-magnet, arranged in the main circuit and provided with the compensating-lever and spring as shown, with the swinging lever or frame bearing the train, the toothed carrier E, and the fixed detent *l*, all arranged to operate substantially as and for the purpose set forth.

253,084. FLUE-BRUSH. JOHN M. GIBSON, Cincinnati, Ohio. Filed May 27, 1881. (No model.)

Claim.—1. The combination of member B and filling D with member A, consisting of a single casting with T-formed legs *a*, having extended ribs *a'* and hub *a²*, substantially as set forth.



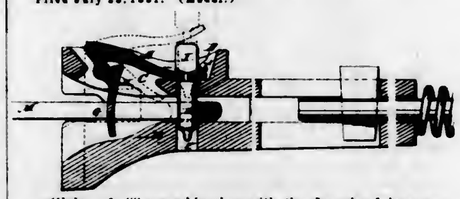
2. The combination of member A, consisting of a single casting, with T-formed legs *a*, having extended ribs *a'* and hub *a²*, with

253,084.

member B and filling D, the said members A and B being clamped together by nut *c* on bolt C and provided respectively with flange *a'* and collar *b'*, which serve as abutments for the inner ends of the filling, substantially as and for the purpose set forth.

253,085. FRUIT-CAN. FREDERICK B. GIBB, Oakland, Cal. Filed Nov. 1, 1881. (No model.)

Claim.—The combination of the can having its top provided with the perforated thimble, the screw-threaded stopper having the socket *h*, the ratchet-key *k*, and the rubber covering *o*, substantially as specified.

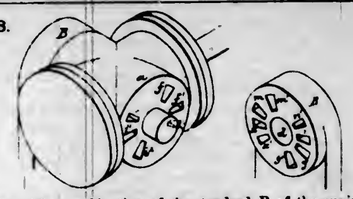


253,086. MEANS FOR SEALING CANS. FREDERICK B. GIBB, Oakland, Cal. Filed Aug. 3, 1881. (No model.)

Claim.—1. The cover *a*, having an opening, *c*, in combination with a jar having a notch or hole at its neck and a hole in its top, and a yielding air-tight covering for the cover *a*, as set forth.

2. The cover *a*, having an opening, *c*, in combination with a yielding air-tight covering, as set forth.

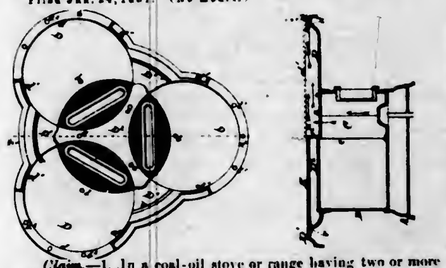
253,087. CAR-COUPLING. JAMES L. GRIFFIN, Cuneata, Tex. Filed July 25, 1881. (Model.)



Claim.—1. The combination, with the draw-head in a car-coupling, of the lever A, pivoted in the front of draw-head, the pin E, suspended in a slot, D, of said lever, and the lever G, having the projection H, the whole adapted to operate in connection with the link, as described.

2. The coupling-pin E, constructed, substantially as herein shown and described, with a flat head, J, and an annular recess J', directly under this head, as set forth.

3. The combination, with the draw-head B, of the side projections, L, provided with apertures K, substantially as herein shown and described, and for the purpose set forth.



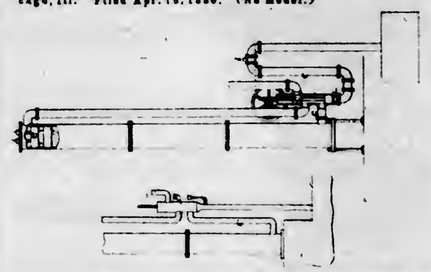
253,088. OSCILLATING ENGINE. LEWIS GRIscom, Pottsville, Pa. Filed Nov. 21, 1881. (No model.)

253,088.

Claim.—The combination of the standard B of the engine, having two sets of steam and exhaust ports spaced as described with the cylinder having two sets of ports spaced in respect to those of the standard as set forth, whereby the ports above and below the center port serve alternately as blind ports and acting ports, as set forth.

253,039. COAL-OIL STOVE. WILLIAM HAILES, Albany, N.Y. Filed Jan. 24, 1881. (No model.)

Claim.—1. In a coal-oil stove or range having two or more burners, each situated in a combustion-chamber, the combination, with said combustion-chamber and a top plate provided with openings *a a*, of a division-plate arranged on the top plate and adapted to keep each volume of the hot products escaping from each burner through said openings separate from the others, so that each volume will operate independent of the other without commingling, substantially as set forth.



2. In a coal-oil stove or range, the combination, with an opening, *a*, serving as a discharge-opening from a combustion-chamber provided with a burner, of a top plate having an extension, D, arranged horizontally and laterally off from one side of said opening, flange-strips *d' d'*, and a plate, E, operating to extend the opposite side of said opening *a* vertically to a line on a plane with said flange-strips, whereby the hot products from the combustion-chamber will be compelled to pass in a horizontal direction from said opening to the outer extremity of said extension, for the purpose set forth.

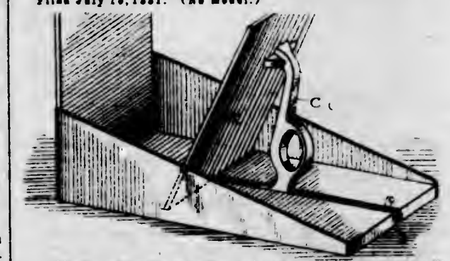
3. In a coal-oil stove or range having two or more burners, situated each in an independent combustion-chamber, the combination, with a top plate provided with openings *a a*, and lateral extensions D, leading from the same, of flange-strips *d' d'*, made with the sides of said extensions, and division-plate E, having its upper surface on a plane with the upper edge surface of said flange-strips, whereby each volume of the hot products of combustion from the several burners will be preserved, separated, and made to pass horizontally over an individual lateral extension to the extremity of the same, in the manner and for the purpose set forth.

4. In a coal-oil stove or range having two or more burners, each situated in an individual combustion-chamber, the combination, with a top plate provided with openings *a a* and laterally-extended portions D D, of flange-strips *d' d'*, made with opposite sides of said extensions, upwardly-curved marginal rims *d*, extended outward past said flange-strips and terminating on a plane below the upper edge surface of the same, and the division-plate E, situated between openings *a a* and having its upper surface on a plane with said flange-strips, whereby the volume of hot products of combustion from each burner will be made to move horizontally in a flue formed between each of said extensions and the bottom of a vessel placed over the same and in close contact therewith, as set forth.

5. In a coal-oil stove or range having groups of burners in which each burner of a group is provided with an individual combustion-chamber, the combination, with the same and a top plate provided with openings *a a*, for discharging the hot products of combustion, and lateral extensions D D, leading horizontally from said openings and having their opposite sides provided with flange-strips *d' d'*, of removable division-plates E, separating the discharge-openings of the combustion-chambers of each burner of a group, and plate F, separating the discharge-openings of one group of combustion-chambers from the other, whereby a variety of operations may be had with vessels of different sizes, substantially as set forth.

253,040. HYDRAULIC ELEVATOR. WILLIAM E. HALE, Chicago, Ill. Filed Apr. 16, 1880. (No model.)

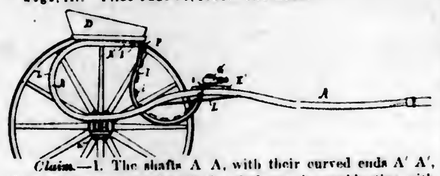
Claim.—1. The lifting-cylinder of a hydraulic elevator, in combination with pipes extending downward and upward from each end of the same to a point about thirty-three feet below the limit of the upper travel of the piston, whereby the column of water in a lifting-cylinder of over thirty-three feet in length is counterbalanced, substantially as and for the purpose described.



2. The lifting-cylinder of a hydraulic elevator exceeding thirty-three feet in length, in combination with a pipe communicating with one end thereof and serving as a discharge-pipe, and also to hold a counterbalancing-column for the water on one side of the piston and a pipe communicating with the other end of said cylinder, and adapted to hold water to counterbalance the water on the opposite side of the piston, and suitable valve appliances for controlling the water and regulating its admission and discharge, substantially as set forth.

3. The lifting-cylinder of a hydraulic elevator exceeding thirty-three feet in length, in combination with a discharge-pipe connecting with the upper end of said cylinder, a counterbalancing-pipe connecting with the lower end of the same, and suitable valve appliances, said pipes being arranged so that the column of water in said lifting-cylinder below the piston is counterbalanced, substantially in the manner set forth.

4. The lifting-cylinder of a hydraulic elevator exceeding thirty-three feet in length, in combination with a combined supply and discharge pipe connecting with the upper end of said cylinder, and suitable valve appliances controlling the supply and discharge, and a counterbalancing-pipe connecting with the lower end of the lifting-cylinder, whereby the column of water in the said cylinder below the thirty-three-foot level is counterbalanced, substantially as set forth.

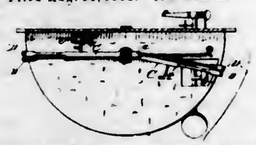


5. The combination, with the working-cylinder of a hydraulic elevator closed at both ends, provided with piston and piston-rod, inlet and discharge openings, pipe containing an upper counterbalancing water column, and valve appliances, of a discharge-pipe extending upward from the end of the cylinder to a point above the bottom to discharge the water at a level above the bottom, substantially as set forth.

253,041. BILL-FILE. CHARLES W. HAYNS, Washington, D. C. Filed July 18, 1881. (No model.)

Claim.—As an improved article of manufacture, a paper-file provided in its bottom with the longitudinal opening *b* and slot *c*, and having the lever C, provided with the longitudinal bar D, fitting and conforming throughout its length to the opening *b*, and file-board E, all constructed to operate substantially as and for the purpose set forth.

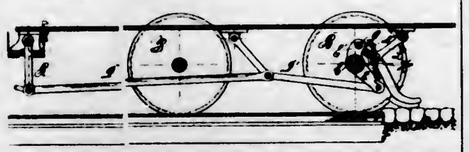
253,042. TWO-WHEELED VEHICLE. OLIVER HERBST, Oswego, Ill. Filed June 11, 1881. (No model.)



Claim.—1. The shafts A A, with their curved ends A' A', bent in the manner as described and shown, in combination with seat D and axle C.

2. The combination of a bent wooden shaft A with the tightening-wire I, provided with nuts at each end, for the purpose set forth in specification.

3. The combination and arrangement of the foot-rest with the ends of the shafts A A, and plate *e*, affixed to cross-bars E and E', substantially as shown and described.



4. The foot-rest string-pieces I I, with slats *i i*, and rod M, in combination with the spring-wires N and O, suspended from plate *e* on top of the cross-bars, as shown and described.

253,043. MUSIC-LEAF TURNER. ADOLFO HEILPRIN, New York, N. Y. Filed Aug. 16, 1881. (No model.)

Claim.—The arms C C, carrying turning-fingers D D and projecting studs *n n*, in combination with a cushion, U, against which said studs are received, as described.

253,044. CAR-STARTER. LUDWIG HELM, Berlin, Germany. Filed Nov. 21, 1881. (No model.) Patented in Germany Sept. 3, 1880.

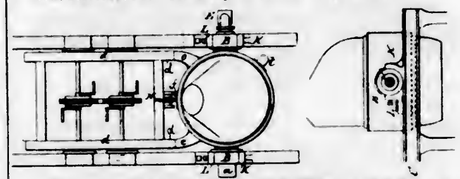
Claim.—1. The combination and arrangement of the presser-foot H with the spiral spring for assuring a firm gripe of the foot H, and with the lever combination E E' and slotted arm L, substantially as described in the foregoing specification and shown in the accompanying drawings.

2. The combination of the lug M and the pivot or pin for the spiral spring with the lever E E', connecting-rods D D', and the arm R, substantially as described in the foregoing specification and shown in the accompanying drawings.

3. The construction and arrangement of the clutch or catch and releasing mechanism, consisting of the catch or hook S, bearing U, spindle T, pivot W, foot or treadle piece X, and volute spring Y, substantially as described in the foregoing specification and shown in the accompanying drawings.

4. In a car-starter, the combination of a presser-foot, H, a slotted arm pivoted to the bottom of the car, and a lever pivoted upon the axle, and connected to the draw-bar and to the presser-foot, said presser-foot being adapted to drop into contact with the roadway when the pull on the draw-bar is relaxed.

5. In combination with the draw-bar D and connecting mechanism, substantially as described, the presser-foot H, having a shoe of elastic, or partially elastic, material.



253,045. PROCESS OF TREATING AMMONIACAL SALTS. HENRI J. E. HENNEBUTH, Anglet, Department of Basses-Pyrénées, France. Filed Dec. 1, 1881. (No specimens.) Patented in France June 16, 1881.

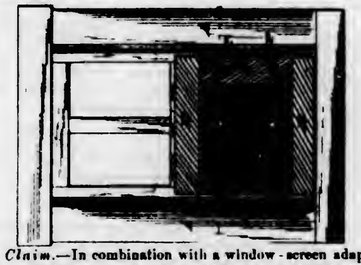
Claim.—1. The herein-described process of treating ammoniacal salts, which consists in heating the liquids containing the same, acidulating the same, and then adding lime thereto in order to decompose the fixed ammoniacal salts, substantially as set forth.

2. The herein-described process of preventing the formation of froths and foams in ammoniacal liquors by adding thereto, after the same have been heated, a slight quantity of acid, in order to eliminate the carbonates which may give rise to the formation of carbonate of lime, substantially as set forth.

3. The herein-described process of eliminating by means of acid the carbonates which tend to cause the formation of carbonate of lime in the treatment of liquids containing fixed salts of ammonia, which it is desired to decompose by lime, substantially as and for the purpose set forth.

253,046. BESSEMER-STEEL PLANT. WILLIAM M. HENDERSON, Steelton, Pa. Filed Sept. 27, 1881. (No model.)

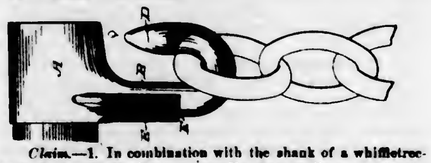
Claim.—1. The combination, substantially as described, of flanged wheels B with the trunnions *a*, of a converter.



2. The combination of a converter and flanged wheels adapted to the trunnions thereof, with girders constituting a track for the said wheels, and with fixed and removable stops K and L on the said track, adapted to the wheels, all substantially as specified.

3. The combination of the converter having projections *e e*, having the truck beams adapted to bear upon said projections *e e*, and a coupling device for attaching the truck to the converter, as set forth.

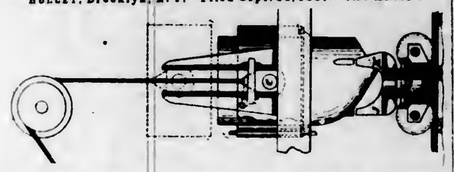
4. The combination of the converter having projections *e e*, the truck having beams adapted thereto, the coupling-link, means for attaching said link to the converter and truck, and the lever N, as specified.



253,047. WINDOW-SCREEN. DAVID W. HERSEY, Pembroke, Me. Filed July 30, 1881. (No model.)

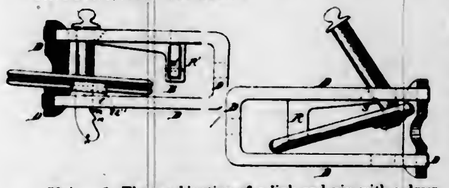
Brief.—A sliding screen is provided with bifurcated nibs on one side, and on the other with notched spring-bolts in cylindrical casings to rest on the rails. The inner ends of the bolts have knobs or handles.

Claim.—In combination with a window-screen adapted to slide vertically on a track and provided at one end with the small notched or bifurcated nibs P P, the cylindrical casings H H, set in the opposite end of the screen, one above the other, and inclosing the locking bars or bolts I, having projecting notched ends adapted to embrace the track by reason of spring mechanism N inside the casings, the inner ends of the bars being provided with knobs or heads J, by which the bolts may be conveniently operated to adjust the screen, substantially as set forth.



253,048. WHIFFLETREE-HOOK. MATHAN HILL, Clyde, assignor of three-fourths to John K. Divers, Bangor, Mich. Filed Nov. 9, 1881. (No model.)

Claim.—1. In combination with the shank of a whiffletree-hook, the longitudinal ribs or bars E, substantially as and for the purposes set forth.



2. The described whiffletree-hook, consisting of the ferrule A, rigid hook B, catch or barb D, and the ribs or bars E, all constructed of a single piece of metal.

253,049. BESSEMER-CONVERTER PLANT. ALEXANDER L. HOLLEY, Brooklyn, N. Y. Filed Sept. 24, 1881. (No model.)

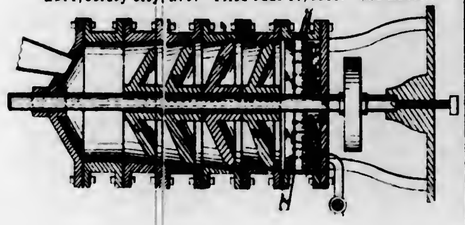
Claim.—The combination of the trunnion-ring of a Bessemer converter with suitable hoisting mechanism for lifting the trunnion-ring, and with a converter-shell detachable from the trunnion-ring, and with a car and lift under the converter, the combination being for the purpose of lifting the trunnion-ring off the shell, so that the shell may be removed laterally and a repaired shell may be placed in the trunnion-ring in the manner described.

253,050. CAR-COUPLING. CHAS. L. HORACK, Brooklyn, N. Y. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination of a link and pin with a draw-bar, D, the latter containing a standard, R, for the purpose of confining one end of said link within the draw-bar, the other being held there by means of the coupling-pin.

2. The combination of a stationary link, pin, and washer with a draw-bar, the latter being provided with a seat, S, below the upper pin-hole for supporting the pin, substantially as specified.

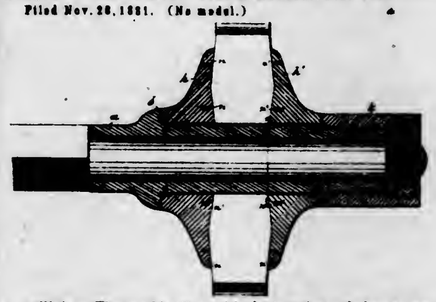
3. The combination of a link and pin and washer attached to the draw-bar D, the latter containing a standard, R, constructed as the vertical arm of an angular piece, the horizontal arm forming a seat for the coupling-pin, substantially as specified.



4. The combination of a stationary link, pin, and washer with a draw-bar, the latter containing a vertical standard back of the pin-holes and attached to the upper part of the draw-bar, for the purpose of confining the rear end of the stationary link when not required for coupling purposes.

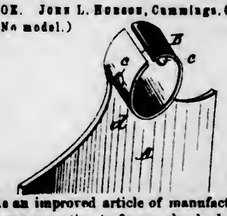
5. The combination of a stationary link, pin, and washer with a draw-bar, said link being constructed with longitudinal grooves on its sides, and the washer with lips corresponding with said grooves, substantially as specified.

6. The combination of a stationary link and pin with the draw-bar D, said draw-bar being provided with the rear standard, R', constructed with lugs swinging outward, so as to hold the rear end of said stationary link in an elevated position when not required for coupling purposes.



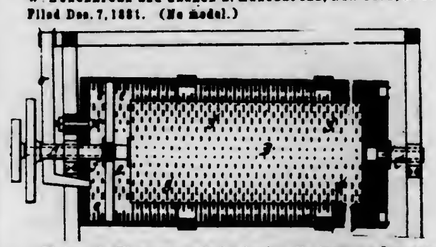
7. The combination of a stationary link and pin with the draw-bar D, said draw-bar D being provided with the standard R', constructed with lugs forced outward by means of a spring, for the purpose of confining one end of the stationary link when not required for coupling purposes.

253,051. ORE PULVERIZER AND AMALGAMATOR COMBINED. FREDERICK J. HOYT, New York, N. Y., and WILLIAM H. HOYT, Jersey City, N. J. Filed June 17, 1881. (No model.)



Claim.—The combination, substantially as hereinbefore set forth, with the vertical shaft and grinding-disks, of the shell constructed with the grinding-surfaces to co-operate with the disks, and with the amalgamating-pan in the lower part, the annular water-supply pipe, the water-overflow pipe, and the amalgam-discharge spout of the pan, for the purpose specified.

253,052. WAGON-HUB. JOHN A. HUDGENS, Pine Bluff, Ark. Filed Nov. 28, 1881. (No model.)

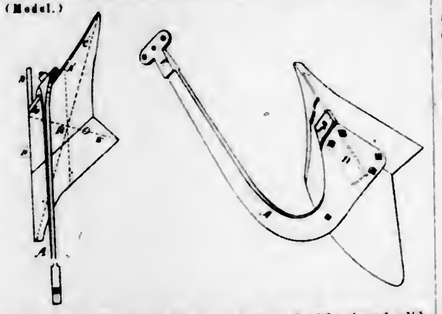


Claim.—The combination, with the tapering axle-box *a*, provided with the circular shoulder *b*, polygonal part *c d*, and cylindrical outer end, *f*, screw-threaded on its periphery, of the hub-collars *h h'*, provided with double-beveled surfaces *m m'* on their inner faces, and polygonal central orifices, nut *k*, and spokes *l*, having their squared ends resting against the polygonal faces of the axle-box, their front faces beveled inwardly and abutting against each other, and their side faces provided with the inclined planes *n n'*, fitting against the surfaces *m m'* of the collars, substantially as described, and for the purpose set forth.

253,053. HOE. JOHN L. HUDSON, Cummings, Ga. Filed July 14, 1881. (No model.)

Claim.—As an improved article of manufacture, the hoe A, cut away at its upper portion to form a shank, *d*, and having the split eye B, with holes *c* in opposite sides thereof to receive a transverse tightening-bolt through the handle, substantially as and for the purpose set forth.

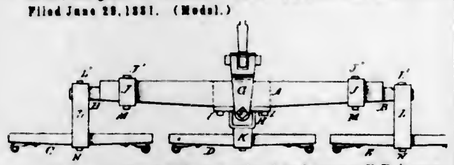
253,054. MACHINE FOR SCOURING COPPER, &c. GEORGE W. HUNGERFORD and GEORGE E. HUNGERFORD, New York, N. Y. Filed Dec. 7, 1881. (No model.)



Claim.—1. The outer cylinder having its inner surface provided with teeth which are arranged in sets extending longitudinally and alternating with blank spaces, in combination with the inner cylinder having teeth on its outer surface, substantially as shown and described, for the purpose set forth.

2. The outer cylinder constructed with side staves which are alternately provided with teeth on the inner surface of each cylinder, in combination with the inner cylinder having teeth on its outer surface, substantially as described, for the purpose set forth.

3. The outer toothed cylinder having a screen located at one end thereof and staves alternately terminating at the inner end of the screen and extending the entire length of the cylinder, in combination with the inner toothed cylinder, substantially as shown and described, for the purpose set forth.



253,055. PLOW. FRANKLIN B. HUNT, Richmond, assignor of one-half to D. S. Robbins, Economy, Ind. Filed July 5, 1881. (Model.)

Claim.—1. In a plow, the beam A, formed with a broad solid rear end, and bent downwardly and laterally and closely fitting the mold-board, and extending down beneath the wing of the plowshare, and bolted to the wing of the share and mold-board, respectively, and independently of each other, and having a downwardly-turned portion, F, to which the landside of the share is bolted, substantially in the manner as and for the purpose herein shown and described.

2. In a plow, the beam A, formed with a broad and solid rear end, and bent downwardly and laterally to closely fit the mold-board and share, and arranged parallel with and between the landside D and the line A', and bolted to the mold-board and wing of the share independently of each other, substantially in the manner as and for the purpose herein shown and described.

253,056. DRAFT-EQUALIZER. FRANKLIN B. HUNT, Richmond, assignor of one-half to D. B. Robbins, Economy, Ind. Filed June 29, 1881. (Model.)

Claim.—1. The double-tree strips A and eveners B B, in combination with the plate H and clips J J, the clips and plate being held in place by means of lateral wood-screws, substantially as set forth.

2. The double-tree strips and single-trees placed arch side foremost, in combination with the eveners and clips J J and L L, said clips being held in position by means of lateral screws, substantially as shown and described.

3. In combination with the double-tree strips and eveners, the clips K K' and single-tree D, substantially as shown and described.

4. The plate H, provided with the hole S, recesses P P, and tongue V, substantially as set forth.

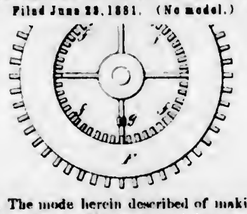
5. The single-trees C E and eveners B B, connected by means of the clips L L, and held in position by means of lateral screws, substantially as set forth.

6. The double-tree strips A A and single-trees placed arch side foremost, in combination with the eveners and clips L L K and J J, the clips being held in place by means of lateral screws, substantially as set forth.

7. In combination with the double-tree strips, eveners, and single-trees, the clips J J L L, plate H, and clip G, substantially as set forth.

8. In combination with the double-tree strips, eveners, and single-trees, the clips J J L L K, held in position by means of lateral screws, substantially as set forth.

9. In combination with the double-tree strips A, eveners B B, and single-trees C D E, the clips J J L L K, plate H, and clip G, substantially as shown and described.



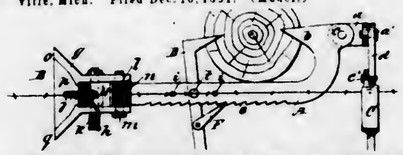
10. The ends of the eveners, rounded, as shown at O, Fig. 6, for the purpose of making a rear bearing for the clips L L, in combination with lateral screws, substantially as shown and described.

11. The combination and arrangement of the plate H, provided with the tongue V, and the clip G, whereby the double-tree strips are held and prevented from springing inward or outward, substantially as set forth.

12. The clip K K', held onto the single-tree by means of a lateral screw, and having rearwardly-projecting arms, to which the eveners are attached, substantially as shown and described.

13. In combination with the double-tree strips A A, the movable or adjustable clips J J, held in place when adjusted by means of lateral screws J', whereby the double-tree may be converted into a triple-tree, substantially as set forth.

253,057. PREPARING TYPE-FORMS. JOHN P. HUNT, Philadelphia, Pa. Filed June 29, 1881. (No model.)



Claim.—1. The mode herein described of making type-bars for printing, said mode consisting in maintaining a mass of molten or semi-molten metal in a trough or channel, impressing characters upon the face of the same by suitable matrices, and feeding the bar from the trough or channel as it solidifies, as set forth.

2. The combination of the trough, the reservoir for supplying molten metal thereto, a disk, F, carrying matrix-bars *f*, and means, substantially as described, for depressing said bars, as set forth.

3. The combination of the trough, the metal-reservoir, the matrices, and the movable bottom B of the trough, as set forth.

4. The combination of the trough, the metal-reservoir, the matrices, and the feed-rolls E, as set forth.

253,058. WIRE-STRETCHER. HENRY H. HUTCHINS, Fondville, Mich. Filed Dec. 10, 1881. (Model.)

Claim.—1. The hooked plate or bar A, in combination with the levers or jaws C C', guide B, hooked lever D, and eccentric H, substantially as and for the purposes set forth.

2. The hooked plate or bar A, formed with the lugs *e e*, in combination with the pivoted link *a* and the levers C C', pivoted thereto, substantially as described.

3. The hooked bar or plate A, formed with the slot *f*, in combination with the hooked lever D, provided with pawl F, the plate being formed with the notches *e*, substantially as and for the purposes set forth.

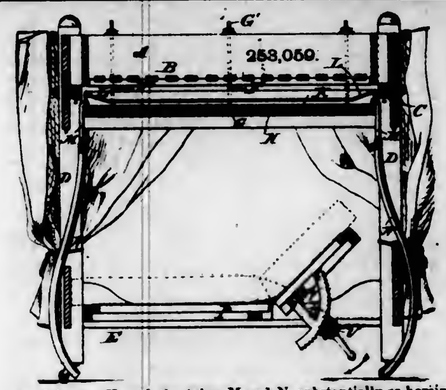
4. In combination with the plate or bar A, the eccentric H and the hopper-shaped guide B, substantially as and for the purposes set forth.

5. The guide B, formed of the diagonal plates *o*, *p*, and *q*, and the bed-plate *n*, the plate *o* being extended above the plate *q* and carrying the eccentric H, in combination with the main bar or plate A, substantially as described.

6. The combination, with the eccentric H, of the diagonal plates *o q*, reaching past the edges of the said eccentric, substantially as shown and described, whereby a narrow throat or passage is formed and the danger of the barbs catching over the edges of the eccentric avoided, as set forth.

7. The guide B, secured to the bar or plate A by means of the bolt or pin *m*, substantially as and for the purposes set forth.

253,059. REFRIGERATING-BEDSTEAD. CHARLES P. JACKSON, Chicago, Ill. Filed Sept. 12, 1881. (No model.)



Claim.—1. A bedstead constructed, substantially as herein shown and described, with an ice-box supported above it, and with an adjustable head-rest, as set forth.

2. The combination, with a bedstead, of an ice-box supported above it, substantially as shown and described.

3. The combination, with a bedstead, of an ice-box supported above it, and of a drip-water pan below this ice-box, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the bedstead-posts D, of the cross-pieces C, the ice-box A, the drip-pan K, the hollow ceiling H, and the rods F, substantially as herein shown and described, and for the purpose set forth.
